Artificial filaments or threads. H. DREYFUS. U. S. 1,669,158, May 8. A soln. of an org. cellulose deriv. such as cellulose acetate in acetone and aldehyde mixt. or other solvent with a b. p. below 40° is spun into an evaporative atm.

Forming composite threads from artificial silk filaments produced by the stretching process from copper-ammoniacal solutions. J. P. BEMBERG AKT.-GES. Brit. 275,637, Aug. 5, 1926. Mech. features.

Cellulosic pulp. I. G. FARBERNIND, A.-G. Brit. 274,892, July 21, 1926. Materials such as wood or straw are subjected to the action of HNO_3 vapors which may be obtained by passing air through a 60% HNO_3 soln. at a temp. of 30–40°. Subsequent boiling in alkali yields a cellulose of high purity.

Pulp from wood or similar materials. T. L. DUNBAR. U. S. 1,669,234, May 8. Fibrous material is digested with a soln. such as sulfate or soda while steam is introduced and the steam is permitted to condense and mix with the liquor used for digestion; the mixed liquor is continuously circulated through the fibrous material, and after a certain vol. of liquor accumulates the excess is then passed into an accumulator. An app. is described.

Apparatus for making laminated paper. I. A. NEWCOMER. U. S. 1,669,011, May 8.

Apparatus for cleaning paper pulp and feeding it to a paper-making apparatus. R. S. CLARKE. U. S. 1,668,141, May 1.

Friction-drag device for testing the finish of paper sheets. C. H. LE P. JONES. U. S. 1,668,593, May 8.

Treating paper to render it impermeable and washable, etc. L. R. MÈCRE. Brit. 275,617, Aug. 4, 1926. Paper is first treated with a soln. contg. a mixt. of at least 2 of the substances: alum, orchid flower (farine d'orchi), gum tragacanth, alga gum and resin; and is subsequently treated with borax, $(\text{NH}_4)_2\text{SO}_4$, $(\text{NH}_4)_2\text{CO}_3$, H_3BO_3 or other reagent to render the material first applied insol. Coloring substances may be added, and the paper may be preliminarily treated with an alk. soln.

24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

Microscopic studies of the structure of Poudre B. J. DESMAROUX. *Mem. poudres* 22, 259-84(1926).—A study of the condition of guncotton in Poudre B showed that nitration did not alter the structure but beating cuts, grinds and tears the fibers. Guncottons contg. up to 25% sol. in ether-alc. were found to consist of a phys. mixt. of sol. and insol. fibers. Some of the insol. fibers were superficially etched and corroded by ether-alc. (cf. Bruin, C. A. 16, 1317). Diphenylamine powders (2%) exposed to alc. vapors in a closed vessel at temps. as high as 55° turned black in 3-4 days. Diphenylamine powders which go through a cycle of mixing, graining, solvent recovery, resolution in a non-oxidizing atm., followed by mixing, etc., become black after the 7th or 8th remixing. Information as to the structure of gelatinized powders was obtained by dyeing the guncotton with oxydiamine black J. W. R., gelatinizing with sol. cotton, mixing, extruding and pressing into strips. These were dried, softened with 95% alc., sectioned with a microtome and mounted in balsam. The solvent in powders is distributed between the swollen guncotton and the sol. gelatinized cotton. The morphological texture of the fiber was found to be without influence on soly. A method was developed for counting the number of fibers per sq. mm. in the sections, which gave approx. results with regard to uniformity in mixing. The longitudinal resistance of the extruded strips was found to be greater than the lateral resist. No differences were observed in the rate of combustion of long and lateral sections. Based on their differing solubilities in alc. and water, with corresponding differences in rate of diffusion, several dyes were found suitable for staining the dried undyed sections. The best water-sol. dye found was oxydiamine black J. W. R. and the best alc.-sol. dye diamine blue R, although this was a poor color for photographing. With aq. dyes, the alc.-softened sections required 24-42 hrs.' soaking in an almost satd. soln., while the alc. dyes required 1-2 min., the method being that of trial and error. By the use of dyes it is possible to distinguish a well-dehydrated from a poorly dehydrated powder and a water-dried from an air- or alc.-dried powder.

Purification of guncotton. P. VIEILLE. *Mem. poudres* 22, 317-19(1926).—The fact that an approx. const. coeff. of exchange was secured whether boiling was carried out for 80 hrs. or for 200 hrs. led to an investigation of the acid content of the water. Analysis showed that the increase in acidity was 84% HNO_3 , 8% H_2SO_4 , 8% of undetd. org. acids.

Influence of temperature on the washing of guncotton. P. VIEILLE. *Mem. poudres* 22, 315-6(1926).—A quant. measure of the influence of temp. was secured by measuring the exchange coeffs. between 89.5° and 110°. The results showed that the reaction was tripled in speed for each 10° rise in temp.

Influence of the coefficient of exchange on the ease of alkaline saturation of guncotton. P. VIEILLE. *Mem. poudres* 22, 307-10, 311-4(1926).—A low coeff. will not necessarily give good stability at 110° but it is necessary for good stability if a short carbonation with CaCO_3 is employed. Alk. boils which reduce the exchange coeff. to a low figure will not necessarily produce a guncotton of high stability. Prolonging the boiling from 80 to 450 hrs. had little effect in lowering stability. Prolonged acid washing had no effect on soly. or nitrogen content. An exchange coeff. of 0.014 after 64 hrs.' boiling is insufficient for a good stability test; an 80-hr. boil is necessary for a satisfactory carbonation.

Inflammability of nitrocelluloses. P. PASCAL. *Mem. poudres* 22, 285-98, 299-306(1926).—Uniformly moistened nitrocelluloses were packed in paper cartons and fired from the exposed surface or from the center of the carton. Ignition proceeded from a slow combustion to a detonation as the % moisture decreased. Beaten cotton was less inflammable than unbeaten. A comparison of nitrocelluloses prepd.

by displacement and by the pot process showed the former to be consistently more inflammable. The free acidity, alky. and origin of the cotton were eliminated as factors and the effect was traced to a higher percentage of nitric acid in the displacement nitrating bath. The nitrocelluloses which ignite most readily burn more slowly and with less deflagration than the more difficultly ignitable samples. The factors affecting inflammability are physical state (beaten or unbeaten), density of loading, % of nitrogen, composition and temperature of the nitrating bath. The av. moisture content of a lot is no indication as to the inflammability of the mass, as the surface may dry, ignite readily and propagate the flame throughout the mass. A. J. PHILLIPS

The evolution of gases from heated nitrocellulose powders. J. DESMAROUX. *Mem. poudres* 22, 245-53(1926).—Powders stabilized with AmOH or Ph₃NH were heated in a glycerol bath to 75° or 108.5° and the gases evolved were collected in an evacuated tube over Hg. The gases consisted of CO₂, N, N₂O, NO and CO, the vol. of the first increasing and that of the second decreasing with time. The tests at 75° were less precise than those at 108.5° and the gas compns. at the 2 temps. were diff. for the same period of heating. The rate of evolution of gas rose to a max. and then declined. A. J. PHILLIPS

Coefficients of exchange of nitrocellulose. A. KOEHLER AND M. MARQUEROL. *Mem. poudres* 22, 320-5(1926).—Nitrocellulose decarbonated with water satd. with CO₂ is dried for 2 hrs. on the steam bath. To a non-soluble, green glass pressure flask of 125-cc. capacity are added 5 g. dry cotton and 90 cc. of distd. water. The flask is closed and heated in a sterilizer for 23 hrs. at 100°, cooled, the soln. filtered and titrated to det. the coeff. of exchange. This is the acidity in mg. of H₂SO₄ given up in 1 hr. by 100 g. of nitrocellulose in the presence of water at a definite temp. A correction is applied for the acid left on the fibers and the process is repeated on the same sample. Results are reported on powders manufd. in 1911-12 showing coeffs. ranging from 5.0 (first heating) to 2.9 (second heating). Relations between the coeffs. indicate that between 90° and 130° an increase of 10° triples the values, while between 40° and 90° an increase of 5° doubles the value of the coeff. A. J. PHILLIPS

Effects of temperature and pressure on the explosibility of coal-dust and air mixtures. HIDENOSUKE SANO. *Nihon-Kôgyôkwaishi* No. 486, 845-52(1925); *J. Inst. Metals* 38, 659; (cf. *C. A.* 21, 177. In Japanese).—It has been shown that the lower limit of inflammability in coal-dust and air mixts. descends with rising initial temp. Increasing the initial pressure of the mixt. up to 5 atm. from atm. pressure had no effect in changing its lower limit, but had the tendency to lower its ignition temp. Dust clouds which are incapable of starting inflammation by simple ignition can propagate explosions, being affected by rising initial temp. and pressure caused by the pioneering wave accompanied ahead by the flame of explosion. H. G.

A firedamp explosion in the Gabriel field, Karwin (Silesia), and the reopening of the mine. ANON. *Montan. Rundschau* 20, 121-9, 157-66(1928).—While workers were digging into a seam a slight escape of smoke and a burned odor were observed. The spot was walled off, whereupon an explosion occurred, blowing down the walls and killing 15 men, injuring 10 badly, 7 slightly. Two major explosions occurred, 10-12 minor explosions on blocking off, and 24 minor explosions after blocking off. In reopening work 2 were killed, one from lack of O₂, the other from a fall. E. M. S.

PIQUE, RENÉ: La poudre noire et le service des poudres. Paris: Société de Publications Colloïdales. 210 pp. F. 15 (bound). Reviewed in *Parfumerie moderne* 21, 64; *Rev. prod. chim.* 31, 246-7(1928).

Explosives. F. W. GUTHKE. *Brit.* 275,228, July 28, 1926. Solid polyvalent alcs. such as pentites and hexites and liquid polyvalent alcs. such as glycol and glycerol are nitrated together. Mannitol, sorbitol, glycerol and ethylene glycol and similar compds. may be used.

Non-detonating composition for smoke or flame production, signalling, etc. VICKERS, LTD., AND E. E. F. BERGER. *Brit.* 275,021, Aug. 9, 1926. Ca silicide 40 and KNO₃ 60% may be formed into granules and used alone or with a smoke-producing compn. as described in *Brit.* 127,031.

25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

Old and new methods of printing basic colors. M. W. ALLING. *Am. Dyestuff Rept.* 17, 235-8, 270-1 (1928). L. W. RIGGS

Modern vs. "old-school" piece dyeing. C. F. HOPPE. *Am. Dyestuff Rept.* 17, 239-41 (1928). L. W. RIGGS

Dyeing rayon with indanthrene colors. G. RUDOLPH. *Kunstseide* 9, 366-8 (1927).—A general description is given of the process of dyeing viscose rayon with indanthrene dyes. Detailed directions for 11 shades of colors of an accompanying sample are given. FREDERICK C. HAHN

Sisal dyeing. FRED GROVE-PALMER. *Am. Dyestuff Rept.* 17, 241-3 (1928). L. W. RIGGS

Simultaneous charging and black-dyeing of silk. A. L. HOFFMANN. *Kunstseide* 9, 369-70, 461-2 (1927).—Different processes for the simultaneous dyeing in black and charging of silks are discussed, and a no. of good processes are recommended. In contrast to the catechu-bluewood treatment, higher charging is obtained by treating the silk, after treatment with iron liquor, with 10% $K_4Fe(CN)_6$ soln. at 50°, followed by a hot catechu bath, the further treatment being as usual. FREDERICK C. HAHN

Method of detecting complete development of Indigosols and Soledon colors on wool. Preliminary communication. H. R. HIRST AND P. E. KING. *J. Soc. Dyers Colourists* 43, 266-7 (1927).—Certain anomalies exist in the fastness to light and weather of dyeings of Indigosol and Soledon colors on wool. The object of this study was to det. the cause of these anomalous results and to test the possibility of the use of ultra-violet radiation as a check on the correct development of the leuco- or other compd. on the wool, and hence assist the dyer in producing fast dyeings. Certain Indigosol dyeings when examd. by means of ultra-violet radiations showed a strong violet fluorescence on the original dyeing, but not on portions exposed to light for some weeks. Also Indigosol dyeings developed by different oxidizers showed strong fluorescence in some cases, in others none. Fluorescence appears to indicate incomplete development caused by incomplete oxidation. With dichromate oxidizer the results were better at 50° to 55° than at 20° to 25°. On the other hand at 85° there was fluorescence attributed to oxidation products of indigotin. Unoxidized or undeveloped Indigosol can be extd. from dyed wool by dil NH_4OH or Na_2CO_3 . When this is completely removed the wool no longer fluoresces, but the extd. solns. fluoresce as long as they contain any Indigosol. The exhaustion of the dye bath is shown by only a faint fluorescence when subjected to ultra-violet radiation. An aq. soln. of Indigosol acidified with H_2SO_4 and exposed to light of the fadeometer, deposited a blue ppt. and lost its fluorescence in 90 min. Examn. for fluorescence by ultra-violet radiation gives promise of being a valuable method of control in this type of dyeing. Further work is in progress. L. W. R.

Critical theory of the examination of textiles. ADOLPH ROSENZWEIG. *Kunstseide* 9, 372-4, 418-20, 464-6, 519-21, 607-9 (1927).—The testing of textiles is discussed from a critical and theoretical standpoint. FREDERICK C. HAHN

The influence of ultra-violet rays on the strength properties of fiber materials. P. HEERMANN AND H. SOMMER. *Leipzig Monatschr. Textil Ind.* 40, 207-12 (1925); *Expt. Sta. Record* 57, 694. —According to addnl. data (cf. *Leipzig Monatschr. Textil Ind.* 40, 161-3 (1925)), mineral-weighted silk is most sensitive to light, followed in order by raw silk, jute, raw and bleached cotton, raw wool, mercerized cotton, nitro- and viscose rayons, chrome wool, bleached flax yarn and the most resistant cuprammonium rayon and raw flax yarn "Monopol black" dye appeared to render silk highly resistant, and its use is suggested for balloon and airplane fabrics. H. G.

Manila hemp from St. Vincent. ANON. *Bull. Imp. Inst.* 26, 1-4 (1928).—Samples of different grades of *Musa textilis* grown in St. Vincent were found to have approx. the same chem. comp. and to be of comparable quality to the ordinary commercial grades from the Philippines. A. PAPINEAU-COUTURE

Treatment of rayon. W. ALTERHOFF. *Kunstseide* 9, 368-9 (1927).—*Avivage*, a treatment which makes rayon resemble silk from the standpoint of "feel" and other qualities, is described, and the most recent oils used in this treatment are discussed. F. C. H.

Weaving and knitting of rayon. CARL ABERLE. *Kunstseide* 9, 379-80, 425-7, 472-5 (1927).—A general article on the prepn. of yarn, types of knitting, types of machines, forming and finishing. FREDERICK C. HAHN

Streaked rayon fabric. FRANZ MÜLLER. *Kunstseide* 9, 381-4 (1927).—The causes

of streakiness in rayon cloth and methods of avoiding this difficulty by special weaving methods are discussed.

FREDERICK C. HAHN *

Immunized cotton. W. A. MIEDENORP. *Proc. Am. Assoc. Textile Chem. Colorists* 1928, 132-6; *Am. Dyestuff Rept.* 17, 250-4.—"Immunized" cotton is made by the esterification of alkalinized cotton with *p*-toluenesulfonyl chloride. Its uses and advantages are shown in an address and discussion.

Dyes. BRITISH ALIZARINE CO., LTD., W. H. DAWSON and P. BEGHIN. Brit. 275,283, March 4, 1926. Isoviolanthrones are made by heating Bz-1-halogenbenzanthrones or their derivs. which are not substituted in the 2-position, with alkali hydroxide in concd. form in the presence of an aromatic amino compd. such as PhNH_2 , *p*-toluidine or naphthylamine; temps. of 75-220° may be used.

Dyes. BRITISH DYE STUFFS CORPORATION, LTD., A. SHEPHERDSON and W. W. TATUM. Brit. 275,421, Aug. 19, 1926. 1-Hydroxy-2-sulfo-4-sulfoarylidioanthraquinones which dye wool reddish blue shades are made by treating 1-hydroxy-2-halogen-4-sulfoarylidioanthraquinones with a soln. of a metal sulfite such as Na_2SO_3 , filtering, and evapg. the filtrate.

Dyes. F. STRAUB and H. SCHNEIDER. U. S. 1,669,069, May 8. Chromable dyes are made by the action of a reducing agent such as an alkali sulfide in the presence of a water-sol. org. OH compd. such as glycerol on azo dyes derived from nitrated diazotized 1-amino-2-hydroxynaphthalene-4-sulfonic acid and a naphthol.

Dyes. I. G. FARBERIND. A.-G. Brit. 274,527, Feb. 17, 1926. Vat dyes of the 2-thionaphthene-2-indolindigo series are formed by condensing hydroxythionaphthenes such as 5,7-dichloro- or 5,6,7-trichloro-hydroxythionaphthene or similar halogen, or halogen, alkyl and acyl derivs. with isatin- α -derivs. such as 5,7-dibromoisatin chloride, isatin- α -anilide or similar compds. Numerous examples and directions for making the intermediates are given. The dyes obtained dye wool and cotton from the vat in fast blue to violet shades.

Dyes. I. G. FARBERIND. A.-G. Brit. 275,258, July 29, 1926. Diazotized *p*-aminomethylacetanilide or other diazo compd. is coupled with the product obtained by the action of chloroformic ethyl ester on the Na salt of 2,8,6-aminonaphtholsulfonic acid or other similar aminonaphthol derivs. suitably in the presence of an acid-binding agent.

Dyes. I. G. FARBERIND. A.-G. Brit. 275,292, April 9, 1926. Thioindigoid dyes are made by condensing perinaphthoxypenthiophene or one of its nuclear substitution derivs. with 1-halogen-2,3-naphthisatin- α -halides or arylides or their further halogenated derivs., 2,3-diketodihydro-4,5-benzo-3-hydroxythionaphthenes or their 2-halides or 2-anils or similar compds. The dyes from acylaminoepinaphthoxypenthiophenes may be saponif. for the removal of the acyl group. The products may be further halogenated. They dye animal and vegetable fibers from the vat fast blue to green shades. Several examples are given for producing the dyes and the intermediates used.

Dyes. I. G. FARBERIND. A.-G. Brit. 275,609, Aug. 9, 1926. Dyes giving blue tints on wool in a feebly acid bath are produced by introducing the residue of a 4-alkoxydiphenylamine into a triarylmethane dye as one of the aryl groups. Examples are given.

Dyes. I. G. FARBENIND. A.-G. Brit. 275,613, Aug. 5, 1926. Dyes similar to those described in Brit. 274,128 (C. A. 22, 2065) are obtained by coupling a diazo compd. of a 1,3-dimethyl-4-amino-2-halogenbenzene or of a 1,3-dimethyl-6-alkyl-4-amino-2-halogenbenzene with a 2,3-hydroxynaphthoic arylide.

Dyes. I. G. FARBENIND. A.-G. Brit. 275,636, Aug. 4, 1926. Amino compds. of the anthraquinone series are treated with halohydrins in the presence of acid-binding agents such as Na_2CO_3 , Na_2HPO_4 , NaOAc or MgO , with or without condensing agents. The products, several examples of which are given, dye cellulose acetate red, red-violet and blue shades and color stearic acid similar shades.

Dinitrodiphenylamine dyes. I. G. FARBENIND. A.-G. Brit. 274,999, June 21, 1926. Dyes contg. at least 2 nitro groups in their mol., which dye wool and leather yellow and brown to red-brown tints, are made by condensing an aromatic nitro compd. having an exchangeable halogen (other than 1-halogen-2,4-dinitrobenzene) with 4-aminodiphenylamine or a deriv. 4-Nitro-4'-aminodiphenylamine-2-sulfonic acid may be condensed with 1-chloro-2-nitrobenzene, 1-chloro-4-nitrobenzene or 1-chloro-2-nitro-4-benzaldehyde. Other examples also are given.

Monoazo dyes. FABRIQUE-DE PRODUITS CHIMIQUES ROHNER SOC. ANON. PRATTELIN. Brit. 275,147, Aug. 2, 1926. Diazotized oxamic acids of the diaminodiphenyl series are coupled with aromatic amines and the products are subjected to alk. sapon. The monoazo dyes thus obtained can then be tetrazotized and coupled with 2,3-hydroxynaphthoic arylides, in substance or on the fiber, to produce black trisazo dyes which form good pigment colors when produced in substance.

Monoazo dyes. J. R. GEIGY AKT.-GES. Brit. 275,220, July 29, 1926. An aminosulfobenzoic acid (such as 2-chloro-5-amino-4-sulfobenzoic acid) having the sulfo group in the o-position to the NH_2 group is diazotized and coupled with the usual coupling components such as β -naphthol or 2,8,6-aminonaphtholsulfonic acid. Red and bluish red dyes are obtained with the components just mentioned, and by using pyrazolones as components dyes are obtained which give greenish or yellow tints.

Yellow vat dyes. SEBASTIAN GASSNER. U. S. 1,667,848, May 1, 1926. 5,5'-Dibenzoyl-amino-1,1'-dianthrimide or various anthraquinone anthrimides having an acyl-amine substituent such as acetyl-, benzoyl- or salicyl-amine in each of the nuclei opposite to the nuclei linked together by the imino group are treated with concd. H_2SO_4 at a temp. not higher than about 35° . Dyes are obtained giving with alk. hyposulfite solns. reddish yellow vats from which cotton is dyed yellow to yellowish orange shades fast to light and washing.

Dyes and intermediates. I. G. FARBENIND. A.-G. Brit. 275,301, April 19, 1926. 3-Arylamino-1,8-naphthosultams and their sulfonic acids are made by treating 1,8-naphthosultamsulfonic acids which contain a sulfo group in the 3-position to the sultam N atom with aromatic amines, preferably with addn. of a salt and diluent. These products may be used as intermediates for producing dyes by condensation with aromatic nitroso compds. or by subjecting them to simultaneous oxidation with aromatic *p*-diamines, *p*-aminophenols or their homologs or substitution products. Examples are given for producing dyes which give reddish violet and violet shades on wool from an acid bath.

Forming dyes on the fiber. I. G. FARBENIND. A.-G. Brit. 275,326, May 4, 1926. Hydroxynaphthocarbazoles and their homologs and substitution products are used in dyeing or printing cotton with azo dyes formed on the fiber. Numerous examples are given and the dyeings obtained vary from brick-red to brown and black and are fast to washing, Cl and bucking.

Ester-like derivatives of vat dyes. W. BAUER. U. S. 1,668,392, May 1, 1926. A leuco compd. of dibromo-indigo or other vat dye is treated with the chloride of pyrosulfuric acid in the presence of an org. base such as dimethylaniline. The products thus obtained are stable in the solid form, sol. in water and may be used in dyeing and printing.

Benzanthrone derivatives. I. G. FARBENINDUSTRIE A.-G. Brit. 275,271, Aug. 2, 1926. Amidated sulfurized benzanthrone derivs. are obtained by reaction of hydroxylamine in H_2SO_4 soln. upon a benzanthranyl sulfide, disulfide, mercaptan or $\text{C}=\text{N}$ deriv. of one of these or upon one of the oxidation products described in Brit. 263,200 (C. A. 22, 170) preferably in the presence of a metal compd. such as FeSO_4 or CuSO_4 which promotes the reaction. The products are dye intermediates. Several examples are given.

Lakes. I. G. FARBENIND. A.-G. Brit. 274,627, June 28, 1926. Lakes are made from the condensation products obtained by the interaction of a halogen atom of an aromatic compd. halogenated in the nucleus with the amino group of a primary or secondary amine which may contain substituent groups such as sulfonic, COOH or OH groups, e. g., the condensation product of 2,4-dinitrochlorobenzene and anthranilic

acid or the condensation product of 2,4-dinitrochlorobenzene and sulfanilic acid, which form, resp., orange and greenish yellow lakes, by use of Na_2CO_3 , BaSO_4 , $\text{Al}_2(\text{SO}_4)_3$ and BaCl_2 .

Dyeing apparatus. W. GERBER. U. S. 1,669,333, May 8.

Dyeing apparatus. I. MITCHELL. Brit. 274,651, July 31, 1926.

Apparatus for bleaching, dyeing, washing and drying yarns and fabrics. W. WINTER and H. JORDAN. Brit. 275,363, May 31, 1926.

Dyeing. J. W. LEITCH & CO., LTD., A. E. EVERSHED and J. A. WALLWORK. Brit. 274,550, April 19, 1926. Animal and vegetable fibers, regenerated celluloses and cellulose acetate or their mixts. are dyed in a hyposulfite vat contg. stearin soap or other alkali salt of a higher fatty acid together with Na_2CO_3 or NH_3 or both. The vat may be used at higher temps. than when NaOH is used. Examples are given.

Dyeing "acetate silk." I. G. FARBERIND. A.-G. Brit. 275,307, May 1, 1926. Monoazo dyes are used which are obtained either by coupling a diazotized aminonaphthoic acid with a component or by coupling an unsulfonated diazo compd with an aminonaphthoic acid. Numerous examples are given.

Dyeing cellulose acetate. I. G. FARBERIND A.-G. Brit. 274,823, July 24, 1926. Azo dyes are used which contain a dihydroxydialkylamine group, e. g., the dye from diazotized 3,4,5-trichloroaniline and dihydroxydiethylaniline gives a clear orange shade, the dye from *p*-nitroaniline and dihydroxydiethyl-*m*-toluidine a dark yellowish red and the dye from 2,4-dinitroaniline and dihydroxydiethyl-*m*-toluidine a deep bluish bordeaux.

Dyeing cellulose acetate or other cellulose esters and ethers. BRITISH DYE STUFFS CORPORATION, LTD., R. S. HORSFALL, L. G. LAWRIE and J. HILL. Brit. 275,373, June 11, 1926. Azo dyes are used which are prepd. by coupling diazotized sulfonylides of amines of the C_6H_5 or C_{10}H_7 series with amines of the same 2 series. Several examples are given for prep. the dyes and intermediates.

Dyeing cellulose esters and ethers. I. G. FARBERIND. A.-G. Brit. 275,230, July 29, 1926. Dyeing of "acetate silk" or like materials is effected with a mono-sulfonated arylazodiarylamine contg. at least 1 nitro group in the diarylamine complex. Examples are given for producing dyeings of different colors.

Dyeing with irregular markings on fabrics. R. S. BRACEWELL. U. S. 1,668,934, May 8. An easily flowing color mixt. comprising an indigo dye or other finely divided insol. dye and an oil is floated to form a film on the surface of a non-solvent liquid such as water and fabric is brought into contact with this film to take up the film; afterward the fabric is treated with a reducing agent such as an alk. hyposulfite soln. to render the dye sol. and cause it to penetrate the fabric and it is then fixed by oxidation.

Pattern effects on "acetate silk." CALICO PRINTERS' ASSOCIATION, LTD. and J. R. WHINFIELD. Brit. 275,357, May 25, 1926. The material is printed with a salt of a delustering agent such as Na phenolate or aniline-HCl and subsequently treated with hot dil. inorg. acid or alkali (according as the delustering agent used is acidic or basic), to decomp. the salt and set free the delustering agent. Resists also may be used.

Coloring cellulose esters and ethers. SOC. CHIMIQUE DES USINES DU RHONE. Brit. 275,553, Aug. 3, 1926. A dispersed insol. inorg. coloring substance is formed in a soln. of a cellulose ester or ether, e. g., a soln. of cellulose acetate in acetone may be successively treated with FeCl_3 and $\text{K}_4\text{FeC}_6\text{N}_6$, and the ester or ether may then be recovered by pptn. or by evapn. of the solvent. The solns. may be used as varnishes or for the manuf. of films or threads. Org. coloring agents may be added to modify the color.

Coloring material from henna leaves. C. POLLACCHI. U. S. 1,668,603, May 8. Henna leaves are extd. with water rendered alk. by a sol. alk. salt such as Na_2CO_3 , and after acidulating the liquor thus obtained the coloring matter is extd. from the liquor with a volatile solvent such as C_2HCl_3 which is insol. in water. An app. is described.

Protecting wool during treatment with ammonia, etc. V. HABERKORN. Brit. 275,374, June 11, 1926. Material such as wool is protected during treatment with NH_3 soln., dyeing, etc. by use of a soln. such as may be prepd. from waste wool by dissolving it in an alk. soln., boiling and slightly acidifying with H_2SO_4 .

Finishing cotton fabrics to resemble wool. H. I. HUEY. Brit. 274,860, July 20, 1926. Unstretched cotton fabric is treated with gaseous or liquid CS_2 and then with alkali lye or is treated with an emulsion of CS_2 and alkali.

Apparatus for washing or other treatments of fabrics in rope form. J. E. SHAW and A. SHAW. Brit. 274,703, Dec. 1, 1926.

Yarns and fabrics of cellulose acetate, etc. C. S. PARKER, W. KERSHAW, F. L. BARRETT and BLEACHERS' ASSOCIATION, LTD. Brit. 274,584, April 29, 1926. Crepe-like effects due to shrinkage are produced in artificial threads formed of cellulose acetate

or like esters by treatment with dil. HNO_3 (30–50° T.) at temps. of 0–50°. The treatment may be applied to mixed goods.

Mixed fabric containing "acetate silk." G. HEBERLEIN. U. S. 1,667,892, May 1. A woven figured effect is produced by dissolving the "acetate silk" from portions of the fabric.

Apparatus for treating artificial silk wound on bobbins with washing or other liquids. BRYLSKA, LTD. AND F. W. SCHUBERT. Brit. 274,928, March 29, 1926.

Apparatus for treating hanks of artificial silk or other textile materials with liquids. O. KOHORN & CO. AND A. PERL. Brit. 274,885, July 20, 1926.

Apparatus for gas-singeing of yarns. R. MÜLLER-ZOLLINGER. U. S. 1,669,033, May 8.

Apparatus for singeing textile yarns. SOC. LE BLAN ET CIE AND E. FLORIN. Brit. 275,253, Aug. 2, 1926.

Creping silk fabrics. J. PAYET. U. S. 1,668,694, May 8. Creping is effected while the threads still contain their natural gums.

Treating cellulosic materials with sulfuric acid. W. KERSHAW, F. L. BARRETT, C. S. PARKER and BLEACHERS' ASSOCIATION, LTD. Brit. 274,940, April 23, 1926. Cotton fabrics or yarns or other cellulosic materials are treated with H_2SO_4 contg. dissolved cellulose and on washing out the acid with water the cellulose is pptd upon and within the body of the material. Heat and pressure treatment may be used to obtain pattern effects.

Desizing textile materials. I. G. FARHENIND. A.-G. Brit. 274,795, Jan. 18, 1926. The effect of enzymic desizing liquors is enhanced by addn. of an aromatic acid such as propyl- or butylnaphthalenesulfonic acid or benzylsulfanilic acid or their salts or condensation products of sulfonated phenols or naphthalene with CH_2O .

Recuperating "dry-cleaning" liquids. J. T. FENTON. U. S. 1,669,235, May 8. Dry-cleaning liquids such as gasoline after use are treated with a substance such as fuller's earth which will effect coagulation of colloidal impurities and these are removed by filtration after agitating the mixt. An app. is described.

Bleaching fur skins, etc. H. STEIN, W. E. AUSTIN and I. LIEBOWITZ. U. S. 1,668,875, May 8. An aq. soln. contg. over 3% H_2O_2 (suitably about 7.5%) is used together with NH_3 and a water-sol. soap.

Resists on animal fibers. K. DAIMLER, C. E. MÜLLER and H. GARTNER. U. S. 1,668,144, May 1. Aromatic sulfonic acid compds. are used, the aromatic residues of which are connected with any residues by bridging atoms which are bivalent metal-loids.

26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

Examination of titanium white as a linoleum pigment. FELIX FRITZ. *Farbe u. Lack* 1927, 589–90, 603, 615.—In the manuf. of white linoleum, ZnO , MgO and CaO are unsuitable because they cause hardening with free fatty acids; white lead is poisonous and lithopone contains sulfur which may cause darkening. The ideal pigment, TiO_2 is non-poisonous, has low sp. gr., a high n and great tinting strength. The relatively high price is its only bar to greater use. G. G. SWARD

Use of oil shales in the preparation of ultramarine. B. K. KLIMOV AND V. A. LANIN. *Trans. State Inst. Applied Chem. (Moscow)* 1927, No. 5, 89–105.—The raw materials used in U. S. S. R. in the manuf. of ultramarine consist of kaolin (10 p.), soda (10 p.), sulfur (10 p.), infusorial earth (3 p.) and tar (2–3 p.). The latter 2 ingredients being expensive, K. and L. investigated the possibility of replacing them by oil shales which are indigenous to the Leningrad area where the ultramarine factories are located. These oil shales, or rather bituminous slates, contain on the av. 40–45% volatile org. matter which serves to produce a reducing atm., and also contain the necessary silica. On an exptl. scale the prepn. of ultramarine by the use of oil shales was quite successful and even permitted a decrease in the amount of S employed; the amts. of Fe and lime contained in the shales had no harmful effect on the reaction. The best results were obtained with shales having the following compn.: Volatile matter 30–46.11%, non-volatile org. matter 8–10.65%, SiO_2 21.51–26%, CaO 6–8.36%, Al_2O_3 5–6.29%, moisture 0–4.21%. The yields in ultramarine were normal, i. e., crude ultramarine 65–70% of the mixed mass, commercial ultramarine 50–55% of the mixed mass. On a factory scale, however, the results obtained were not good, the reason for the

failure being attributed to the kaolin used, which had not previously been ignited at a sufficiently high temperature.

The significance of negative catalysis in the formation of protective coatings. BERNARD NELSON
JOHANNES SCHRIEBER. *Farbe u. Lack* 1927, 600-2; *Korrosion u. Metallschutz* 4, 82-6(1928).—Because the 3 double bonds in eleostearic acid are adjacent, wood oil dries chiefly by polymerization and with no increase in wt. On the other hand linseed and poppyseed oils dry by oxidation. The so-called negative catalysts, phenols, amines, derivs. of hydroxylamine, etc., terpenes esters and some metals retard oxidation. Wood oil contg. these compds., therefore, continues to dry Also in *Farben-Ztg.* 33, 680-2(1927).

The presence of dispersed phases in fatty drying oils. A. EIBNER AND A. GRETH.
Chem. Umschau Fette Oele Wachse, Harze 35, 97-100(1928); cf. *C. A.* 22, 1695.—Auer's hypothesis (*C. A.* 22, 1695) that fatty drying oils in their original state contains 2 phases which can be sepd. by shaking with formic acid, is disproved by expts. with 12 samples of linseed, wood and perilla oil that were treated with 45%, 95% and abs. formic acid. In no case of fresh oil could any dispersed phase be sepd., but from wood oil and from oxidized linseed oils a sepn. of the dispersed phase could readily be made with formic acid, the dispersed phase showing an I no. of 131.7 and the dispersing medium 134.2.

Cellosolve and its derivatives in nitrocellulose lacquers. E. W. REID AND H. E. HOFMANN. *Ind. Eng. Chem.* 20, 497-504(1928).—"Cellosolve" is the monoethyl ether of ethylene glycol. "Cellusolve" and its derivs. have little or no odor. These substances are excellent solvents for nitrocellulose and are being widely applied in the lacquer industry. The properties of "Cellosolve," of its acetate and of "Butyl Cellosolve" ($\text{HOCH}_2\text{CH}_2\text{OBU}$) are discussed. The use of various resins in connection with them is discussed. The manuf. of lacquers contg. these products is outlined and type formulas are given for lacquers suitable for the automobile, furniture and brush lacquers fields.

Viscometer for plant use. ROBERT FREUND. *Farben-Ztg.* 32, 2889-30(1927).—The known methods for detg. the viscosity of lacquers are inadequate for plant use. F. proposes the applications of a weight of suitable shape, suspended on a fine wire or thread the latter being marked at intervals of 5 cm. The rate of fall of the weight, i. e., the rate of submersion of the marks below the surface of the liquid indicates the viscosity of the liquid with sufficient accuracy provided that the instrument is standardized.

Varnishes with synthetic-resin base. M. H. VAN LAER. *Petit. j. du brass.* 35, 433-4(1927).—Hard varnishes with a synthetic-resin base insol. in alc., moderate heat, 1% KMnO_4 , SO_2 , 5% Na_2CO_3 , NH_4F , 1% HCHO and KHSO_3 are described. Only caustic NaOH and antiformin attacked the varnish.

Glyptal, a new synthetic resin. H. WARREN. *Electrician* 98, 286-7(1927); *Science Abstracts* 30B, 347(1927).—Glyptal is a condensation product formed by heating a mixt. of glycerols and phthalic anhydride to 210° . It is better than formaldehyde-phenol condensation products in resistance to arcking and discharge, in flexibility and in ability to bond mica. A classification is tabulated of synthetic resins with the names and makers. Glyptal is not subject to "tracking." It is very pale yellow or almost water-white, transparent and changes from a fusible and sol. state into a relatively infusible and insol. condition on heating. After curing, glyptal is not brittle, but becomes leathery, at high temps. It is freely sol. on acetone; the usual solvent consists of acetone, benzene and denatured EtOH. Glyptal holds with tenacity to smooth surfaces and is used for mica pasting.

The production of rosin and turpentine from the native pine by the incision method. F. C. PALAZZO AND E. ALINARI. *Atti II congresso naz. chim. pura applicata* 1926, 25-23; cf. *P.*, *C. A.* 18, 1916; 19, 2270.—Detailed data on the fractional distn. of the oleoresins from the same pines already described are given. The incision method furnishes an excellent rosin (*M* on the American scale) and a very high yield of limonene.

C. C. DAVIS

Viscosity of nitrocellulose [as applied to the lacquer industry] (MERZ) 23. Coloring cellulose esters and ethers [for use as varnishes] (Brit. pat. 275,553) 25. Drying printing inks (U. S. pat. 1,668,943) 13.

Final Report of the Committee, Chemical Section, National Safety Council, on Spray Coating. Chicago: National Safety Council. 53 pp. Reviewed in *J. Ind. Hygiene* 10, 131(1928).

PLÉSSOW, GUSTAV: **Die Anstrichstoffe.** Ein Auskunftsbuch über ihre Rohstoffe, Herstellg., Eigenheiten, Verwendg., Bezugsquellen, usw. Berlin: W. de Gruyter & Co. 228 pp. M. 15.

Bituminous paints. COLAS PRODUCTS, LTD., AND F. LEVY. Brit. 274,955, April 28, 1926. Pigments are incorporated in reversed bituminous emulsions or jellies such as may be prepd. by the methods described in Brit. 251,323 (C. A. 21, 1364). Several examples are given.

Rust-preventive paints. ROSTSCHUTZ-FARBWERKE DR. LIEBREICH GES. Brit. 275,234, July 27, 1926. Oil paints are made contg. an alk. or alk. earth compd. the sp. gr. of which is less than that of the pigment used. Mg oxide, hydroxide, carbonate or basic carbonate may be used, *e. g.*, in a paint which may also contain linseed oil, white lead and "vine black."

Titanium pigment. JOSEPH BLUMENFELD. U. S. reissue 16,956, May 8. See original pat. 1,504,673, C. A. 18, 3282.

Composition for removing nitrocellulose lacquers. E. F. CATHCART. U. S. 1,669,387, May 8. Acetone 75 gals. is stirred into a hot soln. of paraffin 4.5 lbs. in C_6H_6 25 gals. until the mixt. becomes cold.

Compositions for coating plaster or other porous materials. C. TAUBER (trading as G. LEUCHTE NACHF.). Brit. 275,610, Aug. 3, 1926. Compns. for coating brick, wood, stone, plaster or other surfaces comprise a Mg soap such as Mg resinate, stearate, oleate or linoleate which may be used with linseed oil, wood oil or other oils, varnishes, solvents, pigments, etc.

Linoleum cement. A. B. CRAVEN, C. S. BEDFORD and YORKSHIRE DYEWARE & CHEMICAL CO., LTD. Brit. 274,722, Jan. 3, 1927. The process described in Brit. 274,300 (C. A. 22, 2072) is modified to utilize the resinous by-product extd. from gutta-percha or balata, either in the semi-fluid condition or after oxidation to convert it into a solid resin.

Phenolic resins. BAKELITE CORPORATION. Brit. 275,011, July 12, 1926. After a usual heat curing treatment, phenolic resins are improved as to their insulating properties by further prolonged heating at a lower temp., *e. g.*, by heating for 48-80 hrs. at 125-135°.

Synthetic resins. A. A. DRUMMOND. Brit. 274,581, April 26, 1926. Synthetic resins such as those formed from phenol and CH_2O are purified by treatment with the vapor of an org. solvent, such as EtOH, of lower b. p. than water and preferably miscible with the resin.

Synthetic resins. P. HALLER and H. KAPPELER. Brit. 274,501, July 16, 1926. The process described in Brit. 266,258 (C. A. 22, 691) is modified by treating the condensation product such as obtained from CH_2O and $PhNH_2$ with an org. base, a neutral or acid salt or an org. acid, *e. g.*, with methylamine or pyridine or their aq. solns., aq. solns. of Na_2SO_3 or $NaHSO_3$, NH_4Cl , $(NH_4)_2S$, Pb acetate, HOAc or tannin.

Synthetic resins. R. H. KIENLE. Brit. 275,219, Aug. 2, 1926. Condensation products of a polyhydric alc. such as glycerol and a polybasic acid such as phthalic acid are rendered tough and flexible in their fully hardened condition by adding to the original ingredients or to the sol., fusible intermediate product materials such as indene polymer, dibutyl phthalate, triphenyl and tricresyl phosphates, benzyl benzoate, benzyl alc., indene, diphenyl, diphenyl ether, *o*-cresyl benzoate, ethyl lactate, glycol diacetate, triacetin, *p*-toluidine, aniline, benzyl acetate, BuOAc, cresol or butyl phthalate.

Synthetic resins. J. H. SCHMIDT. Brit. 275,604, Aug. 3, 1926. Synthetic resins of the glycerol-phthalic anhydride type are formed in a two-stage process; in the first stage solvents of high b. p. are either absent or are present in small quantity only, and in the second stage a solvent of high b. p. is present for which there may be used diethyl oxalate, or di-Et or di-Bu phthalate or tartrate. Polyglycerols may be used instead of glycerol and org. acids such as maleic, succinic or malic or their anhydrides may be used instead of phthalic anhydride. Various modifications are described.

Resinous condensation of phenol and butyl alcohol. C. F. SCHRIMPE. U. S. 1,667,872, May 1. PhOH 100 and BuOH 65 parts are condensed in the presence of a small proportion of an acid catalyst such as HCl. $(CH_3)_3N_4$ and wood flour or other fillers may be added.

Blocks of differently colored layers of artificial resin. M. HELFREICH. U. S. 1,668,590, May 8. Artificial resin in liquid condition is poured around colored hard artificial resin and the block thus formed is then hardened.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

Rancidity determinations. C. W. POWICK. *Oil and Fat Ind.* 5, 107-8(1928).—No valid results are obtained in the Kreis test if the acid, because of the presence of NOCl, gives a blank test with phloroglucinol. Under these conditions rancid fats appear sweet while sweet fats may appear rancid unless the positive reactions be spectroscopically controlled.

E. SCHERUBEL

Behavior of potassium iodate and potassium iodide solution toward fats. B. M. MARGOSCHES, KARL FUCHS AND BRUNO KRAKOWETZ. *J. prakt. Chem.* 118, 225-37 (1928).—The action of KIO_3 and HI solns. on fats results in the production of HIO. The formation of this acid depends not only on the hydrolysis of HI and KIO_3 , but to a certain extent on the oxidation of HI by KIO_3 . The HI equiv. of the HIO, 50% of the I consumed, reacts with the KIO_3 to form I. The difference between the detn. and the blank shows only half the I consumed and this must be doubled to obtain the I no. Lower I nos. are obtained with increased time of reaction. By using equiv. amts. of HI and KIO_3 correct I nos. are obtained. In the case of wool oil, resins and fats contg. hydroxy acids, lower I nos. are obtained with HI and KIO_3 .

E. SCHERUBEL

Useful addition to laboratory extraction apparatus. P. L. MENAUL. *Oil and Fat Ind.* 5, 108(1928).—In the detn. of oil in cottonseed meal the best technic is to enfold the sample in a 12.5-cm. filter paper which is then folded in another 12.5-cm. filter paper and then extd. Meal dust always appears in the ext. To avoid this the lower tip of the outside paper is moistened with distd. H_2O . The papers are so rolled that the outer one extends $\frac{1}{2}$ in. below the inner one contg. the sample which must not be moistened. The wet tip retains all the meal dust.

E. SCHERUBEL

Unification of oil-testing methods. H. SCHLÜTER. *Chem.-Ztg.* 52, 261-4(1928).—The German Material-Prüfungsamt has developed a new open-cup app. for detg. the f. p. of mineral oils (obtainable from Dr. H. Glockel, Berlin, N. W. 6, Luisenstr. 21) which eliminates the 2 principal sources of error in present methods: (1) fixing a definite position of the therm bulb and (2) the method of applying the test flame. The app. is heated by either gas or electricity; it consists of a metal cup, 40 mm. diam. and 40 mm. deep, with a shoulder to hang from an inverted bowl that serves as air bath. The thermometer is fixed by resting its bulb on a form on the bottom of the cup. The form is removed after adjustment and is screwed in place to a standard. The bulb, when in position, is 5 mm. from the wall and 5 mm. from the bottom of the cup. The test flame is 1 cm. in length and is adjusted until it burns in the center of the oil surface and at a level with the cup's edge. The rate of heating is $3-5^\circ$ per min., beginning at 120° for machine oils and at 220° for cylinder oils. The flame is applied at every degree rise for 2 seconds until the first flash appears.

P. ESCHER

Contribution to the chemical investigation of Malvaleae. III. Hibiscus manihot. L. J. PIERAERTS. *Mat. grasses* 20, 8138-9(1928); cf. *C. A.* 21, 3756.—The compn. of the seed is: H_2O 10.80, total ash 4.56, H_2O -sol. ash 2.68, total N 3.51, crude protein (N \times 6.25) 23.34, ether ext. 13.42, crude fiber (Weende) 24.95, pentosans 11.44, P_2O_5 1.07% (= 23.46% of total ash), alky. of total ash (as K_2CO_3) 24.88, alky. of H_2O -sol. ash (as K_2CO_3) 60.64%. The constn. of the oil extd. with petr. ether b. below 60° are: d_{20}^{20} 0.9194, acid no. 6 (= 3% oleic acid), sapon. no. 197, I no. 103, Crismer no. (with 99.6% alc.) 62° , n_{25} 1.4695, unsapon. residue 0.92%, Hehner no. 95.80%, Milliau-Becchi reaction gives strong reduction with formation of a Ag mirror, Halphen reaction positive (orange color at 80° , becoming light red at 100° and cherry red after 1 hr. at 100°). The oil closely resembles cottonseed oil in many respects.

A. PAPINEAU-COUTURE

Endemic asthma due to castor-bean dust. K. D. FIGLEY AND R. H. ELROD. *J. Am. Med. Assoc.* 90, 79-82(1928).—A linseed and castor-oil mill in the neighborhood was found to be the immediate cause, by inhalation of castor-bean dust, of 30 cases of asthma, and the probable cause of 55 other cases.

L. W. RIGGS

The composition of Italian beeswax. D. CORTESSE. *Atti II congresso naz. chim. pura applicata* 1926, 1347-52.—The phys. and chem. constn. of 24 samples produced in various parts of Italy were detd. The following results show the min. and max. values: d_{15}^{15} 0.9597-0.9680, m. p. $63-4^\circ$, f. p. $60-1^\circ$, n_D^{20} 27-30, n_D^{40} 42.9-45.9, acid no. 19.03-20.92, sapon. no. 92-96.2, ester no. 72.20-77.13, I no. 8.0-10.3. The small variations indicate the uniform quality of Italian beeswax and the care exercised in its production. The data also serve as a basis for judging adulteration in beeswax which shows different constn.

C. C. DAVIS

Doubtful official standards for settled soap. K. RIETZ. *Chem.-Ztg.* 52, 261

(1928).—Com. settled soaps contain at most 0.1% free alkali, and only 0.02% when intended as a base for toilet soaps. The Deut. Arzneibuch VI allows for its official "Sapo medicatus" 0.2% free alkali (calcd. as NaOH) which is 10 times as much as the com. product contains. An error in the opposite direction is shown in the official soap specification for the Railways of the German Empire, which calls for settled soaps "free from uncombined alkali and unsapond. fat," which requirement would exclude practically all com. products. P. ESCHER

Waste in the Mexican soap industry. G. G. COLIN. *Ind. Eng. Chem.* 20, 526-7 (1928).—The chief sources of waste lie in poor glycerol recovery, excessive use of caustic and poor salt recovery. E. SCHERUBEL

Saponification under pressure. JOSEF GROSSER. *Am. Perfumer* 23, 55-6, 121-2 (1928).—This is a discussion which concludes that sapon. under pressure for soap manuf. has little prospect of realization. E. SCHERUBEL

Deflocculation and detergency not entirely correlative. Detergent experiments on cotton oiled with carbon black. R. M. CHAPIN. *Oil and Fat Ind.* 5, 95-105 (1928).—A machine was devised to wash and rinse small slips of fabric with vertical agitation in test tubes in a water bath. The slips were held at one end in spring clips suspended from rocker arms and were weighted at the free ends. The machine carried 4 double rocker arms and 8 clips with their suspending shafts, which are equipped with perforated metal disks to cover the test tubes. Detergent expts. were made on cotton cloth soiled in water suspensions of non-oily C black. The most powerful detergent was an alk. soln. of Na stearate or palmitate at 70°. In this effect of alkali, deflocculation and detergency are parallel but other correlations were vaguely defined. The method will not suffice for selection of the superior among com. soaps. Comparative tests were made on the power of soap solns. to prevent absorption of suspended C black by clean fabric. Acid soaps were the more effective, probably as a result of masking of absorptive affinities by an oily film of fatty acid. Power to prevent absorption is not correlative with detergent power in the special case of the prevention of absorption of suspended C by fabric. This result is based on tests using soap solns. E. SCHERUBEL

Cereals and the agricultural-chemical industries which depend upon them (SCURTI)
12. Rancidity of coconut oil produced by mold action (СТОКОЕ) 11C. Apparatus for emulsifying fats with water (Brit. pat. 275,375) 1.

Einheitliche Untersuchungs-Methoden für die Fett-Industrie. I. Edited and produced by the Wissenschaftliche Zentralstelle für Öl- und Fettforschung E. V. Berlin. Stuttgart: Wissenschaftliche Verlagsgesellschaft b. m. H. 105 pp. R. M. 5. Reviewed in *Chemistry and Industry* 47, 373 (1928).

TOBLER, FR.: **Der Flachs als Faser- und Ölpflanze.** Berlin: Julius Springer. 273 pp. R. M. 19.50. Reviewed in *Bull. Imp. Inst.* 26, 120; *J. Textile Inst.* 19, p 52 (1928).

Sulfonating fats, fatty acids, etc. CHEMISCHE FABRIK MILCH AKT.-GES. Brit. 275,267, Aug. 2, 1926. Sulfonation of various materials (to produce products suitable for use as fat-splitting or emulsifying or solubilizing agents) is effected by strong sulfonating agents such as chlorosulfonic acid, and the sulfo acids formed may be neutralized without sep. purification; their Ca salts are sol. Fats, oils, fatty acids of vegetable and animal origin, oxy-fatty acids, blubbers, resins, tallow oil, wool fat and its distn. products, naphthene acids or mixts. of these, with or without addn. of aromatic hydrocarbons, phenols, hydrophenols and chlorobenzenes may be treated in this manner.

Splitting fats. G. PETROFF. Brit. 274,741, Feb. 1, 1927. The emulsions formed in splitting oils and fats by Twitchel or other usual reagent of similar character are decompd. by adding a small quantity of CaSO₄ (0.1-0.5%) and preferably a small quantity of H₂SO₄ also.

Purifying fats and fatty oils. METALLBANK UND METALLURGISCHE GES., AKT.-GES. Brit. 275,536, Sept. 20, 1926. Suspended impurities are freed from water by heating *in vacuo* and are then removed by filtration.

Recovering fats from wool-washing, etc. C. VAN OVERSTRAETEN. Brit. 275,627, Aug. 6, 1926. Fat is extd. from wool-washing and other wash waters by washing with lukewarm water the ppts. obtained from froth flotation, chem. pptn. or other known processes, then boiling with Na₂CO₃ or other alkali, heating and drying, maintaining at a temp. of about 105°, decanting the fat from settled impurities and boiling with water, and then further purifying if desired by centrifuging.

Drying oils from cashew nuts. M. T. HARVEY. Brit. 275,574, Aug. 6, 1926. Oil from the shells of cashew nuts or from the gum or sap of the cashew tree or other source of anacardic acid and cardol are either heated with a metal such as Cu, Ni, "monel metal," Pb, Mg, Ca or Mn or with an oxide, hydroxide or carbonate of a metal such as Cu (as described in Brit. 272,510—C. A. 22, 1863) or with oleates, stearates or other metal compds. or may be heated under pressure either alone or with the materials specified. The products may be used for impregnating fabrics, cords or paper, or for coating metal wire, bars, or sheets, and for elec. insulating purposes. They may be thinned with hydrocarbon solvents.

Phosphatides from soy beans or other oil-seeds. H. BOLLMANN. U. S. 1,667,767, May 1. A mixt. such as that obtained from soy beans and which may comprise phosphatides with oil, water and other impurities is agitated and heated to about 60° with 3 vols. of strong alc. and the resulting soln. is cooled to successively lower temps. to effect sepn. of its constituents; the remaining soln. is finally evapd. under reduced pressure at a low temp.

Shaving soap. R. F. SMITH. U. S. 1,667,993, May 1. A K vegetable oil shaving soap is mixed with about 40–50% of finely divided talc.

28—SUGAR, STARCH AND GUMS

F. W. ZERBAN

The sugar industry in the United States. RENÉ BOUCHON. *Bull. soc. ind. Rouen* 55, 350–68(1927).—An address. A. PAPINEAU-COUTURE

Extraction of crystallized sucrose from the carob. G. ODDO AND V. DE FONZO. *Gior. chim. ind. applicata* 9, 400(1927); *Brit. Chem. Abstracts* 1928B, 29.—On an industrial scale, sugar can be extd. directly from the carob by org. solvents, particularly EtOH, MeOH or Me₂CO. The carob contains 20–26% sucrose and about 15% invert sugar. The sugar first obtained is in the form of pale yellow crystals with an agreeable odor of carob, but the color and odor disappear after 1 crystn. and the yield of white sugar is 16–23% of the carobs. By distn. of the mother liquors almost all of the solvent can be recovered and is available for subsequent extns. The residual thick molasses contains dextrose and levulose, with 2–3% of sucrose, and it may be utilized for the prepn. of confectionery, EtOH, antiparasitic agents for plants, etc. The seeds, which are about 10% by wt. of the carob, have a market value of about 1.2 lire per kg., the perisperm yielding a dye which imparts delicate pink tints to silk and wool, and the albumin yielding a size for dressing and tanning. The residues are also of com. value. Sicily produces 300,000–450,000 quintals of carobs per yr. and Italy about 800,000 quintals. C. C. DAVIS

Nitrogen problem in cane culture in Java. O. ARRHENIUS. *Arch. Suikerind.* 36, 111, 91–152(1928).—Investigations have been carried out along 3 lines. (1) In *physiological studies* it was found that different cane varieties have varying percentages of N. As the N concn. of the nutrient soln. grows, the N assimilation also increases. Sand-water cultures show that under normal conditions the N requirement of cane corresponds to 8–10 pikols (NH₄)₂SO₄ per bouw. It is very probable that cane may utilize ammonia N directly. Old cane can stand N hunger much better than young cane. (2) Studies on *NH₄-NO₃ equil* have shown that Java soils, even when under water, have little or no nitrite. NH₄ is nitrified within 1 month, but different soils produce different amts. of nitrates. The p_H of the soil has no effect on nitrate production. The latter is the most essential process for cane growth. (3) *Statistical treatment of fertilizer tests in the field* proves that on soils of low productivity max. applications of (NH₄)₂SO₄ always give good results. The greater the productivity, the less fertilizer has to be used. There is an inverse proportionality between amt. of fertilizer added and nitrate produced. By mapping soils according to nitrate production, field expts. can be planned more intelligently. P. R. PEKELHARING

Chlorine question in sugar-cane culture in Java. O. ARRHENIUS. *Arch. Suikerind.* 36, 1, 90–100(1928).—The effect of Cl in the form of NaCl on the yield of cane was studied in sand-water cultures, the soil soln. being renewed every day. The cane was harvested after 6 months, weighed and analyzed. The results are tabulated. Two varieties were used, P. O. J. 2878 and 2883. Both gave the same type of curve. The max. limit of Cl is 0.06% of the soil soln. The curve shows a peculiar form and is probably composed of a Cl curve and an antagonism curve. The distribution of Cl in the soil is shown on soil maps of 2 plantations. In both cases the max. Cl content is found near the coast. However, this is not caused by infiltration but by the concn. of drain-

age water from the higher levels. The Cl content of cane grown on soils high in Cl is not excessive. The only practical measure against the poisonous effect of Cl is thorough leaching of the soil, perfect drainage and heavy irrigations. P. R. PEKELHARING

Relation between different properties of sugar-cane soils. O. ARRHENIUS. *Arch. Suikerind.* 35, 1197-1213(1927).—Relations between acidity, P_2O_5 and N content of soils have been studied. That between soil acidity and P_2O_5 content rests on the different solubilities of mono-, di-, and triphosphates. The P_2O_5 content influences nitrate production. Soils low in P_2O_5 will yield better crops not only with phosphate fertilizer, but in many cases addn. of N will improve the yield. Physiol. expts. will have to be carried out to support these field results. P. R. PEKELHARING

Control and mill report of the Java sugar experiment station (1927). ANON. *Arch. Suikerind.* 35, IV, 85-91, 226 51(1927).—The final report on results obtained in 171 factories taking part in the mutual control is presented. The av. purity of final molasses was 29.3, lower than ever before. Total losses were lower than in former yrs. because of better clarification and lower molasses. Unknown losses showed little difference from former yrs. Sugar production per hectare was higher than in 1926, but slightly lower than in 1925. P. R. PEKELHARING

Undetermined sugar losses* in the process of defeco-saturation. L. O. SHNAIDMAN. *Nauchnuie Zapiski* (Russian) 5, 322-8(1928).—In the chem. purification of the juices in the process of satn. a loss of sugar has been definitely established. It is caused by the adsorption power of the lime. The amt. of this loss depends on the quantity of lime pptd. in the satn. process, on the lime added in the process of defecation, on the concn. of the sucrose in the juice, on the temp. and undoubtedly on the reaction of the satd. juices. With an increase in the amt. of lime used in the defecation the coloration of the juices should diminish and the loss of dry matter increase. Under ordinary conditions of defeco-satn. where 2.5-3.0% CaO is added to the diffusion juice at a temp. of 80-85°, the loss of sugar in the filter-press mud is 0.7-0.9%. Along with the sucrose some non-sucrose substances are adsorbed and go into the filter-press mud; analysis of these is important in order to establish the amt. of sucrose lost. J. S. J.

Criticism of the chemical theory of saturation. L. O. SHNAIDMAN. *Nauchnuie Zapiski* (Russian) 5, 273-8(1928).—The polarization of a sugar-lime soln. was 60.7, alky. to phenolphthalein 2.16. CO_2 was passed through the soln. until a thick mass formed; air free from CO_2 was then forced through it. One portion of the mixt. was filtered and the fractionated filtrates were analyzed immediately; another portion was stoppered and left standing for 3 hrs. and 25 min. A cryst. ppt. was formed from the originally amorphous mass. The alky. and polarization of the filtrate from the 2nd portion were found to be 0.52 and 60.9, resp. The successive filtrates from the 1st portion showed wide variations both in alky. and polarization. The alkalinity was 2.16 (original), 0.24, 0.44, 0.53, 0.54, 0.59, 0.69 (av. 0.53); the polarization was 57.04, 59.77, 61.54, 61.67, 61.87, 63.20 (av. 60.88). Thus it may be seen that the alky. and polarization depend upon the time at which the fractions are analyzed. The chemistry of the process which takes place in the satn. vat may be represented as follows: $C_{12}H_{22}O_{11}CaO + CO_2 = CaCO_3 + C_{12}H_{22}O_{11}$. In the 1st stage of satn. a colloidal soln. of lime forms which with the decrease in alky. becomes unstable and begins to gel. The amorphous $CaCO_3$ by virtue of its high surface-adsorption power adsorbs from soln. both the sucrose and the monosucrate of Ca. As the amorphous substance crystallizes, the active surface decreases and hence the adsorption. This explains why in a delayed filtration the lost fractions have more dry matter; there is less adsorption by the crystals than by the gel. J. S. JOFFE

Observations on the crystallization of second product fill-mass in the crystallizers. B. E. KRASIL'SHCHIKOV. *Nauchnuie Zapiski* (Russian) 5, 309-12(1928).—With a fill-mass of 93.63-93.17 Brix a lowering of the coeff. of supersatn. took place, i. e., the crystn. progressed with the cooling of the fill-mass. Only after the temp. dropped to 45° the coeff. slightly increased. With a fill-mass of 94.55-94.09 Brix and with more rapid cooling the coeff. of supersatn. increased from the beginning of crystn. and remained high throughout. The purity of the mother liquor in the 2nd series of expts. towards the end of crystn. was higher than in the 1st series. J. S. JOFFE

Continuous diffusion. H. P. SOKOLOV. *Nauchnuie Zapiski* (Russian) 5, 279-81(1928).—A description of an app. for the continuous diffusion in the sugar plant is given beginning with the charging of the cosettes. A picture of the app. accompanies the article. J. S. JOFFE

***Regulating the density of milk of lime.** L. D'YACHUK. *Nauchnuie Zapiski* (Russian) 5, 285-87(1928).—D. describes in detail and illustrates with a diagram a new type of a regulator which controls the introduction of the lime during the process

of satn., etc. It is automatic in its work, easy to clean and simple in construction.

J. S. JOFFE

Washing the filter-press mud. B. E. KRASIL'SHCHIKOV. *Nauchnye Zapiski* (Russian) 5, 287-90(1928).—Tests were made on the comparative efficiency of cold and ammoniacal hot water washings of filter-press mud. There is more sugar in the cold water washings. The hot ammoniacal treatment takes out more solids, but less sugar.

J. S. JOFFE

The decolorization of refinery liquors with active carbons. JOSEF WIESNER. *Z. Zuckerind. czechoslovak. Rep.* 52, 101-108, 120-123(1927).—For a refinery, melting daily approx. 500 tons of raw sugar, W. finds from a comparison of actual working data a saving in decolorization costs of 64% in favor of Norit over bone char. In favor of bone char is its rational, easy and certain revivification, the dependable faultless and permanent decolorization of liquors, and the revenue obtained from spent char and dust. Against the use of bone char are the cost for large and high buildings, storage spaces, large heat and sugar losses, high steam, fuel and water consumption, large vol. of sweet water, high labor cost, impossibility to stop and start the process instantly and large capital investment for bone char in process and interest losses thereon. In favor of Norit is the possibility of instant starting and stopping, small capital investment for app. and machinery, small space requirements, little sweet water, smaller sugar losses, improved crystn. lower alkalinities, and higher density of liquors and a capital investment for Norit which is $\frac{1}{4}$ that of bone char and which is expended gradually throughout the year. Against Norit is the possibility of turbid liquors therefore requiring addnl. mech. filtration, greater cloth expense, 25% reduction of decolorizing power after first regeneration which must be replaced with fresh Norit, complete exhaustion after 30-70 regenerations and valueless residues. Refineries having bone char equipment can very profitably increase their melting capacity by installation of addnl. Norit equipment.

F. R. BACHLER

Simultaneous adsorption of sucrose and coloring matter by adsorption carbons. J. VAŠÁTKO. *Z. Zuckerind. czechoslovak. Rep.* 52, 45-52(1927).—The presence of sucrose reduces the decolorizing power of the char. Increased sucrose adsorption is accompanied by increased ability of the carbon to adsorb more H_2O . Adsorption of coloring matter is irreversible and grows with increasing temp. Conc'd. sugar soln. is a poor medium to accomplish chem. or chem.-phys. reactions. All purification processes occur more rapidly and the more completely the more dil. the solns. are, or, the less sucrose they contain. Therefore, decolorization of sugar soln. is best and most economically carried out in thin juices. The rate of adsorption of coloring matter is greatest in the first 5 min. and improves with increasing temp. Alky. falls with length of time of contact and increased temp.

F. R. BACHLER

Decomposition of sucrose by adsorption carbons. JOSEF VAŠÁTKO. *Z. Zuckerind. czechoslovak. Rep.* 52, 129-37(1927).—A 20 Brix sugar soln. was treated with 12 different carbons under varying conditions of time, temp., alky., quantity of C and rate of shaking. Decompn. of sucrose was detd. No relation existed between rate of adsorption and the decompn. of sucrose. In faintly alk. solns. rate of decompn. was decreased. At 20° it was negligible. Decompn. grows with temp., time of contact, quantity of C used and the rate of shaking. V. divides the carbons into 2 groups. The first, which causes no appreciable decompn. of sucrose, comprises 1 animal C. and 6 gas activated carbons (Carbo animalis Supra Norit 5 x, Supra Norit 3 x, Supra Norit 2 x, Superior Norit, Standard Norit and Poly carbon). This group shows less than 2% ash, more than 90% C and less than 0.2% Fe_2O_3 . The second group, which causes decompn. of sucrose, comprises 2 carbons of animal origin and 3 carbons produced by impregnation processes (Carboraffin H, Carboraffin, Blood Char, Anticromos, Bone Char "K"). These carbons are marked by contg. more than 3% ash, less than 90% C and more than 0.5% Fe_2O_3 . But it is not alone the chem. compn. which influences decompn., another important property plays a role on which V. promises more information.

F. R. BACHLER

Ash determinations of raw sugars. CHR. MRASEK. *Z. Zuckerind. czechoslovak. Rep.* 52, 149(1927).—Raw sugars, upon arrival at the refinery, are sampled and analyzed for the purpose of checking polarization and ash of that of the official sample. Herebefore 2 portions had to be weighed out for detn. of ash and sugar. Since Šandera's electrometric method has been introduced only one weighing is necessary. M. gives a table comparing the sulfate and conductometric ash detns. of the raw sugars produced by 21 factories. The conductometric ash is on the av. 0.007% lower than the sulfate ash. When higher differences occurred these were due to the presence of insol. inorg. matter.

F. R. BACHLER

Comparative analyses of ash of raw sugars by ignition and the electrometric method and apparatus of K. Šandera. FRANZ HERLES. *Z. Zuckerind. czechoslovak. Rep.* 52, 145-8(1927).—The ash flatus by ignition of 127 commercial raw sugar samples were checked by Šandera's electrometric app. 68.5% of the total analyses checked within $0.00 \pm 0.02\%$; 85.04% checked to within $0.00 \pm 0.03\%$. In 19 cases, or 14.96% of all samples, differences ranging between $\pm 0.04\%$ were found and in most of these the differences were due to the presence of insol. inorg. impurities which, of course, cannot be detd. by the electrometric method. The electrometric method would be ideal for commercial labs. to check the accuracy of the official chem. method. F. R. B.

The determination of invert sugar in molasses. R. OFNER. *Z. Zuckerind. czechoslovak. Rep.* 52, 103-12(1927).—Certain nitrogenous non-sugars in molasses, which partially or wholly escape pptn. by $\text{Pb}(\text{OAc})_2$, cause a heavy grayish green ppt. of Cu, which is erroneously ascribed to the presence of invert sugar. Nucleins and purines, occurring in dealed molasses soln., strongly reduce Fehling soln., and these can be completely removed by adsorption if to the soln. to be dealed about 1 g. of Norit, or bone char, is added. If these compds. are removed molasses soln. can be used directly to prep. auxiliary invert-sugar tables. For greater accuracy 10-20 g. substance should be used. Inasmuch as pptn. of Cu by invert sugar occurs in molasses later than in raw sugar soln., boiling time should be extended to 7 min. Alc. may be used to assist filtration. By frequent detns a volumetric method like that of Bruhns or Schoorl can now be used to advantage. F. R. BACHLER

Molasses of exceptionally low purity. G. VAVRINECZ. *Z. Zuckerind. czechoslovak. Rep.* 52, 124-27(1927).—At the end of the campaign 1926-27 1400 carloads of beets, that had been harvested prematurely and siloed for 7 weeks during a warm fall, were worked, resulting in extremely low purities. During storage, sugar and purity of beets fell 3%, invert sugar rose to 1.2%. Molasses from the first half and the end of campaign compared as follows: true purity 59.95-52.85, apparent purity 59.1-51.3. Total non-sugar 29.33-35.77, org. non-sugar 21.15-25.14, in 100 parts of org. non-sugar are N 6.71-4.91, volatile acid 7.19-9.51, Et_2O -sol. acids 4.73-6.77; in 100 parts of ash are Fe_2O_3 6.00-2.11, CaO 10.85-27.74. F. R. BACHLER

Fuel value of bagasse. E. C. VON PRITZELWITZ VAN DER HORST. *Arch. Suikerind.* 35, 1242-58(1927).—The meaning of "high" and "low" caloric value is explained. The high caloric value is recommended for the calens. used in the fuel control, in connection with the "quality figure," which expresses the relation between low and high caloric value. Simple formulas for calcg. low and high caloric value are given, based on moisture and sugar in bagasse, and the results are compared with those of practical tests. The agreement between the 2 was satisfactory. P. R. PEKELHARING

Starch and translocation. E. G. PRINGSHEIM. *Naturwissenschaften* 14, 305-7(1926); *Physiol. Abstracts* 12, 409.—There is no special "translocation starch." Whenever formed, starch is a reserve. H. G.

The tackiness of rice, corn and wheat starch in comparison with potato starch. W. EKHARD. *Z. Spiritusind.* 51, 23-4(1928).—By the Saase test rice was low, corn and wheat were about alike. Prolonging the cooking from 2 to 10 min. weakened rice and improved wheat and corn. Potato starch was similar to rice starch. C. N. F.

Soil microorganisms and their relation to soil fertility (ALICANTE) 15. Cereals and the agricultural-chemical industries which depend upon them (SCURTI) 12. Iodometric determination of glucose (NICHOLS) (ALVARADO, VOORHIES) 7. Investigations on maize (LAMPE) 12. Organic fertilizers from sugar cane (HARDY) 15.

Sugar. RAFFINERIE TIRLEMONTAISE SOC. ANON. Brit. 274,799, July 24, 1926. In order to obtain an increased yield of sugar crystals, massecuite is cooled to a pasty or plastic condition and then sepd. into crystals and sirup by centrifugal app. exerting an especially high centrifugal effect. Brit. 274,800 relates to the similar removal of false grain from sugar sirup or molasses which may be preliminarily treated with air, CO_2 , or other gas to form a froth.

Sugar from sugar-juices. M. R. J. SCHMID. U. S. 1,668,470, May 1. In order directly to produce refined sugar, sugar cane juice or sugar beet juice is heated, limed while hot, further treated with a small quantity of alum and H_3PO_4 , and sulfurized to produce an exceedingly slight acid reaction, filtered, treated with C, again filtered and then submitted to ordinary sugar-producing procedure.

Dextrose. C. EBBERT, W. B. NEWKIRK and M. MOSKOWITZ. U. S. 1,668,308, May 1. Starch is subjected to an acid hydrolysis conversion carried substantially as far as possible, the converted liquor is neutralized until coagulation and pptn. of

impurities occur, filtered, and then subjected to another acid hydrolysis conversion, and neutralized and filtered.

Treating molasses. R. L. CORBY, F. M. SCALES and W. H. F. BÜHRIG. U. S. 1,667,928, May 1. In treating molasses such as may be intended for use in yeast manufacture the molasses is rendered distinctly alk. with an alk. Na compd. such as NaOH, NaHCO₃ or Na₂CO₃ and a H₂O-sol. P-contg. precipitant such as a phosphate is then added, the mixt. is moderately heated and insol. substances are sepd. from the soln.; the reagents are so proportional that immediately prior to the heating the reaction of the mixt. is slightly alk. to litmus.

29—LEATHER AND GLUE

ALLEN ROGERS

Tanning materials of the British Empire. ANON. • *Bull. Imp. Inst.* 25, 380-403 (1927); 26, 22-38(1928).—A review of the distribution and uses of oak, larch, chestnut, cutch, gambier, sumach, myrobalans, divi-divi, algarobilla, teri, *Acacia arabica*, canaigre and "red dock" or "wild rhubarb" in the British Empire. A. PAPINEAU-COUTURE

Chemistry of combination chrome and vegetable tanning. G. GRASSER and HIROSE. *J. Coll. Agr. Hokkaido Imp. Univ.* 20, 203-17(1928).—Strips of calf skin were tanned in liquors contg. basic Cr sulfate and tannin from oak galls in varying proportions. The resulting leathers were subjected (1) to the boil test, and contraction in vol. and area noted, and (2) swollen with dil. HCl, and degree of swelling noted. In leathers tanned 1 day, contraction on boiling increased with increasing proportion of vegetable tannin. In leathers tanned 8 days, contraction for all leathers tanned in liquors in which chromium: tannin $\geq 1:1$ was the same as for pure chrome leather. Min. acid swelling after 1 day tannage was shown by leathers tanned in liquors in which Cr: tannin = (7:3) — (3.5:6.5). After 8 day tannage all leathers tanned in liquors contg. any Cr whatsoever showed the low degree of swelling characteristic of pure Cr leather.

H. B. MERRILL

Miscellaneous experimental investigations from the Institute of Tannery of Science [of the College of Agriculture, Hokkaido Imperial University]. GEORG GRASSER. *J. Coll. Agr. Hokkaido Imp. Univ.* 20, 219-32(1928).—I. *Soluble methylene compounds of tannin anhydrides.*—The well-known pptn. of tannin as methyleneditannin by HCHO in the presence of acid takes place only on heating or long standing. Phlobaphenes of oakwood ext., pptd. by boiling with acid, dissolve in HCHO soln. In the presence of excess HCHO, the soln. is not pptd. by diln. The dil. soln. is pptd. on heating with dil. HCl. After boiling with dil. NaOH, the dil. soln. gives no ppt. with HCl or with gelatin. The concd. soln., boiled with NaOH, gives a ppt. with both HCl and gelatin. Conclusion: 2 mols. tannin condense on heating, forming insol. phlobaphene, which with HCHO forms sol. methylenephlobaphene. The latter boiled with dil. NaOH forms a Na deriv. of methylenephlobaphene, not precipitable by acid or gelatin, but with concd. NaOH forms a Na compd. of phlobaphene, splitting out the methylene group, from which compd. the original phlobaphene is liberated on acidification. II. *Methylene derivatives of tannic acid.*—Tannic acid from oak galls forms compds. with numerous aldehydes similar to that formed with HCHO, which is supposed to contain 2 mols. pentadecalloyl-glucose joined through a methylene group. The soly. relationships of these compds. are given. III. *The phloroglucinol reaction of tannin.*—This reaction serves to distinguish (1) gambier from other catechol tannins, and (2) mimosa and maletto from oak, chestnut and valonia. The test is best made with a test paper made by soaking filter paper in 2% vanillin soln. A few drops of the tanning ext. placed on the paper and acidified with concd. HCl give a cherry red color in the presence of phloroglucinol. IV. *The behavior of the albumin-globulin and of the corine of the skin towards protein reagents.*—Lime skin was extd. with 5% NaCl, yielding a soln. of globulin + albumin (1). The residue was extd. with 0.025 N Ca(OH)₂, yielding a soln. of corine (2). Residual collagen was hydrolyzed, giving a soln. of gelatin (3). The behavior of these 3 solns. towards 12 protein reagents was detd. Positive tests were obtained as follows: biuret, 1, 2, 3; Molisch's, 3; S reaction with Pb(C₂H₃O₂)₂, 1, 2, phenol pptn., 2, 3; HgCl₂, 1, 2, 3; tannin, 1, 2, 3; KHgI₃, 1; picric acid, 2, 3. V. *Rate of conversion of green into violet chromic salts.*—The addn. of Na salts of acetic, oxalic and other org. acids hastens the conversion of the green soln. of K₂SO₄·Cr₂(SO₄)₃ into violet, judged solely on apparent color change.

H. B. MERRILL

The disinfection of skins infected with anthrax by treating with sodium sulfide. G. BRORZU. *Boll. soc. ital. biol. sper.* 2, 1015-6(1927).—The addn. of 2% Na₂SO₄ or

KSCN to a 1.5% soln. of Na_2S increases the germicidal action of the latter so that anthrax spores in rabbit or guinea-pig furs are killed in 36 hrs. at a temp. of 15–20°. P. M.

Wetting and emulsifying agents [for treating leather] (Brit. pat. 274,611) 22.

Gerbereichemisches Taschenbuch. Herausgegeben von der Vereinigung akademischer Gerbereichemiker Darmstadt (Vagda). Dresden and Leipzig: Theodor Steinkopff. 177 pp. Bound, R. M. 6.

WILSON, JOHN ARTHUR: **The Chemistry of Leather Manufacture.** Vol. I. 2nd ed. New York: The Chemical Catalog Co., Inc. 495 pp. \$10. Reviewed in *Chem. Met. Eng.* 35, 239(1928).

Tanning hides. M. M. MERRITT. U. S. 1,668,652, May 8. Hides are intermittently suspended in the atm. while wet with tanning liquor for a time sufficient to permit evapn. of a portion of the water and leave a liquor residue in the hides richer in tanning substances than that as originally absorbed and are alternately immersed in the liquor which is caused to flow rapidly over the surface of the hide. An app. is described.

Composition for staining and polishing leather. R. WEBSTER. Brit. 275,522, April 14, 1927. A wax such as carnauba wax, soap, a dye such as nigrosine and ghatti gum are formed into an emulsified pasty mixt. with water and a small quantity of CH_2O may be added.

Development of the present automobile tire. W. F. ZIMMERLI. *Trans. Am. Inst. Chem. Eng.* 19, 79–92(1927).—Descriptive. C. C. DAVIS

The industrial application of rubber latex. PHILIP SCHIDROWITZ. *Trans. Inst. Rubber Industry* 3, 362–8(1928).—A crit. review of present developments, including the concn., preservation, handling, transport and variability of latex, and its use in tires, casings, inner tubes, proofed goods and dipped goods. A general discussion follows the paper. C. C. DAVIS

The testing of rubber goods for sunlight effect. H. E. WRIGHTMAN. *Rubber Age* (N. Y.) 23, 75–6(1928).—Exposure of vulcanized rubber mixts. to ultra-violet light showed effects which differed from the effects of sunlight, particularly with mixts. contg. reclaimed rubber, in the latter case mixts. which failed in service being comparatively resistant to ultra-violet light, and *vice versa*. The use of a violet C arc gave results conforming more closely with those for exposure to sunlight. An app. for duplicating the effect of sunlight and air is described, in which the temp., humidity and air supply are controlled while the rubber under tension is exposed to artificial light of known wave lengths which resemble sunlight in their relative intensities. C. C. DAVIS

Remarks on plasticity determinations in the Williams press. O. DE VRIES. *India Rubber J.* 75, 429–30(1928).—In comparative tests of different types of unmatificated rubber in the ordinary Williams plastometer and in the modified form of de Visser (cf. C. A. 20, 839) in which a const. pressure per unit surface is exerted on the rubber, the de Visser method gave irregular results which bore no relation to the corresponding results with the original Williams method. These irregular results with the de Visser app. were proved to be due to inherent mech. difficulties and it is considered that until this general method of detg. plasticity is placed on a mathematical basis, the de Visser app. is less reliable than the original Williams app. C. C. DAVIS

The distribution of fillers in rubber mixtures. ST. REINER. *Gummi-Ztg.* 42, 1359–60(1928).—Detns. of free S and of the ash at different points in representative rubber mixts. prepd. under ordinary factory conditions showed unexpected variations. Thus the ash of a mixt. which had not been calendered was 53.95–63.60%, a variation which was greatly reduced after calendering. Mixts. prepd. in the wet way showed relatively little variation. C. C. DAVIS

The relation between the cotton and rubber industries. R. TRUESDALE. *Trans. Inst. Rubber Industry* 3, 269-85 (1928).—A crit. review and discussion of the use of cotton in the rubber industry, with data showing the structure and phys. properties of different cotton cords and fabrics. C. C. DAVIS

Guanidine accelerators. History and litigation. ANON. *Rubber Age* (N. Y.) 23, 79-80 (1928). C. C. DAVIS

The application of the analytical quartz lamp in the rubber laboratory. F. KIRCHHOFF. *Kautschuk* 1928, 24-7.—A study similar to that of Nagle (cf. C. A. 22, 1251) was made of various inorg. and org. rubber ingredients or substances of interest in rubber manuf. to det. how many of them can be identified by means of characteristic *fluorescent colors* when viewed in ultra-violet light. The light was filtered so that the samples were lighted only with radiation of 3000-4000 Å. U. The characteristic fluorescence of substances depends upon their purity, and the presence of impurities greatly changes these fluorescent colors. Thus com. ZnO varies considerably because of differences in impurities (cf. Nagle, *loc. cit.*), varying from S-yellow for the purest grade to dark yellow-ocher, greenish yellow or pale rose. Since BaSO₄ is a brown-violet and ZnS a bright orange, the fluorescence of lithopone varies with the ZnS content. Many other inorg. compounding ingredients give characteristic colors which in most cases differ greatly from their colors in sunlight. Among aliphatic substances, vegetable and animal oils, fats and waxes and paraffin hydrocarbons show characteristic fluorescent colors. Phenols and aromatic acids show particularly bright colors and with increase in complexity of the ring, *e. g.*, quinoid compds., the intensity of the fluorescence becomes particularly great. On the other hand, NO₂ groups weaken the fluorescence. The introduction of Zn into feebly fluorescent compds. increases greatly the fluorescence, *e. g.*, quinosol, which is not fluorescent, becomes strongly so when converted to its Zn deriv. Dyes, org. rubber accelerators and antioxidants are also among the groups in which many of the individual members show characteristic colors. Proteins, sugars, starch and resins show more or less strong fluorescence. Different types of rubber show different fluorescent colors and when compounding ingredients are added these colors change so that sometimes it is possible to det. qualitatively the nature of a mixt. The differences in color of the various rubbers depend chiefly upon the acetone ext. and the exts. of different rubbers show different colors. In general, ultra-violet light analysis is useful in rubber technology for *identifying ingredients, controlling their purity and judging the correctness or thoroughness of a mixing*. It should also be of value in following the *natural or artificial aging of rubber mixts.* through oxidation. C. C. DAVIS

The identification of dusting agents on thin-walled rubber articles, cured with sulfur chloride, by means of the Hanau analytical quartz lamp. RUDOLF DITMAR AND WILHELM DIETSCH. *Gummi-Ztg.* 42, 1415 (1928).—Different types of dusting agents, *e. g.*, starches, talc, CaCO₃, etc. can be readily identified by examg. them in filtered ultra-violet light (cf. preceding abstr.), under which conditions they show characteristic fluorescent colors. Even starches from different sources can be distinguished. Org. accelerators also show characteristic colors which allow their identification.

C. C. DAVIS

Physiological aspects of the flow of latex in rubber plants (ZIMMERMANN) 11D. C black (Brit. pat. 274,573) 18. Tanks or vats formed of cement mixed with latex and lined with rubber (Brit. pat 275,316) 1.

SCHIDROWITZ, PHILIP: **Recent Progress in Rubber Chemistry and Technology.** London: Ernest Benn, Ltd. 3s. 6d., net.

Liquid rubber composition. H. P. BUTLER. Brit. 274,742, Feb. 2, 1927. A strongly adhesive compn. suitable for coating fabrics is formed by dissolving crude rubber in a solvent such as C₆H₆, with or without CCl₄, and heating to about 100° for 2-3 hrs. Gums such as damar, copal or kauri gum, drying oils and nitrocellulose may also be added, as may also various thinners and driers. Cf. C. A. 21, 3489; 22, 2081.

Rubber composition. HARRY L. FISHER. U. S. 1,668,235, May 1. Raw rubber is treated with *p*-toluenesulfonic acid (suitably at a temp. of about 110° or higher) to produce a reaction product which may be used for making molded articles. U. S. 1,668,236 specifies treating rubber 100 (in the absence of a solvent) with H₂SO₄ of 1.94 sp. gr. 2-25 parts to form a thermoplastic product.

Rubber composition. H. L. FISHER. U. S. 1,668,237, May 1. Rubber is heated with a mixt. of H₂SO₄ and *p*-toluenesulfonic acid in the relative proportions of 100:

8:2 and suitably at a temp. of about 88–130° to form a thermoplastic product suitable for making phonograph records, etc.

Rubber dispersion. H. L. TRUMBULL and J. B. DICKSON. U. S. 1,668,879, May 8. A viscous paste is formed from glue, casein or gluten, this is masticated and rubber is added, while the mastication is continued, in such large quantities as to produce a dispersion of the paste in the rubber, and the phase of the dispersion is then inverted to bring the paste into the continuous phase. The product thus obtained is similar to latex.

Reclaiming rubber. L. T. SMITH. Brit. 274,797, July 20, 1926. The material is treated with a solvent b. 160–200° such as a fraction of pine wood ext. consisting mainly of dipentene and contg. also pinene, terpinene, terpinolene and other terpenes.

Printing on rubber with colored rubber solutions. S. SAUL. Brit. 275,298, Jan. 6, 1927.

Paper for backing sheet rubber. G. E. GRIMM. U. S. 1,667,853, May 1. A backing for sheet rubber such as that used for patching rubber tires comprises paper carrying a smooth even coating of shellac or other hard resin mixed with a soft resin such as colophony and with castor oil or other suitable vegetable oil. Alc., turpentine and CH_2O also may be added. U. S. 1,667,854 specifies coating paper with waterglass, dextrin and glycerol, and then with rubber.

Articles of hard rubber. W. B. WESCOTT. U. S. 1,668,475, May 1. In forming abrasive wheels or other articles, a mixt. is made from comminuted old rubber, abrasive materials in granular form, S, and latex soln.; this mixt. is dried, molded and vulcanized.

Compositions containing rubber and cellulose derivatives. P. ALLMAN, H. N. MORRIS and I. H. MARLOR. Brit. 274,968, April 30, 1926. Rubber is dissolved in one or more of the volatile hydrogenated products of aromatic hydrocarbons or their hydroxy compds. or ketones or isomers or esters of such compds., e. g., cyclohexanone, and mixed with a soln. of cellulose derivs. such as cellulose nitrate or acetate. Non-volatile hydrogenated aromatic hydrocarbons such as *ar*-tetrahydrohydronaphthol may be used as softening agents.

Vulcanizing rubber to leather. L. B. CONANT. Brit. 275,194, July 29, 1926. The leather is preheated to about the temp. of vulcanizing and the rubber is attached by heat and pressure.

CHEMICAL ABSTRACTS

Vol. 22.

JULY 10, 1928

No. 13

1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

The Bates laboratory aspirator. E. N. BATES AND G. P. BODNAR. U. S. Dept. Agr., *Circ.* 9, 1-12(1927).—This device is designed to sep. granular substances by means of a current of air which passes through the substances as they fall in a thin stream. It was developed primarily for use in the lab. analysis of small grains but has other applications. Public service patent No. 1,524,012 covers the manuf. of the aspirator.
C. R. FELLERS

A constant-rate aspirator. C. F. HOTTES AND A. L. HAFENRICHTER. *Science* 67, 320-2(1928).—Two 10-40-l. bottles are supported, one in an inverted position directly over the mouth of the other. By means of tubes, compd. curves, stopcocks and a const.-level device, the principle of Mariotte is utilized to produce a const. flow from the upper to the lower bottle. The gas thus collected in the upper bottle can be sampled and analyzed. The upper bottle can be refilled with the used liquid in the lower bottle while the app. is in operation as an aspirator.
L. W. RIGGS

Practical arrangement of apparatus for microfiltration. GEORGES FONTES AND LUCIEN THIVOLLE. *Bull. soc. chim. biol.* 10, 495-500(1928); cf. C. A. 21, 2712.—
L. W. RIGGS

Dust-free air. A. BATTIGE. *Apparatebau* 40, 97-9(1928); 6 cuts.—Descriptions of H. Wittmeyer's *air filters*.
J. H. MOORE

The new pocket polarimeter of Zeiss-Ikon A. G. (Goerzwerk). K. SEILER. *Schweiz. Apoth. Ztg.* 65, 442-4(1927); cf. C. A. 18, 2944.—This improved instrument, to be used with any source of white light, allows accurate detn. of dextrose from 0.5 to 10%; the error for 0.5% is -0.04%, and for 1 to 10% varies from -0.01 to -0.05%. To find the % of dextrose, multiply the observed angle of deviation by 2. The instrument is well adapted for the *detn. of sugar in urine*.
S. WALDBOTT

Results of examination of three daylight polarimeters. K. SEILER. *Schweiz. Apoth. Ztg.* 66, 61-4(1928); cf. preceding abstr.—Five solns. of dextrose of known concns. (0.5 to 9.95%) were examd. with the Zeiss-Ikon (I), the Leitz R-polarimeter, Model B (II), and L. Merker's polarization app. (III). I is superior to II and III, as it shows a plain, clear field of vision, sharp changes of color, has exact zero adjustment and gives very accurate results. The errors in II and III are, resp., -6% and +6%.
S. WALDBOTT

Permanently saturated hydrogen electrode for the determination of p_H . JEAN SWYNGEDAUW. *Bull. soc. chim. biol.* 10, 430-42(1928).—See C. A. 21, 2487. L. W. R.

Simple apparatus for microanalytical determination of nitrogen that may be split off by caustic solution. H. LEOPOLD. *Chem.-Ztg.* 52, 309(1928); 2 cuts.—Description of an easily constructed distn. app.
J. H. MOORE

A method of calibration of a McLeod gage. R. J. CLARK. *J. Sci. Instruments* 5, 126-30(1928); 4 cuts, 2 tables.—Directions are given for constructing a gage and for correcting the error due to the meniscus.
J. H. MOORE

Buret-reading device. MAURICE HYMAN. *J. Soc. Chem. Ind.* 47, 100T(1928).—A piece of white celluloid, measuring 3 by 1.5 in., has 0.66 of its area blackened. Over the blackened portion is placed a strip of transparent celluloid so that its upper edge coincides with the upper margin of the black area and affixed by eyelets near the ends, thus leaving an opening between the pieces sufficient to allow the device to be slipped over the buret. The device is placed on the buret so that the upper margin of the black area is just below the meniscus. The eye is brought into a position such that the upper edge of the transparent celluloid in front of the buret and the upper margin of the black area behind the buret are seen as one coincident line, and the device is gradually raised until this line forms a tangent to the black crescent of the meniscus. T. S. C.

A new potentiometric titrating device. EBBE LINDE. *Svensk Kem. Tids.* 39,

285-7(1927) (German text).—A potentiometer titration chain is described in which a vacuum-tube amplifier is inserted. A. R. ROSE

* The spectrodenso-graph of Goldberg. HELMUTH SCHERING. *Collegium* 1928, 143-50.—The spectrodenso-graph gives absorption curves of solid and liquid, transparent or colored substances and of solid, opaque colored substances such as paper or fabrics. The curve is registered automatically and can be completed in 2 or 3 min. I. D. CLARKE

Apparatus for catalytic hydrogenations by Adams' method. G. A. C. GOUGH AND HAROLD KING. *Chemistry and Industry* 47, 410-1(1928).—The app. consists of a standard H cylinder, with reducing valve, which discharges through a valve into a second H cylinder. The second cylinder carries a sensitive gage, from which the H consumption can be detd., and a two-way valve. One outlet of this valve goes to the hydrogenation flask, and the other to a vacuum pump. T. S. CARSWELL

An instrument to record the carbon dioxide content of a gaseous mixture. K. GORDON AND J. F. LEHMANN. *J. Sci. Instruments* 5, 123-6(1928); 1 cut.—The app. is based on the variation in cond. of a bicarbonate soln. in equil. with a satd. carbonate soln., and is independent of other constituents of the gaseous mixt. BaCO_3 is used. J. H. MOORE

Air-free gas from a Kipp apparatus. L. C. BANNISTER. *Chemistry and Industry* 47, 364(1928).—The thistle funnel supplying the acid reservoir of the Kipp app. was replaced by a glass stopcock. To this was attached tubing from a vacuum pump and the pressure inside was reduced until the acid rose as high as possible. The stopcock was then closed and the pump tubing transferred to the gas-delivery cock. This was opened and the air sucked out of the app. until the acid came nearly into contact with the solid chemical. The process was repeated, and gas evolution then allowed to commence by opening the top stopcock and regulating it so that the pressure above the acid increased at the same rate as that in the gas reservoir, until both reached atm. pressure. Each successive repetition reduces the amt. of impurity present to a small fraction. T. S. CARSWELL

A simple automatic control of vacuum. S. P. MILLER AND P. V. MCKINNEY. *Ind. Eng. Chem.* 20, 552(1928).—A modified Bur. of Mines vacuum control (C. A. 21, 3266) was made by using a fine capillary (inner tube of a blast lamp) against which pressed a rubber stopper mounted upon the movable arm (bent down) of an electromagnet made from an old elec. bell vibrator. This device held a vacuum of 5 mm. and controlled it automatically to within 0.3 mm. W. C. EHAUGH

Improved aluminum alloys in the construction of apparatus and machines. P. SCHWERBER. *Apparatebau* 40, 85-8(1928).—A general discussion, with several references. J. H. MOORE

Lead and lead compounds (alloys) in apparatus construction. H. BUDE. *Apparatebau* 40, 101-2(1928). J. H. MOORE

Apparatus for taking cross-section samples from large quantities. RINCK. *Kali* 22, 105-6(1928).—Description of a simple device which gives satisfactory results in practice, but is no more free from error than any app. usually used for this purpose. A. L. HENNE

Flow meter. H. WINKELMANN. *Apparatebau* 40, 99-100(1928).—The Grefe meter is described. J. H. MOORE

A simple control unit for electrically heated mercury-vapor pumps. D. R. BARBER. *J. Sci. Instruments* 5, 133-4(1928); 1 cut.—An automatic cut-off based on the principle of the U-tube manometer. J. H. MOORE

A new jelly-strength tester, and some experiments on gelatin gels. A. F. TRACEY. *J. Soc. Chem. Ind.* 47, 94-6T(1928).—In testing gels made from photographic gelatin with the app. of Lipowitz, it was found that a much more definite end point was obtained when the end of the plunger resting on the gel had a spherical rather than a flat end. Much more comparable and uniform results were obtained when the jelly strength was expressed as the load in g. per cm. of plunger circumference rather than as load in g. per sq. cm. of plunger area. Temp.-jelly strength curves showed that usually the jelly strength decreased very rapidly with rise in temp., except in the range 19-23°, where the curves showed an almost horizontal inflection. An app. designed to measure the depression of a jelly under a given load consisted of a special type of strength tester, in which the movement of the plunger was observed from the movement of a spot of light thrown by a mirror attached to the plunger by a multiplying movement. T. S. CARSWELL

A new rapid incinerating oven. ARTUR FORNET. *Chem.-Ztg.* 52, 319(1928); 1

cut.—Fornet's oven for *burning flour*, etc., without using chemicals or pure O, is described. J. H. MOORE

WHITE, WALTER P.: *The Modern Calorimeter*. Am. Chem. Soc. Monograph Series, No. 42. New York City: Chemical Catalog Co., Inc. 194 pp. Bound, \$4.

Electron tube. H. C. RENTSCHALER (TO WESTINGHOUSE LAMP CO.). U. S. 1,670,483, May 22. Evacuated tubes contain a plate, a grid, and a refractory metal filament activated by a coating of Ra oxide.

Röntgen-ray tube. NAAMLOOZE VIENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIKEN. Brit. 275,751, May 26, 1926. Structural features.

Luminous electric discharge tubes. J. B. J. M. ABADIE. Brit. 276,018, Aug. 14, 1926. In tubes filled with gases such as Ne, He or N and with Hg vapor, the glass is charged with fluorescent salts such as those of U or covered with fluorescent substances such as sulfides. The light from a He Ne mixt. filtered through yellow U glass is green as is also the light produced by fluorescence of the glass under the action of ultra-violet rays emitted by the gas mixt. The glass may be colored green by oxides, and the electrodes may be charged with Hg salts such as Hg cyanide which decomposes to yield Hg and N.

Luminous electric discharge tubes. J. B. J. M. ABADIE. Brit. 276,019, Aug. 14, 1926. In luminous elec. discharge tubes contg. Ne, He or other rare gas, the gas is purified before introduction into the tubes by an elec. discharge or arc between electrodes having zones of different temp. caused by the arc (one electrode being of an alkali or alk. earth metal or metal of the W group and the gas being circulated over the electrodes by convection). The gas pressure in the tube and the material of the electrodes are chosen to minimize disintegration of the electrodes and impurities in the gas are absorbed in the tubes by threads of W or other metal of the W group. Various other operative and structural details are given.

Electric resistance thermometer. SIEMENS BROS. & CO., LTD. AND L. G. SALMON. Brit. 276,464, June 15, 1926.

Mechanically-operating differential thermometer for use with recording calorimeters. SECRETARY OF THE BOARD OF TRADE AND C. V. BOYS. Brit. 276,803, July 22, 1926. Structural features.

Thermometer for automobile radiators, etc. G. JOANNES. U. S. 1,670,577, May 22.

Thermometer for use on internal-combustion engines. P. C. C. PASSMAN. Brit. 276,570, Feb. 18, 1927.

Wet and dry bulb thermometers and protective cage mounting adapted for use in drying kilns. V. R. JOSE, JR. U. S. 1,670,507, May 22.

Heat-saturator indicator. R. L. FEARN. U. S. 1,669,510, May 15.

Air filter. G. HAIN. U. S. 1,670,348, May 22.

Rotary filter with filter disks carried on a rotatable horizontal shaft. E. J. SWEETLAND. Brit. 275,779, July 23, 1926.

Filter press. W. T. CHATFIELD. Brit. 276,820, Aug. 19, 1926.

Colloid mill. R. LISTER & CO. AND F. V. LISTER. Brit. 276,594, April 22, 1927.

Colloid mills. W. H. WHATMOUGH. Brit. 276,737-8, May 29, 1926.

Forming disperse systems in a colloid mill. W. H. WHATMOUGH. Brit. 276,400-1, April 22, 1926. Mech. features.

Mixing mill for paints, foods, etc. C. J. COOPER and A. M. MASON. Brit. 276,196, Nov. 1, 1926.

System of connected kilns for continuous working. M. M. MINTER. Brit. 275,858, June 18, 1926.

Shaft kiln for manufacture of lime, "gypsum", cement, etc. and for calcining ores. G. MARTIN. Brit. 276,066, May 17, 1926.

Apparatus for feeding coal or other materials to top-fired kilns, etc. T. C. FAWCETT, LTD., D. L. FAWCETT and A. E. BOTTOMLEY. Brit. 275,701, April 24, 1926.

Electron-emission material. H. L. BERGER. U. S. 1,671,007, May 22. A metallic core of comparatively high cond. such as Ag is coated with an oxysulfide such as Ca oxysulfide.

Electron-emission material. J. W. MARDEN. U. S. 1,670,463, May 22. In order to activate W, Mo, Pt, Ta or similar refractory metal which may be used for cathodes a small proportion of a powd. Al alloy of Th or other electron-emission metal is added to the refractory metal also in powd. form, the mixt. is compressed into a slug, heat-treated and worked into the desired form.

Activating electron-emission filaments. T. P. THOMAS. U. S. 1,670,487, May 22. Filaments such as those formed of W are coated with Th oxalate and heated *in vacuo* to decomp. the Th oxalate and deposit free Th.

Apparatus for sterilizing liquids with ultra-violet rays. E. O. SCHEIDT. U. S. 1,670,217, May 15.

Mercury-vapor lamp for treating liquids with ultra-violet rays. E. GOLTSTEIN. U. S. 1,669,819, May 15. Liquid to be treated is circulated through a quartz tube extending within a Hg-vapor lamp the outer walls of which are formed of glass.

Tubular heat-exchange apparatus. BABCOCK & WILCOX, LTD. Brit. 276,262, March 22, 1927.

Continuous heat-exchange apparatus for regenerative hot-blast stoves, etc. F. A. FAHRENWALD and H. E. SMITH. Brit. 275,706, May 6, 1926.

Apparatus for aerating water or other liquids. J. J. BRATHERTON and D. MALONE. Brit. 276,495, Aug. 23, 1926.

Apparatus for deaerating liquids. RICHARDSONS, WESTGARTH & CO., LTD. AND J. R. WALKER. Brit. 277,041, March 9, 1926.

Apparatus for washing air or other gases. PNEUMATIC CONVEYANCE & EXTRACTION, LTD. AND S. N. CHEW. Brit. 277,112, June 10, 1926.

Apparatus for washing gases to remove dust, etc. ATELIERS J. HANREZ SOC. ANON. AND A. MODAVE. Brit. 277,281, Sept. 13, 1926.

Apparatus for scrubbing gases or for other gas and liquid contact operations. F. H. WAGNER. U. S. 1,669,638, May 15. Liquid is sprayed laterally at different levels of a vertical app.

Apparatus for gas scrubbing or for other contact of gases with liquid sprays. F. H. WAGNER. U. S. 1,669,795, May 15.

Liquefaction apparatus for separating gaseous mixtures. M. FRANKL. Brit. 276,292, Feb. 18, 1926.

Apparatus for estimating constituents of gases, etc., by different actions of heat rays passing through gases and falling on bolometers. SIEMENS & HALSKE A.-G. Brit. 277,025, Sept. 4, 1926.

Charging device for gas producers and similar apparatus. R. MÖLLER. U. S. 1,670,203, May 15.

Spray humidifier for treating air or other gases. CARRIER ENGINEERING CO., LTD. AND S. L. GROOM. Brit. 276,214, Dec. 24, 1926.

Automatic device (operating by diffusion and differences of pressure) to cut off gas flow in case of leakage. ELECTROLUX, LTD. Brit. 277,018, Sept. 2, 1926.

Apparatus (in which the saturation temperature of air or other gases is controlled) for effecting dehumidification. CARRIER ENGINEERING CO., LTD. AND S. L. GROOM. Brit. 276,221, Jan. 11, 1927.

Multipass gas condenser. J. S. HAUG. Brit. 275,971, Aug. 12, 1926.

Diffusion apparatus for testing gases in mines, etc. H. SEWERIN. Brit. 276,234, Oct. 23, 1926.

Apparatus for treating gases with catalysts or other solid materials. D. M. HENSHAW, S. G. WATSON and W. C. HOLMES & CO., LTD. Brit. 276,736, June 12, 1926. In removing H_2S from gases with Fe oxide, removal of moisture or C_4H_8 with silica gel, or in other gas treatments, an app. may be used in which the treating material passes downwardly through a hollow casing with foraminous walls through which the gases pass in a zig-zag manner.

Vacuum flotation apparatus for concentrated coal, ores, etc. F. E. ELMORE. Brit. 275,778, July 16, 1926.

Vacuum pump of the piston type. J. A. R. BENNET. U. S. 1,669,734, May 15. Mech. features.

Forming gas-tight seals in making electric discharge devices. A. W. HULL. Brit. 276,345, Aug. 23, 1926. A conductor such as Ni-Fe alloy coated with Cu may be surrounded by alternate cylinders of glass and Cu and by a Cu-coated metal shell, swaged together while the glass is plastic. Various structural details are given.

Apparatus for distilling volatile from non-volatile substances. E. WICKER. Brit. 277,085, June 7, 1926. An app. is specified suitable for sepp. volatile from non-volatile substances such as fatty acids, fats and oils, tars, tar oils or mineral oils by heating *in vacuo* and injecting liquids such as water, toluene or alc. as a mist suspended in heated vapors or gases such as CO_2 or N. Catalysts for hydrogenating may be added and H supplied with the gas for hardening fats, etc. Bleaching and purifying agents also may be added in the app.

Oil viscometer for use in connection with crank cases of engines, etc. F. B. MASON. Brit. 276,281, May 9, 1927.

Apparatus for conditioning fibers by spraying them. BORNE, SCRYMSEY CO. Brit. 277,213, Jan. 5, 1927.

Color comparison apparatus. TINTOMETER, LTD., F. E. LOVIBOND and G. S. FACETT. Brit. 277,166, Sept. 3, 1926.

Apparatus for testing hardness of materials. R. ESNAULT-PELTERIE. Brit. 276,776, June 30, 1926.

Thermionic valves. EDISON SWAN ELECTRIC CO., LTD., L. H. SOUNDY AND T. W. PRICE. Brit. 276,703, April 28, 1926. The electron-emitting surface of a cathode is confined to a small area so that the potential drop across the surface is less than 0.1 v. and less than $\frac{1}{1000}$ of the potential drop between the surface and the anode; e. g., a spot of CaO or SrO may be applied to a Pt filament.

Beginnings of chemistry. CARLO ORESTE ZURETTI. *Giorn. chim. ind. applicata* 10, 121-31(1928).—Bibliographical researches are described which deal with alchemical symbols, processes and app. used by the alchemists, alchemical doctrines in various Greek manuscripts, various formulas, symbols and diagrams of early app. Reproductions of original manuscripts are included. The work is part of a complete treatise of alchemy to be published in Italy, in which historical records from previously unexamined manuscripts will appear. C. C. DAVIS

Education in chemical and physicochemical science in the United States. WALTER FRANKENBURGER. *Z. Elektrochem. angew. physik. Chem.* 34, 269-74(1928). E. H.

Valence in chemical teaching. W. DAHMEN. *Z. physik. chem. Unterrichts*, 39, 127-9(1926).—Brief general discussion of teaching method. M. BEBER

Simple experiments on polymorphism. W. FLÖRKE. *Z. physik. chem. Unter-*

richt 40, 71-6(1927).—Expts. dealing with transition of rhombic to monoclinic sulfur, transition of monoclinic to rhombic S, specific gravity of monoclinic and rhombic S, detn. of transition point of NH_4NO_3 , proof of transition of NH_4NO_3 by the change of crystallographic relationships and transition of KNO_3 are described. M. BEBER

Experimental demonstration of the existence of the ammonium radical. S. GENELIN. *Z. physik. chem. Unterricht* 39, 235-7(1926)—A current is passed through a concd soln. of $(\text{NH}_4)_2\text{SO}_4$, mercury serving as cathode. The ammonium amalgam formed is filtered off quickly, transferred to a small test tube and allowed to decompose. The products are identified as NH_3 , H_2 and Hg , thus proving the original presence of NH_4 . M. BEBER

Microchemical reactions in teaching. P. RISCHBIETH. *Z. physik. chem. Unterricht* 39, 67-71(1926).—In addition to creating an interest in the student the study of crystals under the microscope has very definite advantages. Directions for showing Na and Li uranyl acetates; isomorphism of sulfates and selenates, phosphates and arsenates, antimony and bismuth salts; $\text{M}_2\text{CuPb}(\text{NO}_3)_4$ where M is K, Rb, Cs, Tl; $\text{M Hg}(\text{CNS})_4$ where M is Cd, Zn, Cu, Co; formation of $\text{Na}_2\text{Ca}(\text{CO}_3)_2$; reduction of selenous by sulfurous acid; formation of complexes as shown by $\text{Pb}(\text{NH}_3)_4\text{Cl}_2$ and $\text{Pb}(\text{NH}_3)_2\text{Cl}_2$. Other reactions can be obtained from texts on the subject. M. BEBER

A student experiment on the melting and crystallization points of lead and tin. FRIEDRICH HOFMANN. *Z. physik. chem. Unterricht* 39, 165-6(1926). M. BEBER

Dissociation of carbonates by heat as student experiments. L. DOERMER. *Z. physik. chem. Unterricht* 40, 122-3(1927).—Objection to Rischbieth's method (cf. following abstract) is the Pt tube, which is unavailable in many schools. Expts. described here eliminate it. M. BEBER

Dissociation experiments with a platinum tube. P. RISCHBIETH. *Z. physik. chem. Unterricht* 40, 112-5(1927); cf. preceding abstract.—Expts. giving quant. results dealing with dissociation of various carbonates, siderite, rhodochrosite and pyrolusite are described. M. BEBER

Hydrolysis of sodium chloride as an experiment. HORST BRÜCKNER. *Z. physik. chem. Unterricht* 41, 92-3(1928).—Although hydrolysis of salts of strong acids and strong bases can be practically disregarded it can be demonstrated. A knife point full of NaCl is placed in a yellow glowing Pt crucible at about $1100-1200^\circ$. After it is melted about 1 cc. H_2O is added. When about $\frac{1}{2}$ the H_2O is evapd. (about 20 sec.), the dancing drop is allowed to drop into about 100 cc. dil. blue litmus soln. The melted NaCl remains in the crucible and on cooling is dissolved in water; this turns red litmus blue. The drop of H_2O had colored the blue litmus red, showing that the solid NaCl had become alkaline and the drop acid. M. BEBER

New experiments with thermite. H. ZEITLER. *Z. physik. chem. Unterricht* 40, 16-21(1927).—Z. describes a com. thermite mixt. "moxbriquettes" which he uses to demonstrate many expts. with the thermite reaction, such as its use for heating purposes, a detn. of its heat of reaction, burning it under water, and dissociation of halides, sulfates and carbonates by its heat. M. BEBER

Revision of the atomic weight of uranium. The analysis of uranium tetrachloride. O. HÖNIGSCHMID AND W. E. SCHILZ. *Z. anorg. allgem. Chem.* 170, 145-60(1928).— UCl_4 is prep'd. by heating UO_3 with C in a current of Cl_2 , sublimed twice and melted in atm. of N_2 , to liberate dissolved Cl_2 . Nineteen detns. of the ratio $\text{UCl}_4 : 4 \text{ Ag}$ and 18 of $\text{UCl}_4 : 4 \text{ AgCl}$ gave $U = 238.14$. C CALINGAERT

Some properties of non-metallic elements in relation to their cohesive forces. A. M. TAYLOR. *Trans. Faraday Soc.* 24, 157-9(1928).—Cohesion may be explained in terms of attractive forces operative between unlike charges and between elec. doublets. With non-metals the linkage is homopolar, the cohesive forces originating from elec. doublets which arise from deformation. With metals it is heteropolar, ionic charges adding to the elec. doublet effect. "In polar crystal lattices the units are oppositely charged ions, and the forces of cohesion vary as the inverse square of the distance of sepn. provided deformation of the electronic shells is absent." Broadly speaking compressibility indicates the nature of the cohesive forces, and hardness may be treated as a quant. estimate of their magnitude. JEROME ALEXANDER

The formation of chemical formulas on transition from homopolar to heteropolar linkage and vice versa. CHRISTOPH SCHWANTKE. *Z. physik. chem. Unterricht* 39, 226-8(1926); cf. C. A. 20, 2101. M. BEBER

Physical classification of the elements. C. G. BEDREAG. *Ann. sci. univ. Jassy* 14, 47-59(1926); cf. C. A. 19, 1656.—Recent exptl. data on the spectra of Co and Ni multiplets confirm the previously given system of the elements. Two stages through which the passage from one element to the succeeding one can be analyzed: variation

of the electronic group $R_n \rightarrow R_n + 1$ and variation of $N \rightarrow N + 1$. B. notes both in his own previously-given tables and in Stoner's model how the variable properties of the same element are functions of the no. and arrangement of electrons remaining in the at. structure. He also draws attention to the importance of the detection of the electronic (or combination) bands from the standpoint of electronic distribution.

A. PAPINEAU-COUTURE

The rare earths in the general classification of the chemical elements. LUIGI ROLLA. *Scienza* 43, 159-68(1928) (Italian).—A general review of the periodic system is given and the position of the rare-earth group of elements therein is explained. The work of Moseley on at. nos. is explained together with its relation to the Mendelyev table. Finally, the analogy between ionization potential and chem. properties is given. The periodicity of 2 groups of 8 elements followed by 2 of 18 elements which in turn is followed by a large period of 32 elements is shown graphically. It is this last period which contains the rare earths. In this group is the vacant position of element 61. Its identification brilliantly confirms the general theory of the constitution of matter.

R. H. LAMBERT

The natural system of the elements. W. DAIMEN. *Z. physik. chem. Unterrichts* 40, 106-12(1927).—A review of a no. of periodic arrangements. M. BEBER

Atomic constants and physical properties. MAX BORN. *Z. physik. chem. Unterrichts* 40, 241-53(1927).—A lecture. M. BEBER

Combination and space. N. S. KURNAKOV. *Z. anorg. allgem. Chem.* 169, 113-39 (1928).—An address given at the General Assembly of the 4th Mendelyev Congress at Moscow 1925 in which K. points out the relation between geometrical conceptions and chem. equil. The formulas which apply to the relations of points, lines and surfaces in polyhedral complexes which enclose a three-dimensional space can be applied to our usual stereochemical formulas.

E. R. SCHIERZ

Pyrophoric lead. G. R. LEVI AND A. CELERI. *Atti. accad. Lincei* [6], 7, 350-5 (1928).—The paper is in 2 parts: (1) *detn. of Pb in the presence of its oxides*, and (2) *methods of prepn. of pyrophoric Pb and analyses of the products*. Ordinary analytical methods for detg. Pb are unreliable for its detn. in the presence of its oxides and 4 other methods were tried. Pb was dissolved in hot aq. FeCl₃ acidified with HCl, MnSO₄ was added, the soln. was dild. and titrated with KMnO₄. The results were very low, and elimination of HCl or its replacement by H₃PO₄ did not improve the method. Pb was then treated with aq. AgOAc, hot and cold, but no method giving uniform results could be developed. Replacement of AgOAc by AgNO₃ gave even worse results. No volumetric method could be devised and attempts were made to measure the H by treatment with boiling concd. HCl in a current of CO₂. This method of detg. Pb gave precise results even in the presence of its oxides, and it was adopted for the study of pyrophoric Pb. The method of van Rijn for the prepn. of the latter was improved by heating Pb tartrate *in vacuo* in a sealed tube at 480° for 2-4 min., cooling and filling the tube with 1% C₆H₆ soln. of paraffin. By protecting the product in this way, spontaneous oxidation is avoided. This method of prepn. gives a product with about 87% free Pb. A pyrophoric Pb which is less active and contains about 72% free Pb is prepd. by heating in a sealed tube at 350-60° a mixt. of Pb tartrate and paraffin. *Röntgenographic examn.* showed only lines of Pb, but when exposed to the air the lines of PbO appeared. Pyrophoric Pb prepd. from Pb citrate by the same 2 methods used for Pb tartrate gave products contg. 89 and 72% Pb, resp. Heating Pb oxalate and paraffin at 300° for 1 hr. also gave an active pyrophoric Pb contg. about 30% free Pb. *Röntgenographic examn.* indicated that in this case the formation of free Pb was chiefly a surface phenomenon. Decompn. of Pb oxalate in a current of CO₂ gave a product contg. only 4% free Pb which did not oxidize in air at room temp. and was composed chiefly of PbCO₃, though *röntgenographic examn.* indicated the presence of PbO. Pb formate and paraffin heated at 300° for 1 hr. yielded a product which contained about 91% free Pb, which oxidized rapidly in air and which showed only lines of Pb when examd. *röntgenographically*. The expts. showed that (1) pyrophoric Pb has the same cryst. structure (face-centered cubes) as ordinary Pb; (2) the pyrophoric granules are large enough to give sharp, fine lines in Debye photographs; (3) pyrophoric Pb sometimes slightly contaminated with PbO can readily be prepd. by heating Pb citrate, tartrate or formate, and (4) slow oxidation of pyrophoric Pb forms yellow PbO, the extent of the oxidation in a given time depending upon the size of the particles.

C. C. DAVIS

The temperature of transformation of liquid sulfur to viscous sulfur. PAUL MONDAIN-MONVAL AND PAUL SCHNEIDER. *Compt. rend.* 186, 751-3(1928).—The viscosity of pure S was studied as a function of temp. and it was found to undergo in-

ternal transformation at 160°. By adding increasing amts. of impurities (triphenylmethane was added since it does not react with S below 280°) the transformation takes place at higher and higher temps., reaching a limit corresponding to the appearance of a new phase. Around 170° S and triphenylmethane are miscible in all proportions. But raising the temp. to 200° causes a sepn. of 2 layers, one rich in S and the other in triphenylmethane.

E. G. VANDENBOSCH

Internal equilibrium in liquid sulfur. I. D. L. HAMMICK, W. R. COUSINS AND E. J. LANGFORD. *J. Chem. Soc.* 1928, 797-802.—Ineffective chilling may account for the vertical portion of the Smith and Holmes' (*J. Am. Chem. Soc.* 27, 979 (1905)) alleotropic line, which is supposed to represent the equil. between S_λ and S_μ in liquid S. In the present work an attempt is made to eliminate this portion by using better chilling methods. Thus, fine droplets of S are prepd. by suspending liquid S in a mixt. of $(\text{NH}_4)_2\text{SO}_4$ and H_2SO_4 , of about the same d. as the S. The time of transference of the S mixt. from the heating unit to the cooling-bath (ice- H_2O) is cut to a min., the mixt. falling into the bath on breaking the bottom of a glass tube. After properly washing, hardening, selecting and drying the droplets are ground to pass through 50 mesh. To analyze, this is treated with CS_2 in a Soxhlet extractor. The plot shows that as the droplets are more effectively chilled the transverse section of S. and H's alleotropic line becomes more elongated, the vertical being reached at 40% S_μ instead of their 33%. This proves that this portion of the curve is due to ineffective chilling and that it is not a truly alleotropic line. The changes taking place during the hardening of the chilled droplets have not yet been taken into account by anyone. J. BALOZIAN

A new allotropy of cobalt. HAKAR MASUMOTO. *Kinzoku no Kenku* [9], 2, 877-93 (1925); *J. Inst. Metals* 37, 377-8 (In Japanese.).—Hitherto it has been believed that Co possesses only the magnetic transformation at 1150° and has no other transformation, but from an investigation on the change of several properties of Co at high temps. (intensity of magnetization, elec. resistance, thermal expansion, sp. heat, etc.), M. concludes that Co has a new transformation or an allotropy taking place at 477° and 403° during the heating and cooling, resp. It was also confirmed by x-ray analysis that below the transformation point Co has a hexagonal close-packed lattice (H), and above it a face-centered lattice (γ); hence the new transformation during heating consists of the change from H lattice to γ lattice, and the transformation during cooling of the change from γ lattice to H lattice. The peculiar course of the magnetization-temp. curve below 400° is due to the magnetic transformation of the hexagonal Co, and the abrupt rise at 477° and the abrupt fall at 403° are due to the change of the intensity of magnetization during the transformation. The diminution of magnetization at higher temps. is due to the magnetic transformation of the face-centered Co. H. G.

Allotropic modifications of phosphorus. V. IPAT'EV AND V. NIKOLA'EV. *Ber.* 61B, 630-4 (1928).—White or colorless P is obtained by heating ordinary yellow P with benzene at 200° at 70-80 atm. pressure in presence of an inert gas (N_2 or CO_2). Its d. is 1.82. It is also obtained from the violet-ruby-red P. Purple P is obtained in different ways; it is formed when the white P is heated in the pressure app. at 200-280°. Violet-ruby-red P is obtained by heating Pb and yellow P at 335° and 165 atm. N_2 pressure. Its d. was found to be 2.11. Black P is obtained by heating red P at 350° 4-5 days under 150-250 atm. N_2 pressure. Its d. is about 2.70.

M. FENSKE

Space group of potassium, rubidium and cesium sulfates. F. P. GOEDER. *Proc. Nat. Acad. Sci.* 13, 793-7 (1927).—Assignment of a space group to the sulfates of K, Rb and Cs, is based on crystallographic measurements and x-ray pictures taken by the Laue method and studied by means of gnomonic projection combined with earlier work with x-rays by the powder method. The Laue photographs were made with a tungsten Coolidge tube at root mean square voltages which never exceeded 56,600 volts and usually was not above 50,000. The min. wave length was 0.218 Å. U. A simple orthorhombic lattice containing 4 mols. is the smallest elementary unit agreeing with the patterns. By a comparison of the observed Laue patterns with the patterns theoretically possible from space groups 2 Di-1 to 2 Di-16, it is possible to exclude all except 2 Di-13.

A. W. KENNEY

Researches on lead phosphate and lead chlorophosphate (pyromorphite). F. ZAMBONINI AND A. FERRARI. *Atti accad. Lincei* [6], 7, 283-91 (1928).—A röntgenographic examn. of $\text{Pb}_3(\text{PO}_4)_2$ and pyromorphite shows that their cryst. structure is fundamentally the same. $\text{Pb}_3(\text{PO}_4)_2$ and pyromorphite have a values of 9.66 and 10.03 Å., resp., and on the assumption that the axial ratio $a:c$ is 1:0.736 in each case, the vols. are 578 and 638 (Å. U.)³, resp. If these vols. contain $3\text{Pb}_3(\text{PO}_4)_2$ and $\text{PbCl}_2 \cdot 3\text{Pb}_3(\text{PO}_4)_2$, resp., the calcd. ds. are 7.03 and 7.06, resp. Expts. showed the d_{20}^{20} of $\text{Pb}_3(\text{PO}_4)_2$

to be 7.011. This identity of structure of $\text{Pb}_3(\text{PO}_4)_2$ and pyromorphite is at variance with the views of Abegg and Bodländer (*Z. anorg. Chem.* **30**, 480 (1899)) and of A. Werner (*C. A.* **2**, 636), who considered pyromorphites as halides of a complex cation. It is difficult to det. by expt. the orientation of PbCl_2 in the $\text{Pb}_3(\text{PO}_4)_2$ lattice, for the structure of the latter is in doubt. The increment in vol. is almost the same as the vol of PbCl_2 . The ions of PbCl_2 perhaps enter the interspaces of the $\text{Pb}_3(\text{PO}_4)_2$, in which case the ratio $3\text{Pb}_3(\text{PO}_4)_2:\text{PbCl}_2$ corresponds to satn. of the interspaces, and pyromorphites contg. less PbCl_2 would exist. The researches of Amadori and Viterbi on natural pyromorphites and of Amadori (*C. A.* **14**, 391) on the system $\text{Pb}_3(\text{PO}_4)_2\text{--PbCl}_2$ failed however to identify any such pyromorphites. Regarding pyromorphites as $\text{Pb}_4(\text{PbCl})(\text{PO}_4)_2$, the passage of $\text{Pb}_3(\text{PO}_4)_2$ to pyromorphite involves the replacement of a Pb ion by 2 univalent PbCl groups, in which case the increment in vol. would be that observed, and in accord with exptl. research there could be no crystals with a ratio of $\text{Pb}_3(\text{PO}_4)_2:\text{PbCl}_2$ other than 3:1.

C. C. DAVIS

Recrystallization of very pure aluminum wire. F. SCHMID AND G. WASSERMANN. *Z. tech. Physik* **9**, 106-9 (1928).—On heating hard Al wire (0.35 or 0.8 mm. diam., 99.95% Al) at 600° for 3 hrs. recrystn. occurs with perfect unidirectional orientation of the grains with [111] parallel to the wire axis, as shown in Debye-Scherrer diagrams. The texture of the recrystd. wire is, however, different from that of Cu wires treated in similar way. For the 0.35-mm. wire which had more or less the same texture initially, the strength decreased after the treatment from 20.6 to 3.5 kg. per sq. mm., the percentage elongation changed from 1 to 5 as compared with 20% for unicryst. Al wire. It shows that the crystallite orientation is not the only factor governing the elastic properties. For Al-Si (eutectic) alloy wires (1 mm.) the strength decreases from 26.5 to 15.6 kg. per sq. mm. after ignition, the elongation changes from 2 to 17.5% with unchanged x-ray texture.

B. J. C. VAN DER HOEVEN

Self-diffusion and recrystallization. ADOLF SMEKAL. *Naturwissenschaften* **16**, 262-3 (1928).—S. shows from several examples (ion conduction, diffusion, recrystn., etc.) that the theory of imperfect crystal lattices with loose electrons in the defective spots accounts for many features of the crystals. Only near to the m. p. of the crystal the activity of the rest of the lattice electrons becomes noticeable. B. J. C. v. d. H.

The inner crystal structure of some native metals. H. C. H. CARPENTER AND S. TAMURA. *Bull. Inst. Mining Mcl.* No. 283, 1-16 (1928); cf. *C. A.* **22**, 1879.—"Moss" Cu in mats may indicate that certain forms of native Cu have originated in the molten state. Ag may sep. from Ag-bearing Cu alloy. Very little at. rearrangement has taken place in Egyptian coppers, bronzes, etc., except in specimens accidentally heated. Metals electrolytically and also chemically deposited may show twin crystals. Slowly cooled Fe and steel did not exhibit appreciable crystn. The supposition that metals recrystallize under the influence of vibration has been eliminated. Meteoric iron has been used in the past for lethal weapons but not all native iron is of meteoric origin, for coal measures fired with native iron ore produced practically a native steel. Alluvial depositions were segregations in granular media.

S. L. B. E.

Resistance to shear in metal crystals. G. I. TAYLOR. *Trans. Faraday Soc.* **24**, 121-5 (1928).—Formation of imperfections of a single crystal under stress preventing rows of atoms from slipping is an untenable point of view. The fact that resistance increases as a crystal is placed under stress can, however, be explained by assuming regions where a high concn. of stress can occur so that locally very high values of the shearing stress can be reached although the mean shear stress is small. X-ray expts. are shown to verify the conclusions drawn.

R. H. LAMBERT

An investigation on eutectic crystals. MATSUJIRŌ HAMAZUMI. *Suiyō-Kwaishi* [6], **4**, 973-82 (1924); *J. Inst. Metals* **36**, 453.—[In Japanese.] An expt. was made to discover the crystal grain of cell in eutectic alloys. The crystal grain in eutectics can be detected by the etching method only when the metal in the cell is more basis than the surrounding crystals. The eutectic is nothing but the constituent inlaid within surrounding crystals in polygonal cells. Both these crystals crystallize simultaneously and independently of each other. This action proceeds chiefly by the spontaneous crystn. power of these metals. The primary crystal has a decided effect upon the orientation of the eutectic.

H. G.

Crystallographic study of the artificial amalgam Ag_3Hg_4 . T. J. WOYNO. *Compt. rend. soc. polonaise phys.* **7**, 1-3 (1926); *J. Inst. Metals* **37**, 523.—[In French and Polish.] The compd. Ag_3Hg_4 forms thin needles which are really rhombic dodecahedrons of which the sides [110] are elongated in the direction of the [111] axis. The substance belongs therefore to the cubic system.

H. G.

Deformation, fracture and strengthening of crystals. M. POLANYI. *Naturwissenschaften* 16, 285-94; *Trans. Faraday Soc.* 24, 72-84(1928).—A lecture with 37 references.

The fractional combustion of hydrogen and methane mixed with air. P. RITSCHBIETH. *Z. physik chem. Unterricht* 39, 121-3(1926).—Because of the facts that hydrogen burns more readily than CH_4 and that in a mixt. of the two with air the former is burned exclusively when the mixt. is in contact with a Pd wire heated almost to glowing, the two gases can be sepd. Expts. are described.

The compressibility isotherms of hydrogen, nitrogen and a 3:1 mixture of these gases at temperatures between 0° and 400° and at pressures to 1000 atmospheres. E. P. BARTLETT, H. L. CUPPLES AND T. H. TREMEARNE. *J. Am. Chem. Soc.* 50, 1275-88(1928).—The additive vol. rule in the case of these gases is apparently valid within the limits of exptl. error at 300° but at lower temps. there is a decided deviation. The additive pressure rule is valid to within 2%, if defined in the following way: the pressure exerted by one constituent in a gaseous mixt. equals the product of its mol. fraction and the pressure it would exert as a pure gas at a mol. concn. equal to the mol. concn. of the mixt.

The law of molecular forces. A. W. PORTER. *Trans. Faraday Soc.* 24, 108-11(1928).—P. reviews the work on interacting forces between mols. The term a/v^2 in the van der Waals equation is too small to obtain accurate numerical values even by assuming the term as a measure of such forces. Viscosity measurements offer some information but simple considerations based on gas laws are insufficient. More success may be expected on effects in solids, although difficulties due to motion of mols. arise.

Approximate theories of diffusion phenomena. S. CHAPMAN. *Phil. Mag.* [7], 5, 630-6(1928).—In the kinetic theory consideration of diffusion phenomena the detailed picture usually used for deriving the desired relations involves the discussion of the flow of one or more types of mols. across planes. The equation giving the no. of mols. considered, their mol. fractions and the relation $m_1c_1^2 = m_2c_2^2 = \alpha T$ have so far been combined with the above considerations in a manner which leads to incompatibilities and therefore to erroneous results. C. points out that the correct theory of the various diffusion phenomena depends on the detn. of the velocity-distribution function, which in non-uniform states deviates slightly from the Maxwellian form. However, in spite of many attempts C. has so far failed to find any simple arguments on which to base an easy approx. theory of thermal diffusion.

A consequence of two diffusion equations. W. HERZ. *Z. anorg. allgem. Chem.* 170, 246(1928).—Gapon (*C. A.* 22, 1082) has shown that $D\sqrt{n} = \text{const}$ (D = diffusion coeff., n = no. of atoms in the mol.). Since $D\sqrt{M} = \text{const}$. (M = mol. weight), it follows that $\sqrt{M}/n = \text{const}$. This is shown to be fairly correct for 19 compds. G. C.

The liquid state. W. HERZ. *Z. anorg. allgem. Chem.* 170, 233-6(1928); cf. *C. A.* 22, 1069.—The expression $Z/\sqrt{\gamma}$ (Z = no. of mols. per cc., γ = surface tension) is nearly const. for liquids over a wide range of temp. Likewise, Z/\sqrt{B} (B = internal pressure). These relations hold equally well for associated and non-associated liquids.

Boiling points of the normal paraffins at different pressures. SIDNEY YOUNG. *Proc. Roy. Irish Acad.* 38, 65-92(1928).—A crit. study of the most recent data published on the subject. The work, which is of unusual importance, contains many tables of recalcd. values of vapor tensions and crit. comparison with the actual values.

The relation between the coefficients of expansion and compressibility of fluids. V. S. VRKLIJAN. *Z. Physik* 48, 111-7(1928); cf. *C. A.* 21, 677, 1733.—The relation previously established between the coeffs. of expansion and compressibility is greatly simplified by a slight change in the definition of the coeff. of expansion. The validity of the relation is extended thereby. Application to Bridgman's data on org. liquids shows the theory is strictly accurate. The general formula for the max. density of water and aq. solns. is derived. This corresponds to the equation of van der Waals and the formula of Lussana as special approximations.

Properties of dry liquids. S. B. MALI. *Phil. Mag.* [7], 5, 609-14(1928); cf. *C. A.* 18, 348; 20, 528.—M. attempts to calc. the proportions of the less and more volatile components of dried and undried liquids.

Surface tensions of liquid mixtures. K. M. STACHORSKY. *Z. Elektrochem.* 34, 111-2(1928).—By replacing the internal pressures in Biron's equation with surface

tensions, a similar one is obtained: $\gamma = \gamma_1 \gamma_2 / [\gamma_1 (1 - x) + \gamma_2 x]$, where γ , γ_1 and γ_2 are the surface tensions of the mixt., and the first and sec. components, resp., and x is the mol. fraction of the first component. The surface tensions of unassocd. pairs of liquids (at 55°, benzene (I) and nitrobenzene (II), and toluene and II; at 20°, I and Et acetate (III), II and III, III and CCl_4 , and Pr formate and CCl_4 ; at 18.2°, I and Et_2O , and I and toluene) are calcd., x varying from 0 to 1. The exptl. values are slightly smaller than the calcd. The greater the difference between the surface tensions of the pure components, the greater the deviations of the hyperbolas, as given by the equation from a straight line.

J. BALOZIAN

Cohesion in surface films. N. K. ADAM. *Trans. Faraday Soc.* 24, 149–54 (1928).—The three principal film states are (1) condensed, with close-packed, nearly vertical mols., (2) gaseous with mols. lying flat in the surface and more or less independently motile, (3) expanded, which are intermediate between (1) and (2). Recent work indicates the correctness of the suggestion of Garner, that in liquid expanded films, the mol. chains have a considerable tilt, which may be the consequence of their trend toward close-packing, following close-packing of the mol. heads. With urea derivs. the close-packed heads form very incompressible solid films (area 25.5 sq. A. U.), the rigidity being in the plane of the surface. If the thickness is taken as 3 atoms, the compressibility is of the same order as for org. substances in bulk. Compression probably does not rearrange the film, which is maintained solid and with heads apart mainly or entirely by the cohesion of the terminal NHCONH_2 groups. "This solid structure must be one of the thinnest solids known. It breaks down at a certain transition temp., allowing the chains to come into contact. This temp. may be regarded either as a transition temp. between two 'allotropic' condensed films, or as the 'm. p.' of the two-dimensional structure 3 atoms thick, showing that allotropy may be strictly analogous to melting, a part only of the crystal lattice structure giving way under the thermal agitation." Rigidity is partly detd. by length of chains in contact, which with an effect due to lateral attraction between heads, det. closeness of packing. With aliphatic acids, especially, a double bond in the middle of the chain (as with oleic acid) tends to instability of the film, probably because of increased attraction for water. Since surface films, as always in matter, result from a balance of oppositely acting forces, rise in temp. changes condensed films into expanded, and finally into gaseous films. By noting the tendency of films to collapse, we may distinguish the attraction of the end groups for water, whose importance Langmuir first pointed out. "The hydrocarbons, and alkyl halides cannot be induced to form films on water; the ethers and phenol esters form transient films when spread by a solvent; the methyl esters show slight signs of collapse, while the acids and many other series of compds. form films which will usually resist 10 dynes per cm. compression, or more, with very little collapse. . . . a compression on these very thin films, of the order of 40 atm. The adhesion between the ends of the mols. and the water must be very great to prevent buckling of the films under this, or larger compressions." A rough classification follows: (A) Very weak attraction, no film formed: hydrocarbon, CH_3I , CH_3Br , CH_3Cl . (B) Weak attraction, films unstable (groups in increasing order of attraction for water): CH_3OCH_3 , $\text{C}_6\text{H}_5\text{OCH}_3$, COOCH_3 . (C) Strong attraction: CH_2OH , COOH , CN , CONH_2 , CH:OH , $\text{C}_6\text{H}_4\text{OH}$, CH_2COCH_3 . Films with very long chains always collapse more readily than those with chains of moderate length. Where the approach of the sol. group to water is blocked by a large group, stability diminishes. Pentaerythritol tetrapalmitate forms a fairly stable expanded film, its 4 side chains being forced into vertical position by the cohesive forces. Since the same cohesive forces dominate both film and crystal formation, predictions of m. p. may be worked out. "We now know that the structural formulas of organic chemistry, too often taught as being merely symbolical representations of reactions, do in fact represent the shapes of the mols. with considerable accuracy."

JEROME ALEXANDER

Cohesion in the crystalline state. F. I. G. RAWLINS. *Trans. Faraday Soc.* 24, 155–6 (1928).—A brief review considering the energetics of the cryst. state. "Stratified" lattices are invariably associated with great ionic deformability. Here, mean values are of no avail. "Forces of great magnitude, perhaps even pseudoheteropolar, must be operative within each layer, whereas the weakest forces akin to homopolar, hold the layers together. Actually, the crystal forms beautiful flakes, giving evidence of its stratified habit." A perfect example is CdI_2 .

JEROME ALEXANDER

The influence of particle size upon the dissociation pressure of solid substances. II. Lead carbonate. M. TZENTNERSHVER and J. KRUSTINSONS. *Z. physik. Chem.* 132, 185–8 (1928); cf. C. A. 21, 689; 22, 521.—Dissocn. pressures of PbCO_3 prepd. in 3 different ways were detd. at temps. 255.5–285.5°. Data for samples of min. particle

radius 18.75 and 37.5×10^{-5} cm., when substituted in the equation for surface tension at the boundary solid-vapor, give an approx. value of $63,000$ dynes/sq. cm.

R. J. HAVIGHURST

Adsorption. IV. Adsorption by coconut charcoal from binary mixtures of saturated vapors. The systems methanol-benzene, ethyl alcohol-benzene, propyl alcohol-benzene and butyl alcohol-benzene. F. G. TRYHORN AND W. F. WYATT. *Trans. Faraday Soc.* **24**, 36-47(1928); cf. *C. A.* **20**, 1545.—Adsorption by coconut charcoal from mixts. of benzene with the first 4 members of the normal aliphatic alcs. has been studied in order to confirm the existence of the 3 definite stages of adsorption believed to be present. In the first stage the ratio of the wts. of the 2 components is independent of time. From the Langmuir equation the molar ratio is calcd. and found to agree well with exptl. results especially in the MeOH and EtOH mixts. The close relation between the compn. of the adsorbed phase during the first stage and the form of the vapor-pressure curve of the binary system is discussed. The extent and sharpness of the second stage varies greatly from system to system. The selective action of charcoal is shown by appropriate graphs. The error resulting from displacement of air is very small. A possible quantum mechanism involving energy transfers in the infrared region is suggested for this selective action.

R. H. LAMBERT

Adsorption from solutions. W. HEYNE AND M. POLANYI. *Z. physik. Chem.* **132**, 384-98(1928).—Series of adsorption measurements from aq. and alc. solns. were made at -21.3° , 0° , 20° , 25° and 50° . The adsorbent was charcoal. The adsorbed substances were succinic, benzoic, cinnamic, aminobenzoic and phthalic acids, and phenol. "Affinity curves" are drawn by plotting affinity of wetting *versus* amt. adsorbed. Increase of temp. displaces the affinity curve in the direction of higher affinity of wetting. This is the reverse of the effect of temp. increase on adsorption of vapors by charcoal. In adsorption measurements from solns. the solvent is displaced from the charcoal by the adsorbed substance. In dealing with wetting phenomena the energy required to distort the space lattice must play a part. The adsorption of a given substance from soln. in an org. solvent is less than from aq. soln. At temps. at and above the m. p. the adsorption of phenol resembles that of a vapor.

R. L. DODGE

Adsorption, heats of adsorption, and character of attachment between small amounts of sulfur dioxide and charcoal. M. POLANYI AND K. WELKE. *Z. physik. Chem.* **132**, 371-83(1928); cf. *Ibid* **132**, 321(1928).—Earlier adsorption isotherms of SO_2 on charcoal in the range between a few ten-thousandths and 3% of the satn. value are discussed. The results indicate that up to about 0.0005 of the satn. value the SO_2 is held on the charcoal by intense but short-range forces (20,000 cal.). The SO_2 adsorbed at 0.0006-0.0008 of the satn. value is held by forces of decreasing intensity (min 6000 cal.). These SO_2 mols. have greater mobility. They can be regarded as gas mols. having 2-dimensional motion. The transition from adsorbed gas to condensed liquid film occurs when the adsorbed SO_2 amounts to about $1/30,000$ the satn. value. Above this transition range the heat of adsorption has increased to about 11,000 cal., and the mobility of the adsorbed mols. has decreased.

R. L. DODGE

The adsorption of ferric chloride by crystallized barium sulfate. M. L. DE BROUCKÈRE. *Bull. sci. acad. roy. Belg.* **13**, 827-36(1928).—B. makes a systematic study of the adsorption of FeCl_3 (I), by crystd. BaSO_4 (II), to det. whether it is due chiefly to ions, complexes or micelles. The adsorption was studied in neutral solns. and in solns. contg. 1 to 0.001 *N* HCl . The concn. of I was varied from 1 to 0.001 *N*. II was fused with Na_2CO_3 and the Cl detd. nephelometrically and the Fe colorimetrically. The results obtained indicate that in neutral soln. the Fe is adsorbed to a much greater degree than the Cl. As the acid concn. increases the ratio of Cl adsorbed increases until it is greater than the Fe. It is suggested that, all things being equal, the Fe is adsorbed 10 to 200 times more than the univalent and bivalent cations. This is not due so much to the tervalence of the Fe as it is to the existence in soln. of micelles and complexes more strongly adsorbed than the simple ions. The micelles rich in Fe decrease somewhat when HCl is added and the soln. contains more and more of the micelles rich in Cl.

D. H. POWERS

Determination of the size of particles in sols. H. J. C. TENDRLOO. *Chem. Weekblad* **25**, 158-61(1928); cf. *C. A.* **21**, 3513.—A review, 22 references.

B. J. C. VAN DER HOEVEN

The adsorption of hydrogen ions and its effect on the swelling and electrical charge of gelatin. B. N. GHOSH. *J. Chem. Soc.* **1928**, 711-9.—The relation between swelling, elec. charge and adsorption of H ion was studied with gelatin. The electroendosmotic method was used to measure variation of elec. charge with H-ion concn. Swelling attains a max. at p_H 2.6, decreasing at higher H-ion concns. while the elec. charge con-

tinues to increase, thus showing the independence of these 2 properties. H_2SO_4 shows less swelling and lower elec. charge than HCl , HNO_3 or $\text{CCl}_3\text{CO}_2\text{H}$. The Langmuir adsorption equation holds fairly well for the amt. of H_2 taken up by gelatin. The relation between amt. of H_2 taken up and elec. charge is definitely estd. R. H. LAMBERT

Colloidal platinum. III. Its natural acidity and its coagulation by acids. S. W. PENNYCUICK AND R. J. BEST. *J. Chem. Soc.* 1928, 551-60.—The acidity of colloidal Pt solns. was detd. both in the presence of other acids and alone. The acids used were HCl , HNO_3 , tartaric and citric. During coagulation, which occurs in a very limited range of p_{H} , no acid is removed from the soln. Quinhydrone electrodes were used for p_{H} detn. The free strong acid in soln. is probably platinic acid. Aging and boiling increase acidity markedly. R. H. LAMBERT

The colloidal state and cohesion at the time of solidification. JACQUES ÉRÉRA. *Trans. Faraday Soc.* 24, 162-4(1928).—The fact that the dielec. const. of certain media, having permanent dipoles near the point of fusion, varies greatly, is attributed to a colloidal state through which the substance is supposed to pass during solidification. The dielec. const. of acetic increases sharply to fall quickly again as the acid solidifies. Substances such as C_6H_6 , C_6H_{12} , CCl_4 , TiCl_4 and SnCl_4 do not show this property, since they do not possess truly permanent elec. moments. Associated mols. have permanent dipoles and it is in these materials that the colloidal phase is believed to exist. R. H. L.

Emulsions. Silicic acid gels. H. N. HOLMES. *Bull. soc. chim.* 43, 261-88(1928).—H. gives a general survey and discussion of the researches in these two fields. L. B. M.

Note on the influence of hydrolyzed gelatin on the precipitation of silver chromate. T. R. BOLAM AND B. N. DESAI. *Trans. Faraday Soc.* 24, 50-2(1928).—Hydrolyzed gel produces greater dispersion of Ag_2CrO_4 than unhydrolyzed. The inhibition period appears to pass through a max. with time of boiling. The protective action is not identical with the inhibition action. The former prevents aggregation of small particles to larger masses while the latter opposes formation of nuclei on growth centers. R. H. LAMBERT

Solvation of the disperse phase in jellies. H. GAUNT AND F. L. USHER. *Trans. Faraday Soc.* 24, 32-6(1928).—A study of gels was made to obtain information as to the mechanical structure of gels of substances usually regarded as lyophobic. The liquid obtained on syneresis of gels of SiO_2 , $\text{Fe}(\text{OH})_3$ and $\text{Al}(\text{OH})_3$ was analyzed, a reference substance having been introduced before gelation. The best reference substances found were H_2SO_4 and HNO_3 ; oxalic and arsenious acids as well as chloride and iodide also were tried. The ratio of water to material was for SiO_2 , 1.04; pptd. silicic acid, 1.5; $\text{Fe}(\text{OH})_3$ pptd., 3.0 and $\text{Al}(\text{OH})_3$ pptd., 6.1. The unity value for SiO_2 gel supports the chem.-chain hypothesis. A change of oxide to sulfide, however, breaks down the gel; so this fact together with the large ratios for the ferric and Al hydroxides favors a solvation theory. R. H. LAMBERT

The influence of electrolytes on the swelling of agar. B. K. CLARKE. *Carnegie Inst. Washington Yearbook* 25, 170-3(1925-6); *Expt. Sta. Record* 57, 817.—In an attempt to correlate some of the known phys. or chem. properties of the alkali metals or of solns. of their salts with their effect on the swelling of agar, auxographic results showing irregularities are noted. The Hofmeister or lyotropic series is not a const. thing like the atomic-number series, but depends upon concn. A careful study was made of the H-ion concn. changes in the KCl series, and the results are tabulated with suggestions. H. G.

The significance of the symbol p_{H} and the measurement of the hydrogen-ion concentration in solutions. GIUSEPPE ANTONIO BRAVO. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 6, 10-31, 33-49, 61-8(1928).—A review of the theory of the electrolytic disson. and the electrochem. and colorimetric methods used for the p_{H} detn. GUENTHER SCHWOCH

Concentrated solutions. V. Experimental determination of the thermodynamic activity of the components of binary mixtures of organic compounds. MLLÉ. M. ROLAND. *Bull. soc. chim. Belg* 37, 117-40(1928).—R. measures the total vapor pressure of several binary mixts. by means of the Kohnstamm method: a known quantity of the mixt. is sealed in an ampoule free of air, and the ampoule is put in the vacuum chamber of a manometer, where it is allowed to burst; the vapor pressure is read directly. The following mixts. have been investigated: acetone-diisomyl; acetone-sec.-butylcyclohexane; sec.-BuOH- PhNO_2 ; sec.-BuOH- PhNH_2 ; sec.-BuCl- PhNO_2 ; sec.-BuOH-EtBr; sec.-BuOH-isopentane, sec.-BuOH- CS_2 . The thermodynamic activity of the constituents has been calcd. from the vapor tensions by means of G. N. Lewis' theory. A. L. HENNE

Reaction rate and law of mass action in chemical teaching. ERNST HILS. Z.

physik. chem. Unterricht 39, 62-7(1926).—To demonstrate that $V = K \cdot C_A^{q_1} \cdot C_B^{q_2} \dots$ in $q_1A + q_2B + \dots = p_1C + p_2D + \dots$ H. uses (1) Reduction of AgNO_3 by FeSO_4 : $\text{Ag}^+ + \text{Fe}^{++} = \text{Ag} + \text{Fe}^{+++}$; (2) sepn. of I_2 from HIO_3 by H_2SO_3 , $5\text{HSO}_3^- + 2\text{IO}_3^- = 3\text{HSO}_4^- + 2\text{SO}_4^{--} + \text{I}_2 + \text{H}_2\text{O}$. That $K = C_A^{q_1} \cdot C_B^{q_2} \dots / C_C^{p_1} \cdot C_D^{p_2} \dots$ in the same general reaction H. uses (1) Reaction of AgNO_3 by FeSO_4 , $\text{Ag}^+ + \text{Fe}^{++} \rightleftharpoons \text{Ag} + \text{Fe}^{+++}$; (2) $\text{Na}_2\text{CO}_3 + \text{H}_2\text{S} \rightleftharpoons \text{H}_2\text{O} + \text{Na}_2\text{S} + \text{CO}_2$; (3) $2\text{AsCl}_3 + 3\text{H}_2\text{O} \rightleftharpoons 6\text{HCl} + \text{As}_2\text{O}_3$. M. BEBER

Differential equations of a reacting mixture. R. D. KLEEMAN. *Phil. Mag.* [7], 5, 620-9(1928).—K. deduces a number of differential equations which give the final state of equil. of a reacting mixt. and claims that the various results obtained fall into line with the general result obtained (C. A. 22, 1888) that the const. of mass action is in general a function of temp., vol. and the masses of the constituents, but that in special cases it may be a function of the temp. only. The fundamental nature of the mass const. is in all cases detd. by equations of the type given. GEORGE GLOCKLER

The decomposition of *p*-phenetylcarbamide (dulcin) on heating in aqueous solution. KURT TAUFEL, CARL WAGNER AND HEINRICH DÜNWALD. *Z. Elektrochem.* 34, 115-27(1928).—Aq. solns. of *p*-phenetylcarbamide (I) when heated to 100° decompose, as primary reactions, into: (1) *p*-phenetidine (II) and cyanic acid (III) and (2) *p*-phenetilisocyanate (IV) and NH_3 . The velocity const. for the sum of these reactions is about 0.0040 (time in min.). The course of the secondary reactions is largely dependent on the H-ion concn. On heating, the final decompn. products of strong acid (HCl) solns. are II, NH_3 and CO_2 , the III and IV formed being completely hydrolyzed; of alk. solns., they are II, NH_3 , CO_2 and cyanate, the first primary action being more rapid. In AcOH soln. the II and IV formed react to produce di-I, its amt. depending largely on the II concn. In strong acids and bases the di-I formed is negligible. A retardation of the decompn. of I occurs in ammoniacal soln., due to NH_3 (autocatalysis) and slightly in AcOH and alk. solns. At room temps., the dissocn. const. of III is detd. colorimetrically as 2.2×10^{-4} . The hydrolysis const. of I is detd., at 100° , from elec. cond. measurements on II-AcOH solns. as 6×10^{-5} , and from this the basic dissocn. const. of II as approx. 8×10^{-9} . The velocity const. of the hydrolysis of the cyanate ion in alk. soln., at 100° , is found to be 0.0028 (time in min.). On boiling a normal urea soln., contg. I or II, with HCl a positive indophenol reaction is obtained, but as II or its derivs. may be present, it is not suitable as a test for *p*-aminophenol in urea. In using I to sweeten foods its decompn. on heating should be considered. J. B.

Decomposition of diacetone alcohol by sodium hydroxide in water mixtures of organic solvents. GÖSTA ÅKERLÖF. *J. Am. Chem. Soc.* 50, 1272-5(1928); cf. C. A. 21, 688; 22, 901, 1888.—A preliminary study has been made of the decompn. velocity of diacetone alc. at 25° with 0.1 N NaOH as a catalyst in non-aq. solns. Mixts. of glycerol, ethylene glycol, MeOH, EtOH, PrOH and iso-PrOH with varying amounts of H_2O were used as solvents. In pure polyhydric alcohols the velocity decreased with an increase in the no. of hydroxyl groups; in primary alcs. the velocity increased with increase in the mol. wt. of the alc. used; and in isomeric alcs. the velocity was greatest when the alc. contained the most compact alkyl group. A. J. KING

Reaction of sulfur with aluminum and magnesium. H. DANNIEL AND K. W. FRÖHLICH. *Z. angew. Chem.* 40, 809(1927).—The reactions of S with Al and Mg are commonly considered sluggish. Attention is called to their explosive nature if started with a mixt. of KClO_3 and S. H. F. KRIEGE

Displacement of metals or their oxides from solution by hydrogen under pressure. V. IPAT'EV. *Ber.* 61B, 624-30(1928).—Complicating side reactions occur in the reaction of H_2 under pressure with solns. of Pb nitrate and acetate. A series of basic salts is obtained from Pb nitrate by changing pressures and temp.; 3 cryst. modifications of Pb oxide were obtained, a blood-red, a yellow and a white. The sepn. of metallic Pb begins at 80 atm. pressure at 275° and is complete at $325-330^\circ$. M. F.

The reaction of arsenites with permanganate in acid solutions. TADEUSZ ORYNG. *Roczniki Chem.* 7, 334-44(1927); cf. C. A. 16, 2439; 19, 1998; 20, 2442; 21, 3574.—The oxidation of arsenite by KMnO_4 in H_2SO_4 soln. takes place in 3 stages: $2\text{MnO}_4^- + 6\text{OH}^- + 3\text{AsO}_3^- \rightarrow 2\text{MnO}_4^{--} + 3\text{H}_2\text{O} + 3\text{AsO}_4^-$ (I); $2\text{MnO}_4^{--} + 14\text{H}^+ + \text{AsO}_3^- \rightarrow 2\text{Mn}^{+++} + 7\text{H}_2\text{O} + \text{AsO}_4^-$ (II); $2\text{Mn}^{+++} + \text{H}_2\text{O} + \text{AsO}_3^- \rightarrow 2\text{Mn}^{++} + 2\text{H}^+ + \text{AsO}_4^-$ (III). The velocity v of I is immeasurably high, that of II very high; III alone permits kinetic measurements. The KMnO_4 consumption decreases with the speed of addn. The titration was always completed in 3-5 min. An increase in the acid concn. causes first a decrease, above 2 N an increase, in KMnO_4 consumption. Apparently H_2SO_4 hastens III and inhibits II. It was found exptly.

that Mn^{+++} is light green and Mn^{++++} raspberry red. The effect of As concn. on v is practically zero even if the ratio As:Mn is not strictly const.; v is practically independent of the temp. between 5° and 28°, but at 92–6° the entire Mn is reduced to Mn^{++} . The complete reduction is indicated by the lower $KMnO_4$ consumption and confirmed by a control expt. One drop of $KMnO_4$ in excess is sufficient. In order to obtain const. results the attempt was made either sufficiently to hasten III or to arrest the reaction at II. When sufficient $KMnO_4$ for a reduction to Mn^{++} is present the soln. is colored light green by Mn^{+++} . In the absence of excess $KMnO_4$ III takes place. It is not influenced by Ni, Cu, Cr, Fe, Th, SO_4 or Cl ions, it is hastened by relatively large Mn^{++} and by minute quantities of Br^- and especially I^- , and delayed by PO_4^{---} . In the presence of 0.0001 M KI III, which normally takes 15 hrs., is completed in 15 min. Although $MnSO_4$ increases v it also increases the $KMnO_4$ consumption in proportion to its concn. The soln. darkens and a ppt. seps. toward the end. Apparently Mn^{++} inhibits III by causing the formation of scarcely sol. manganomanganites. The $KMnO_4$ consumption, however, shows that the reduction goes beyond Mn^{+++} . It is evident at the same time that II is autocatalyzed by Mn^{+++} rather than by Mn^{++} . Na_2HPO_4 suppresses III practically completely. The excess consumption of $KMnO_4$ points to the formation of Mn^{++++} . The effect of Na_2HPO_4 is attributed to complex formation. The green solns. of Mn^{+++} turn brown (Ostwald's scale nc) on the addn. of Na_2HPO_4 , without forming a ppt. MnO_4^- and Mn^{++++} also seem to be intercepted by phosphates since the latter slow up their reduction. The ppt. formed during the titration consists of $Mn(OH)_4$ or $MnO(OH)_2$. It always contains Mn^{++} . It is concluded from the findings that insol. Mn^{++++} compds. form only by a secondary reaction which has a very low v and that the main reaction is: $2 Mn^{++} + 4 H_2O = Mn^{++} + Mn(OH)_4 + 4 H^+$ (IV). The high H^+ concn. necessarily delays IV, while the insol. of $Mn(OH)_4$ continuously shifts the reaction to the right. The hastening effect of $MnSO_4$ on III is probably caused by its hastening IV, which in its turn speeds up II very considerably. M. J.

Catalytic activity of hydrochloric acid and of potassium and of sodium hydroxide in aqueous solution. ETHEL M. TERRY. *J. Am. Chem. Soc.* 50, 1239–1250 (1928).—Use being made of the thermodynamic activity coeffs. of the various substances, the catalytic influence at various molalities has been formulated for aq. HCl, KOH and NaOH. These expressions correctly describe the observed catalytic effects even in the presence of neutral salts as NaCl and KCl, in the acid and alk. hydrolysis of esters and in the decompn. of diacetone alc. in the presence of KOH. M. FENSKE

The catalytic action of platinum and the chemical law of mass action. BERNHARD BATSCHA. *Z. physik. chem. Unterricht* 40, 258–61 (1927).—The difficulty in teaching mass action lies primarily in the insufficient mathematical prepn. of the student. But much can be accomplished by clear statement of the fundamentals and by proper expts. The catalytic action of Pt is made use of in a no. of described expts. M. BEBER

The dislocation theory of catalysis. J. BÖESKEN. *Chem. Weekblad* 25, 135–40 (1928).—A review of Böesken's theory of catalysis by "dislocation." By quasi-elastic collisions with the catalyzer mols. slowly reacting mols. are distorted (dislocated) electrically and thus activated. The process of activation takes place in the very short time (order of 10^{-12} sec.) of actual collision; no compd. with the catalyzer is formed (physical catalysis). True chem. catalysis, a second type of catalysis, includes the formation of definite intermediate compds. As shown from examples (e. g. acetaldehyde polymerization) the dislocation has a highly specific character depending on the nature of the catalyzer. Due to the fact that most catalyzers have a polar character B. assumes for the mechanism of dislocation an inductive action of the dipole on the catalyzed mols. For bimol. catalyzed reactions both mols. have to be dislocated. In physical chem. terms the catalyzer brings about changes in energy and in entropy of the intermediary activated state (Arrhenius) of the reacting mols., thus changing the value of the reaction const. K from $\ln K = -(\epsilon_i - \epsilon_p)/RT + (\eta_i - \eta_p)/R + C$ in which i and p refer to activated and normal state, ϵ is energy, η entropy (Scheffer and Kohnstamm equation). For physical catalysis the change in $(\epsilon_i - \epsilon_p)$ (A of Arrhenius) is probably small; it is the change in $(\eta_i - \eta_p)$ (B of Arrhenius) which causes K to increase (more favorable spatial conditions due to polarized state). For chem. catalysis the $\epsilon_i - \epsilon_p$ change will on account of compd. formation be noticeable (increase probably), but counterbalanced by a larger $\eta_i - \eta_p$ change (increase) so as to give a larger K . Exptl. evidence for these considerations was found by van Thiel (*Akad. Wetenschappen* 31, 235 (1922)): the temp. coeff. of the chemically catalyzed reaction was larger than that of the non-catalyzed reaction. B. J. C. VAN DER HOEVEN

Catalytic decomposition and oxidation of formic acid. ERICH MÜLLER and KJRT SCHWABE. *Z. Elektrochem.* 34, 170–185 (1928).—The rate of catalytic decompn. of

aq. solns. of HCOOH into H and CO_2 in the absence of air was measured by a static method. The catalysts employed were finely divided Pd , Pt , Rh , Ir , Ru and Os . Pd , supported on BaSO_4 , was the most active. Pt and Rh were much less active. The other metals were entirely inert. The rate of oxidation of aq. solns. of HCOOH in the presence of air was measured with the same metals as catalysts. Pd , Pt and Rh were all strongly catalytic for this reaction. The other metals were inert. Both the decompn. and oxidation rates were approx. unimol. The potential of the active catalysts was measured during reaction. The Pd , Pt and Rh showed a potential that indicated a ratio of $p_{\text{H}}/P > 1$. This fact supports Wieland's theory that catalytic oxidation of HCOOH in aq. soln. by gaseous O depends on an activation of H , not on an activation of O . R. L. DODGE

The interaction of chlorine and sulfur monochloride. Preparation of sulfur dichloride; use of antimony pentachloride as catalyst. RICHARD PARKINSON BOTHAMLEY. *Trans. Faraday Soc.* **24**, 47-50 (1928).— SbCl_5 accelerates the reaction between S_2Cl_2 and Cl_2 , the rate of the reaction having been measured. A period of induction due to the physically dissolved Cl_2 first appears. The rate increases with decreased temp. and the reaction is found to be photochem. A description of the app. follows. R. H. L.

Equilibria between molten metals and molten salts. VII. Tin, lead, stannous bromide and lead bromide. R. LORENZ AND G. SCHULTZ. *Z. anorg. allgem. Chem.* **170**, 247-56 (1928).—The equil. concns. of the system $\text{Sn} + \text{PbBr}_2 \rightleftharpoons \text{SnBr}_2 + \text{Pb}$ are detd. at 400° and 600° over the whole range of compn. Two solid phases are always present. The system does not follow the simple mass-action law. The Lorenz equation of mass action in condensed systems (*C. A.* **18**, 3518, **19**, 3412) gives a very good agreement with the values of $K = 2.79$ at 400° and 0.192 at 600° . When Bi is added to the system at 400° , it does not participate in the reaction, and is found quant. in the metal phase. It affects, however, the equil., decreasing the concn. of Sn . When the mol. concn. reaches $\text{Sn}:\text{PbBr}_2:\text{Bi} = 1:1:1$, further addn. of Bi are practically without effect. When the whole diagram is redetd. in the presence of an excess of Bi , the simple mass action law is followed much more closely, although the const. C increases regularly from 0.259 to 0.473 . The addn. of LiBr to the system does not affect the equil. G. CALINGAERT

Researches on the system: $\text{Pb}(\text{NO}_3)_2\text{-NH}_4\text{NO}_3\text{-H}_2\text{O}$. G. MALQUORI. *Atti II congresso nat. chim. pura applicata* **1926**, 1135-40.—The system was studied at 0° , 10° and 20° . The results, which are tabulated in detail and shown as a triangular diagram, show a single triple point for each temp., corresponding to satd. solns. of the 2 salts. Therefore no solids exist, other than $\text{Pb}(\text{NO}_3)_2$ and NH_4NO_3 . The quantities of $\text{Pb}(\text{NO}_3)_2$ in soln. vary only slightly even with relatively large quantities of NH_4NO_3 , but the quantity of NH_4NO_3 in soln. varies greatly with the proportion of $\text{Pb}(\text{NO}_3)_2$ present. The increment in the soly. of $\text{Pb}(\text{NO}_3)_2$ caused by increasing proportions of NH_4NO_3 diminishes with increase of temp., as with KNO_3 and NaNO_3 (cf. Glasstone and Sanders, *C. A.* **17**, 3844). Measurements of the d , viscosities and n values of satd. NH_4NO_3 and $\text{Pb}(\text{NO}_3)_2$ solns. at 20° are tabulated, and in conjunction with ultra-violet absorption spectra are to be used in an attempt to explain the anomalous soly. phenomena. C. C. DAVIS

Investigation of the alloy system aluminum tin zinc. HIDETO NISHIMURA AND OSUKE SUZUKI. *Suiyô Kwarshi* [10], **4**, 1441-53 (1925); *J. Inst. Metals* **38**, 412. [In Japanese].—The constitutional diagram of this system is explained both theoretically and practically, and the const. point was discovered as $I + \beta \rightarrow \alpha + \gamma$. The ternary eutectic point of $I \rightarrow \alpha + \gamma + \delta$ coincided at the eutectic point of the binary alloys of Sn and Zn . H. G.

The systems: Hydrogen chloride-ethyl ether and hydrogen chloride-acetone. D. MCINTOSH. *Bull. Chem. Soc. Japan* **3**, 82-6 (1928).—The systems: $\text{Et}_2\text{O-HCl}$ and $\text{Me}_2\text{CO-HCl}$ were investigated by means of the f. p. method. The following compds. were detected: $\text{C}_4\text{H}_{10}\text{O-HCl}$, $\text{C}_4\text{H}_{10}\text{O-2HCl}$, $\text{C}_4\text{H}_{10}\text{O-5HCl}$, $\text{C}_3\text{H}_7\text{O-HCl}$ and $2\text{C}_2\text{H}_5\text{O-5HCl}$. A mixt. of acetone and more than 60% mols. HCl forms a glass on cooling. A. L. HENNE

Conduction of electricity in quartz. A. D. GOLDHAMMER. *Z. Physik* **47**, 671-90 (1928).—The current passing through quartz after the removal of the potential studied by means of the quadrant electrometer falls very rapidly in the interval 0.01 to 10 sec., and does not uniformly follow the law $i = \beta t^{-n}$. Conclusion: The decay is conditioned by the formation of an opposing potential which does not depend on space charges in the crystal. A complicated effect of previous passage of a current on the cond. is described. W. WEST

Quinhydrone electrode in amyl alcohol solutions. HARRY SELTZ AND D. S. MCKIN-

REV. Ind. Eng. Chem. **20**, 542-4 (1928).—To det. the neutralization numbers of petroleum products (especially those used in turbines, transformers and oil-circuit breakers) an electrometric titration was devised. A quinhydrone half-cell is made from a 5-8 in. test tube (with a perforated bottom) contg. (a) an agar-agar bridge with dissolved LiCl and (b) an Am alc. soln. of quinhydrone into which a Pt electrode dips. This half-cell passes through a rubber stopper into a soln. to be tested, held in a wide-mouth 400-cc. bottle. Other perforations in the stopper carry a second Pt electrode, an inlet tube for passing N_2 through the oil soln., a buret tip, and a N_2 outlet tube. Ten cc. of an oil sample dissolved in 125 cc. of Am alc. are placed in the bottle and titrated with 0.1 N or 0.05 N KOH in amyl alc., with N_2 serving as a stirring agent and preventing oxidation. The potentiometer is read as usual. For comparison titrations of the Am alc. itself and of benzoic and stearic acids in Am alc. soln. are made. The app. and procedure are simple and the results accurate to within 1% when the titration amounts to 1.0 cc. or more. Illustrative data and computations are given. W. C. EBAUGH

The action of acids on metals under high pressure. G. TAMMANN and K. BOCHOW. *Z. anorg. allgem. Chem.* **169**, 33-41 (1928).—In order to det. the mechanism accompanying the decrease in the rate of soln. of metals in acid with increased pressure of H, T. and B. have devised an app. whereby the potential (P) of the metal against Hg and the resistance (R) of the soln. can be measured at 30° during the evolution of H. Measurements on Al(I), Zn(II), Fe(III) in 1 M H_2SO_4 ; Al(IV), Fe(V), Cd(VI) in 1 M HCl and Mg in 0.1 M H_2SO_4 show that for (II), (IV) and (V) the pressure rises rapidly with time, reaching max. values (II) 300 kg./ cm^2 , 5 hrs.; (V) 100 kg./ cm^2 , 5 hrs.; (I) 400 kg./ cm^2 , 10 hrs.; (IV) 240 kg./ cm^2 , 18 hrs.; (III) and (VI) require 3 days to reach max. of 300 and > 150 kg./ cm^2 , resp. As the evolution of H proceeds, the potential of Zn against Hg drops from 1.38 to 0.35 v.; R increases only 3 times, indicating that the cessation of evolution of H is not due to the formation of a protective film of H around the Zn, but at the soln. of H in the Zn, thereby "ennobling" the P of Zn, making it much less than the P of Hg against the H electrode (0.78 v. at 400 kg./ cc). Similar results obtain for Al, Fe and Cd. With Mg R increases from 30 to 400-600 Ω , indicating the formation of a protective film of basic salt ($30\text{MgO} \cdot \text{SO}_3$). The changes of P with pressure ($\Delta e / \Delta p \cdot 10^4$) for Zn, Al and Cd are of the same order of magnitude as for H/Pt electrode (0.2-0.4). For the other metals P varies irregularly with pressure. Upon removing the H pressure the metals recover their normal P almost immediately. This passivity of the metals is probably due to the accumulation of negative H ion causing the formation of hydrides like LiH on the surface. E. R. SCHIERZ

Supplement to "electrolytic decomposition of glass." P. SELÉNYI. *Ann. Physik* **85**, 643-4 (1928); cf. *C. A.* **22**, 670. —An a. c. discharge was maintained between Cu plates in an evacuated glass bulb immersed in a KNO_3 bath. The circuit furnishing current for the decompn. of the bulb included a Cu coulometer, one of the plates and the bath. O_2 is liberated quant., being detd. by weighing the oxide-coated plates, reducing with H_2 and reweighing. J. E. SNYDER

Electrical resistance of pure metals in the molten state. YOSIJI MATSUYAMA. *Kinzoku no Kenku* [4], **3**, 254-61 (1926). [In Japanese.] *J. Inst. Metals* **37**, 426-7. —The method of measurement is that constantly used in the Tôhoku Imperial University lab. (*Sci. Rep. Tôhoku Imp. Univ.* **13**, 75 (1924)), and the metals investigated were Hg, Sn, Sb, Cd, Pb, Zn, Bi, Al and Ag. Curves (reproduced in the abstract, *Trans. Am. Soc. Steel Treat.* **10**, 319 (1926)) show the relation between the sp. resistance of molten metals and the temp.; the sp. resistance of these metals increases more or less with the rise of temp., except in the case of Zn, in which a slight decrease is observable. The sp. resistances $\times 10^6$ of the molten metals at their m. ps. are: Hg 93.1, Sn 48.1, Bi 126.7, Cd 32.2, Pb 95.8, Zn 37.0, Sb 115.0, Al 25.5, Ag 17.3. H. G.

The origin of magnetism and atomic structure. KOTARÔ HONDA. *Z. Physik* **47**, 691-701 (1928). —A classical theory of magnetism is developed from the fundamental consideration that paramagnetic properties originate in the nuclear electrons. The tendency to orient in the magnetic field is opposed by the nuclear angular momentum which is very great in diamagnetic substances; in ferro-magnetic substances the resultant angular momentum is nearly zero, while in paramagnetic substances the momentum has a finite value. In the assumption that a magnetic molecule has a rotational energy of rT it is shown that the Langevin expression for the effect of temp. is obtained. The application of the theory to allotropic changes and to melting is considered. W. WEST

The magnetic susceptibility of aluminum. C. CHENEVEAU. *Compt. rend* **186**, 1102-4 (1928). —Two specimens of extra pure Al, tested by the magnetic balance method, gave $\chi = 0.58 \times 10^{-6}$ as the mean value of the mass susceptibility at 18° . The speci-

mens contained 0.06% Fe. Similar tests on 3 samples of Al used for elec. conductors gave a mean value $\chi = 0.59 \times 10^{-6}$. These samples contained 0.5% Fe. Results previously published by several observers are considered and C. suggests that the discrepancies between these results and his own may be due to superficial contamination with Fe from the tool used in shaping the specimen. Such contamination would not be detected by ordinary analytical methods and C. took special precautions to avoid it. There seems to be no simple law connecting the magnetic properties with the trace of Fe alloyed with the Al. C. concludes that absolutely Fe-free Al would probably have approx. the same susceptibility as his *extra pure* Al. W. W. STIFLER

A simple mode of procedure for an indirect determination of molecular heat of vaporization. J. NARBUTT. *Z. physik. chem. Unterricht* 39, 151-4 (1926).—The app. and method are described for the detn. of mol. heat of vaporization at atm. pressure in which the equation $d \ln p/dT = \lambda/RT^2$ is used. M. BEBER

Heat of fusion and vibration number. W. HERR. *Z. anorg. allgem. Chem.* 170, 237-40 (1928).—The ratios of the heats of fusion per g. to the vibration numbers for metals and metal-like elements are grouped around an av. value. Hg, Al and Be are out-standing exceptions to this rule. Typical metalloids do not follow the rule at all. This applies also to metallic compds., in which case the at. wts and values are replaced by the mol. wts. divided by the nb. of ions. The salts of Ca and the alkali metals do not follow the rule. G. CALINGAERT

The specific heats of amorphous carbon and semi-coke. ERNST TERRES AND HEINZ BIEDERBECK. *Gas u. Wasserfach* 71, 265-8, 297-303, 320-5, 338-45 (1928).—Pure carbon was prepd. at temps. under 600° by (1) reaction of Na on solid BaCO₃ at 550°; (2) reaction of Cl₂ with turpentine under 600°; (3) by thermal decompn. of CH₄ (porcelain fragments used as catalyzer) under 600°. Specific heats were detd. by the method of Terres and Schaller (*C. A.* 17, 1883) with a few changes. Graphs are shown for the changes of sp. heats of each of the carbons with temp. The turpentine and BaCO₃ carbons reach a nearly const. sp. heat of about 0.38 at 500° and show only slight increases up to the graphite value (1150°). The CH₄ carbon reaches a similar value at 700° and continues with only slight changes up to the graphite value. Four German coals were coked at 400-900° and their sp. heats detd. by the above method. The sp. heats of these cokes are higher than for high temp. cokes from the same coals. The calcd. sp. heat of pure coke for all of these cokes was 0.3825 ± 0.0025 between 500° and 900°. Under 500° the sp. heats differ widely. R. W. RYAN

A thermochemical contribution to the study of the system cadmium-mercury. T. W. RICHARDS, H. L. FREVERT AND C. E. TEETER, JR. *J. Am. Chem. Soc.* 50, 1293-1302 (1928).—The large amt. of heat absorbed during the soln. of Cd amalgams in Hg has been detd. to be somewhat larger than the latent heat of melting of Cd and Hg. It is dependent on the wt. and compn. of the solid. Its magnitude is one of the best means of locating the exact solidus pt., since it indicates whether or not the amalgam is fully solid or contains included liquid Hg. The solidus pt. is defined as the pt. at which liquid first appears when the solid is completely homogeneous. An amalgam that is completely homogeneous must contain drops of liquid amalgam, after it is melted and again cooled to that pt., on account of the increased concn. of Cd within the crystals, which in turn causes a smaller thermochemical effect upon soln. in Hg. The results obtained agree with those of Bijl and of Smith between 20° and 30°. • A detailed description of their app. and technic is included. J. H. PERRY

The mean specific heats of diatomic gases nitrogen, carbon monoxide, oxygen, hydrogen of carbon dioxide and of water-vapor between 0° and 3000° abs. FRITZ SCHMIDT AND HERMANN SCHNELL. *Z. tech. Physik* 9, 81-92 (1928).—A crit. review is given of data on mean sp. heats from the literature. Partly by recalcn. and graphical interpolation a table is given for the mean C_p between 0° and 3000° abs. of CO, O₂, N₂ (4.81 up to 6.10), of H₂ (4.70 to 5.90), of H₂O vapor (5.96 to 9.61) and of CO₂ (5.96 to 10.98). Data from 36 literature sources were employed. B. J. C. VAN DER HORVEN

Heats of transformation and fusion in carbon steels, cast iron, and some other metals. SABURŌ UMINO. *Kinzoku no Kenku* [8], 3, 385-93 (1926); *J. Inst. Metals* 37, 432; cf. *C. A.* 22, 1750.—By means of the method of mixts. U. measured the heat of transformation and that of fusion for carbon steels, cast Fe, Mn and Ti. Mn-heat of transformation 835°, 2.88 g.-cal.; 1044°, 4.53 g.-cal.; latent heat of fusion, 64.80 g.-cal. Ti—heat of transformation and of fusion, 232°, 0.60 g.-cal.; 303° (m. p.), 3.67 g.-cal. H. G.

The heat of fusion and that of the new transformation in tellurium. SABURŌ UMINO. *Kinzoku no Kenkyu* [10], 3, 498-501; *J. Inst. Metals* 38, 381-2; cf. *C. A.* 22, 1750. [In Japanese.]—By the calorimetric method, U. measured the heat con-

tent and the sp. heat of Te at different high temps. beyond its m. p. up to 550°. He thus found a new transformation at 348°, with a heat of transformation of 0.63 cal. The latent heat of fusion at 446° was 33.50 cal. H. G.

Relativistic rule for equipartition of energy. F. F. P. BISACRE. *Phil. Mag.* [7], 5, 639-40(1928).—Statistical-mechanical argument that the mean energy $\epsilon \rightarrow RT$ as $T \rightarrow \infty$. Cf. *C. A.* 22, 532.

Absolute zero of externally controllable entropy and internal energy of a substance and a mixture. R. D. KLEEMAN. *Phil. Mag.* [7], 5, 668(1928); cf. *C. A.* 21, 2416.—Negative sp. heat is an impossible concept. GEORGE GLOCKLER

Calculation of the energy and parameters of an ionic lattice of the corundum type. VALERIAN SCHMAELING. *Z. Physik* 47, 723-31(1928).—The lattice energy of corundum, calcd. on the assumption of a lattice of rigid spherical ions held together by Coulomb central forces, is 3330 kg. cal. per mol, in comparison with the value 3305 kg. cal. obtained by applying the Born cyclic process. The agreement is considered to support the assumption of an ionic lattice for Al_2O_3 . W. W.

The limit of transparency of air and of quartz for ultra-violet light. F. ZERNIKE. *Physica* 8, 81-7(1928).—From expts. with a large Hilger quartz spectrograph it was found that $\lambda\lambda$ 1990 and 1935 are not noticeably absorbed by 2.5 m. air path; $\lambda\lambda$ 1862 and 1854 were reduced 20 and 150 times, resp., in strength. Photograms are shown of shadows cast by quartz on a fluorescent screen indicating the lack of uniformity in transparency, angles of 60° between the shadow edges are evidence of the trigonal structure. The least absorption found for quartz was for λ 1990 75% transmitted by 1 cm., for λ 1862 60%. Fluorite is in many cases preferable for its higher transparency.

The molecular dispersion of light at the critical state. K. C. KAR. *Physik. Z.* 28, 710-11(1927); cf. *C. A.* 21, 1593—A correction of the calcn. given in the previous paper. B. J. C. VAN DER HOEVEN
EMIL KLARMANN

Theory of light-scattering in liquids. C. V. RAMAN AND K. S. KRISHNAN. *Phil. Mag.* [7], 5, 498-512(1928).—An examn. of the data for the depolarization of the light scattered by fluids indicates an apparent change, usually a large diminution, in the optical anisotropy of the mols. of a given substance, as it passes from the condition of vapor to that of liquid. A new theory is put forward which offers a natural explanation of the foregoing fact without any artificial hypotheses. In the treatment of the optical properties of liquids usually given, the polarization field acting on a mol. is assumed to be independent of its orientation in the field. This assumption is not justifiable when the shape of the mol. departs greatly from spherical symmetry, and consequently the distribution of polarizable matter surrounding it ceases to be symmetrical. The strength of the polarization field will in these circumstances be dependent on the orientation of the mol. in the field, and may be expressed in terms of three consts. characteristic of the mol. for the given d. and temp. of the fluid. The theory of light-scattering is developed on this basis, and gives an expression for the intensity of scattering which is in close accord with facts. It also enables the depolarization of the scattered light in the liquid to be successfully calcd. from that of the corresponding vapor, at least in those cases where the consts. of anisotropy of the polarization field can be detd. from the shape of the mol. GEORGE GLOCKLER

Polychroism and orientation of ions in crystals of the rare earths. R. BRUNETTI. *Atti accad. Lincei* [6], 7, 238-44(1928).—A study of the literature and an examn. of crystals of certain salts leads to the conclusion that the polychroism of crystd. salts of the rare earths is evidence of the orientation of an axis of the ionic structure in some definite relation to the directions of symmetry of the cryst. structure. Measurements of the absorption spectra of $Pr_2(SO_4)_3 \cdot 5H_2O$ and of $Nd(BrO_3)_3$ in different directions and at different temps. indicate that in the spectra of trivalent ions of the rare earths which make up a symmetrical crystal, there are (1) frequencies corresponding to linear vibrations in a direction approx. the same as that of the principal axis of the crystal, and (2) frequencies, in general distinct from the preceding, the vibrations of which take place in a plane approx. perpendicular to the principal axis, and which are resolvable into 2 vibrations of equal intensities normal to each other. The researches of Henri and Jean Becquerel (*Ann. chim. phys.* [6], 14, 170(1888); *Le Radium* 4, 49, 107, 328 (1907); 5, 5, 227(1908)), are discussed in their relation to the present expts. and deductions. The orientation of luminous vectors in a plane perpendicular to a predetd. direction and the work of B. are favorable to the supposition that radiations of type (2) are absorbed in a longitudinal direction for circularly polarized waves. This fact and the established existence of linearly polarized radiations justify the belief that ions within the cryst. lattice often assume a simple orientation. In monoaxial crystals the

ionic axis of orientation coincides with the direction of the crystallographic axis, while in biaxial crystals ions are present which have the same orientation with respect to the principal axis, but perhaps have other orientations. This orientation does not in all cases depend upon thermal movements of the ions within the cryst lattice. A *mol. energy of orientation* (cf. Debye, *Physik Z.* **27**, 67(1926); Cabrera, *C. A.* **21**, 3818) probably exists in the crystals and this orientation is characteristic not only of the mol. as an elementary unit but of its constituent parts, particularly its cations. This is in accord with the fact that the magnetic susceptibility of the anions is in general negligible compared with that of the cations of the paramagnetic rare earth elements (cf. Decker, *C. A.* **20**, 2112). The polychromism of rare earth salts also offers a means of explaining the complicated absorption spectra of colored ions of the rare earths. If λ is a quantic no. related to the orientation of the ion, the rectilinearly polarized radiations correspond to the increment $\Delta\lambda = 0$ and circularly polarized radiations to $\Delta\lambda = \pm 1$, the radiations $X \rightarrow (X - 1)$ and $-X \rightarrow -(X - 1)$ corresponding. In connection with detns. of variations of the spectra of the rare earth salts under various conditions, this suggests an intramol. field, symmetrical in the crystallographic sense to an axis coinciding with one of the directions of cryst. symmetry, and of elec. nature (cf. Weiss and Foex, *Le magnetisme* 166(1926)). C. C. DAVIS

Remarks on the chromosphere theory of A. Unsöld. E. A. MILNE. *Z. Physik* **47**, 745-50(1928); cf. *C. A.* **22**, 539, 1532. The pressure required in the chromosphere by Unsöld's theory is impossible, a layer 10⁴ km. thick could not be carried against gravity at the sun's surface at U's pressure. A theory is developed for the formation of the chromosphere above the reversing layer, whose central point is that ionization in the chromosphere, which is not in thermodynamical equl, is not detd. by Saha's formula, but by the balance of photoelec. ionization and replacement of atoms by the radiation pressure from below. W. WEST

Dispersion by hydrogen-like atoms in undulatory mechanics. BORIS PODALSKY. *Proc. Nat. Acad. Sci.* **14**, 253-8(1928). The Schrodinger wave equiv. for a hydrogen-like atom in the field of a plane electromagnetic wave is solved. The value of $n^2 - 1$ for zero frequency agrees exactly with that obtained for the dielec. const. by Van Vleck, Epstein and Pauling. The results for optical frequencies are not in very good agreement with Langer's detns. (*C. A.* **21**, 1219) but the great exptl. difficulties may account for the disagreement. W. WEST

Important experimental foundations of the Bohr atomic theory. J. FRANCK. *Z. physik. chem. Unterricht* **41**, 18-27(1928).—Lecture. M. BEBER

The quantum postulate and the newer development of atomistics. N. BOHR. *Naturwissenschaften* **16**, 245-57; *Nature* (supplement) **121**, 580-90(1928).—A review of modern quantum mechanics B. J. C. VAN DER HOEVEN

The limit of the periodic system. W. KOSSEL. *Naturwissenschaften* **16**, 298-9 (1928).—The end of the periodic system at the at. no. $Z = 92$ has been explained by the possibility of the K electrons falling into the nucleus *via* spiral orbits for the high nuclear charges, the limit found in this way was $Z = 137$. The same result can be found by assuming that the electronic dipole attraction ($3 M_2 r^{-4}$) becomes larger than the Coulomb repulsion ($e^2 r^{-2}$) at the short distance prevalent at high at. no., resulting in breakdown. The crit. distance is calcd. to be 3.36×10^{-11} cm. as compared with the diam. of a U K orbit of 11×10^{-11} cm. This limit will be lowered by a moment of the nucleus itself which is quite possible. It is as yet considered coincidental that at the same time the nucleus structure for the heaviest elements tends to be unstable.

B. J. C. VAN DER HOEVEN
How can atoms radiate? H. A. LORENTZ. *J. Franklin Inst.* **205**, 449-71(1928).—An excellent summary of 4 different theories of spectral emission from atoms, viz. classical, Bohr's quantum theory, dynamics of matrices, and wave mechanics, is given; the advantages and shortcomings of each are stated in plain simple words. W. F. M.

Light quanta and wave mechanics. J. C. SLATER. *Phys. Rev.* **31**, 895-9(1928).—Light quanta are treated by wave mechanics by analogy with electrons. It is shown that their wave equation is the ordinary optical wave equation. Heisenberg's principle on indeterminateness (*Z. Physik* **43**, 172(1927)) becomes a description of diffraction. In problems in which localization of quanta is found exptly., wave packets are to be set up; these are applied to the expts. of Bothe and Geiger (*Z. Physik* **32**, 639(1925)). and of Compton (*C. A.* **19**, 2779). The paths of quanta coincide with the rays of geometric optics with a deviation of the error in geometric optics; by the principle of indeterminateness, more accurate laws for the paths are neither necessary nor possible.

BERNARD LEWIS
The physical pendulum in quantum mechanics. F. U. CONDON. *Phys. Rev.* **31**, 891-4(1928).—It is pointed out that the Mathieu functions of even order are the characteristic functions of the phys. pendulum in the sense of Schrodinger's wave mechanics. The relation of various properties of the functions, as known from purely analytical investigations of them, to the pendulum problem is discussed. BERNARD LEWIS

The quantum mechanics of a system of particles. E. H. KENNARD. *Phys. Rev.* **31**, 876-90(1928).—The mechanics of a system of particles is developed on the basis of Schrodinger's wave equation without the use of matrices. It is shown that simple cases can be handled as easily by this as by the matrix method. The passage to classical theory as an approximation stands out very clearly. The measurement of velocity, energy and angular momentum as secondary phys. qualities is discussed, the usual probability amplitudes being obtained. The conservation of momentum and of energy is treated in terms of the new theory. BERNARD LEWIS

The problem of the normal hydrogen molecule in the new quantum mechanics. S. C. WANG. *Phys. Rev.* **31**, 579-86(1928).—The value of Z in the Schrodinger equation for the normal H_2 mol. is so detd. as to give a min. value to the variational integral

which generates Schrödinger's wave equation. This min. value of the integral gives the approx. energy E . For every nuclear sepn. D there is a Z which gives the best approximation and a corresponding E . An approx. energy curve is thus obtained as a function of the sepn. The min. of this curve gives the following data for the configuration corresponding to the normal H_2 mol.: Heat of dissocn. = 3.76 v., the moment of inertia $J_0 = 4.59 \times 10^{-41}$ g. sq. cm., the nuclear vibrational frequency $\nu_0 = 4900$ cm $^{-1}$.

BERNARD LEWIS

The electric moment of alkali atoms. J. J. WEIGLE *Phys. Rev.* **31**, 672-5 (1928).—The elec. moments of atoms can be calcd. if one knows van der Waals' const. a which can be obtained from the vapor-pressure equation. Thus for all the substances for which the vapor-pressure curve has been detd. it is possible to calc. the elec. moment or the elec. moment of inertia. Values of the elec. moment for Na, K and Rb as calcd. are 0.18, 0.24 and 0.24×10^{-18} , g. $^{1/2}$ cm. $^{1/2}$ sec. $^{-1}$ e, resp. These values although not very accurate are interesting, for Bohr's picture of the alkali atom, with the penetrating orbit of the valence electron precessing around the nucleus, gives no elec. moment. The values above are so small as to be negligible and are thus in accord with the theory.

BERNARD LEWIS

The energy of the helium atom and of the positive hydrogen ion in the normal state. B. N. FINKELSTEIN AND G. F. HOROWITZ *Z. Physik* **48**, 118-22(1928).—Calens. made by Wang (*C. A.* **22**, 721) on the basis of the Ritz method are extended to include the energy of the normal He atom as a limiting value of that of the H mol. In a similar way the energy of (H_2^+) is calcd. and is found to be theoretically 1.166 times that of the normal H atom.

H. F. JOHNSTONE

A statistical method for the determination of some properties of atoms. II. Application to the periodic system of the elements. E. FERMI. *Z. Physik* **48**, 73-9; *Atti accad. Lincei* [6], **7**, 342-6(1928); cf. *C. A.* **22**, 1721.—For heavy atoms the electrons surrounding the nucleus may be considered as a completely degenerated gas. On the basis of the Pauli exclusion principle statistical calens. are made for the distribution of the d. of the electron gas and from this the elec. potential in the interior of the atom is detd. From further mathematical considerations the no. of electrons, N_k , that have a given azimuthal quantum no., k , is found as a function of the at. no. Z . The values of Z at which a new electron series may occur as predicted by the theory agree well with those known from the periodic system.

H. F. JOHNSTONE

Study of a statistical theory for the transition between two excited states of an atom. KARL BOLLERT. *Z. Physik* **48**, 98-110(1928).—A type of probability closely related to complex numbers is discussed. The idea is applied to the energy relations in excited states of an atom. The theory shows that for a change from one excited state to another the energy and frequency of the resulting radiation depend on these probability conditions. Further, a definite max. deviation from these conditions detd. the width of the resulting spectral lines. The results are shown to be in accord with the Bohr frequency condition and the Heisenberg quantum condition.

H. F. J.

The energy of formation of the compound HCl-HBr. CARLOS DEL FRESNO. *Z. anorg. allgem. Chem.* **170**, 222-4(1928).—F. considers that the compd HCl-HBr must be dissocd. as either $H_2Cl^+ Br^-$ (I) or $H_2Br^+ Cl^-$ (II). (I) must have the same energy of formation as KBr, since H_2Cl^+ has the same nuclear charge and no. of electrons as K^+ ; likewise with H_2Br^+ and Rb. A comparison of the energies of KBr and RbCl leads to the conclusion that (I) (chloronium bromide) is the correct formula for the addn. compd.

G. CALINGAERT

Structure and dimensions of the benzene ring. J. K. MORSE. *Proc. Nat. Acad. Sci.* **13**, 789-93(1927).—A precise description is given of a space scale model of the benzene ring. The centers of the 6 C nuclei are located on the surface of a sphere having a radius 1.394 times the radius of the C atom (R). Twelve of the electrons assocd. with these C atoms are located on a concentric sphere whose radius is 1.155 R , and the remaining 24 possible electron positions are all on the surface of a third concentric sphere whose radius is 2.134 R . This model indicates the known properties of benzene, and, therefore, is consistent with the facts. The positions in space of the 6H atoms attached to the C atoms may well be quite different from the positions of the atoms of substituted groups attached to C atoms; and this may explain the chem. inertness of benzene compared to the activity of its derivs.

A. W. KENNEY

Isotopes. OTTO OLDENBERG. *Z. physik chem. Unterricht* **41**, 27-30(1928).—Lecture.

M. BEBER

The systematization of isotopes. GUIDO BECK. *Z. Physik* **47**, 407-16(1928).—A new way of arranging the known isotopes of at. no. up to 60 according to the no. of nuclear electrons and protons to be added to certain basic configurations is presented

by a diagram. This brings out clearly various fundamental regularities, several of which were previously recognized, and allows many predictions of isotopes not yet found. An interpretation of these regularities is sought by postulating a shell structure for the nucleus similar to that for the external electrons. The existence of an isobar then indicates the beginning of a new shell. It is suggested that the periodicity of two in no. of nuclear electrons may be connected with the known double magnetic moment of the spinning electron, and that the tendency toward an even no. of protons may be similarly interpreted. Pauli's exclusion principle may also be applicable. F. A. J.

Radioactivity and age of the earth. RENE VAN AUDEL. *Rev. gen. sci.* 39, 206-13 (1928).—This article gives a general review of the various calcns. of the age of minerals as detd. from the concn. of He and Pb formed from the disintegration of Ur and Th. The results include uraninite of South Dakota whose age was detd. by C. W. Davis to be 1665 million years. L. D. R.

Radioactivity of some springs of the Pyrenean region. J. ALOY AND JACQUES AVERSENQ. *Compt. rend.* 186, 775-7 (1928).—The content of radon and spontaneous gases of the principal springs of the 2 stations, Ax-les-Thermes and Ussat-les-Bains, and also of 2 sulfur springs in the valley of Haute-Ariège, has been detd. The waters of Ax, weak in abs. value, have considerable permanent radioactivity. The cold springs are more radioactive than the warm ones. L. D. R.

Phenomena, similar to those of radioactive substances, presented by metals. S. MARACINEANU. *Compt. rend.* 186, 746-8 (1928); cf. *C. A.* 21, 2841, 3152, 3819.—Metals of roofs exposed to the sun are radioactive. This is not due to the atm. or dust. Pb was formerly thought by M. to go back to Po, but these studies indicate that it goes to Ra D. M. has previously found pure Po develops penetrating rays after a time. L. D. R.

Coefficient of absorption in lead of γ -rays from Thorium C' and Radium C. I. BASTINGS. *Phil. Mag.* [7], 5, 785-93 (1928).—Careful measurements on the absorption of γ -rays in Pb have shown that the coeff. increases with the thickness of Pb penetrated in the case of Th C', but decreases in the case of Ra C. The difference is shown to be in general agreement with the consequences of Compton's theory of scattering. The important fact evolves that Th C' acts almost as a monochromatic source of γ -radiation. GEORGE GLOCKER

The nature of ball lightning. K. F. BOTTLINGER. *Naturwissenschaften* 16, 220 (1928).—It is suggested that ball lightning may consist of local atom disintegration (possibly of N₂) induced by the extremely high potentials of the lightning effect; the potential required for Ra α rays is 12×10^6 v. The nucleus of the ball should be radioactive for a short period. B. J. C. VAN DER HORVEN

Theory of the electrical conductivity of metals. P. LAPINSKY. *Ukrain. physikal. Abhandl.* 1, 70-4 (1926); *J. Inst. Metals* 38, 394-5. [In Russian, with German summary.]—It is shown that the formulas of W. Thomson and Borelius can be deduced from the laws of thermodynamics if it is assumed that the condition of the conducting electrons as a thermodynamic system in the metal depends on the temp., on the chem. compn., and on other phys. magnitudes. At low temps. the condition of the electrons is analogous to the vapor phase, and the relation between the abs. temp. T and the elec. cond. at low temps. may be expressed by the following equation, which is analogous to that of van der Waals: $(\sigma + a/T^2)(T - T_0) = (d.p.e.T_0)/k$, where T_0 is the original temp., d the distance between 2 atoms, p the no. of electrons passing per sec. from 1 atom to its neighbor, e the charge on the electron, and k and a are consts. H. G.

Low-voltage arcs in iodine. H. F. FRUTH. *Phys. Rev.* 31, 614-28 (1928); cf. *C. A.* 21, 3156.—Low-voltage arcs in monatomic and mol. I vapor were investigated together with their spectra. 6.5 v. is the min. radiating potential of the atoms; 8.02 and 9.5 v. are the ionization potentials of the atom and of the mol., resp. Non-oscillating abnormal arcs were maintained down to 4.9 v. and oscillations were observed around 12 v. With arc currents of about 2 amp. the filament current could be cut off and the arc sustained indefinitely at 30 v. or above. At 4.9 v. the spectrum contained only 3 lines ($\lambda\lambda$ 2062, 2535, 3135), the continuous band 3460 and several groups of bands. At slightly higher voltages arc lines appear and at 8 v. the strongest spark lines begin. These lines are succeeded by new ones at higher voltages, making it probable that the stripping of the atom is in progress. Peculiar behavior of the lines 2535 and 3135 A. U. was observed. Three continuous bands (at 4080, 4300, and 4800 A. U.) are present in mol. but not in at. I. A band system lying between 2224 and 2050 A. U. was observed and 2 groups of 4 bands each were found at 2880, 2833, 2776, 2716, A. U. and 2480, 2379, 2290 and 2243 A. U. BERNARD LEWIS

The effect of initial velocity of electrons upon the anode current of a vacuum tube.

N. KARO. *Phys. Rev.* **31**, 858-61(1928).—The initial velocity of electrons causes deviations of anode-current, anode-voltage relation of vacuum tubes as derived from the space charge equation. By eliminating other causes of deviation, K. measured the degree of deviation of the current-voltage curve from the $3/2$ power law at various filament temps., and found that the effective initial velocity of electrons varies from 0.5 v. at 2250° K. to 4 v. at 3000° K. The effective initial velocity seems to be independent of the electrode dimensions.

BERNARD LEWIS

Ionization in positive ion sheaths. P. M. MORSE AND W. UYTERHOEVEN. *Phys. Rev.* **31**, 827-32(1928).—It was found that the positive ion current to a plane auxiliary collector placed in a Ne discharge had about twice the value expected from the equations of Langmuir and Mott-Smith (*C. A.* **19**, 1531). M. and U. believe this increase must be due to an ionization within the sheath surrounding the electrode or to an emission of electrons from the surface of the electrode. Four different possible causes of the increase are analyzed and relations between the voltage drop V , total current to the collector i , and sheath thickness x are obtained. Comparison with data shows that the increase in i is probably caused by the ionization of the metastable atoms within the sheath by radiation from the discharge. The relations: $V = A (B x^{3/2} + (x^{5/2})_0)$, and $i = i_0 + I_0 x^2/2$ hold and check fairly well with the 3 exptl. curves. Considerations of at. energy states of the metastable atoms show that this ionization would be most marked in the noble gases and almost non-existent in Hg vapor, the gas investigated by Langmuir and Mott-Smith (*C. A.* **19**, 1531).

BERNARD LEWIS

Positive ray analysis of water vapor ionized by impacts of slow electrons. H. A. BAPTON AND J. H. BARTLETT, JR. *Phys. Rev.* **31**, 822-6(1928).—An electromagnetic method of sepg. gas ions of different mass, such as that used by Dempster, has been employed in a study of the ions produced by electron impact in water vapor. The principal ions appearing were $(H_2O)^+$ and $(OH)^+$. Of these the $(H_2O)^+$ ions were more abundant. Evidence was obtained that a third type of ion, probably $(H_3O)^+$, was produced in very small quantities. H^+ and H_2^+ ions were always very few in no. or unobservable. No $(OH)^-$ or any other negative ions were observed. The ionization potential corresponding to $(H_2O)^+$ was 13 ± 1.5 v., being probably in agreement with the ordinarily measured value. The $(OH)^+$ ionization potential was not distinguishably different. A study was made of variations in the relative abundance of the ions as a function of pressure. The $(H_2O)^+$ ion appears to be the primary ion, as it predominates at low pressures, but is of the same order of magnitude as the $(OH)^+$ ion at high pressures (0.007 mm.).

BERNARD LEWIS

The characteristics of triodes at saturation potentials of the grid. A. LO SURDO. *Atti accad. Lincei* [6], **7**, 279-83(1928); cf. *C. A.* **21**, 2094. —The variation of the satn. current depends upon the action of the elec. field on the filament and on the electrons in its immediate vicinity. Therefore, expts. were carried out to det. the effect of protecting the filament from strong variations of the elec. field. A triode served for this purpose, the filament and the grid being united by a pile whose c. m. f. was high enough to sat. these 2 electrodes. The filament-grid and plate acted as a rectifier. The characteristics of this system were detd. The current as a function of the potential between grid and plate is shown graphically. In the satn. phase the current increases in proportion to this p. d. as occurred in the rectifying valve already described, though the increments of current are much smaller. Below the range of currents which correspond to satn. potentials the function is far different. With increase of plate potential the current first increases to a max. at 20-5 v. (independent of the grid potential), then decreases to a min. at 450 v., where it is an inverse current. It then increases rapidly, and at a high enough p. d. the state of satn. is reached (cf. *Proc. Inst. Radio Eng.* **6**, 5(1918); **10**, 320(1922)). This behavior of the current is explained by the secondary emission of electrons from the plate by electronic bombardment. When the plate potential is less than the grid potential, the electrons are drawn toward the grid, while those from the filament bombard the plate with a velocity which varies with the plate potential. With high enough plate potential, the plate emits electrons which are drawn to the grid, compensating for the plate current due to the charges of the electrons emitted from the filament and which fall on the plate. With increase of plate tension, the velocity of the electrons bombarding the plate increases and the secondary electronic emission increases, reducing the plate current. When the velocity of the electrons which bombard the plate is sufficiently great, the secondary emission of electrons exceeds the electronic absorption and the current changes sign.

C. C. DAVIS

Influence of gaseous impregnation on the photoelectric sensitivity of metals. HANS KLUMB. *Z. Physik* **47**, 652-70(1928).—Specimens of Ta, W, Mo, Ni, Pa, originally photoelectrically sensitive to λ 254 μ , were found insensitive to wave lengths at least

as short as 230μ after degassing *in vacuo*. Since sensitivity to 254μ gradually returned, except when a liquid air trap was attached to the app., it appears that the sensitivity is assocd. with a gas which can be condensed in liquid air. Addn. of purified H_2 , N_2 , O_2 , A-He, CO_2 or coal gas to the degassed metal inhibited the return to the sensitive condition, but addn. of water vapor accelerated it. Evidently water vapor is the only gas of those investigated to which the sensitizing effect to the long ultra-violet can be attributed. The importance of these effects in connection with attempts to correlate photo-elec. properties of metals with such properties as position in the e. m. f. series, work function, ionization potentials, etc. is noted. W. W.

Variation of electromotive force in a photoactive cell containing a fluorescent electrolyte, with the intensity of illumination. WM. RULE. *Proc. Nat. Acad. Sci.* **14**, 272-8(1928).—The e. m. fs. produced when one electrode chamber of a cell filled with fluorescein soln. (0.05 g. fluorescein and 10 g. NaOH per l. of water) is illuminated were studied by means of the quadrant electrometer. During illumination, the e. m. f. takes initially a small + value, then, passing through zero, assumes a much larger - value, increasing with time to approach a max. value. Stopping the illumination causes a slight increase of e. m. f. and then a gradual fall. With increasing intensity of illumination the magnitude of the e. m. f. attained increases to approach a max. value for high intensities. The results are interpreted as due to the formation of a concn. cell by means of the photochem. changes in the electrolyte. W. WEST.

Directions of emission of photoelectrons. PIERRE AUGER. *Compt. rend.* **186**, 758-60(1928); cf. *C. A.* **21**, 1754.—The photoelec. effect produced in A, diluted with H_2 , by the $K\alpha$ rays has been taken up. A. and Francis Perrin have previously proposed a theory for the emission phenomena. The results seem to necessitate a modification of the proposed theory; possibly call for a sort of orientation in the absorbing atom. L. D. R.

The inner photoelectric effect with silver halides. S. I. SHEPPARD. *Nature* **121**, 574 5(1928).—Consideration of the energy steps in the Born cycle for calcg. lattice energies of the Ag halides shows that if the photolysis of these salts consists of a sepn. of electrons from the halide ions, followed by an acceptance by the Ag ions, 2 quanta are necessary. (1) λ 1300 or smaller, to overcome the lattice energy, (2) λ 3000 or smaller to liberate electrons. Previous work on photoconductance indicates some such mechanism, although quanta of much smaller energy are known to be active in the photolysis of Ag halides. Also new expts. on the photopotentials of Ag-AgX electrodes in electrolytes show that photoelectrons are liberated concomitant with the production of free halogen. These expts. have led to a modified theory of the inner photoelec. effect, in which it is required that both the lattice energy and electron affinity are lowered at interfaces, particularly at true interfaces with conductors. The inner photoelec. effect might therefore occur at longer wave lengths than the above. To account for the failure of the reciprocity law, Baker (*C. A.* **21**, 2853) has suggested that 2 quanta, acting within a short interval of time, are concerned in photographic action. This is in accord with the theory of S., if the first quantum is that necessary to disrupt the lattice, and the second to release the photoelectron from the halide atom. F. A. J.

Influence of charged metallic points on the spark discharge. T. THOMSON. *Phil. Mag.* [7], **5**, 513-36(1928).—Electromagnetic radiations emanate from the air in the immediate neighborhood of charged metallic points from which elec. discharges are taking place in air at atm. pressure. The intensity of the radiations increased with the intensity of the discharge. The radiations produce photoelec. effects and ionization. The radiations producing the photoelec. effects emanate only from the neighborhood of positively charged points. The ionizing radiations emanate from the neighborhood of both positive and negative points. The photoelec. radiations can penetrate 15 cm. of air at atm. pressure and the ionizing radiations are absorbed by 3 cm. of air at atm. pressure. These results differ from those of Wynn-Williams (*C. A.* **20**, 1351) in regard to the precise locality of the source of the radiations, and in regard to their penetrating powers. A theory is suggested of the action of a charged metallic point in facilitating the passage of a spark between spherical electrodes. This theory differs from that offered by W.-W. in ascribing the greater part of the action to the photoelec. effect. The action of the ionizing radiations in facilitating the passage of the spark depends on the nature and state of the surface of the cathode. The ionizing radiations are capable of facilitating the passage of the spark, even when no straight line can be drawn in air from the metallic point to the line of the spark discharge. It is suggested that the action of the ionizing radiations in such cases is an indirect effect due to the impact of positive ions on the metal of the cathode. The exptl. results of Morgan (*C. A.* **21**, 3544) are examd. and confirmed, but a somewhat different explanation

of them is given. The results of the present expts. are considered in relation to the theory of the spark discharge recently put forward by Taylor (*C. A.* **21**, 1221, 1405, 2220, 3923), and are found generally to support this hypothesis. Some of Townsend's conclusions (*Electricity in Gases*, pp 330-1) with reference to his theory of the spark discharge are considered in the light of the results of the present expts. and modifications of these conclusions are suggested.

GEORGE GLOCKLER

Field currents from points. C. F. EYRING, S. S. MACKNOWN AND R. A. MILLIKAN. *Phys. Rev.* **31**, 900-9(1928). The laws governing the extrn. of electrons in metals in high vacua by fields, first developed through expts. with crossed wires, then with fine wire cathodes discharging to cylindrical anodes have been now found to hold throughout for field currents between points and planes. The theory needed for the detn. of the potential gradients at points is given and crit. gradients are then detd. exptly. The generality of the linear relation between $\log i$ and the reciprocal of field strength is established by expt.

BERNARD LEWIS

The drop of potential at the cathode in flames. P. E. BOUCHIER. *Phys. Rev.* **31**, 833-50(1928).—The theory as given by J. J. Thompson (Conduction of Electricity through Gases, 64 pp) for the drop of potential at plane electrodes has been modified by allowing for recombination in the layer and a similar theory for cylindrical electrodes has been worked out. An equation is given for plane cathodes and the exptly. results for Pt electrodes immersed in pure and NaCl flames agree well with the theoretical equations given. The drop in potential at the cathode occurs in a sheath of uniform thickness, which completely surrounds the electrode. It is possible to est. the thickness of the sheath. Over 95% of the potential drop takes place across the sheath at the cathode provided it is of clean Pt. With an unclean cathode, electrons are emitted which partially neutralize the accumulation of positive ions reducing the sheath thickness. The mobility of the positive ions averages 12.4 and 8.1 cm. per sec. for 1 v. per cm for a pure and NaCl flame, resp. By studying the characteristic current voltage wave for a wire probe in a flame, a correction of the order of 1 v. is found, to be applied to the measured probe potential in order to obtain the true gas potential adjacent to the test probe. The c. d. at the surface of the cylindrical sheath is const. for any given flame conditions and cathode size. Thus one can measure the c. d. existing in the small uniform gradient just outside the sheath. The c. d. at the sheath surface in a pure flame varies from 1 to 2.5 microamp. and for a NaCl flame from 5 to 11 microamp.

BERNARD LEWIS

Reflection of atoms by a crystal. A. FLETT AND H. F. OLSON. *Phys. Rev.* **31**, 643-7(1928).—Beams of Cd and Hg atoms striking a clean rock-salt surface are reflected so that incident and reflected beams make equal angles with the normal to the crystal surface. The divergence of the reflected beam is only a little greater than that of the incident beam. Na is not reflected from a rock salt surface. H atoms striking a similar surface leave as at. H. The distribution of the directions in which they leave the surface was never the same for any two crystals. This may be due to residual adsorbed gas.

BERNARD LEWIS

The reflection of positive rays by a platinum surface. G. E. READ. *Phys. Rev.* **31**, 629-33(1928).—An app. similar to a spectrometer set up in a good vacuum was employed. A beam of Li ions accelerated through a known potential impinged upon a Pt reflector. The intensity, energy and direction of the reflected beam were measured by means of a rotating collector. Provided the reflector was "clean," i. e., white hot or cold but a few sec., a considerable reflection was observed at certain angles. The angle of reflection was approx. specular but varied slightly with the accelerating voltage. The percentage reflected depended markedly upon the accelerating voltage. The max. occurred approx. at 48 v. where approx. 75% was reflected. The reflected beam consisted of ions which had lost the major portion of their energy. With a beam of K positive rays, approx. the same type of results was obtained.

BERNARD LEWIS

Some experiments in positive-ion kinetics. G. P. HARNWELL. *Phys. Rev.* **31**, 634-42(1928).—The motion of positive ions of K and Cs through gases such as He, Ne, Ar, H₂ and N₂ was investigated in an exptl. tube of simple design. The results were best explained on the basis of a free path approx. equal to the kinetic theory value and on an av. fraction of energy lost per collision considerably less than would be expected on ordinary considerations. H. suggests that the explanation of this is to be found in a more accurate consideration of the fields of force involved in these encounters.

BERNARD LEWIS

Dispersion of space charge in mercury vapor. G. SPIWAK. *Z. Physik* **46**, 725-38 (1928).—The influence of Hg vapor on the current in a 3-electrode tube was studied. Up to a limiting potential the anodic and emission currents are stable at pressures from

1.7×10^{-4} to 2.0×10^{-3} mm. of Hg. Emission current-grid potential and anodic current-grid potential curves are rectilinear, the slope of the latter increasing with the vapor pressure of the Hg. A relation between emission current and Hg pressure is derived, based upon the influence of positive Hg ions on the negative space charge surrounding the hot filament. Exptl. and calcd. values are in agreement. J. E. S.

The affinity of oxygen for electrons. M. A. DA SILVA. *Compt. rend.* **186**, 583-4 (1928); cf. *C. A.* **21**, 3309.—The ionization curves for A differ markedly whether the current is carried by the neg. ions or by the pos. ions. Satn. is reached at 3×88 v. and at 18×88 v., resp. Addn. of O has no effect on the ionization curve for A when the current is carried by the pos. ions, but deflects the curve for neg. ions toward the pos. It is probable that O₂ fixes the electrons with great ease. O₂ does not fix the pos. ions of A to form ion complexes. D. H. POWERS

Physical significance of glow-electron emission. A. v. HIPPEL. *Z. Physik* **46**, 716-24 (1928).—Glow-electron emission is considered as a process of temp. ionization by at. impacts. An emission equation is developed which is independent of assumptions concerning the behavior of conducting electrons. Its validity is not restricted to the solid phase. The emission work and const. depend upon the temp., and the former is related to the polarizability of the atom. J. E. SNYDER

Corona discharge in helium and neon. L. G. H. HUXLEY. *Phil. Mag.* [7], **5**, 721-37 (1928).—The starting potentials were measured and used to discuss the behavior of positive ions and electrons in discharge tubes. The theory of Townsend that positive ions can produce ionization by impact with gas mols. is proved and H. believes that they do not set free appreciable amts. of electrons from the cathode. GEORGE GLOCKLER

The longitudinal thermomagnetic potential difference in a bismuth crystal. C. W. HEAPS. *Phys. Rev.* **31**, 648-52 (1928).—The longitudinal thermomagnetic p. d. in a Bi crystal has been measured at room temp. for various orientations of heat current, magnetic field and crystal axis. The results are plotted showing the change of thermoe. m. f. as a function of magnetic field strength. When the heat current is parallel to the crystal axis the field produces an apparent increase of thermo-e. m. f., the max. being about 7% in a field of 7000 gauss. When the heat current is perpendicular to the crystal axis the field produces a decrease in the force, the max. being 23% in a field of 7000 gauss. The results may be explained qualitatively by assuming that a magnetic field produces a structural change of some sort in the at. system of Bi. This change, in the direction normal to the field, is essentially different from the change parallel to the field. BERNARD LEWIS

Electrical properties of monatomic gases. J. S. TOWNSEND AND S. P. MACCULLUM. *Phil. Mag.* [7], **5**, 695-700 (1928).—The best way to purify monatomic gases is to remove small traces by means of a high-frequency discharge using external electrodes. The gases (H₂) evolved when sealing off a tube can thus be removed rapidly and the monatomic gas is then spectroscopically pure. The high-frequency discharge ionizes the H₂ and causes it to be absorbed rapidly by the quartz walls of the tube. Accurate measurements on the sparking potential of gases thus purified were possible. In Ne purified as above at 37.2 mm. pressure and electrode-distance of 4, 5, 6 and 7 mm. the sparking potentials are, resp., 263, 292, 318 and 344 v. There is further discussion of theories of elec. discharge. GEORGE GLOCKLER

Dielectric constants and magnetic susceptibilities in the new quantum mechanics. III. Application to dia- and paramagnetism. J. H. VAN VLECK. *Phys. Rev.* **31**, 587-613 (1928); cf. *C. A.* **21**, 2096, 2840.—Modifications are given in the mathematical theory published in part I which are required by the moment now being magnetic instead of elec. The main addns. are the appearance of a diamagnetic term, and allowance for the fact that the magnetic moment consists of 2 parts arising, resp., from orbital electronic motions and from the electron's internal spin. Pauli's formula for diamagnetic susceptibility cannot be applied to mols. contrary to V.'s previous claim. It is instead an upper limit to the diamagnetism in non-monatomic mols. Limiting values for the paramagnetic susceptibilities of atoms, are: $\chi = N[4s(s+1) + k(k+1)] \beta^2/3kT$ and $\chi = [Ng^2j(j+1)\beta^2/3kT] + N\alpha$, where β is the Bohr magneton and α is a const. These 2 formulas are vigorously applicable when the multiplet intervals are, resp., very small or very large compared to kT , and are valid regardless of whether the magnetic field is strong enough to change the quantization by producing a Paschen-Back effect. The paramagnetic susceptibility of mols. is calcd. on the basis of the Hund (cf. *C. A.* **20**, 2283; **21**, 1930) theory of mol. quantization. Formulas are given applicable to his couplings of type (a) and type (b) provided in the former the multiplet interval are either very large or very small compared to kT . The exptl. susceptibilities

for O_2 and ClO_2 are in accord with the assumption that the normal states are, resp., 3S and 2S terms. Polatonic mols. may have lower paramagnetic susceptibilities than diatomic mols. because the dissymmetry causes large fluctuations in electronic angular momentum. Spectroscopists have found that the normal states of the NO mol. are 2P terms sep'd. by 120.9 cm.^{-1} . This permits an unambiguous calcn of the susceptibility which agrees with the exptl. value within 1.5%. Deviations from Curie's law are calcd. which result from the doublet interval being comparable with kT . B. L.

Dielectric constants of dilute solutions of polar liquids in non-polar solvents. J. D. STRANATHAN. *Phys. Rev.* **31**, 653-71 (1928).—With the hope of eliminating effects of assocn., to which is attributed the failure of Debye's theory in representing the behavior of such polar liquids as the alcs., the dielec. behaviors of dil. solns. of several alcs. in benzene have been studied. A heterodyne heat method was used. Both dielec. and d. data were obtained at each 10° temp. interval from freezing to boiling. The mol. polarization found for the dissolved alc. was plotted against concn., one such curve was plotted at each 10° interval. To obtain the polarization of the alc. in the unassocd. state these curves were extended to cut the zero-concn. axis. The resulting intercepts for the various temps. were checked against theory. By taking the contribution due to electron displacement from optical data, it was found that the zero concn. intercepts for Me, Et, Pr and Am alc. (benzene as solvent) lead to values of the elec. moment which are essentially independent of temp. This is in agreement with the Debye theory; it is in contrast to the behavior of the pure liquid alcs. The moments found are 1.64, 1.74, 1.75 and 1.62×10^{-18} for the above alcs., resp.

BERNARD LEWIS

A note on magnetic susceptibility of solutions. J. J. WEIGLE. *Phys. Rev.* **31**, 676-9 (1928).—It is shown that when a soln. of different magnetic susceptibilities is placed in a magnetic field, there is a difference between the concn. of the solute in the field and outside of the field. This difference is, however, so small that it can hardly be measured experimentally; therefore it cannot vitiate the measurements of the magnetic susceptibility of solns. by the classical methods.

BERNARD LEWIS

Space-distribution of the photoelectrons ejected by x-rays. E. C. WATSON. *Phys. Rev.* **31**, 728-41 (1928); cf. *C. A.* **21**, 3309. The theories heretofore proposed to account for the apparent emission of x-ray electrons from the atom over a wide range of angles instead of in one definite direction are not entirely satisfactory. The Rutherford theory (*C. A.* **5**, 3538) is applied to the problem. This theory together with the assumption that the electrons all start out from the parent-atom in the same direction can be made to explain satisfactorily all the details of the observed space-distribution. It gives the quant. amt. of spread, it gives the form of the distribution curves; it explains the difference between the lateral and longitudinal distributions; it explains the dependence of the amt. of spread upon the nature of the atoms from which the electrons are ejected and the frequency of the x-rays which do the ejecting; and it accounts for the disagreement among various observers regarding this dependence. It is pointed out that the scattering of 17 kv. electrons by H nuclei is many times greater than can be accounted for on the classical theory.

BERNARD LEWIS

The natural width of x-ray spectra lines. D. COSTER. *Z. Physik* **45**, 797-800 (1927).—Referring to previous explanations of the variation in width of x-ray spectra lines, C. suggests that the following points should be considered: (1) higher multiplet structure; the radiating centers may have a more complex structure than doublets; (2) lines of the second type, that is, from doubly ionized atoms, (3) band spectra. In general, the abnormally great width of the line is not to be explained entirely by external causes, but may be due, at least partly, to conditions within the atoms themselves.

A. W. KENNEY

The reflection of x-rays by plane surfaces. H. E. STAUSS. *Phys. Rev.* **31**, 491-6 (1928).—The reflection of the $K\alpha$ radiation of Mo by plane surfaces of glass and quartz and by sputtered films of Ni, Pt and Ag has been investigated. The crit. angle of reflection of Ni was smaller for transparent films than for opaque ones. The crit. angles for both Ni and Pt were lower than the values calcd. from the electron theory. The exptl. values for the crit. angle of Ag agreed with the theoretical within the limits of error. Doan (*C. A.* **21**, 3548) has found exptl. values of the crit. angle for films of a no. of metals that agree with those predicted by the theory. If the theory does hold with Ni and Pt too, it is necessary to assume that the densities of sputtered films of Ni and Pt are less than those of the metals. Further, it must be assumed that with Ni the d. varies with the thickness of the film, being smaller for the thinner films. The observed crit. angle for quartz was smaller than the theoretical value as though the surface d. was less than the av. d. Both glass and quartz surfaces showed a weak residual reflection beyond the crit. angles, of a type that was not present in the sputtered films. The

phenomenon may be caused by irregular densities over the surface, due possibly to the polishing or to the heterogeneous compn. of the 2 substances. BERNARD LEWIS

Absorption and dispersion of x-rays. J. A. PRINS. *Physica* 8, 68-81(1928).—A review is given of the theory of absorption and dispersion as applied to x-rays. It is derived that the total "strength" p_k for the K shell (*i. e.*, the no. of resonators involved in the K radiation) is equal for dispersion and for absorption. For measurements on Fe (steel) p_k was found to be 1.3. Kramers and de L. Kronig explain this by a more complete occupation of the outer quantum orbits. The exptl. material used was a non-rusting steel (72 Fe, 19 Cr, 8 Ni, 1 C in at. %) mirror of 5×7 cm., n being detd. by total-reflection methods. A bibliography of 44 titles on this subject is included.

B. J. C. VAN DER HOEVEN

An anomaly in the x-ray region. J. H. VAN DER TUUK. *Physica* 8, 60-7(1928).—A short review is given of the classification of x-ray lines with their companion lines. The L_{γ_1} and L_{γ_2} lines have for W an intensity ratio 2:3, theoretical 1:2, the L_{β_1} and L_{β_2} ratio also is anomalous. Down from Dy ($Z = 66$) the L_{γ_2} satellite widens, giving $L_{\gamma_{10}}$ at the soft side of L_{γ_2} . For the study of this abnormality new photographs of the L_{γ_2} , γ_3 doublet between Mo (42) and Dy (66) were taken and are discussed. The phenomenon is considered to be due to anomalousness of the N_{II} and N_{III} levels; further insight is lacking.

B. J. C. VAN DER HOEVEN

The application of the x-ray laws to optical spectra of higher rank and the classification of Ga IV and Ge V. J. E. MACK, OTTO LAPORTE AND R. J. LANG. *Phys. Rev.* 31, 748-72(1928).—By application of the Moseley law and the 2 doublet laws of x-ray spectroscopy, the $(3d^34s)$ and $(3d^44p)$ levels of Ga IV and Ge V and a tentative $(3d^{10})$ level for Ga IV have been found. The levels formerly classified as 3D_1 , 1P_1 ($3d^44p$) of Zn III have been interchanged. On the hypothesis that as the nuclear charge increases, the levels of an isoelectronic sequence tend to cluster into groups forecasting the next higher ion due to a transition from ls - to jj -coupling, evidence is adduced to show that of the 3D , 1D (d^2s), the 3D_2 level approaches the limit $^2D_3(d^2)$ contrary to the theory of Hund. The case is analogous to that of Ne, in whose empirical series 3P_1 ($2p^33s$) approaches 2P_2 ($2p^3$). Distinction is made between x-ray and optical spectra in application to x-ray laws. (1) Exact representation of isoelectronic optical spectra on a Moseley diagram generally requires knowledge of series limit correlations of individual levels; the problem is close to that of general term-representation. (2) X-ray energy levels are ionization energies of neutral atoms, whereas in isoelectronic spectra the net charge increases with the at. no. Z ; the first-order screening no., σ , increases with Z in x-ray spectra, but decreases to an asymptote in isoelectronic spectra. The difference might be explained by outer screening. If σ is plotted as a function of Z , the initial slope of the curve depends upon the n - and l -values of the added electron but changes only slowly with the total no. of electrons and substantially not at all with the ion configuration for a given no. of electrons, this rule implies that the lines on the Moseley diagram, representing the addn. of a given n electron to different isoelectronic sequences, contg. nearly the same no. of electrons, are parallel to a second approximation. The irregular doublet law applied to isoelectronic sequences in the neighborhood of a closed d-shell (d^{10}), is valid for $(p)^{1/2} - (s)^{1/2}$ but not for $(d)^{1/2} - (p)^{1/2}$ or $(f)^{1/2} - (d)^{1/2}$.

BERNARD LEWIS

Simple method of determining orientation and structure in crystals by x-rays. W. E. DAWSON. *Phil. Mag.* [7], 5, 756-68(1928); cf. *C. A.* 22, 892.—If the rotation of a crystal be accompanied by a proportional movement of the recording film, the angle turned through by the crystal between successive reflections may be obtained and sufficient data are thus obtained for detg. uniquely the direction of the normals belonging to each set of at. reflecting planes and hence also the orientation and space-lattice of the crystal. The arrangement used may be called an x-ray goniometer. G. G.

The quantum theory of the polarization of impact radiation. J. R. OPPENHEIMER. *Proc. Nat. Acad. Sci.* 13, 800-5(1927).—If the results of the general theory of the polarization of light are applied to electrons, the momentum rule formulated by Skinner follows, and the excitation does not change the component of angular momentum in the direction of the electron beam. Experimentally, these rules are not always applicable. This paper is a mathematical discussion developing a theory more in accord with the known facts, first by taking into account the spin of the impacting electron and the Heisenberg resonance principle, and second by discarding the assumption that the perturbing energy is small. The modified theory makes the following predictions of the polarization of impact radiation: for very high electronic velocities the line has a polarization of $-p$. As the velocity of the electron diminishes the polarization diminishes and changes sign at about 200 v. The polarization then increases with diminish-

ing velocity, and if extrapolated to the resonance velocity gives a polarization of $+p$.

A. W. KENNEY

The fluorescent spectrum of sodium vapor in the vicinity of the D lines. R. W. WOOD AND E. L. KINSEY. *Phys. Rev.* 31, 793-9 (1928).—When Na vapor is mixed with H_2 , air or N_2 at pressures between 2 and 3 mm. the D lines can be excited by radiation in the region 5100 to 5250 Å. Since this radiation is absorbed only by the Na mols. it is probable that the primary act is the excitation of the mol. The D lines may then be emitted by collisions of the second kind with atoms, or by dissoec. either spontaneously or as a result of collisions with the foreign gas into a normal and an excited atom. Further expts. must distinguish between these processes. A band group previously studied by Wood and Galt (*C. A.* 6, 1092) appears in the yellow region of the fluorescence spectrum under white light stimulation when N_2 or H_2 was present at a pressure of 6 ± 1 mm. and indications are that they are excited by light of their own wave length. The expts. also verify completely the older work of Wood and Galt on a cathode ray spectrum. Photographs of the absorption spectrum and other considerations indicate that these bands are not the bands ascribed by Barret (*cf. C. A.* 18, 1433) and Pringsheim (*cf. C. A.* 20, 3387) to a Na-K mol.

BERNARD LEWIS

The K absorption edges of potassium and chlorine in various compounds. J. M. NUTTALL. *Phys. Rev.* 31, 742-7 (1928).—The K absorption edges of K and Cl were photographed, a vacuum spectrometer of the type designed by Siegbahn being used. Four compds. were used for the absorption of K namely, sylvine, orthoclase, lepidomelane and phlogopite. In the first 2 the absorption occurred in the reflecting crystal itself, in the last 2, in thin sheets of the substance placed in the path of the beam which was dispersed by a calcite crystal. The Cl of the sylvine also gave an excellent Cl K absorption edge. In these photographs as many as 5 secondary edges were observed. The fine structure of the K edge thus extended in wave lengths from 3420 to 3365 x. u. or over a range of about 67 v. The fine structure of the Cl edge extended from 4383 x. u. to 4341 x. u. or about 27 v. That portion of the fine structure which is more remote from the principal edge is not satisfactorily explained by Kossel's (*Z. Physik* 1, 119 (1920)) original hypothesis and is perhaps best accounted for by double ionization of the atoms absorbing the x-radiation.

BERNARD LEWIS

Luminescence excited by x-rays in colloidal alkaline earth salts. C. H. BOESSEVAIN AND W. P. DREA. *Phys. Rev.* 31, 851-7 (1928).—The gelatinous ppts. of Ca, Sr and Ba fluoride formed in the presence of an excess of Ca, Si or Ba ions are positive colloids which luminesce in x-rays. The intensity of luminescence increases after the ppt. has been brought to red heat. These salts do not luminesce if pptd. in the presence of excess fluoride. The positively charged fluorides are changed to negative colloids by washing in dil. alkali. This causes the luminescence to disappear. Washing with dil. acid or distd. water is without effect. Colloidal $BaSO_4$ shows a similar behavior. $CaWO_4$ and $SrWO_4$ are negative colloids, the ppts. formed in the presence of excess tungstate ions fluoresce brightly in x-rays; when formed in the presence of excess Ca or Sr ions they fluoresce very faintly. A table is given showing the extent of the luminescent bands into the ultra-violet. Fluorides that have been heated in a H_2 atm. show a dark discoloration and do not luminesce in x-rays. The presence of impurities diminishes the luminescence of colloidal ppts. The alk. earth chlorides and phosphates, Ca and Sr sulfate and $BaWO_4$ formed only cryst. ppts. that did not luminesce in x rays. The hypothesis is made that the luminescence of colloidal ppts. is due to a thin layer of ions that is adsorbed on the surface of the colloidal particles.

BERNARD LEWIS

The non-appearance of the recombination luminescence in the reaction between alkali and halogen atoms. V. KONDRAT'EV. *Nature* 121, 571-2 (1928).—The direct combination of neutral atoms to form mols. of the NaCl type does not give rise to the continuous band emission which is to be expected as the complement of the continuous absorption bands observed for such mols. by Franck, Kuhn and Rollefson (*C. A.* 21, 3023). Instead, a strong emission of the D lines is observed in the chemiluminescence spectrum during the formation of NaCl. This is interpreted as due to the excitation of Na atoms by collision with NaCl mols. having considerable energy and a relatively long life. K. assumes that these are dipoles, Na^+Cl^- . The possibility of the direct formation of these dipoles from neutral atoms is indicated by an intersection of the potential-energy curves of the systems atom-atom and ion-ion, which shows that at the corresponding internuclear distance an adiabatic transfer of the electron to the Cl atom is conceivable. A large vibrational energy would thereby be imparted to the dipole, which may be increased by the absorption of temp. radiation to $Q + J - E$ (Q = heat of reaction, $Me + X \rightarrow MeX$, J = ionizing potential of Me, E = electron affinity of X). This makes possible the excitation of lines in the chemiluminescence spectrum

having an excitation energy greater than Q . On this theory, radiation is to be expected in the recombination of 1 normal and 1 excited atom, when the curves for Me^+X or MeX^+ do not intersect with that of Me^+X^- . A continuous emission band has been observed for the reaction $\text{K} + \text{I}_2$ (C. A. 20, 1179), whereas it is not found for $\text{Na} + \text{I}_2$. The 2 curves for Na^+I and Na^+I^- intersect, while those for K^+I and K^+I^- do not.

F. A. JENKINS

The lowest terms in the spark spectrum of nickel and copper (Ni II and Cu II). R. J. LANG. *Phys. Rev.* 31, 773-5(1928).—The lowest terms $^2\text{D}_{3,1}$ in the spark spectrum of Ni (from the state d^0) are found to be 6884 and 8391 cm^{-1} below $a^4\text{F}'_6$. In the spark spectrum of Cu the lowest term is $^1\text{S}_0$ (d^10) and lies 21,925 cm^{-1} below $a^2\text{D}_3$.

BERNARD LEWIS

The arc spectrum of germanium. C. M. GARTLEIN. *Phys. Rev.* 31, 782-92 (1928).—The wave lengths of lines in the Ge arc spectrum have been measured in the region above 1870 Å. U. with an accuracy of 0.03 Å. U. From these lines the *relative energy levels* have been detd. and transitions corresponding to 73 lines have been identified. In the normal state, the Ge atom contains 2 p valence electrons which give rise to the lower levels $3\text{P}'_{012}$, $^1\text{D}_2$, $^1\text{S}_0$ which lie deepest as predicted by the theory of Hund. The next higher levels arise from the configurations ps and pd. At least 2 members of each of 11 series have been found and approx. limits have been calcd. to be 65,300 for $^2\text{P}_2$ and 63,600 for $^2\text{P}_1$. The first resonance potential is 4.65 v. and the ionization potential detd. by the limit $^2\text{P}_1$ is 7.85 v. The similarities in the arc spectra of Si, Ge, Sn and Pb are pointed out and the relative term values for these spectra are brought together in a single diagram.

BERNARD LEWIS

Certain multiplets in the spectra of cadmium III and indium IV. R. C. GIBBS AND H. E. WHITE. *Phys. Rev.* 31, 776-81(1928).—Guided by the transitions from ^3PDF , ^1PDF ($4d^5s$) to ^3D , ^1D ($4d^5s$) already detd. for Pd I and Ag II the corresponding lines have been identified in the spectra of Cd III and In IV. The transitions from ^3D , $^1\text{P}_1$ and $^1\text{P}_1$ ($4d^5p$) to $^1\text{S}_0$ ($4d^10$), the latter being the lowest level in each of the spectra, have also been identified for Ag II, Cd III and In IV. These combinations account for nearly all the strong lines in each spectrum. The term values for the 4 isoelectronic systems Pd I, Ag II, Cd III and In IV together with those in the corresponding elements in the first long period have been plotted on a Moseley diagram which brings out certain similarities and variations between these 2 sets of spectra. The validity of the irregular doublet law is again confirmed by the almost const. shift in the corresponding radiated frequencies ($4d^5s - 4d^5p$) on passing in succession from Pd I to Ag II, to Cd III and to In IV.

BERNARD LEWIS

The nitrogen after-glow. J. C. McLENNAN, RICHARD RUEDY AND J. M. ANDERSON. *Nature* 121, 537-8(1928).—The intensity distribution in the Tl series lines as excited by active N_2 is similar to that obtained when the Tl lines are excited by metastable Hg atoms having an energy of about 5 v. This does not agree with the common view that the 11 v. dissocn. energy of N_2 is available for exciting spectra in active N_2 , as a result of recombination of at. N. It is suggested that chemiluminescence may account for the appearance in active N_2 of the lines of Hg, Zn, etc., which require an electronic excitation up to 10 v. In support of this, it is found that mixts. of Kr and Xe with active N_2 do not show any lines of the inert gases. The after-glow obtained with a mixt. of Xe and N_2 showed no absorption for the Xe radiation $\lambda 8819$, indicating that no Xe atoms were present in their metastable state of about 8.4 v.

F. A. JENKINS

Production of active nitrogen. JOSEPH KAPLAN. *Proc. Nat. Acad. Sci.* 14, 258-60(1928).—A blue glow was obtained in air at 5 mm. pressure pumped through a bulb excited by a condensed discharge with spark gap in series from a 6-in. spark induction coil. The spectrum, examd. from 4500 Å. U. to 1800 Å. U., showed the α bands of N_2 , the known and some new β and γ bands of NO, 2nd positive bands of N_2 , and some 4th positive bands. No transitions to the normal level of N_2 appeared. Since the 0-0 bands both of the 2nd and 4th positive groups require more energy than that furnished by the recombination of N atoms, the presence of these bands in the after-glow raises a difficulty for the hypothesis that active N is atomic.

W. WEST

Voltage-intensity relations in the mercury spectrum. W. D. CROZIER. *Phys. Rev.* 31, 800-11(1928).—Voltage-intensity curves have been obtained for 20 lines of the Hg spectrum, when excited by electron impact. The range of accelerating voltage was from excitation to 50 v., the discharge tube being designed to eliminate most of the disturbance due to positive-ion formation. The components of 4 of the triplet groups were resolved and investigated separately. No significant change appears in the no. of atoms in a given energy state if the ionization potential is passed. The components of each of the dD groups of energy levels are excited at practically the same voltage

but have quite different excitation functions. The excitation function for d_1 , d_2 and s levels and for the $2p_2$ level appear to be similar in form and to have sharp maxima within a few v. of the excitation voltage. The excitation functions for d_2 and D levels also appear similar, increasing uniformly to 30 or 40 v. where they have broad maxima. The voltage-intensity characteristics of lines originating in transition down from the same initial level agree in type but sometimes show certain differences in shape. It appears that the probability of different transitions down from a given energy state may not be independent of the way in which this state is excited. There is evidence that a large no. of excitations of $2p_2$ by transitions down from higher levels are not followed by $1S-2p_2$ transitions. BERNARD LEWIS

Equilibrium of nitrogen and hydrogen with ammonia in a corona discharge. G. L. WENDT AND J. B. SNYDER. *J. Am. Chem. Soc.* **50**, 1288-92 (1928).—The equil. of NH_3 with a 1 to 3 ratio of N_2 and H_2 resulting from the action of a 60-cycle corona discharge between a Pt wire and a coaxial cylindrical glass electrode is such that at a pressure of 733 mm. of Hg and a temp. of 28.5°, 4.1% of NH_3 by vol. results under the conditions of the expts. The temp. at which the same equil. concn. would result thermally was calcd. and found to be 270° and, possibly, a temp. above 2500°. The mechanism of the corona discharge appears to be that of activating various mol. species in such a way as to increase enormously the reaction velocities, to change the ratio of decomposition and formation and to produce a shift in equil. corresponding to that at elevated temps. JAMES M. BELL

The quenching of mercury resonance radiation by foreign gases. M. W. ZEMANSKY. *Phys. Rev.* **31**, 812-21 (1928).—Milne's (*J. Math. Soc. (London)* **1** (1926)) theory of the diffusion of imprisoned resonance radiation is applied to Stuart's (*C. A.* **19**, 2909) expts. on the quenching of Hg resonance radiation by foreign gases and expressions obtained for the no. of excited Hg atoms per cc. and the quenching in terms of the no. of impacts of the second kind per sec. per excited atom. Stuart's experimentally detd. values of the quenching are used to give the relation between these impacts and the pressure of the foreign gas and the result is obtained that the no. of impacts of the second kind per sec. per excited atom is not a const. fraction of the total no. of collisions. The total no. of impacts of the second kind per cc. is calcd. and taken as the reaction velocity, and upon plotting against the pressure it is shown that the reaction velocity varies as the 0.6 power of the pressure for all the foreign gases. It is shown that these results can be explained on the theory that impacts between excited Hg atoms and foreign gas mols. give rise to metastable Hg atoms which diffuse to the incident wall and meet the adsorbed foreign gas mols. to which they give up their energy. This theory is also capable of explaining the behavior of a large quantity of inert gas on the disson. of H_2 by excited Hg atoms and also the effect of the latter on O_2 . BERNARD LEWIS

Decomposition of hydrazoic acid in ultra-violet light. KARL GLEU. *Ber.* **61B**, 702-7 (1928).—Solns. of HN_3 in dil. acids, H_2O and dil. alkalies have been illuminated during 15 min. by means of a quartz Hg lamp ($i = 2.25$ amps; $v = 120-180$ v.). HN_3 immediately decomposes, the products obtained were measured quantitatively.

The infra-red absorption spectra of the halogen derivatives of methane. A. L. HENNE, EASLEY, L. FENNER AND B. J. SPENCE. *Astrophys. J.* **67**, 185-94 (1928).—A sensitive radiometer and a concave grating ruled with 10,000 lines per in. were used to examine the infra-red absorption spectra, between 1μ and 2.5μ , of CH_3I , C_2H_5Cl , CH_2Br_2 , CH_2I_2 , CH_2BrI , $CHCl_3$, $CHBr_3$, CHI_3 , CCl_4 , CBr_4 and $CBrCl_3$. No bands were found

for those compds. which do not contain H. For the others a large no. of new bands were discovered of which the wave lengths were measured. These are tabulated and illustrated graphically. Although the bands resemble each other and exhibit shifts depending on the at. no. of the halogen atom, yet attempts to establish series relationships were not successful. C. C. KIESS

The effect of pressure on the spectrum of the iron arc. H. D. BABCOCK. *Astro-phys. J.* **67**, 240-61(1928).—Wave lengths of Fe lines emitted by arcs in vacuum and in air have been examd. for pressure shifts. The measurements were made with the Fabry-Perot interferometer. Correlation of the observed shifts with the term combinations which produce the lines is explained as a depression of the terms with pressure, high terms being more affected than low terms, and those of the septet and quintet system more than those of the triplet system. An examn. of the temp. effect based on the work of King for Fe, Ti, Sc, Ba and Ca shows that a progression of one temp. class corresponds to a change in excitation potential of 0.72 v. (For a similar investigation cf. Catalan, *C. A.* **18**, 2647, 3142.—Abstractor.) C. C. KIESS

The absorption spectra of anthracene derivatives. I. EDWARD DE BARRY BARNETT, J. W. COOK AND T. H. ELLISON. *J. Chem. Soc.* **1928**, 885-90.—The absorption spectra of anthracene and its derivs. in alc. solns. exhibit a group of bands between which approx. const. frequency differences occur. These bands, up to 6 in. no., are listed in a table in which the compds. are arranged in order of complexity of the groups introduced into the *meso*-position of anthracene. As long as the bridge bond is present, the effect of substituents on the positions of the bands is slight. One alkyl, alkyloxy, phenyl or benzyl group, introduced into the *meso*-position shifts the spectrum from 60 to 80 frequency units toward the visible. A second substituent causes a further shift of approx. 70 units toward the visible. C. C. KIESS

Absorption spectra of formaldehyde and of carbon monoxide and a very close relationship between the two molecules. VICTOR HENRI AND SVEND AAGE SCHOU. *Compt. rend.* **186**, 1050-2(1928).—The vapor of CH_2O has 29 absorption bands between 3053 Å. U. and 2780 Å. U. in the ultra-violet corresponding to different vibrational states of the mol. Each of the bands is resolved into a large no. of fine lines which correspond to the rotational states of the mol. The spectrum is formed of triplets which can be arranged into P, Q and R branches, and which exhibit the same sepn. for all the bands; thus showing that they are of electronic origin. This systems of bands is likened to the at. spectrum of Mg, the normal state of which is ^1S and the excited states $^3\text{P}_{0,1,2}$. This interpretation is confirmed by comparison with the absorption spectrum of CO, for which bands corresponding to $^1\text{S} - ^1\text{P}$ have been observed by Leifson. There should be likewise bands corresponding to $^1\text{S} - ^3\text{P}$ and these have now been observed with a 1-meter column of vapor at 730 mm. pressure at the predicted place near 2060 Å. U. C. C. KIESS

Structure of the second order spectrum of sulfur (S II). J. GILLES. *Compt. rend.* **186**, 1109-11(1928).—With the aid of Zeeman effects lines of the spectrum S II have been classified as multiplets of the quartet system. They represent combinations between P' and D terms with a common P term, and of P' , D and F terms with a common D' term. C. C. KIESS

The absorption spectrum of nitrous oxide. MAURICE LAMBREY. *Compt. rend.* **186**, 1112-4(1928).—The prior discovery by others of the NO bands recently described (*C. A.* **21**, 3555) is acknowledged. Tables of wave lengths of the details of the band structure are now given. C. C. KIESS

The question of the dehydration of barium cyanoplatinite under the action of Röntgen rays. A. TRAPESNIKOV. *Z. Physik* **47**, 732-44(1928).—The dehydration of $\text{BaPt}(\text{CN})_4 \cdot 4\text{H}_2\text{O}$ in *vacuo* and the hydration at atm. pressure were studied with a microbalance. No dehydration occurs at atm. pressure. At 0.015 to 0.004 mm. there is a first water loss of either 5.34 or 4.46%, corresponding to $1\frac{1}{2}$ or $1\frac{1}{4}$ mols. of H_2O . Repeated dehydration and hydration causes the appearance of a modification contg. in the hydrated condition, $3\frac{3}{4}$, $3\frac{1}{2}$ or $3\frac{1}{4}$ mols. of H_2O , capable of losing 1 mol. or $\frac{3}{4}$ mol. in *vacuo* and regaining this at atm. pressure. In the first dehydration, the original green color changes to brick red, which persists throughout subsequent hydrations. A 6-hr. exposure of $\text{BaPt}(\text{CN})_4 \cdot 4\text{H}_2\text{O}$ to x-rays from a tube taking 55 kv. and 7 milliamps. caused the crystals to become orange; no loss of water could be detected. The radiated product behaved like the unirradiated in *vacuo*. W. WEST

A quantitative study of the changes produced in the absorption bands of certain organic fluorescent dye solutions by alteration of concentration and temperature. W. E. SPEAS. *Phys. Rev.* **31**, 569-78(1928).—The forms of the absorption bands have been obtained for solns. of rhodamine B and eosin at different concns. and temps.; also for

solns. of fluorescein, uranine and resorcinol-benzoin at various temps. An increase in concn. has the same general effect on the absorption bands as a lowering of the temp. In a concd. aq. soln. of rhodamine B there are 2 prominent bands in the visible which overlap. Effects of changes in concn. and temp. on the bands are studied both in concd. and dil. solns. The same effects are studied in concd. and dil. solns. of rhodamine B in alc., also for an alk. alc. soln. of eosin, neutral alc. solns. of fluorescein and eosin, alc. soln. of uranine and resorcinol-benzoin. A theory proposed by Merritt (C. A. 21, 204) to account for the form of the absorption bands of the org. dye solns. on the long-wave-length side has been tested with the data herein recorded and has been verified for dil. aq. solns. of rhodamine but not for the other solns. BERNARD LEWIS

Luminescence of mercury vapor in the electrodeless discharge. WITOLD MAJEWSKI. *Compt. rend. soc. polonaise phys.* 6, 15-43(1926); *J. Inst. Metals* 37, 540.—(In Polish, with French summary.) Hg vapor at a pressure of 0.001 mm. is only slightly illuminated by the electrodeless discharge, but the illumination increases rapidly with rise of pressure. The light is first white, then green, and finally with higher pressures disappears. A spectrograph shows 3 distinct spectra: a line spectrum, a continuous banded spectrum, and a spectrum of resolvable bands. The line spectrum increases in intensity with the pressure, and resembles in general the arc spectrum. Continuous bands occur between 5769 and 5461 Å. U., 4916 and 4359 Å. U. and 3663 and 3132 Å. U. H. G.

Resonance rays of selenium vapor. (Preliminary note.) VIKTOR EISENFRUCHT. *Compt. rend. soc. polonaise phys.* 7, 65-8(1926); *J. Inst. Metals* 37, 544.—[In French and Polish.] When Se vapor is illuminated by means of a Hg vapor lamp, a fluorescent spectrum contg. more than 60 lines is obtained. These may be arranged in series corresponding with the exciting Hg lines 4047, 4078 and 4359 Å. U. The lines of each series are related by the equation $v = v_0 - ai$, where v_0 is the frequency of the exciting line, a is a const. characteristic of each series, and i is 0, 1, 2, etc. H. G.

Conditions of the formation of bands in a mixture of hydrogen and mercury vapor. ANDRZEJ SOLTAN. *Compt. rend. soc. polonaise phys.* 7, 67-91(1926); *J. Inst. Metals* 37, 549; cf. C. A. 21, 3157.—[In Polish, with French summary.] Examin. of the intensities of Hg lines in the presence of H under low pressure indicates the existence of a compd., HgH. H. G.

The spark spectrum of argon. I. T. L. DE BRUIN. *Z. Physik* 48, 62-6(1928); cf. following abstract.—The lowest-energy quartet terms of the A II spectrum have been identified and details are given for 5 multiplets. A very close similarity exists between the P I, Ne II and A II spectra. W. F. MEGGERS

The spectrum of ionized argon (AII). T. L. DE BRUIN. *Nature* 121, 576; *Naturwissenschaften* 16, 238(1928); cf. preceding abstract.—The A II spectrum contains doublet and quartet terms, in close analogy to that of P I and Ne II. The triplet $4p^4S - 4s^4P$ at $\lambda\lambda 3729.300$ (9), 3850.565 (8), 3928.599 (7) involving the deep quartet $4s^4P$ term with term-differences 844.40 and 515.70 formed the starting-point for the analysis. Other low-lying quartet terms are $4p^4P$ ($\Delta v = 307.75, 357.30$) $4p^4D$ (439.36, 494.57, 260.32) and (3) d^4D (153.98, 149.62, 107.03). F. A. JENKINS

The spectra of ionized neon (Ne II) and ionized argon (A II). II. T. L. DE BRUIN. *Verslag Akad. Wetenschappen Amsterdam* 37, 340-50(1928); cf. C. A. 22, 1276.—A comparison is made between the quartet terms of ionized neon (Ne II) and ionized argon (A II). Nearly all the quartet terms expected from the Heisenberg and Hund theory have been identified. Also in *Proc. Acad. Sci. Amsterdam* 31, 2-13 (1928). A. L. HENNE

Band spectra and electron terms of the molecules Na₂, NaK and K₂. R. RITSCHL and D. VILLARS. *Naturwissenschaften* 16, 219-20(1928).—The (K₃₅)₂ and K₃₅K₄₁ (isotope) band spectra were found in agreement with the results of Carrelli and Pringsheim (C. A. 21, 3830). A classification formula is given for the edges of the band spectra of K₂ (8000 to 9000 Å. U.) and NaK (around the D line). Several details are discussed. B. J. C. VAN DER HOVEN

Anomalous Kerr effect in sodium vapor. ARTHUR BRAMLEY. *J. Franklin Inst.* 205, 539-47(1928). W. F. MEGGERS

Extreme ultra-violet spectra excited by controlled electron impacts. K. T. COMPTON and J. C. BOYCE. *J. Franklin Inst.* 205, 497-513(1928).—A new vacuum spectrograph is described. In connection with it a low-voltage arc is used as a light source and the spectra of He, Ne and A are excited practically free from impurities. The wave lengths of new lines He I, Ne I and Ne II are published and a table of term values accounting for 203 Ne II lines is given. Results for A will be reported later. W. F. M

The origin of the green aurora borealis line. L. A. SOMMER. *Naturwissenschaften*

16, 219(1928).—The longitudinal Zeeman effect of the $\lambda 5577.35$ green aurora line excited in an O_2 -A mixt. was studied by a Perot Fabry interferometer. The photograms gave a doublet of threefold normal width; this allows the classification of the aurora line in the term system of the O arc spectrum as $3P_1 - 1S_0$ with a potential of 2.23 v.

B. J. C. VAN DER HOEVEN

Extension of the violet CN band system to include the CN tail bands. F. A. JENKINS. *Phys. Rev.* 31, 539-58(1928).—The fine-structure lines of the CN tail bands are measured, the wave-nos. being given for 13 bands as excited by the reaction of C_2H_2 with active N. Estd. intensities are given. Each band has a doublet P and a doublet R branch, but the doublet sepns. vary markedly, being undetectable in the majority of the bands. Large perturbations affecting several lines of each branch are also found. The combination principle is applied to det. the relative vibrational quantum nos. for the tail bands. The consts. B' and B'' represent a continuation of the consts. of the ordinary CN bands to the high values of the vibration quantum no. n . The tail bands are thus merely the high- n members of the ordinary CN sequences and those measured are shown to be the (11, 9), (12, 10), (13, 11), (9, 8), (10, 9), (11, 10), (12, 10), (10, 10), (11, 11), (12, 12), (13, 13), (14, 14) and (15, 15) bands of the violet system. With this assignment the tail bands give $B'' = 1.894-0.0181 n^2$ compared with $1.891-0.0173 n^2$ obtained by Kratzer (*C. A.* 17, 3135) from the low- n bands of the system. There are some new features of the band-spectrum structure. The violet CN system includes some bands shaded to the violet and others shaded to the red (the tail bands), with an intermediate type in which the lines have practically equal spacing on a frequency scale. Also the band-origin of a given sequence, with increasing n , pass through a max. of frequency, the result being that a sequence may form a "head" composed of bands. One of the rotational perturbations is investigated, and the deviations of the terms from their expected values in this case give a typical "resonance" curve. A diagram of the vibrational intensity distribution in the violet CN system is discussed. Certain anomalous bands of longer wave length are found which do not fit into the system. In agreement with Mulliken's (*C. A.* 21, 3541) prediction the first line of the R branch is found to be double, that of the P branch not being resolved. The intensity difference for the doublet components for low- n is observed and the extd. relative intensities are in satisfactory quant. agreement with the theory.

4—ELECTROCHEMISTRY

COLIN G. FINK

Progress in the electrochemical industry. RUDOLF MEINGAST. *Chem.-Ztg.* 52, No. 37, *Fortschrittsber.* No. 2, 29-52(1928).

The rational use of the electric furnace in steel foundry practice. A. TENIVELLA. *Met. italiana* 20, 69-75(1928).—A crit. review of present practice, difficulties encountered and recommendations for the most efficient operation, including discussions of the relations between the pouring temp. and the dimensions, the advantages of a battery of small furnaces over a pair of furnaces of large capacity, the advisability of heating

under conditions which assure a const. voltage with varying charges, the necessity for scrap of high quality, with low C content, the necessity for using economizers, the best types of furnace construction and problems of operation. C. C. DAVIS

Production of aluminum. A. SULFRIAN. *Metallborse* 15, 706-7, 764-5, 820-1 (1925); *J. Inst. Metals* 36, 562.—New methods, arrangements and auxiliary media and reactions for the production of light metals, especially of Al, are described. The electrolytic method for the production of Al from cryolite and Na Al fluoride is described. The difficulties in the production of Al, Mg and Ca are discussed. A method for the continuous production of Mg is described. The electrolytic production of Al from a molten bath of NaCl and AlCl₃ and several new patents for the production of Al are given. The refining of Al is considered. H. G.

Electrolysis of tin at the Mitsubishi Osaka refinery. ZENSHICHI KIMURA. *Nihon-Kôgyôkwaishi* 41, 602-38 (1925); [In Japanese]; *J. Inst. Metals* 38, 561.—Crude Sn metal obtained from ores of the Akenobe mine is refined by electrolysis. Hydrofluosilicic acid has been used as the electrolyte since 1920. Various kinds of electrolytes were compared with each other, the quality of the anode, acidity of electrolyte, c. d., and working time being varied. Expts. were made on the reduction degree of Sn in soln., purity of cathode, amt. of slime and condition of deposition. In practice the electrolyte contains SiF₄H₂, 8-10%; Sn fluosilicate, 2.5-3%; H₂SO₄, 2%; a small quantity of F₂Si and β -C₁₀H₇(OH); and glue 0.3%. C. d. is 83.3-41.6 amp. per sq. m. of anode area, voltage being 0.33 or 0.15 v. at 15-28°. The current efficiency is 85-75%, and loss of SiF₄ amounts to 8 kg. per ton of electrolytic Sn. In this plant 60 tons of Sn were treated per month. H. G.

Electrolysis of water with an alternating current. CANAUD. *Compt. rend.* 186, 688-90 (1928).—When a 50 cycle a. c. of 110 v. is passed into H₂O between 2 Fe electrodes, 14 × 7 cm., placed at such a distance that the current is 5 amps., there is gaseous evolution between the electrodes. Pieces of metal, immersed in the H₂O, not in contact with the electrodes, also cause liberation of gases. The gases consist principally of those dissolved in the H₂O, together with a small quantity of H₂. The vol. of gas is variable but the quantity of H₂ is const. and about 0.3% of that obtained with 4.5 amps d. c. During the process the electrodes are oxidized to FeO. E. G. VANDENBOSCHE

The commercial deposition of nickel. E. J. DOBBS. *Electroplaters' and Depositors' Tech. Soc.* (advance copy), 1926, Nov., 1-7; *J. Inst. Metals* 38, 553.—A comparison is made between the single and double Ni salt solns. Modern practice in the working of the former, involving the neutralization of acid, the filtration of the soln., agitation, and the removal of org. matter, is outlined. Pinholing is said to be due to org. matter, which may be removed by oxidizing agents or spraying into the air. A heated soln. is advocated. H. G.

Nickel anodes and their use. W. S. BARROWS. *Can. Foundry* 17, 14-6 (1926); *J. Inst. Metals* 37, 625.—A description of expts. on the wear of Ni anodes, and discussion of the effects of various impurities. It is much easier to maintain an equil. between anode and cathode efficiency with low-purity Ni anodes than with high-purity anodes, and a properly cast 90-92% anode is better than a poorly cast 95-97% anode. S and Cu are both injurious but red stains on anodes when the bath is idle may be due to Co and do not necessarily indicate Cu. Sn does not improve the real quality of an anode but makes the casting easier, and, like Si, increases the formation and maintenance of slime on the anodes. Fe and Mn are generally harmful, but Fe is sometimes useful where a white finish is required, as in stove plants. The question of cleaning anodes is discussed. In general, B. favors the non-cleaning system, as the cost of labor and the loss of Ni in cleaning usually outweigh the better results after cleaning. H. G.

Present status of chrome plating. E. LIEBREICH. *Korrosion Metallschutz* 4, 29-32 (1928).—See C. A. 22, 195. E. H.

Chromium versus nickel plating. B. MENDELSSOHN. *Motorwagen* 28, 728-9 (1925); *J. Inst. Metals* 36, 567.—M. points out that Cr in its passive state is resistant to oxidation almost up to red heat; it is not attacked either by HNO₃ or H₂SO₄ or by salt water; it is excessively brittle and cannot be applied as plating by any dipping process; difficulties of galvanic plating have been overcome by Liebreich. If desired, Cr may be deposited on Cu plating for a double protection. Cr coating is not expensive. H. G.

The chromium plating of glass-molds. H. W. HOWES. *Glass Rev.* 3, 12-3 (1927); *J. Inst. Metals* 38, 551.—Glass-molds plated with Ni or Ag are of no use, but Cr-plated molds have many advantages. The cost of Cr plating is very high; the "throwing power" of the solns. used is said to be low. As an illustration of the value of Cr-plated glass-molds, certain German results are quoted. These claim that whereas

an ordinary cast-iron mold has to be descaled and polished up after 1500 to 2000 pressings. Cr-plated mold has been used for 80,000 pressings without polishing. In Germany, they have improved the throwing power of the solns., so that even the deepest engravings on the molds can be evenly plated. H. G.

A theory of the electrodeposition of chromium from chromic acid solution. YOGORO KATO AND TORU MURAKAMI. *J. Soc. Chem. Ind. Japan* 31, 124-8 (1928).—By expts. it is shown that the current efficiency for the electrodeposition of Cr is low; it is below 30% in most cases and increases with increasing current density. H overvoltage for metals is known in general to increase with the increasing current density. The cause for this overvoltage is not definitely decided, but K. and M. assume that the overvoltage is due to accumulation of monatomic H. They also apply Nernst's formula for the concn. cell to the calcn. of the concn. of the monatomic H. Under the last assumption, the values of the concn. of the monatomic H at different densities are calcd. from the value of overvoltage. Then these values of supposed concn. of monatomic H and the amt. of Cr deposited are plotted against the values of current density; the two curves are nearly parallel, from which it is concluded that the electrodeposition of Cr from chromic acid soln. takes place not directly by the loss of elec. charge of CrO_4^{--} or $\text{Cr}_2\text{O}_7^{--}$, but directly by the reduction of the monatomic H of the film (consisting of Cr oxides), which is formed on the cathode. Superposition of a. c. on d. c. makes the current efficiency very low, and this fact favors the above theory. The lowering of the current efficiency with rising temp. also favors it. K. K.

Preparation of chromium plating solutions. Physicochemical studies of the solution. Explanation of the phenomena taking place during the electrolysis. YOGORO KATO, TORU MURAKAMI AND SINTARO SAITO. *J. Soc. Chem. Ind. Japan* 31, 128-31 (1928).—Cr plating soln. is generally prepd. from CrO_3 soln. by its partial reduction or by the addn. of $\text{Cr}(\text{OH})_3$. The authors recommend to treat CrO_3 soln. with insol. org. colloids (names of which are not given, cf. Japanese pat. 71,950). In the plating a film of chromic chromate is first formed on the surface of the cathode. By the electrolysis CrO_3 is reduced to $\text{Cr}(\text{OH})_3$, which forms this film when the concn. of the hydroxide becomes sufficiently large near the cathode. From the results of ultrafiltration and diffusion expts. it is confirmed that the chromic chromate soln. is not colloidal. F. p. depression and elec. cond. of the soln. show that $\text{Cr}_2(\text{CrO}_4)_3$ resembles $\text{Cr}_2(\text{SO}_4)_3$ when dissolved in H_2O . Elec. conduction through the plating soln. is therefore concluded to be electrolytic and not due to cataphoresis as is sometimes inferred. K. K.

The estimation of the metal surface protection by electrolytic chromium plating. S. YENTSCH. *Metallwaren Ind. Galvano-Tech.* 25, 147-9 (1927); *J. Inst. Metals* 37, 643.—Different methods for the production of electrolytic Cr plating are discussed. The chem. side of the Cr-plating process is considered. Three different kinds of surface appearance of Cr-plated articles, thickness of the Cr layer necessary for good protection against corrosion, properties of Cr layers, and the results obtained with different Cr-plating processes are discussed. H. G.

The electrochemical production of Prussian blue. B. ORMONT. *Z. Elektrochem.* 34, 106-11 (1928).—Prussian blue is formed on electrolyzing $\text{K}_4\text{Fe}(\text{CN})_6$ solns. with Fe electrodes and anodic c. ds. of 25-100 amp. per sq. dm. Decrease in $\text{K}_4\text{Fe}(\text{CN})_6$ concns. does not affect the current efficiency (c. e.), but as a more sol. Prussian blue is formed at higher concns., 1% $\text{K}_4\text{Fe}(\text{CN})_6$ solns. are used. The effect of the presence of NaCl, Na_2SO_4 or NaNO_3 in the soln. is studied. When NaCl is present, the c. e. is 100%, the light ppt. formed at the anode darkening with time; the energy consumed is < 1 kw. hr./kg. With Na_2SO_4 (or NaNO_3), there is development of O_2 , the anode becoming passive. After a time the passivity stops, in part, and a dark blue ppt. (probably Turnbull's blue) is formed. The energy consumed is 1.5-4 kw. hr./kg., the c. e. at 20° being < 75%. Partial replacement of NaCl by Na_2SO_4 does not affect the results. Traces of NaCl (up to 0.2%) in solns. contg. Na_2SO_4 stop the passivity, the c. e. becoming nearly 100%. Increasing the temp. of solns. contg. Na_2SO_4 (alone) to 70° increases the c. e. to 99%, the energy consumed decreasing to 1.5 kw. hr./kg. The use of air stirring, rather than mechanical, helps the reactions. J. BALOZIAN

Method of extracting and refining metallic bismuth from the flue dust recovered by the Cottrell process at the Ashio copper mine. JÜRO SHIMONO. *Suiyō-Kwaishi* 4, [6], 849-60 (1924); *J. Inst. Metals* 36, 563.—The residue of the flue dust from which arsenious acid has been extd. contains many valuable metals, such as Bi, Pb, Sn and Zn. To recover them economically the residue was treated in an elec. furnace. An alloy consisting of Pb, Sn and Bi settled in the furnace was melted. The liquefaction product was then treated by the dual operation of the simultaneous electrolysis of Sn and Pb and that of Bi. H. G.

A contribution to the theory of the galvanic cell. N. IZGARUISHEV. *Z. Elektrochem. angew. physik. Chem.* 34, 128-9(1928); cf. *C. A.* 20, 2939.—The total energy change in the galvanic cell is the sum of the energies of: (1) hydration or dehydration of the ions; (2) deposition or sepn. of electrons; (3) condensation or evapn.; (4) dissocn. of mols. into atoms or the reverse process. From energy values given in the literature, e is calcd. by substituting in: $4.2A = enF$, (A being the total energy in cal.). Thus, for $Zn|Zn^{++}|H^+|H_2-Pt$, $e = 0.78$; for $Cd|Cd^{++}|H^+|H_2-Pt$, $e = 0.31$; for $Pt-H_2|H^+|Cl^-|Cl_2|Pt$, $e = 2.4$, for $Pt|(H_2)|H^+|Br^-|Pt|(Br_2)$, $e = 1.7$. For a better agreement between the calcd. and exptl. values of e more exact detns. of the energies are necessary. J. BALOZIAN

Extracting and carbonizing coal [for use in making electrodes] (Brit. pat. 277,293)
21. Metallizing fur and feathers (Brit. pat. 276,291) 25.

Primary electric batteries. R. M. BURLISON and W. DEREHAM Brit. 276,404, April 26, 1926. Structural features.

Primary electric battery. G. A. LYON, R. W. ERWIN and G. W. HEISE. U. S. 1,670,585, May 22. In a cell contg. Zn and Cu electrodes and an electrolyte the Cu electrode comprises a perforated Cu container contg. Cu oxide and the latter is surrounded by a protective layer of unglazed paper which dissolves sufficiently in service of the battery to permit contact between the oxide and container.

Dry cell electric battery. J. J. McCANN and C. G. BIRDSALL. U. S. 1,670,590, May 22. A hollow tube is formed of spirally wound paper with overlapping edges united with flour paste; the outside of this tube is coated with a paste contg. electrolyte, and the tube is cut into lengths for insertion in Zn container electrodes.

Electrical conductivity cell. I. B. SMITH. U. S. 1,670,640, May 22. Structural features.

Electrolytic cell, etc., for supplying oxygen to incubators. F. DINTZ. Brit. 275,880, Feb. 22, 1927.

Lining for dry cell electric batteries. V. YNGVE and W. R. VALL. U. S. 1,670,604, May 22. Starchy or gelatinous material required in the cell is applied to the outside surface of paper during the manuf. of the paper.

Carbon electrodes for dry cell electric batteries. E. H. McCABE. U. S. 1,670,040, May 15. In order to provide a metal film on the end of a C electrode, a metal wire such as Cu or brass is melted at its point and the particles of metal as melted are forced by an air-blast against the surface of the C.

Electrode material for self-baking electrodes. C. W. SÖDERBERG. U. S. 1,670,052, May 15. An excess of tar and pitch or other suitable binder is used in sufficiently high proportion to cause the mass in warm condition to settle in the electrode.

Storage battery. F. G. DEWEY. U. S. 1,671,016, May 22. Structural features.

Storage battery. C. J. V. FEVY. Brit. 275,750, May 26, 1926. The negative electrode of a Pb storage battery is protected from oxidation by the air or by substances liberated at the positive plate, by enclosing it in material such as parchment paper or prepd. cellulose such as is used for the manuf. of artificial silk. Various structural features are specified.

Storage battery. N. HARRISON. Brit. 276,704, April 28, 1926. Structural features.

Storage battery. K. NEMETH and A. SZANTO. Brit. 276,797, July 20, 1926. A Pb anode is used with a cathode formed of an alloy of Zn, Ni and Cu which is amalgamated and covered with Zn. Various structural features are described.

Storage battery. OLDHAM & SON, LTD., and H. E. CLARKE. Brit. 275,832, Nov. 3, 1926.

Storage battery. J. TUDOR. Brit. 276,718, May 21, 1926. Structural features.

Storage batteries with cylindrical electrodes. B. HEAP and CHLORIDE ELECTRIC-AL STORAGE CO., LTD. Brit. 277,162, Aug. 19, 1926. Structural features.

Storage battery electrodes. W. J. PLEWS. U. S. 1,670,046, May 15. Electrodes are subjected to the action of a heated gas under pressure (sufficiently great to prevent evapn. of water) for 10 min. or less, in order to hasten setting. U. S. 1,670,047 specifies a similar process of effecting setting of the material of freshly pasted electrodes within 1-5 min. In using steam a temp. of about 260° or higher and a pressure of about 120-150 lbs. per sq. in. are suitable.

Apparatus for electrodeposition of metals. E. M. WANAMAKER. Brit. 276,306, Aug. 19, 1926. Anodes and cathodes are mounted on a frame movable along the cell. Various structural features are specified.

Electrodeposition of chromium. C. H. HUMPHRIES (TO METALS PROTECTION CORPORATION). Brit. 277,295, Sept. 9, 1926. Fe, steel or other metal is Cr-plated at a temp. (suitably about 20°) at which the current efficiency is high to produce a deposit with a dull finish and is then further plated at a higher temp. (suitably about 40°) to obtain a bright finish. The electrolyte may be formed of chromic acid, hydrated Cr hydroxide and $(\text{NH}_4)_2\text{SO}_4$.

Electrolytic refining of aluminum. DEUTSCHE VERSUCHSANSTALT FÜR LUFTFAHRT. Brit. 276,911, April 8, 1927. Al is preliminarily purified electrolytically to about 99.8-99.9% purity and is then further refined in a fused electrolyte cell in which it forms the anode and constitutes the lower-most layer. Metals such as Au, Pt or Ag which do not form solid solns. with Al are added to it to increase its sp. gr. for carrying out the process in the manner specified.

Electrolytic apparatus for producing oxygen and hydrogen, etc. W. G. ALLAN. Brit. 275,785, Aug. 4, 1926.

Apparatus for chromium-plating printing plates, etc. W. S. EATON. Brit. 276,921, May 2, 1927. An electrolytic app. is specified.

Electric arc furnace. C. H. GAGE. U. S. 1,671,026, May 22.

Electric induction furnace. INTERNATIONAL GENERAL ELECTRIC CO., INC. Brit. 276,351, Aug. 19, 1926.

Electric induction furnace. J. R. WYATT. U. S. reissue 16,967, May 15. Original pat. 1,312,069 was issued Aug. 5, 1919. (Cf. C. A. 13, 2488.)

Electric resistance furnace. I. RENNERFELT. Brit. 276,823, Aug. 24, 1926.

Zoned resistor for electric furnaces. F. T. COPE. U. S. 1,670,846, May 22.

Electric ozone generator. SIEMENS & HALSKE A.-G. Brit. 276,637, Aug. 26, 1926.

Temperature-control system for electric driers, etc. S. A. STAEGE. U. S. 1,669,582, May 15.

Electric apparatus for determining moisture content of paper, cellulose, air or other materials. J. D'A. CLARK. Brit. 275,741, May 18, 1926.

Surface contact rectifiers for rectifying alternating current. S. RUBEN. Brit. 277,102, June 9, 1926. In rectifiers of the type described in Brit. 270,362 (C. A. 22, 1550) the electropositive elements may be formed of Al amalgam bodies prepd. by immersing Al in HgCl_2 soln. with oxide coating which may be produced electrolytically by use of a Na borate soln. as electrolyte with a cathode of Pb. The electronegative elements may consist of Cu, Fe, V or Mn oxides or PbO_2 formed by compressing the powd. oxides in a mold. Various structural features are described. Brit. 277,103 specifies electropositive elements of W or other suitable metal of the Cr group and electronegative elements of oxides such as those of Fe, Pb, Mn or V.

Coating electric cables. R. JOSEPH. Brit. 277,017, Sept. 1, 1927. Pb-sheathed armored cables are given a protective coating of inert water-resisting material such as vaseline, paraffin, a mixt. of paraffin and resin or the like and wrappings of jute or other fabric are impregnated with the same substances. Other materials such as As compds. also may be added.

Coating for electric cables. STANDARD TELEPHONES & CABLES, LTD. AND T. N. RILEY. Brit. 275,721, May 11, 1926. In coating elec. cables with a fibrous dielectric such as paper impregnated with a suitable oil or the like, the duration of the drying treatment is detd. in accord with the a. c. leakage and the impregnation treatment is started after the leakage becomes substantially const. below a predetd. value.

Device for rectifying alternating electric currents. SIEMENS-SCHUCKERTWERKE A.-G. Brit. 277, 337, Sept. 11, 1926. In rectifiers comprising oxidized-coated Cu disks the thickness of the oxide coating is 0.001-0.1 mm.

Chromium-plating apparatus formed of aluminum or aluminum alloy. SIEMENS & HALSKE A.-G. Brit. 276,610, Aug. 28, 1926. An electrolytic process is specified.

Use of iodine, phosphorus, etc., to quench the spark at break in high-tension oil or

air-break electric switches. SIEMENS-SCHUCKERTWERKE A.-G. Brit. 277,328, Sept. 20, 1926.

Cementation of steel. SOC. ANON. DES ACIERIES ET FORGES DE FIRMINY. Brit. 277,307, Sept. 7, 1926. Steel is coated electrolytically with a thick compact Ni coating to protect it from the action of N or its compds. during cementation.

Electric lamps. NAAMLooZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 276,176, Oct. 7, 1926. The luminous body of Nernst or similar lamps and the electrodes of arc lamps are made at least in part of Hf oxide.

Coating electric lamp bulbs. F. SKAUPY (TO GENERAL ELECTRIC CO., LTD.). Brit. 276,992, Sept. 6, 1926. Weathering of bulbs or tubes is prevented by coating them with a thin layer of org. material such as paraffin. Fused H_2BO_3 thus coated may be used on lamps emitting ultra-violet or infra-red rays.

Tungsten filament. F. BLAU, F. KOREF and K. MOERS. U. S. 1,670,292, May 22. In order to prep. a W filament which does not readily assume the macro-cryst. form when heated, the filament is subjected to the action of a fluted roller or otherwise treated to produce strains at different points along the filament sufficient to form nuclei of crystn. to promote macro-crystn. and the filament is then heated.

Filaments for incandescent lamps. GENERAL ELECTRIC CO., LTD. AND C. J. SMITHELLS. Brit. 275,735, May 14, 1926. Supports for W filaments are formed of or coated with Cr and U or Mn also may be similarly used although Cr is preferable. These metals are, however, not used adjacent the junction with the filament to avoid alloying of the metal with the W.

5—PHOTOGRAPHY

MOREAU, G.: *La sensitométrie photographique et ses applications.* Paris: Dunod. 304 pp. F. 30.

VIDAL, M.: *Manuel de photographie.* Paris: Dunod. 288 pp. F. 18.

Röntgen-ray photography. F. SIMON. Brit. 276,678, Aug. 25, 1926. The differences of wave length of rays penetrating the object are registered in visible color tints. The photographic sensitive layer is covered, on the side facing the object, by a screen comprising elements having different absorptive powers for the rays, such as a mixt. of starch grains satd. some with a Pb salt, some with a Cu salt and others with an Al salt and dyed with different colors such as green, blue and red.

High-light process of photoengraving. F. J. M. GERLAND. U. S. 1,670,195, May 15.

Photographic emulsion. H. C. J. DREKS. U. S. 1,669,506, May 15. A sensitive Ag halide emulsion contains transparent color pigments and chrome-yellow uniformly distributed.

Photographic etching. J. RIEDER. Brit. 275,763, June 29, 1926. A layer of varnish for use as a sensitive coating for etching is formed of a resin such as sandarac, dragon's blood or shellac which is insol. in gasoline or similar solvents, together with just sufficient benzine-sol. and sensitive asphalt to render the mixt. sol. in benzene where exposed to light for a short time. Rubber may be added, as may also paraffin oil, stearin oil or like substances.

Photographic plates and films. I. G. FARBENIND. A.-G. Brit. 275,933, Aug. 12, 1926. In prep. plates or films having between the sensitive layer and support one or more intervening layers contg. Mn compds. for preventing halation, a layer is used made from an org. colloid of hydrophil nature, contg. Mn compds. and treated by electro dialysis.

Photographic prints colored with pigment colors. F. H. FARMER. U. S. 1,669,869, May 15.

Photographic stencils. J. SURY. Brit. 277,012, Sept. 2, 1926. Fine mesh gauze of metal or other material is coated with gelatin or gum sensitized with an alk. dichromate and after printing is developed in warm water to remove the unexposed gelatin or gum and produce a stencil.

Cementing together layers of cinematograph films. J. E. THORNTON. U. S. 1,670,672, May 22. Printed colloid films to be joined are each separately satd. with a colloid adhesive which may contain glue, HOAc, molasses or glycerol, $(NH_4)_2Cr_2O_7$.

and water and after drying are clamped together and heated to unite them, and are afterward treated with a hardening and insolubilizing agent such as strong light to render the joint formed more permanent.

Projection screens. G. DELBROUCK. Brit. 276,946, Sept. 4, 1926. The screen is covered with granular material such as silica, glass or wood and may also be covered with metal such as Al, Au or an alloy in powd., leaf or other form.

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

The most recent progress in inorganic chemistry. GIOVANNI CANNERI. *Giorn. chim. ind. applicata* 10, 73-6, 135-40 (1928), cf. *C. A.* 22, 1919.—Investigations on the reactivity of O with Ag, the reduction of metallic halides by H, the thermal decompn. of chloroaurates, hydrides, nitrides, selenides, halides, addn. compds. of SO₂ and aromatic hydrocarbons, double salts, Be complexes, Cr amino-acid complexes, basic Bi nitrates, Pt complexes, Fe nitrososulfides, heteropoly acids, hydrogenomolybdates, iso- and heteropolythio salts and manganomolybdates are reviewed, with the original references

C. C. DAVIS

Introduction of bromine and iodine into silicates. A. DUBOIN. *Compt. rend.* 186, 762-4 (1928).—KHF₄ and CoO are heated together in a Pt dish, the product is added to molten KF, and finally SiO₂ is added. After several hrs. heating the mixt. is cooled and KBr or KI added. After 2 or 3 days' heating the iodo- or bromosilicate is extd. with H₂O. These Co derivs. seem to be orthorhombic and are isomorphous with the chlorosilicate.

E. G. VANDENBOSCHE

The fluoride of bivalent uranium. A. SIEVERTS. *Z. anorg. allgem. Chem.* 170, 191-2 (1928).—UF₂·2H₂O, mentioned in *Chem. Zentr.* 1905, I, 1131, and in all the reference books, was never prepd. The only original article, by Giolitti and Agamemnone (*Atti accad. Lincei* [5], 14, I, 165 (1904)) contains a misprint, and the text and tables refer only to UOF₂·2H₂O.

G. CALINGAERT

Thermal dissociation of cadmium nitrate. G. MALQUORI. *Atti accad. Lincei* [6], 7, 249-50 (1928).—According to Vasiliev (*C. A.* 5, 2374) Cd(NO₃)₂, m. 360°, with decompn., but expts. by M. show that it decomp. at 325° to CdO, thus 2 Cd(NO₃)₂ → 2 CdO + 4 NO₂ + 2 O, without the formation of a basic salt. Measurements of the vapor pressures from 200° to 315° (tabulated in detail) show that the decompn. reaction is perfectly reversible and that Cd(NO₃)₂ and CdO are the only 2 solid phases. Utilizing the vapor pressure data for calcg. the heat of decompn. by the Nernst equation, Q was found to be 55,881 cal.

C. C. DAVIS

The action of copper on sulfuric acid. G. FOWLES. *Chem. News* 134, 257-9 (1928).—The nascent H theory, to account for the formation of SO₂ during the reaction of Cu and H₂SO₄, is shown to be untenable. It is suggested that the SO₂ is due to the reducing action of Cu, Cu₂S and Cu₂SO₄ present, the equations representing their action adding up to give: Cu + 2H₂SO₄ = CuSO₄ + SO₂ + 2H₂O. The theories of others are criticized.

J. BALOZIAN

The action of hydrogen on tin salts at high temperatures and pressures. V. N. IPAT'EV AND V. I. NIKOLAEV. *J. Russ. Phys.-Chem. Soc.* 60, 331-8 (1928).—See *C. A.* 21, 3845.

E. J. C.

The reaction between monohydrated ferric oxide and hydrogen sulfide at 100°. T. G. PEARSON AND P. L. ROBINSON. *J. Chem. Soc.* 1928, 814-23.—As discrepancies exist in the literature of the reaction between Fe₂O₃·H₂O and H₂S, it is studied further. The expts. are performed at room temp. and 100°, the ratio of "sulfide" to oxide being detd. in each case. At room temp., variable amts. of a hydrated sulfide are formed, this variation being principally due to caking of the material by the H₂O produced. At 100° the product becomes hot on exposure to air, although it is not pyrophoric until after treatment with CS₂. The "sulfide" ratio is more const. here than at room temp. The S sol. in CS₂ is 2.4% (av.), its presence being due to O₂ adsorbed on the hydrated oxide surface. On treating the product of the reaction with concd. KCN soln., unaltered Fe₂O₃·H₂O and FeS₂ remain as the residue. The black residue formed on dissolving the product in 10% HCl is FeS₂ (after treatment with CS₂), averaging 7%. S is obtained if this residue is extd. with CS₂, indicating that the residue is coated with S. Conclusion: Fe₂S₃ is produced by the primary reaction, some of this being decompd. to give mono- and di-sulfide, equimolarly.

J. BALOZIAN

Yellow ferric hydroxide produced by careful oxidation of suspended ferrous sulfide.

SUZANNE VEIL. *Compt. rend.* **186**, 753-5(1928).—When a suspension of FeS in H_2O is oxidized by a current of air, yellow $Fe(OH)_3$ is obtained. The yellow hydroxide is much less magnetic than the brown. Fe_2O_3 prepd. from brown $Fe(OH)_3$ becomes less magnetic while the oxide prepd. from yellow $Fe(OH)_3$ is several times more magnetic than the former.

E. G. VANDENBOSCHE

The existence of the oxide of silver, Ag_2O_3 . A. P. ROLLET. *Compt. rend.* **186**, 748-50(1928).—A soln. of KOH was electrolyzed with a Hg cathode and a Ag anode. During the process K plates out in the Hg and the Ag is covered with an oxide, so that if allowed to function as a source of e. m. f. the Hg would be cathode and Ag anode. The current obtained from the cell was studied as a function of time. The cathode potential remains const. during the process so that any change in current shows a change in anode potential. There are 2 abrupt drops in potential, giving 3 level stretches in the current. The first corresponds to the peroxide of Ag which is reduced to Ag_2O . When this change is complete there is a drop of 0.24 v. and then Ag_2O is reduced to Ag, with subsequent drop in potential when complete. A third level stretch represents the current obtained as long as K is present in the Hg. The reaction was also studied in the opposite sense. By first oxidizing Ag to Ag_2O and then to the peroxide, the current required corresponds to the formation of Ag_2O_3 .

E. G. VANDENBOSCHE

The composition of titanium peroxide. MAURICE BILLY. *Compt. rend.* **186**, 760-2(1928).—The hydrate of a pertitanic salt can be pptd. by hydrolysis, having a large excess of H_2O . By analysis the formula is found to be Ti_2O_5 , if the salt is hydrolyzed from 10° to 20° . If hydrolyzed around 0° the ratio Ti to O is 2:5.27, but not near the previously suggested formula of TiO_3 .

E. G. VANDENBOSCHE

The amines of double salts. G. SPACU AND C. CREANGA. *Bull. soc. stiinte Cluj* **3**, 160-70(1927).—It has been shown in a number of papers previously published (cf. C. A. **19**, 1995) that various double salts (sulfates, chlorides and bromides) are capable of reacting under favorable conditions with bases whereby amines are obtained corresponding to the initial double salts. This indicates that double salts in the solid state are really complex compds. Thus when the double salt $CdBr_2 \cdot BrNH_4$ (I) is treated with a soln. of pyridine in benzene, $[Cdpy_6]^{Br_2}$ ($BrNH_4$) is obtained. When exposed to

air for 24 hrs. this hexammine leads to the diammine, $[Cdpy_2]^{Br_2}$ ($BrNH_4$). By passing a current of dry NH_3 over I, $[Cd(NH_3)_6]^{Br_2}$ ($BrNH_4$) is obtained, which on heating to 60° is transformed into $[Cd(NH_3)_2]^{Br_2}$ ($BrNH_4$). Treating the double salt $ZnBr_2 \cdot KBr \cdot 2H_2O$ (II) with pyridine leads to $[Znpy_6]^{Br_2}$ K. II gives with dry NH_3 $[Zn(NH_3)_6]^{Br_2}$ BrK which at $60-70^\circ$ yields $[Zn(NH_3)_2]^{Br_2}$ BrK .

EMIL KLARMANN

Studies on the constitution of double salts. Double amines derived from iodides. G. SPACU AND O. VOICU. *Bul. soc. stiinte Cluj* **3**, 321-52(1927); cf. preceding abstract.—When a current of dry NH_3 is led over the double salt $CdI_2 \cdot IK \cdot H_2O$ (1) the double hexammoniate, $[Cd(NH_3)_6]^{I_2}$ IK , results. I gives with pyridine the corresponding compd., $[Cdpy_6]^{I_2}$ IK , which on exposure to air is transformed into $[Cdpy_2]^{I_2}$ IK . Similarly the hexammoniate, $[Cd(NH_3)_6]^{I_2}$ $(IK)_2$, is obtained from the double salt $CdI_2 \cdot 2KI \cdot 2H_2O$ with NH_3 and $[Cdpy_6]^{I_2}$ $(IK)_2$ with pyridine. The latter yields when exposed to air $[Cdpy_2]^{I_2}$ $(IK)_2$. By treating the double salt $CdI_2 \cdot 2NaI \cdot 6H_2O$ with $PhNH_2$ the tetraquodiammine, $[Cd^{an_2}(H_2O)_4]^{I_2}$ $(INa)_2$, is obtained. Analogous methods have been applied in the prepn. of $[Zn(NH_3)_6]^{I_2}$ IK , $[Zn^{1y}py_2]^{I_2}$ K_2 and $[Zn^{Iy}an_2]^{I_2}$ K from $ZnI_2 \cdot 2KI \cdot 2H_2O$, and of $[Zn(NH_3)_6]^{I_2}$ IK , $[Znpy_2]^{I_2}$ IK and $[Znan_2]^{I_2}$ IK from $ZnI_2 \cdot KI \cdot 2H_2O$.

EMIL KLARMANN

Wöhler's titanium cyanonitride. V. M. GOLDSCHMIDT. *Nachr. Ges. Wiss. Göttingen Math. physik. Klasse.* **1927**, 390-3.—In melting Fe ores contg. Ti in a blast furnace, Cu-colored crystals are formed, the so-called "blast furnace dice," which Wöhler

considered a complex titanium cyanonitride with the formula $Ti_{10}C_2N_8$. Crystallographic examn. of the material indicated a crystal structure of the NaCl type, with an av. lattice const. of 4.243 ± 0.002 A. U. G. believes it is a mixed crystal contg. 20 mol. % TiC and 80 mol. % TiN. The value of d. as calcd. on this assumption is 5.32, in good agreement with the exptl. value of 5.28. H. STORERZ

A salt of hexafluorometaphosphoric acid. WILLY LANGE. *Ber.* 61B, 799–801 (1928).—The nitron salt, $C_{10}H_{16}N_4 \cdot HPF_6$, is obtained as by-product in the prepn. of the nitron salt of HPO_3F_2 (cf. C. A. 21, 3500) and sepd. by fractional crystn. A better method consists in adding the nitron to the acid only after 12 hrs. of standing at 18° . After that time HPO_3F_2 is completely hydrolyzed, and the nitron ppts. only HPF_6 . The K salt is obtained by double decompn. with KNO_3 . The nitron salt is stable in H_2O , neutral toward methyl orange and phenolphthalein, unusually resistant toward alkaline solns. The PF_6 ions are decomposed only by molten alkali oxides or by heating with strong acids. $Ba(PF_6)_2$ is sol. in H_2O ; it ppts. immediately with H_2SO_4 . PF_5 probably reacts with NOF, yielding $NOPF_4$. A. L. HENNE

The diselenides of iron, cobalt and nickel. W. F. DE JONG AND H. W. V. WILLEMS. *Z. anorg. allgem. Chem.* 170, 241–5 (1928).—The compds. are prepd. by melting the monoselenides with a slight excess of Se under vacuum* at 230° , for 48 hrs. The Fe compd. obtained shows the x-ray diagram of $FeSe$. The diagrams of $CoSe_2$ and $NiSe_2$ correspond to the pyrites form, T'_h , with $a = 5.854$ (Co) and 6.022 (Ni), and the following distances: Co–Se 2.41, Ni–Se 2.47, and the densities. $CoSe_2$ 7.18; $NiSe_2$ 6.69. G. CALINGAERT

The complex salts of bivalent platinum with α, β, γ -triaminopropane. F. G. MANN. *J. Chem. Soc.* 1928, 890–8; cf. C. A. 21, 388.—(Triaminopropane-monohydrochloride) platinum dichloride monohydrate (I), $[Cl_2Pt \cdot NH_2CH_2CH(NH_2)CH_2NH_2 \cdot HCl] \cdot H_2O$, prepd. from K_2PtCl_6 (II) and triaminopropane 3-HCl (III), is resolved into the optically active form, γ -HCl. Thus, (triaminopropane- γ -monohydrochloride) dichloride platinum, pale yellow crystals, prepd. from II (16 g.) and III (16 g.) in H_2O (250 cc.), refluxed for 2 hrs., concd., filtered, chilled and recrystd. from hot H_2O , darkens at 280° and m. $290-1^\circ$ (decompn.). *d*-(Triaminopropane-mono-*d*-bromocamphor- π -sulfonate) platinum dichloride monohydrate (IV), $[Cl_2Pt \cdot NH_2CH_2CH(NH_2)CH_2NH_2 \cdot C_{10}H_{14}OBrSO_3H] \cdot H_2O$, orange-yellow crystals, hot aq. solns. of I (12 g.) and Ag-*d*-bromocamphorsulfonate (V) are mixed, boiled for 5 min., filtered, concd., cooled and recrystd. 5 times from H_2O ; m 0.5773% aq. soln. $[\alpha] = +76.2^\circ$ and $[M] = +522^\circ$. *d*-(Triaminopropanemonohydrochloride) dichloride platinum, prepd. by dissolving IV in a min. of hot H_2O , dilg. with hot concd. aq. $CaCl_2$, filtering, chilling, filtering off the crystals after 24 hrs., washing with alc. and Et_2O , and drying; in 1.051% soln. $[\alpha] = +49.7^\circ$ and $[M] = +195^\circ$. *l*-(Triaminopropane-mono-*l*-bromocamphor- π -sulfonate) platinum dichloride monohydrate (VI) prepd. from a satd. aq. soln. of I and NH_4 *l*-bromocamphorsulfonate, and recrystg. 5 times from H_2O ; in 0.5032% aq. soln. $[\alpha] = -76.5^\circ$ and $[M] = -524^\circ$. *l*-(Triaminopropane-monohydrochloride) dichloride platinum, pale yellow crystals, prepd. from VI and $CaCl_2$ in aq. soln.; in 1.279% soln. $[\alpha] = -49.1^\circ$ and $[M] = -192^\circ$. (Triaminopropane-mono-*d*-camphor- β -sulfonate) dichloride platinum, $[Cl_2Pt \cdot NH_2CH_2CH(NH_2)CH_2NH_2 \cdot C_{10}H_{16}OSO_3H]$, pale yellow cryst. powder, prepd. similarly to IV from I (10 g.) and V (8.4 g.) and recrystd. from H_2O twice; in 1.294% aq. soln. $[\alpha] = +10^\circ$ and $[M] = +61^\circ$. (Triaminopropane-hydrogen-oxalate) platinum dichloride $[Cl_2Pt \cdot NH_2CH_2CH(NH_2)CH_2NH_2 \cdot (CO_2H)_2]$, orange cryst. powder, prepd. from I and oxalic acid in aq. solns., recrystd. from hot H_2O and dried at 95° in a vacuum; m. $216-7^\circ$ (decompn.). Monochloridetriaminopropaneplatinous monochloride, $[ClPt \cdot NH_2CH_2CH(NH_2)CH_2NH_2] \cdot Cl$, yellow crystals, prepd. from aq. NH_3 and concd. aq. I, filtered, washed with cold H_2O and dried; m. p. $282-3^\circ$. Bis(triaminopropane-monothiocyanate) platinous dithiocyanate (VII), white crystals, prepd. from III (9.4 g.), dissolved in H_2O (50 cc.), 15% aq. NaOH (34.8 cc.) and II (6 g.) dissolved in H_2O (50 cc.), heated until a buff ppt. is formed, this ppt. redissolved, the resulting soln. concd., chilled, filtered free from NaCl, acidified with AcOH, treated with concd. KSCN soln. contg. AcOH, filtered after 24 hrs. and recrystd. twice from hot H_2O ; m. $177-8^\circ$. Bis(triaminopropane-mono-*d*-bromocamphorsulfonate) platinous di-*d*-bromocamphorsulfonate trihydrate, $[Pt(NH_2CH_2CH(NH_2)CH_2NH_2 \cdot C_{10}H_{14}OBrSO_3H)_2] \cdot (C_{10}H_{14}OBr(SO_3)_2 \cdot 3H_2O)$, white crystals, from hot aq. VII (4 g.) and V (11.7 g.; 4 mols.), concd., filtered and recrystd. 7 times from H_2O ; in 0.5184% aq. soln. $[\alpha] = 80.1^\circ$ and $[M] = 347^\circ$, the rotation being due to the 4 sulfonate ions alone. In the 3 following compds. the Pt is bivalent and has a coordination no. 6. Bis(triaminopropane) platinous di-iodide, $[Pt(NH_2CH_2CH(NH_2)CH_2NH_2)_2]I_2$, white crystals, is prepd. as VII, but is treated with KI without AcOH instead of KSCN with AcOH: m. $266-7^\circ$. Bis(triaminopropane) platinous

diiodide, white crystals, is prepd. similarly to the preceding, but NaBr is substituted for KI; m. p. 270-1°. *Bis(triaminopropane) platinumous dipicrate*, $[\text{Pt}(\text{NH}_2\text{CH}_2\text{CH}_2\text{NH}_2)_2(\text{C}_6\text{H}_3(\text{NO}_2)_3\text{O})_2]$, yellow powder, from the above diiodide and a considerable excess of picric acid, which deflagrate on heating. (*Triaminopropane- γ -monohydrochloride*) *palladium dichloride*, yellowish brown crystals, NH_4 chloropalladite (3 g.) and III (6.9 g.; 3 mols.) are dissolved in H_2O (50 cc.), refluxed for 4 hrs., filtered, cooled overnight and rapidly recrystd. from hot H_2O , m. p. 279-80°. *Triaminopropane trihydrogen trioxalate monohydrate*, $\text{C}_3\text{H}_5(\text{NH}_2\text{HOCCO}_2\text{H})_3\cdot\text{H}_2\text{O}$, white needles, from aq. solns. of III and oxalic acid, and recrystd. from hot H_2O ; m. 173-4°. J. B.

7—ANALYTICAL CHEMISTRY

WILLIAM T. HALL

Spectroscopic control of the color change in indicators of the phthalein and sulfurein groups. PAUL BRÜERE. *Bull. soc. chim. biol.* 10, 283-90(1928). Construction of stable colorimetric scales for simple and mixed indicators. *Ibid* 291-3; cf. C. A. 20, 3660; 21, 2445.

The use of indicators in the colorimetric determination of hydrogen ion concentration. T. H. FAIRBROTHER. *Ind. Chemist* 4, 66-9, 93-6(1928).—The practical value of colorimetric p_{H} detns., the method of prepg. suitable buffer solns. and the procedure for carrying out the colorimetric comparisons are explained.

Acidimetric and alkalimetric titrations. A. GRÉGOIRE. *Ann. Gembloux* 33, 277-95 (1927); *Expt. Sta. Record* 57, 804.—This is an instructive discussion of the acidimetric and alkalimetric titrations and the behavior and suitability of indicators on the basis of the theory of acid-base equilibria.

Differential potentiometric titration. I. Simple method (Method I). II. Refined methods (Methods II and III). BERNARD CAVANAGH. *J. Chem. Soc.* 1928, 843-55, 855-72.—The method of titrating to an absolute e. m. f. (cf. C. A. 22, 37) is, in general, more accurate than titrating to a marked change in e. m. f. but the latter principle is more popular in practical work. The methods described in these 2 papers refer to pptn. analysis and depend upon a broader conception of the differential principle, and while retaining the advantage of wide applicability, appear to be an improvement both with respect to convenience and to precision. Instead of the customary process of making quite a no. of readings after the addition of relatively small quantities of reagent in order to detect the max. rate of change in e. m. f., it has been found possible to det. the result of a titration with higher precision from 2 or 3 measurements of e. m. f. corresponding to one or two large additions of reagent. The method is explained with the titration of Cl^- with Ag^+ as a typical example; the original papers should be consulted for details. The methods depend on the changes of the e. m. f. of the indicator electrode and not on the particular values of the e. m. f. Method I is applicable whenever an absolute uncertainty of the order of 0.2-0.15 of the soly. product of AgCl is permissible. A first tentative addn. of reagent is made and from the resulting e. m. f. an approx. estimate of the quantity still required is obtained by reference to a table given. Nearly this amt is then added and the small residual deficiency is evaluated in the same manner as before. Precision depends chiefly on the closeness of approach to the end point, which, in the most dil. solns., is limited by the incompleteness of the reaction in the neighborhood of the end point. The second method described is for more dil. solns. and gives greater precision. It is an extension of Method I to and beyond the end point, depending upon a fairly precise knowledge of the soly. product of the ppt. formed and the use either of a set of accurately drawn curves or of a numerical table. Method III is independent of a knowledge of the soly. product of the ppt. From the 2 e. m. f. changes produced by 2 successive additions of reagent, the result of the titration is obtained by a simple calcn. with the aid of a table given, or by the use of a set of curves. Methods II and III depend upon the conformity of the titration curve to a simple general equation deduced on thermodynamic grounds alone.

W. T. H.

A quantitative method of dust determination. A. SEITZ. *Zentr. Gewerbehyg.* 14, 328; *Bull. Hyg.* 1, 230.—Exact weighed amts. of metallic dust are pptd. on a celluloid plate. The plate is photographed and standards are prepd. In the detn. the celluloid plate is smeared with paraffin and exposed to the air for 24 hrs. Org. dust does not show when photographed.

GEORGE R. GREENBANK

Notes on potassium bisulfate fusions. W. R. KERR. *J. Am. Ceram. Soc.* 11, 330(1928).—Reference is made to the well-known fact that it is advisable to heat KHSO_4 until all moisture is expelled and $\text{K}_2\text{S}_2\text{O}_7$ is formed, before using it as a flux.

C. H. KERR

The action of dichromate on manganous ions. S. ORLOVSKII. *Z. anorg. allgem. Chem.* 170, 184–90(1928).—In alk. soln., $\text{Cr}_2\text{O}_7^{--}$ oxidizes Mn^{++} to $\text{Mn}(\text{OH})_3$, and the oxidizing power of $\text{Cr}_2\text{O}_7^{--}$ decreases when the alk. increases. The method is not directly applicable to the detn. of Mn, either by back titration of $\text{Cr}_2\text{O}_7^{--}$ or by weighing the ppt. The best results are obtained when Mn is detd. by another method in the ppt.

G. CALINGAERT

Progress in the analytical chemistry of light metals. F. I. HAHN. *Z. Metallkunde* 19, 119(1927); *J. Inst. Metals* 37, 565; cf. *C. A.* 20, 2001.—It is pointed out that the methods of estns. of Al and of O in Al hitherto known are not exact. Reference is made to the possibility of an exact estn. of Mg in Al in a different way.

H. G.

Colorimetric analysis of some metals. HUGO FREUND. *Zentr. Hütt. Walzwerke* 30, 79–80(1926); *J. Inst. Metals* 37, 557.—The colorimetric methods that have been proposed for the detn. of small quantities of Mo, W, Cr, P, Fe and Co are discussed, and the procedures of Maag (*C. A.* 19, 1675), Travers (*C. A.* 12, 1158) and Evans (*C. A.* 15, 1264; 19, 3073) are recommended.

H. G.

Volumetric determination of antimony in the presence of lead, tin and copper. A. VASSILIEV AND V. KARGIN. *Papers Pure Appl. Chem. Karpov-Inst. (Moskov); Festschrift. Bach 1927*, 143–56 [In Russian]; *J. Inst. Metals* 38, 508.—In the detn. of Sb by titration with KBrO_3 , Pb and Sn do not interfere; Cu, however, causes the results for Sb to be 0.3–1.7% too low, and Cu and Pb together cause even lower results to be obtained. The PbSO_4 ppt. invariably contains a small percentage of Sb, which may be detd. by dissolving it in HCl and titrating with KBrO_3 .

H. G.

Determination of sulfur in metallic alloys and its influence on their properties. W. MEIGEN AND K. STOCK-SCHRÖBER. *Zentr. Hütt. u. Walzwerke* 30, 277–31(1926); *J. Inst. Metals* 37, 585.—The alloy is dissolved in HCl, with Br or KClO_3 as oxidizer. After removing the excess of the latter by boiling and filtering, if necessary, the soln. is treated with BaCl_2 . If the sample dissolves completely in HCl all the S is evolved as H_2S and may be collected in a Cd or Pb salt soln. Photomicrographs are given of brass, bronzes, Cu, Zn, Sn and Pb contg. less than 1% S, showing the characteristic shape of the various sulfide inclusions, and a table shows the effect of S on the tensile strength, hardness, ductility and d.

H. G.

Separation of the metals of the third group. G. G. LONGINESCU AND (Mlle.) GABRIELLE CHABORSKI. *Bul. soc. stiinti Bucuresti* 27, 41–4(1924); *J. Inst. Metals* 36, 533.—The usual $(\text{NH}_4)_2\text{S}$ ppt. is dissolved in HCl and KClO_3 , the soln. neutralized with K_2CO_3 , treated with an excess of 20% NaOH, boiled and filtered and the filtrate tested for Al and Zn by the usual methods. The ppt. is boiled with 20% $(\text{NH}_4)_2\text{CO}_3$, which dissolves Ni, Co and part of the Cr. On prolonged boiling Ni is pptd. as a green basic salt, and the filtrate can then be tested for Co by the cobaltinitrite method. The insol. residue from the $(\text{NH}_4)_2\text{CO}_3$ treatment is tested for Mn and Cr by the hypochlorite method of Chaborski (*C. A.* 18, 952), and the presence of Fe is confirmed by the $\text{K}_4\text{Fe}(\text{CN})_6$ or KCNS method.

H. G.

Determination of cobalt as cobalto-cobaltic oxide in a stream of oxygen. R. CERNATESCO AND (Mrs.) E. VASCAUTANU. *Ann. sci. univ. Jassy* 15, 69–70(1928).—In an oxidizing atm. the most stable oxide is Co_3O_4 , provided the temp. is not too high. Calcination of black Co hydroxide (from the pptn. of $\text{Co}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$ with KOH and Br) over a good Bunsen flame in a slow current of O_2 gave results differing from +0.14 to –0.32% from theoretical.

A. PAPINEAU-COUTURE

A new method of determining copper in commercial copper sulfate. V. MORANI. *Atti II congresso naz. chim. pura applicata 1926*, 1376–80.—Detns. of Cu in CuSO_4 of known concn. as a test of the Biazzo method (cf. *C. A.* 19, 2613) showed that the latter is rapid and simple and should have the advantage over other volumetric methods in that the detn. can be carried out when Cl is present, as it usually is in com. CuSO_4 . Nevertheless it lacks the precision which it was hoped that it would possess, chiefly because of the uncertain oxidation of HSCN by excess KMnO_4 , as pointed out by B.

C. C. DAVIS

Nephelometric determination of small quantities of lead in the presence of zinc by means of potassium chromate. L. S. VAN DER VLUGT. *Chem. Weekblad* 25, 194-6 (1928).—The Pb ext. is evapd. to dryness with a drop of strong HNO_3 , the residue dissolved in H_2O , filtered and transferred to a colorimeter glass of 100 cc. One drop of N AcOH and 1 drop 10% K_2CrO_4 are added. After shaking, the turbidity is compared with standard turbidities of a scale of solns. with 0.03 up to 0.60 mg. Pb per 100 cc. In the presence of Zn the evapd. ext. (without HNO_3) is dissolved in 3 cc. 10% AcOH , filtered and transferred to the colorimeter glass. One cc. of $\text{Zn}(\text{AcO})_2$ soln. of 20 mg. Zn per cc. is added and filled up to 100 cc. After shaking 5 drops 5% K_2CrO_4 are added, the soln. is shaken again and compared after 10 min. standing. The comparison solns. in this case are made from amts. of $\text{Pb}(\text{AcO})_2$ soln. (1 cc. = 0.1 mg. Pb) with 3 cc. 10% AcOH in the colorimeter glass and further treatment as above for the tested soln.

B. J. C. VAN DER HOEVEN

Determination of potassium. LUIGI GALIMBERTI. *Atti II congresso naz. chim. pura applicata* 1926, 1396-7.—The method is simpler and more rapid than any proposed in the past, and is sufficiently precise for ordinary analyses of K salts. It depends upon the reaction. $\text{Na}_3[\text{Co}(\text{NO}_2)_6] + \text{KCl} \longrightarrow \text{Na}_2\text{K}[\text{Co}(\text{NO}_2)_6] + \text{NaCl}$, the quantity of NO_2 in the latter ppt. being detd. by oxidation with KMnO_4 . *Procedure*.—Evap. to dryness an aliquot part (contg. at least 0.02 g. of K) of the soln., dissolve in 10 cc. of water, add about 10 cc. of Billmann reagent (10% $\text{Na}_3[\text{Co}(\text{NO}_2)_6]$ soln. prepd. at the time, cf. *Z. anal. Chem.* 39, 286(1900)), let stand 3 hrs., filter, wash with cold water, add 50 cc. of 0.1 N KMnO_4 and 100 cc. of water, boil, and agitate until the ppt. is completely oxidized, as an aid to which add 10 cc. of dil. H_2SO_4 (1:4). Add a known quantity of 0.1 $\text{N Na}_2\text{C}_2\text{O}_4$ in excess, agitate until the ppt. redissolves and the soln. is colorless, titrate the excess $\text{Na}_2\text{C}_2\text{O}_4$ and calc. the vol. of KMnO_4 consumed in oxidizing the $\text{Na}_2\text{K}_2[\text{Co}(\text{NO}_2)_6]$ by subtracting from the total vol. that used for the $\text{Na}_2\text{C}_2\text{O}_4$. One cc. of KMnO_4 corresponds to 0.000711 g. of K. Dctn. of K in 40 cc. of 0.01 N KCl contg. large quantities of NaCl and MgSO_4 gave 0.01559 g. (theoretically 0.01561 g.)

C. C. DAVIS

A method for rapid estimation of the free silica contained in feldspar, by means of microscopical examination. I. SCHAEFELZER. *Céramique* 29, 301-2(1926); *J. Inst. Metals* 38, 674.—Advantage is taken of the optical properties of silica, and a preliminary sepn. of the colored portion is first made after heating to a temp. of 1200° .

H. G.

The titration of tin in white metal with potassium bromate. ADOLF SEUTHE. *Mitt. Dortmunder Union* 1, 169-78(1924).—Various methods for detg. Sn in white metal were tested and that of Pinotti (*Chem.-Ztg.* 46, 1082) proved most satisfactory. The alloy is dissolved in HCl and, when disintegrated, KClO_4 is added dropwise. Then the soln. is reduced with Fe and finally with Al, eventually heating till all reduced Sn is in soln. as SnCl_2 . The Sn^{++} is then titrated with 0.1 N I_2 soln. S. finds, however, that the results are not satisfactory if the final titration takes place with KBrO_3 soln.

W. T. H.

New microchemical method for the separation of zinc and copper. R. RIPAN. *Bull. soc. stiinte Cluj* 3, 45-8(1926); *J. Inst. Metals* 37, 575.—The soln. is neutralized with NH_4OH and treated with 5-10 drops of 0.1 $\text{N NH}_4\text{CNS}$, and 5-6 drops of $\text{C}_6\text{H}_5\text{N}$. After heating to boiling to dissolve the Zn compd., 150 cc. of cold water are added, and the green ppt. of $\text{Cu}(\text{C}_6\text{H}_5\text{N})_2(\text{SCN})_2$ is collected in a filtering tube, washed with a dilute soln. of the precipitants, and ignited to CuO for weighing. Zn is recovered by evapg. the filtrate to 10-12 cc. and adding more $\text{C}_6\text{H}_5\text{N}$. The pptd. is collected, washed and ignited to ZnO .

H. G.

Determination of sulfuric acid by means of benzidine. O. NYDEGGER. *Chem.-Ztg.* 52, 318-9(1928).—Details are again given for the pptn. of SO_4^{--} by means of benzidine and for the detn. of S in pyrite. See C. A. 1, 701.

W. T. H.

Analyses with the quartz lamp. BEIN and H. J. BRAUN. *Chem.-Ztg.* 52, 317-8 (1928).—By means of the short, ultra-violet rays from a quartz lamp it is possible to test the genuineness of writing, bank notes, postage stamps, fats, oil, cereals, fruit juices, meats, sausages, precious stones and paintings very rapidly, with certainty and without altering the object.

W. T. H.

An examination of a method of estimating iron and sulfur in sulfides of iron. P. L. ROBINSON, L. A. SAYCE and JAMES STEVENSON. *J. Chem. Soc.* 1928, 813-4.—Weyman (C. A. 14, 1428) published a method for the detn. of Fe and S based upon the observation of Wright that Fe sulfides are decomposed by treatment with neutral CuSO_4 soln. Tests with the method now prove that it is unreliable. With 0.14-0.26 g. of moist FeS , from 3 to 17% of the S is not converted into CuS , as it should be if the method were accurate.

W. T. H.

The practical application of two qualitative tests for hydrocyanic acid in ship fumigation. G. C. SHERRARD. *U. S. Pub. Health Repts.* 43, 1016-22 (1928).—Tests are necessary to det. when a ship after fumigation with HCN is habitable and to det. when it is safe for a fumigating crew to enter a hold for further ventilation and to search for rats. The benzidine-Cu(OAc)₂ test proved too rapid and too sensitive for practical purposes. The methyl orange-HgCl₂ test is sensitive to a concn. of HCN very much lower than the min. lethal concn. It requires 2 min. to complete its reaction so that a few sec. in reading the time does no great harm. To carry out the test, prepare 250 cc. of 0.5% HgCl₂ soln. and a soln. of 0.6 g. methyl orange in 250 cc. of water. Mix 10 cc. of the HgCl₂ soln. with 5 cc. of the methyl orange soln. and add 1 cc. of glycerol. Immerse filter paper in the mixt. and dry in air free from any trace of acid. Such paper will detect 0.84 g. of HCN in 1000 cu. ft. of air. The sense of smell will detect 0.25 g. of HCN per 1000 cu. ft. so that it is not intended entirely to replace the tests of odor, taste and lachrymation but it can replace the use of white rats for testing holds. Owing to the fairly high humidity in most seaports, the normal error will be on the side of safety. The test has been used at the N. Y. Quarantine Station for detecting leaky gas containers. W. T. H.

Estimation of reducing sugars by the ferricyanhydric method. IONESCO-MATIU. *Bull. soc. chim. bol.* 10, 252-60 (1928).—For macro-estn. a measured soln. of standard alk. K₃Fe(CN)₆ is heated to boiling and the sugar soln. is added from a buret, whereupon the ferricyanide is reduced to ferrocyanide, the end reaction being shown by picric acid indicator which changes to a cherry-red color. Five mols. of K₃Fe(CN)₆ oxidize 1 mol. of glucose. For micro-estn. the ferrocyanide produced by reduction of the ferricyanide is estd., after acidifying, by permanganate. L. W. RIGGS

The influence of malic acid in lemon juice in the Warrington method of analysis. FILIPPO PERCIABOSCO. *Atti II congresso naz. chim. pura applicata* 1926, 1369-70.—Lemon juice, with and without the intentional addn. of 1% malic acid, was analyzed for citric acid by the Warrington method. The % of citric acid was the same in each case, showing that even when much more malic acid is present than could occur naturally, the Warrington method is not influenced by its presence. The reason is that Ca malate is so sol. in water that even if a small part is pptd. at first with the Ca citrate it is washed out of the latter during the regular washing of the ppt. C. C. DAVIS

Rapid method of determination of phosphates in liquids in the manufacture of citric and tartaric acids. FILIPPO PERCIABOSCO. *Atti II congresso naz. chim. pura applicata* 1926, 1371-3.—The method is shorter and simpler than the regular Sonnenschein method, and though not extremely precise it is satisfactory for industrial control analyses. It depends upon the fact that when citric and tartaric acids are converted to their NH₄ salts, the oxides of Fe, Ca, Al, Cu, etc. are held in soln. provided that excess NH₄ citrate is present. *Procedure.*—Filter the liquor contg. CaSO₄ and other suspended impurities, remove 10 cc. if very impure or 50 cc. if fairly pure, dil. to 300 cc. or to 200 cc., resp., neutralize with a slight excess of NH₄OH, add 25 cc. of NH₄ citrate for tartaric liquors (this is not necessary for citric liquors), heat, add 25 cc. of Mg reagent, let stand 2 hrs. and calc. the phosphates from the wt. of Mg₂P₂O₇ obtained after ignition. Comparative tests of 11 citric and tartaric liquors with the new method showed close agreement in the analyses. Even the Sonnenschein method may be simplified by eliminating the ignition and destroying the org. substances with HNO₃ instead. In this case boil 10-50 cc. of the liquor with HNO₃ (d. 1.40) for 1.5 hr., replacing HNO₃ lost during the boiling, dil. with water, heat, add (NH₄)₂MoO₄ and proceed according to the Sonnenschein method. C. C. DAVIS

The determination of trioxymethylene. MARIA ESTER ALESSANDRINI. *Atti II congresso naz. chim. pura applicata* 1926, 1356-67.—None of the numerous methods for the detn. of HCHO is applicable to trioxymethylene. A new method is described which is rapid and precise and is not subject to error when trioxymethylene is allowed to stand in soln. a long time before detg. its HCHO content. The instability of trioxymethylene in soln. is the chief obstacle in the development of a method of detn., and expts. on the detn. of trioxymethylene with different methods for HCHO and under varying conditions show that the HCHO decreases progressively with time. This decompn. may be avoided by dissolving the trioxymethylene in alc. KOH or in aq. KCN, in neither of which does HCHO decomp. even on long standing. *First method.*—Dissolve 1.7826 g. of trioxymethylene in 25 cc. of 2% alc. KOH, make up to 1000 cc. with water, add exactly 20 cc. of this slowly to 50 cc. of 0.1 N KCN (previously standardized with 0.05 N AgNO₃), add 5 cc. of 30% MgSO₄, dissolve the ppt. in 1 g. of pure NH₄Cl, add 2 drops of 10% NH₄OH, then 2-3 drops of 5% KI, and titrate immediately the excess KCN with 0.05 N AgNO₃. Each cc. of 0.1 N KCN corresponds to 0.003 g. of HCHO. *Second*

method.—Titrate with 0.05 *N* AgNO₃ 2 solns.: (1) 50 cc. of 0.1 *N* KCN, and (2) 50 cc. from a soln. contg. 0.9541 g. of trioxymethylene in 1000 cc. of 0.1 *N* KCN, first adding 5 cc. of 30% MgSO₄, 1 g. of NH₄Cl, 2 drops of 10% NH₄OH and 2 drops of 5% KI. The difference in the no. of cc. of AgNO₃ is that KCN consumed by the HCHO in 50 cc., 1 cc. of 0.1 *N* KCN corresponding to 0.003 g. of HCHO. C. C. DAVIS

8- MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIKER

Microscopic examination of opaque minerals - determinative tables. M. LIEGRANGE. *Rev. universelle des mines* 15, 67-75 (1927). C. W. OWINGS

Linear compressibility of thirteen natural crystals. P. W. BRIDGMAN. *Am. J. Sci.* 15, 287-96 (1928).—The linear compressibilities of andradite, garnet, beryl, apatite, hanksite, tourmaline, quartz, rutile, barite, topaz, jeffersonite, orthoclase and spodumene have been detd. The results are presented in a table, and compared with other detns.

R. L. HERSHEY

The crystal structure of graphite. H. ORT. *Ann. Physik* 85, 81-109 (1928).

A new and complete analysis of the graphite structure has been made without the use of space group theory. The structure found is the same as that of Bernal (*C. A.* 19, 755).

R. L. HERSHEY

A new occurrence of selenium ores near St. Andreasberg. H. ROSE. *Z. Krist.* 66, 480-3 (1928).—The following minerals are found: clausenthalite, PbSe; tiemannite, HgSe; Bi₂Se₃; ZnSe; umangite, Cu₁₀Se₂; berzelianite, Cu₂Se; and naumannite, Ag₂Se.

L. S. RAMSDELL

Marmatite and christophite. W. F. DE JONG. *Z. Krist.* 66, 515 (1928).—X-ray powder photographs of marmatite and christophite show the ZnS pattern, but with larger spacings, as follows: ZnS, *a* = 5.395; marmatite (27% Fe) 5.415, christophite (34% Fe) 5.420 Å. U. J. concludes that the existence of definite compds., Zn₂FeS₂ and ZnFeS₂ is not disproved.

L. S. RAMSDELL

A variety of pyrite in the metasomatic lead-zinc deposits. H. CHRENDERG. *Z. Krist.* 66, 478-80 (1928).—Report of a chem., mineralographic and x-ray investigation of a variety of pyrite from Aachen and Wiesloch in Baden which contains 7% excess Fe.

L. S. RAMSDELL

The crystal structure of skutterudite and smaltite-chloanthite. IVAR OPTEDAL.

Z. Krist. 66, 517-46 (1928).—Skutterudite (CoAs₃) is cubic, with symmetry T_h^5 . The side of the unit cube is 8.189 Å. U. There are 8 mols. in the cube, and the positions of the atoms are: Co (8c) and As (24d), with *u* = 0.35 and *v* = 1/2 - *u*. The distance As-As is 2.46 and Co-As 2.35 Å. U. Smaltite and chloanthite are not diarsenides, but are impure Ni-bearing skutterudite. They give the same x-ray pattern as skutterudite, with a slight increase in the size of the unit cell, due to the Ni. They do not belong to the pyrite group.

L. S. RAMSDELL

The space group of carnallite. J. LEONHARDT. *Z. Krist.* 66, 506-7 (1928).—KCl.MgCl₂.6H₂O is orthorhombic and belongs to space group V_h^6 . The unit cell contains 12 mols. and has the dimensions *a* = 9.53, *b* = 16.08 and *c* = 22.25 Å. U.

L. S. RAMSDELL

The crystal structure of cryolithionite. G. MENZER. *Z. Krist.* 66, 457-8 (1928).—Na₂Li₃Al₂F₁₂ is cubic, with symmetry of space group O_h^{10} . The unit cube has *a* = 12.10 Å. U. and contains 8 mols. The structure is analogous to garnet, with the actual

dimensions very close to those of $\text{Ca}_3\text{Fe}_2\text{Si}_3\text{O}_{12}$. Since the F atoms are all equiv., the formula is not $3\text{NaF} \cdot 3\text{LiF} \cdot 2\text{AlF}_3$. Pseudo-cubic cryolite probably has the same type of structure.

L. S. RAMSDELL

Cassiterite and topaz from the mines of northern Nigeria. ALFRED SCHOEP. *Natuurw. Tijdschrift* 10, 3-6(1928).—Cassiterite from the Champion mines, Kuru Hills, and from the Rayfield mines is bipyramidal (111), black. The Batura Monguna mines have striated prismatic cassiterite (111 and 120), brownish. Topaz from Ninghi Hills and from Balfour Hill is almost colorless (sometimes slightly blue or green) with (110), (120) and (011) well developed, sometimes (001). The angle $2V = 64^\circ 28' - 65^\circ 54'$, $\alpha = 1.615 - 1.621$, $\beta = 1.622 - 1.628$. The value of $2V$ shows the F content to be about 20%.

B. J. C. VAN DER HOEVEN

X-ray investigation of the structure of brookite and the physical properties of the three titanium dioxides. A. SCHRODER. *Z. Krist.* 66, 493-4(1928).—There are 8 mols. of TiO_2 in the unit cell of brookite, and $a = 9.136$, $b = 5.439$ and $c = 5.153$. β -Anatase (tetragonal holohedral) at 642° changes to α -anatase (probably tetragonal). This change is reversed on cooling. At $915^\circ \pm 15^\circ$ α -anatase changes to rutile, forming stable pseudomorphs.

L. S. RAMSDELL

Titanium in bauxite ores and sludges. W. H. COGHILL. *Bur. Mines, Repts. Investigations* No. 2867, 4 pp.(1928).—Sp. gr. (float and sink) fractionation of granular bauxite sludge indicates that TiO_2 distribution is not favorable to making a rich concentrate by gr. methods. Table concn. was tried. When the Ti was in a mixt. of clay and bauxite, very little selection was shown, indicating its presence in minerals such as leucoxene and xanthitane. Leucoxene is a whitish, granular, flocculent mineral indistinguishable from the mass of amorphous $\text{Al}(\text{OH})_3$, and xanthitane (a hydrous titanate of Al) is a yellow, friable, earthy substance. A general distribution of Ti found in bauxite seems to accord with the well known statistical information that the lithosphere has a tenor of 0.77% TiO_2 . Much of it is too disseminated for concn.

W. H. BOYNTON

X-ray investigation of lateritic rocks and of sporogelite. W. F. DE JONG. *Z. Krist.* 66, 303-8(1928).—The weathering of igneous rocks may result in formation of kaolinitic material, or a sol. constituent and insol. Al and Fe hydroxides. Rinne considered bauxite powder photographs to show the presence of kaolin, diasporite, feldspar and gibbsite, and thus to be a mixt. J. disproves this with a series of powder diagrams of the above minerals, as well as artificial Al hydroxide. Crystallized $\text{Al}(\text{OH})_3$ can occur in three ways: as gibbsite, bauxite and diasporite. Amorphous $\text{Al}(\text{OH})_3$, as sporogelite is not shown by x-rays.

L. S. RAMSDELL

Greenish satinspar (calcite) of Kipushi, Katanga. A. L. HACQUAERT. *Natuurw. Tijdschrift* 10, 7-9(1928).—Calcite is described of greenish color, glassy luster, $d. 2.717$, $\omega = 1.657 \pm 0.003$, $\epsilon = 1.482 \pm 0.003$. Its peculiar structure, alternating dull and glossy bands of 1 mm. width (microcrystalline and elongated CaCO_3 crystals) permit it to be classified as satinspar (Lacroix). The color is caused by 0.095% CuO.

B. J. C. VAN DER HOEVEN

Ferri ferrous feldspar of Madagascar. D. S. BELYANKIN AND N. G. SERGIEV. *Bull. acad. sci. union rep. soviet. sociol.* (VI) 20, 1199-1206.—The mineral derived from the pegmatite of the Itroungay area in Madagascar and described as orthoclastic feldspar by Lacroix in *Minéralogie de Madagascar* (cf. *C. A.* 18, 806) has been subjected to a thorough examn. In optical properties it does not differ from sanidine, but the latter crystallizes preferably in hot lavas, whereas the present mineral is in comparatively "cold" pegmatites. Optical measurement gave $n = 1.556$. It is transparent, homogeneous and pure. It is partly colored in pink and yellow, the coloration being due to a very considerable Fe_2O_3 content. Analysis gives: 0.2 K_2O , 0.6 Fe_2O_3 , 6.9 SiO_2 , a certain amount of K having been removed by solns. The mineral is a ferri ferrous orthoclase.

BERNARD NELSON

The structure of feldspar and micas. MIECZYSLAW DOMINIKIEWICZ. *Roczniki Chem.* 7, 345-56(1927).—Structural diagrams are given showing the kaolin nucleus as a fundamental constituent of feldspar and micas. Anorthite is regarded as normal Ca kaolinite. The SiO_2 split off in the course of kaolinization of feldspar is combined with the Al and not with the SiO_2 part of the kaolin nucleus. Part of the K_2O is combined with this SiO_2 . Orthoclase is K-kaolinite-silicate; the 8 aluminate complexes of the 2 natrolite radicals are satd. with 2 mols. K silicate. The possibility of structural isomerism is evident from the diagram. Kaolinization, whereby alkali silicate is split off and replaced by H, can be effected not only by hydrolysis but also by pneumatolysis (acid vapor, steam). The acid micas with a varying ratio of $\text{Al}_2\text{O}_3 \cdot \text{SiO}_2$ are products of gradual hydrolysis. They may also partly represent mixts. of normal and acid, or of different acid compds. The simplest mica may be derived from a natrolite nucleus.

Replacement of free SiO_2 radicals by F, Mg or both leads to lepidolite, the simple biotite or phlogopite. Other biotites may be substitution products of the natrolite and kaolin nucleus, the aluminate part of which is combined with Mg silicate. M. J.

The rock-forming alkali hornblendes. W. KUNITZ. *Z. Krist.* **66**, 464-5(1928).—Chem. examn. of 16 hornblendes showed only one series: syntagmatite-arfvedsonite, with the compn. of the end members $\text{HNa}_3\text{Fe}_6\text{Si}_9\text{O}_{28}$ and $\text{HCa}_3\text{Al}_3\text{Fe}_3\text{Si}_6\text{O}_{25}$. In studying glaucophane the series gastaldite-riebeckite was confirmed, with the end member compns. of $\text{H}_2(\text{NaAl})_2\text{Mg}_4\text{Si}_9\text{O}_{27}$ and $\text{H}_2(\text{NaFe})_2\text{Fe}_4\text{Si}_9\text{O}_{27}$. L. S. RAMSDELL

An x-ray study of cyanite and staurolite. GABRIEL M. CARDOSO. *Z. Krist.* **66**, 485-7(1928).—A unit cell can be chosen for cyanite which is pseudoorthorhombic centered, with $a = 26.868$, $b = 7.883$ and $c = 5.650$ A. U. This cell contains 16 mols., and agrees closely in dimensions with those of sillimanite and andalusite, if their values of a are multiplied by 4. The parallel growths of cyanite (100) and staurolite (010) are due to the striking agreement in the lattices of the two, at least in the growth directions. The lattice values for staurolite are as follows. $a = 7.81$, $b = 16.59$ and $c = 5.64$ A. U. L. S. RAMSDELL

The structure of benitoite. J. J. P. VALETON. *Z. Krist.* **66**, 496-7(1928).— $\text{BaTiSi}_2\text{O}_9$ is hexagonal, D_{3h}^2 or D_{3h}^4 . The unit cell contains 2 mols. and has $a = 6.64$ and $c = 9.71$ A. U., giving an axial ratio 1.14634, which is twice that usually accepted. Previous detn. by Gossner and Mussgnug (*C. A.* **22**, 1304) is incorrect, because they overlooked some faint lines. L. S. RAMSDELL

Researches on minerals of the apatite group. G. CAROBBI. *Atti II congresso naz. chim. pura applicata* 1926, 1156-81.—The expts. had as their object the discovery of rare elements in minerals. Chem. and spectrographic analyses were made of pyromorphite from Braubach, Nassau and from Leadhills, Lanarkshire, Scotland and of mimetite from Santa Eulalia, Chihuahua, Mexico, the results of which are tabulated in complete detail. In the Braubach pyromorphite were identified Ce, La, Nd, Sa, Y, Eu, Gd, Dy, Er and Yb. In the Leadhills pyromorphite were identified Ce, La, Nd, Y, Eu, Gd, Dy and Er. Cr was present, at least partly as PbCrO_4 , as well as Mn and Ca. In the mimetite of Santa Eulalia were found Cr, Mn, Zn, Ca, Ba and Sr, but spectrographic analysis failed to detect even a trace of any rare earth. In view of the presence of rare earths in 2 pyromorphites, expts. were carried out to det. to what extent the Pb of $3\text{Pb}_3(\text{PO}_4)_2 \cdot \text{PbCl}_2$, of $3\text{Pb}_3(\text{VO}_4)_2 \cdot \text{PbCl}_2$ and of $3\text{Pb}_3(\text{AsO}_4)_2 \cdot \text{PbCl}_2$ can be replaced by La and the products still be isomorphous. The results of these expts. are published elsewhere (cf. C. and Restaino, *C. A.* **20**, 1969). C. C. DAVIS

The space group of gypsum. ETTORE ONORATO. *Z. Krist.* **66**, 504-5(1928).—The unit cell of gypsum has the dimensions $a = 10.47$, $b = 15.151$ and $c = 6.28$ A. U. It contains 8 mols. and has the symmetry C_{2h}^3 . L. S. RAMSDELL

Mineralogical communications from Hungary. II. VICTOR ZSIVNY. *Z. Krist.* **66**, 651-3(1928); cf. *C. A.* **22**, 2125.—A description of calcite, galena, sphalerite, barite and fluorite from Komitat Maramaros and an analysis of melanterite from Komitat Gömör. L. S. RAMSDELL

Manganiferous ore deposits of Sicily. EUGENIO MANZELLA. *Atti II congresso naz. chim. pura applicata* 1926, 1199-1205.—Mn ores at Sommatino and at Castelvetro were examd. physically and chemically. Manganite is the predominant mineral in the Sommatino ore. The Mn content of the ore increases with the depth, varying from 8 to 28.5%. Complete analyses showed the following % compn.: Mn_2O_3 44.66-46.91, CaSO_4 19.12-13.15, CaCO_3 6.90-7.00, clay (SiO_2 , Fe_2O_3 , Al_2O_3 , H_2O) 28.66-32.00. Pyrolusite is the chief component of the Castelvetro ore, analyses showing the % compn.: MnO_2 63.59, Fe_2O_3 3.49, SiO_2 10.26, CaCO_3 21.75. The presence of gang in the Sommatino ore renders it unfit for direct use in siderurgy, but suitable enrichment may make it of value. A discussion of other Mn ores is included, with certain rare references. C. C. DAVIS

Petrographic investigation of coal on the basis of the specific gravities of the individual components, which are separated by means of heavy liquids in a centrifuge. W. GROSZ. *Z. Krist.* **66**, 460-1(1928).—Sepn. by gravity of coal particles smaller than 70μ is not possible, although such sizes are common. The use of a centrifuge greatly increases the possibilities of sepn. The liquid used is CCl_4 with xylol. Petrographic uses of the Grosz apparatus for centrifuging in heavy liquids. L. MILCH. *Ibid* **66**, 461(1928). The sepn. of solid phases by means of the centrifuge. F. v. WOLFF. *Ibid* **66**, 462-4(1928).—Good results were obtained in sepg. fine plates of mica and finely powd. minerals. Practically quant. sepn. can be obtained in some cases. In place of heavy liquids, such as methylene iodide, Clerici or Thoulet solns., melts of AgNO_3 ,

AgTl nitrate, or TIHg nitrate, can be used. The ds. of these melts are 4.1, 4.8 and 5.3, resp.

L. S. RAMSDALL

Paleozoic coals recently found in the Kwantō Mountains. S. TOKUNAGA. *J. Fuel Soc. Japan* 7, 17-9 (English Section) (1928).—T. recently found layers of coal and coaly shale in the Kwantō Mountains in the northern part of Hondo. This is the first discovery of coal in the Paleozoic formations in Japan. The geological formations of the coal-bearing layers are discussed and analytical data on the coal are given.

NAO UYEI

Paleozoic coals found in the Province of Mino. S. TOKUNAGA. *J. Fuel Soc. Japan* 7, 19-20 (English Section) (1928).—The analytical data of Paleozoic coals recently found in the Province of Mino, Gifu, Japan, and the geological formation of the region are discussed.

NAO UYEI

Microscopic zircons as control minerals. J. ZERNDT. *Bull. intern. acad. Polonaise* 1927A, 363-77.—Increasing interest in microscopic petrographical investigations of sedimentary rocks accentuates the desirability of control minerals which are able to indicate the source of the clastic constituents therein. The following control minerals have been established and used. 1. "Exotics," which comprise known mineral fragments often occurring in carpathian sedimentary rocks and form the magmatic as well as the older sedimentary remains which produce the clastic material. 2. Feldspars, which in sedimentary rocks, possess a significance similar to that in large rocks. 3. Quartz, in its various forms as granite, gneiss, vein-quartz, etc., has recently been found to possess a twin structure characteristic of tatra-granite. But many exotics, which show no resemblance to tatra-granite, also possess twin structure. 4. H. R. Lovely and F. P. C. Feilman established that cyanite is characteristic of Wygoda sandstone and epidote for Jamna sandstone, both from Borislav district. 5. O. Thürrach has shown the application of zircon as control mineral in investigations of diluvial sandstones. Z. demonstrates the usefulness of microscopic zircon to characterize magmatic rocks. Zircons were isolated by the methods of Thürrach, enlarged 660 times by means of the marking prism according to Dippel, the crystal habit was detd. and then developed according to the statistical method of Niggli and Goldschmidt. Only characteristics peculiar to zircon can be used; hence only abundance-persistence, combination-persistence and form-persistence can be considered. Zircons were examd. from two kinds of widely spread granite in the Tatra mountains and possessed great similarity. These zircons were similar to zircons from eruptive in rocks the Cracow district. Zircons found in the red granite from Huta-Bystrzycka, Wolhynia, formed a special type and resembled zircons from erratic granites of Lodz and Cracow. Hence, on the basis of crystal form, zircons from northern Wolhynia form a second class. Zircons from granites from Bugaj show all kinds of forms. Zircons from Friedeberg and Streigau are different from those of the Tatra mountains and from Wolhynia. Zircons from Lysogory mountains may be inferred from the Paleozoic (Cambrian) quartzite. Zircons from Jamna sandstone from Worochta (East Carpathians) resembled those from the Lysogory mountains. Zircons from sandstones of Cieszkowice resembled those of Bugaj. Hence it is possible to differentiate petrographical provinces on the bases of phys. form of zircons and to establish the origin of sedimentary rocks. Seven plates comprising 46 orthogonal projections, 99 microphotographs, 14 three-dimensional projections are given.

L. B. ETHERTON

An extrusive gneiss complex on the Nesodden Peninsula near Oslo. O. A. BROCH. *Norsk Geol. Tids.* 9, 81-219 (1926).—Nesodden contains minerals formed on the surface of the earth, strongly metamorphosed, of origin yet partially elucidated, but which form a definite unit termed extrusive (*suprakrustale*), in contrast with gneiss granite and pegmatite. The peninsula probably is exclusively composed of Pre-Cambrian rocks with occurrences of granitic anticlinal batholiths. Extrusive minerals occur in the north, east and west. Torvik granite, an acid granite high in K, is found in the south. Separating extrusive minerals and granite is migmatite, belonging to the basic gneiss granites. Leptite occurs, its light color indicating high silicic acid. It is related to liparite and is perhaps a transformed lava or tuff, micaceous schists being found intermingled with the leptite. Leptitic gneisses denote minerals petrographically intermediate between leptites and micaceous schists, the separation not being sharp. Masses of amphibolite occur resembling the compn. of gabbro. Small amounts of dioritoid minerals occur, more acid than and apparently related to amphibolites. The latter are almost all older than the pegmatites and perhaps older than granite. The veins of amphibolite are biotized at the boundary, being formed at the expense of the hornblende by the addition of K and the sepn. of Ca. The boundary between the extrusive complexes and granite is largely composed of cyanite, staurolite, gedrite and

albite-oligoclase The chem. relations between the minerals indicate that they represent systems in equil. and for such systems, according to the mineralogical phase rule of V. M. Goldschmidt, the max. no. of minerals (phases) to be expected is the same as that of the chem. components which are present. The gneiss complexes have an extrusive character with a large excess of alumina, indicating sedimentary origin. The origin of micaceous schists and leptitic gneiss is somewhat doubtful; they are however related to cyanite-gneiss and to leptite. Venite is genetically related to leptite or to micaceous schist. Amphibolite is somewhat more recent and preferably is to be considered as an intrusion. There are 9 figures in the text, 18 tables, 34 photographs, 36 photomicrographs, a geological chart on a scale of 1/10,000 for a distance of nearly 6 kilometers, with a bibliography of 56 references.

L. B. ETHERTON

The Cicurova granite. D. M. CADERE. *Ann. sci. univ. Jassy* 15, 81-8 (1928).—A detailed chem. and petrographic study (the results of which are given in detail) showed this to be an alk. granite belonging to a magma situated at the border of the syenite magma and alkali-granite, having an av. Al_2O_3 content, low Ca and Mg contents and high in alkalis, and forming part of the potassic facies (the rock being mega-potassic) of the Dobrogean magmatic basin. It closely resembles the Atmagéa granite (which has only been studied petrographically) and also the Caména quartz porphyric rock.

A. PAPINEAU-COUTURE

Arfvedsonite porphyry of Russian Lapland. B. M. KUPLETSKII. *Bull. acad. sci. union rep. soviet social* 1927, 579-92.—An original light-gray vein formation contg. abundant inclusions of dark amphibole has been found in the Chibin range in Laponia. The mineralogical constituents of the formation are: anorthoclase 47.31, nepheline 23.40, albite 23.75, apatite 0.23, ilmenite, rincolite, arfvedsonite, etc., 5.31%. It analyzes: SiO_2 55.41, TiO_2 1.24, Al_2O_3 20.26, Fe_2O_3 2.32, FeO 3.62, CaO 1.31, Na_2O 7.55 and K_2O 7.52%, with some MgO , MnO , H_2O and P_2O_5 . This chem. compn. compares very well with that of chibinite given by W. Ramsay and V. Hackmann ("Fennia" 1894, 11, No. 2, p. 196), only the mineralogical composition of the rock being different on account of different conditions of crystn. The amphibole inclusions contain: SiO_2 48.00, FeO 15.60, Fe_2O_3 11.90, Na_2O 9.37, Al_2O_3 7.38, K_2O 2.43, TiO_2 1.85, MnO 1.76, CaO 1.31, MgO 0.40%. This compn. shows that this amphibole is intermediate between arfvedsonite and riebeckite; its optical properties are those of arfvedsonite. The vein rock is thus an arfvedsonite nepheline-syenite porphyry.

BERNARD NELSON

A natrolite tinguaitite from Dunedin. P. MARSHALL. *Trans. Proc. New Zealand Inst* 58, 533-5 (1928).—Microscopic examn. and analysis of various samples of natrolite-tinguaitite from Dunedin, New Zealand, are given.

A. L. HENNE

Experimental investigations on the permanent magnetism of rocks subjected to heat. F. Y. LEVINSON-LESSING AND A. A. TURTZEV. *Bull. acad. sci. union rep. soviet social* 1927, 875-86 (French).—Specimens of basalt from Auvergne and from Vorontsov, and andesite from Mt. Ljalvar, were heated to various temps. up to 1000°. These treatments produced an increase in the intensity of permanent magnetization acquired by the rock on cooling in the earth's field. In general the higher the temp. the higher the intensity of magnetization. However, definite minima were observed for 400° and 700°. The results are interpreted as confirming conclusions previously announced on the atm. origin of the magnetic anomalies observed in rocks from mountain crests and isolated summits.

W. W. STIFLER

The slime of Lake Tékir-Ghiol. ADRIENNE BURADA. *Ann. sci. univ. Jassy* 15, 129-30 (1928).—The compn. was found to differ considerably from that found by Georgescu (P. Bujor, *Ann. sci. univ. Jassy* 1, 159 (1900)), but on the whole the relationship between the several constituents did not differ greatly from those in the 1st analysis.

A. PAPINEAU-COUTURE

Rock-strata gases in the Cripple Creek district and their effect on mining. F. H. DENNY, K. L. MARSHALL AND A. C. FIELDNER. *Bur. Mines, Repts. of Investigations* No. 2865, 24 pp (1928).—The pre-Cambrian rocks of this district consist of granites, gneisses and schists with intrusion of phonolite, latite-phonolite and syenite. Volcanic activity produced much breccia. Calaverite, pyrite, quartz, fluorite, calcite, dolomite, galena and celestite are found. The irrespirable gases which have resulted in occasional loss of life are a variable mixt. of N , CO_2 and usually O , and are produced by the direct chem. action of air and percolating water on sulfides and carbonates. The max. pressure measured of the rock-strata gases was 0.71" water gage and efflux of gas from the rock into the mine was somewhat parallel with fall in the barometer. The remedial measures suggested are diluting with large volumes of good air and/or sealing the ground with a cement gun.

L. B. ETHERTON

Geochemical inertia of the elements of the triads. P. VINASSA DE REGNY. *Atti*

accad. Lincei [6], 7, 23-5(1928).—A discussion of mol. nos. and the disposition of electrons (cf. C. A. 22, 1535) leads to certain general conclusions. While the first and last terms of each triad must, as with all substances in equil., be monoatomic mols., the intermediate terms must be at least biatomic mols. As a rule, substances whether simple or compd., natural or synthetic, org. or inorg., have even mol. nos. The terrestrial mass is almost completely formed of substances within the atomic no. 28, i. e., within the limits of the first triad. The geochem. inertia of the triad elements is to be ascribed to the no. and to the disposition of the electrons, which is of such a character that they are in a stable state of equil. • C. C. DAVIS

The action of cyanide on metals and minerals. ROBERT HAY. *Roy. Tech. Coll. (Glasgow)* No. 5, 25-9 (1926); *J. Inst. Metals* 36, 424.—Details are given of exptl. work to det. the efficiency of Au soln. in various strengths of KCN in presence of other metals and several metallic minerals. Graphs are given of the electrolytic potential of pure Au and a no. of the common impurities in Au ores in various concns. of cyanide, the most outstanding feature being the lack of evidence of the "selective action" claimed by MacArthur and Forrest. Discussion of the results obtained show that the function of dissolved O is all-important, not only in the soln. of the gold, but also in relation to the impurities present in the ore. H. G.

Mining and treating lead-zinc-vanadium ore in northern Rhodesia. G. L. WALKER. *Eng. Mining J.* 125, 733-6 (1928).—A description of the plant of the Rhodesia Broken Hill Development Co., Ltd., in South Africa. On Dec. 31, 1926, ore reserves were calcd. as 935,000 tons of oxides averaging 30% Zn, 8% Pb and 0.9% V₂O₅; 164,000 tons of sulfides averaging 34% Zn and 20% Pb, and 38,000 tons of V ores averaging 8% Zn, 8% Pb and 3.5% V₂O₅. Over 40% of marketable constituents are secured. The process employed is an adaptation of the H₂SO₄-leach and electrolytic processes. Pilot-plant tests indicate commercial recoveries of 88-90% of the Zn and 70% of the V in the ore. Smelting of leaching-electrolytic plant residues yields a Pb bullion contg. 14 oz. of Ag (approx. 3 times the Ag content of the Pb recovered in straight smelting). Zn from the Rhodesia Broken Hill demands a high price due to the absence of Cd. The hydroelec. plant is susceptible to vast expansion. W. H. BOYNTON

The occurrence of jarosite minerals in oxidized ores as a factor in metal losses. R. E. HEAD AND VIRGIL MILLER. *Bur. Mines, Repts. of Investigations No. 2870*, 13 pp. (1928).—Plumbojarosite and argentojarosite are common in oxidized Pb and Ag ores and have probably escaped recognition in attempts to treat certain oxidized Pb ores in which these minerals are a material portion of the metal content. Often Pb and Ag

recoveries have been below 70%, leaving in the discard a material probably too low-grade to warrant treatment by any prevalent process. A mineralogical description of the jarosite minerals is given and analyses of three plumbojarosite samples are tabulated. The exptl. investigation of representative ores contg. the jarosites indicates: (1) all oxidized ores of Pb, Ag and Au reddish brown or yellow in color should be examd. for members of the jarosite group; (2) the very small size of jarosite crystals, their low sp. gr. and their micaceous character render treatment by gravity methods of concn. practically impossible; (3) these minerals do not sulfidize readily when treated at concns. used in commercial practice; (4) tailings from the treatment of oxidized Pb ores on which low recoveries of Pb and Ag are secured should be examd. for jarosite minerals; and (5) the relative low metal content and distance from transportation facilities of many jarosite ores make them of doubtful economic value. They may be benefited by a suitable pyrometallurgical treatment or in some cases by volatilization methods.

H. C. DUUS

Comments on present practice at the United Verde concentrator and smelter. IV. E. H. ROBIE. *Eng. Mining J.* 125, 729-31 (1928).—After trial, the 4-way type of scoop feeders for the ball mill have been replaced by the standard type. The ball-mill drive—by synchronous motors direct-connected through magnetic clutches—has proved excellent. A marked surge in the classifier overflow was in evidence. A trail-unit flotation unit has air at 1-1.5 lb. pressure, freely admitted in close contact with the ore longitudinally along the bottom of the machine which lifts the pulp, which cascades over the side of the lifting compartment at the top. A fine dispersion of the bubbles results from the thorough mixt. of air and ore particles. The bubbles pass under a sloping baffle and are allowed to rise in a quiet chamber at the side from which the froth is removed. Power consumption is only about 1 kw.-hr. per ton, and repairs will probably be much less than in the usual app. Some mill data are shown. Dry calcined trona is used to make the pulp alk. for pptn. of CuSO_4 and $\text{Fe}_2(\text{SO}_4)_3$. Trona gives very selective conditions in the flotation cell with less froth and little flocculation resulting. The ratio of schist to free quartz has a marked bearing on reverberatory furnace tonnage. The interpretation of assays in terms of mineralogical compn is stressed. Four times the alumina equals the amount of schist present.

W. H. BOYNTON

Revisiting Arizona mining camps. V. E. H. ROBIE. *Eng. Mining J.* 125, 773-5 (1928), cf. preceding abstract.—A ribbed arch of silica brick is a feature of the United Verde reverberatory. The silica brick ribs are laid across the roof of the furnace, between buckstays only. Sep. skewback plates are used against the ribs and the ribs project about 15 in. above. A system of offsetting the joints insures a solid roof construction and the center of the arch, at the top, is keyed when hot. This construction, it is claimed, insures additional life of the arch. Converter practice at Clarkdale follows standard lines. Cast-iron pots are used for slag, and cast-steel ladles for mat. Where a high-grade low-iron concentrate is obtained, smelting flotation concentrates in the moist condition, without roasting, results in the elimination of troubles caused by the accumulation of magnetite in the reverberatory, and lower slag losses, better furnace conditions and dusting losses almost eliminated. Disadvantages are smaller furnace capacity, higher fuel requirements and some trouble in feeding the damp material. The Verde Central is a promising property.

W. H. BOYNTON

Pearlitic iron. RICHARD MOLDENKE. *Iron Age* 121, 1241 (1928).—The method used in producing pearlitic cast iron is described. In this process the Si content of the iron is kept low and the sand molds are preheated. In order to obtain a fairly fine-grained and dense iron the metal is highly superheated in melting and is not allowed to oxidize. Good quality is also dependent upon the proper placing of the gating and risers of the molds. The disadvantages encountered in the production of pearlitic cast iron are: (1) It is necessary to install a high-temp. mold-heating oven; (2) it is almost necessary to use a sep. melting installation and a special building, since it is unwise to produce both low-Si and high-Si iron in the same building.

WILLIAM F. BHRET

Deoxidation of iron with manganese. P. OBERHOPFER AND H. SCHENCK. *Stahl u. Eisen* 47, 1526-36 (1927).—Previous papers relating to the reaction: $\text{FeO} + \text{Mn} \rightleftharpoons \text{MnO} + \text{Fe}$ are critically reviewed. When Mn is added to molten Fe, contg. FeO, some MnO is formed, which being sparingly sol. seps. from the melt. The remaining FeO is divided between the 2 phases, metal and MnO; that is, some of the FeO is taken up from the melt by the MnO. For the state of equil. between metal and slag the following equation is developed, where L is the partition coeff., K' the equil. const. $\{K'/[\text{Mn}]\} + 1 = \Sigma(\text{O})L/(\text{MnO})$, the constituents of the metal in square, those

of the slag in round brackets. K can be expressed as: $K' = \frac{[O]_{Fe}[Mn]}{[O]_{Mn}}$. The 2 unknowns K' and L were detd. by several melts at 1600°. It was shown that up to 0.35% Mn in the molten Fe, the ratio of (MnO)/(FeO) is practically a linear function of Mn. K' is not only a function of the temp. but also of the FeO content of the metal. The importance of a crucible material which does not take part in the reaction at 1600° is emphasized.

Steel with a high manganese content. Its manufacture and its properties. ANTONIO MANUELLI. *Ingegneria Nov.*, 1927; *Mel. italiana* 20, 113-28 (1928).—The manuf., phys. and chem. properties and uses are described, with illustrations and diagrams.

C. C. DAVIS

Arsine intoxication—a case of suspected poisoning in the steel industry. C. W. MUEHLBERGER, A. S. LOEVENHART AND T. S. O'MALLEY. *J. Ind. Hyg.* 10, 137-46 (1928).—AsH₃ is generated by the action of 5% H₂SO₄ on steel, the As being derived from impurities in both the acid and the steel, especially in acid made from sulfide ores. A sample of 25 l. of air taken at the surface of the acid in a pickling tank contained 0.006 mg. AsH₃; but 10 ft. away from the tank 473 liters of air contained only 0.001 mg. AsH₃; a quantity that was considered to be too small to cause As poisoning. The large excretion of 0.77 mg. As₂O₃ per 24 hrs. 46 days after leaving work indicates that the As was taken by mouth rather than inhaled as AsH₃. Use of acid contg. not more than 1 part per million of As₂O₃ is recommended.

C. M. SALLS

The cause of the decrease in bond strength on heating molding sands to 600° F. C. C. DE WITT AND G. G. BROWN. *Trans. Am. Foundrymen's Assoc.* 1928, 277-80.—Tests were made on molding sands to see what effect heating to 600° F. had upon the clay bond and ferric hydrogel bond constituents. Pure silica, kaolin and ferric hydrogel were used as synthetic bonding material. Silica base material and the bond material were heated separately, and then mixed with unheated bond and base material, resp. These mixts. were compared with the unheated bonded system. The results showed that heating the silica base material before mixing with bond material had no noticeable effect on the max. strength of the bonded material. Heating the silica base seems to shift the point of maximum strength toward drier mixts. from 7 to 5% water content. Heating the bond material, however, causes the mixt. to lose practically all the strength. This shows that the loss in bond on heating is due entirely to changes in the clay bond as distinct from the sand or colloidal ferric hydrogel. The tests substantiate the claim that sands bonded by ferruginous material are less affected by heating than those not so bonded.

H. C. DUUS

The influence of ferric hydrogel in the bond of natural molding sands. C. C. DE WITT AND G. G. BROWN. *Trans. Am. Foundrymen's Assoc.* 1928, 247-76.—Quant. data are given showing the relation of colloidal Fe₂O₃ absorbed on the sand grains and on the clay bonding material to the strength of bond in molding sand. The effect of colloidal Fe₂O₃ on the bond of molding sands has been detd. by analysis of natural sands and by the synthesis of molding sand from silica, kaolin and ferric hydrosol. Tests were made on permeability and breaking strength. The results showed that the presence of a natural film of adsorbed material measurably increased the strength both in the natural and artificial products which gave good agreement. The permeability of synthetic sands is more nearly constant with varying water content. The strength of both kinds is decreased to the same degree by heating to 600° F. while the permeabilities are increased to the same degree. Hydrated iron oxide films on both silica and kaolin give an increase in strength especially at the higher water contents. The permeability of silica-kaolin mixts. decreases with successive addns. of water, while the permeability of the SiO₂-Fe₂O₃ combinations shows an increase with water content.

H. C. D.

An automatic precision strength test for sand. G. G. BROWN AND C. C. DE WITT. *Trans. Am. Foundryman's Assoc.* 1928, 235-46.—An automatic testing machine for making tensile or transverse tests is described which is capable of 1% accuracy. A motor-driven wt. is made to travel along a beam which acts upon a piston compressing the sample tested. The wt. required for a definite deformation or a break is recorded by means of an elec. contact which operates a relay stopping the motor.

H. C. D.

The production of high-alumina slags in the blast furnace for the manufacture of alumina cement. T. L. JOSEPH. *Bur. Mines, Repts. of Investigations No. 2869*, 7 pp. (1928).—The operation of a 6-ton blast furnace on a charge of bauxite, limestone, iron ore and cast-iron turnings is described. The bearing which smelting of such a charge has upon the production of alumina is pointed out. The history and compn. of alumina cements are briefly reviewed and the results of operation of the 6-ton furnace are indicated. Economic considerations are noted and three cost estimates are tabulated—one each, with all-scrap burden, all-ore burden and ore-scrap-burden. It seems that

1 ton of metal and 1 1/5 tons of slag can be produced in the blast furnace for \$25-30. If 1 ton of alumina cement is worth \$30 and 1 ton of pig-iron \$20, the combined value leaves an attractive margin for grinding the slag, marketing costs and profit.

W. H. BOYNTON

Investigations of the blast furnace. GEORGE BULLÉ. *Stahl u. Eisen* **48**, 433-40 (1928).—The influence of the quality of the charge and the coke on the blast-furnace process, the reactions involved, the effect of the building construction and the problems of operation were investigated. References are given.

J. A. SZILARD

Importance of gas-solid contact in the blast furnace. T. L. JOSEPH. *Fuels and Furnaces* **6**, 635-40 (1928).—The paper is largely a review of the findings of the Bureau of Mines investigators on the distribution of charge to the rate and character of the reactions taking place in a blast furnace. Within 40 in. from the nose of the tuyères all the O₂ of the blast has been converted into CO. The rate of reduction of an ore depends on its chem. character, fineness of subdivision and uniformity of particle size. Uniformity of size in the particle of the charge decreases segregation and produces a stock column of uniform resistance to the passage of gas. Fine Misabi ore has a much greater potential surface for contact with furnace gases than have old range ores, but is too fine to permit the full passage of reducing gas. Sintering is a possible remedy for removing the disability connected with the use of very fine stock. Restricted gas flow and a faster downward movement of stock in the periphery of the furnace permit unreduced charge to reach the hearth and complicate the proper adjustment of hearth temps. for the control of S and Si content. Changes in practice providing a greater gas-solid contact in the upper part of the furnace will provide a more efficient utilization of the sensible heat of the gases as well as of their reducing power. Coke decreases the resistance of the stock column to the passage of the reducing gases. Fundamental information to guide furnace operators is as yet largely lacking.

Precious metals from ores, etc. F. KRUPP GRUSONWERK A.-G. Brit. 277,001, Sept. 4, 1926. Ores, residues, etc., are heated together with magnetizable materials to a temp. lower than required to melt the mass, and then, after grinding if necessary, subjected to magnetic sepn.

Centrifugal apparatus for amalgamating metal values of ores. R. THAYER. U. S. 1,669,430, May 15.

Concentrating graphite and other ores by flotation. J. F. M. R. ROBILLARD. Brit. 275,673, Aug. 9, 1926. A container is used having slots or apertures in its walls through which jets or streams of water are passed carrying air with them. The apertures may be covered with gauze or other pervious material.

Reducing fine ore concentrates. D. M. CRIST. Brit. 275,791, Aug. 10, 1926. The ore together with a liquid hydrocarbon reducing agent is continuously passed through an air-tight zone heated to the dissoen. temp. of the ore, the reduced product is continuously removed and the gases generated are led off and treated for recovery of by-products. An app. is described.

Treating copper ores. I. F. CLARK. U. S. 1,670,021, May 15. Susceptibility of ores contg. Cu to flotation concn. is improved by treating the ore pulp with C_2H_2 and other oxidizable substances such as aniline or turpentine, the oxidation of which results in insol. substances, producing on the particles of the minerals a coating of cuprous acetylide and of the insol. oxidation products.

Treating tin ores, etc. H. L. SULMAN and H. F. K. PICARD. Brit. 276,743, June 2, 1926. Oxidized Sn ore, concentrates, tailings, slimes, roasted sulfide ore contg. Sn, etc., are mixed with carbonaceous material and treated with gaseous HCl, preferably under reducing conditions and in the absence of free moisture and O (suitably at a temp. of 600-700°) to form and selectively volatilize $SnCl_2$. An app. and numerous details are described.

Treating liquors containing copper and zinc. H. GROTHE and METALLHÜTTE MAGDEBURG GEs. Brit. 276,008, Aug. 11, 1926. Cupric salts in liquors such as those obtained by lixiviating chlorinated roasted pyrites are at least partly reduced to cuprous salts such as Cu_2Cl_2 by use of SO_2 , thiosulfate, sulfides or metals; the cuprous salt may be sepd. and the Cu remaining in the liquor may be pptd. by cementation with Fe. Acid in the liquor formed in the reduction of the cupric salts may be neutralized with ZnO-bearing waste products previous to the cementation. Zn and Co values present may be recovered.

Precipitating copper from metallurgical liquors. I. G. FARBERNIND. A.-G. Brit. 276,017, Aug. 14, 1926. Pptn. of Cu with $Zn(OH)_2$ is effected in 2 or more stages in the first of which the quantity of $Zn(OH)_2$ is insufficient to ppt. all the Cu so that a Zn-free ppt. is obtained; in the last stage an excess of the precipitant is used and the resulting Zn-contg. ppt. may be used as a pptg. agent in the first stage of treatment of a fresh batch of liquor; similarly, if more than 2 stages of pptn. are used, the liquor may be treated with ppt. from a succeeding stage.

Zinc from sulfide ore. H. G. S. ANDERSON. U. S. 1,669,406, May 15. Finely divided Fe and ZnS-bearing material are mixed and heated together to effect reaction and volatilization of the Zn without melting the Fe sulfide formed in the reaction and the latter is recovered in finely divided condition. An app. is described.

Reclaiming values from soldered metals or similar metallic mixtures. W. G. NORDLING and A. STEWART, JR. U. S. 1,669,485, May 15. A metallic mixt. such as corded soldered automobile radiators is heated sufficiently to melt one of the ingredients, e. g., the solder, and the molten constituent is removed from the unmelted residue; the latter is then immersed in a bath of molten material such as NaCN to melt out further quantities of the material, a portion of which has already been removed, and the molten portion is sepd. An app. is described comprising a rotating drum dipping into the heating bath.

Metal values from pyrites cinder. DUISBURGER KUPFERHÜTTE. Brit. 276,200, Nov. 18, 1926. In treating the liquor obtained by leaching chlorinated pyrites cinder, the Cu is pptd. by $Zn(OH)_2$ obtained in a previous operation, the pptn. being preferably effected in 2 or more stages so that a ppt. free from Zn is first obtained and then a ppt. rich in excess of $Zn(OH)_2$ which may be used in treating a fresh batch of liquor; any remaining Cu, together with Ni, Co and precious metals, may then be pptd. by Zn or Ca hypochlorite; most of the Na_2SO_4 is pptd. by cooling or by the addn. of salts such as alkali chlorides, or by both means; remaining sulfate is pptd. as $CaSO_4$ by $CaCl_2$ obtained in a previous operation; Zn is pptd. as $Zn(OH)_2$ by $Ca(OH)_2$, and $CaCl_2$ liquid remains from this treatment. Various other details and modifications are described.

Apparatus for granulating slag. F. SPRIGS. Brit. 277,154, Aug. 4, 1926.

Vortex system for separating ore constituents, etc. R. F. GRANT, E. B. WORTHINGTON and W. L. JACOBUS. U. S. 1,669,820, May 15.

Flux. D. C. LEFF. U. S. 1,670,459, May 22. A flux for use in forming alloys such as Babbitt-metal is formed of HCl 1 gal., Zn 3 lbs., CuSO_4 crystals 12 oz. and resin 21 oz.

Flux for welding cast iron, etc. F. POLITZ. U. S. 1,669,840, May 15. A small proportion of Fe suboxide is used with K_2CO_3 , Na_2CO_3 , NaCl and borax.

Magnetic cores. G. W. ELMEN (TO STANDARD TELEPHONES & CABLES, LTD.) Brit. 277,289, Sept. 11, 1926. Magnetic particles such as Ni-Fe alloy are formed into a compressed mass with insulating material such as that described in Brit. 269,511 (C. A. 22, 1323) and the compressed mass is heat-treated at a temp. sufficient to increase the magnetic properties.

Magnetic core material. G. W. ELMEN. U. S. 1,669,658, May 15. In forming magnetic cores, finely divided insulated particles of magnetic material such as Ni-Fe alloy having an initial permeability substantially higher than that of Fe are compressed, and the compressed mass is heat-treated at a temp. (suitably about 500–800°) sufficient to improve the magnetic properties of the core.

Magnetic material. J. W. ANDREWS. U. S. 1,669,642, May 15. Articles such as magnet cores for loading coils for telephone circuits are formed of particles of magnetic material, *e. g.*, an alloy of Ni 78.5 and Fe 21.5%, carrying a primary insulating coating of silicic acid and waterglass and a secondary insulating coating of silicic acid and Fe_2O_3 sepg. the particles. U. S. 1,669,643 (J. W. ANDREWS and R. GILLIS) specifies an insulating material formed of 5.5 parts chromic acid, an alkali salt such as waterglass 4.5 and talc 5 parts or other filler. U. S. 1,669,644 (J. W. ANDREWS) specifies particles of a Ni-Fe alloy carrying an insulating coating such as Na silicate and formed into a compact mass with an infusible insol. binder such as synthetic resin. U. S. 1,669,645 (J. W. ANDREWS and R. GILLIS) specifies the use of $\text{Hg}(\text{NO}_3)_2$ or other metal nitrate as insulating material for sepg. the particles of magnetic material. Cf. C. A. 22, 1323.

Magnetic material. A. F. BANDUR. U. S. 1,669,646, May 15. In forming articles such as magnet cores for loading coils for telephone circuits particles of magnetic material, *e. g.*, Ni-Fe alloy, are used with an insulating material consisting of kaolin and a flux such as H_3BO_3 sepg. the particles. ZnO also may be used. U. S. 1,669,647 specifies placing on the particles a plurality of coatings of different insulating materials, *e. g.*, successive layers of $\text{Al}(\text{OH})_3$ and H_3BO_3 and of kaolin. U. S. 1,669,648 specifies particles of magnetic material such as Ni-Fe alloy with insulating material between them consisting of constituents of the magnetic alloy and another substance, *e. g.*, Fe and Ni oxides.

Magnetic cores for Pupin coils. FELTEN & GUILLEAUME CARLSWERK A.-G. Brit. 276,301, Aug. 21, 1926. Cores are formed from fine particles of an alloy of Fe with Ni 5–15% which are covered with an insulating layer of cellulose acetate and compressed in heated molds. The core may be immersed in paraffin.

Ingot mold. R. C. KRAUSE. Brit. 277,264, May 26, 1927.

Ingot mold. F. GRISSLER. Brit. 276,255, March 7, 1927.

Ingot-mold core box. J. E. PERRY. U. S. 1,670,594, May 22. Structural features.

Mold for ingot molds. C. WUNDERLICH. U. S. 1,670,331, May 22.

Ingot-casting apparatus (with an annular gallery encircling the furnace). LINTYPE & MACHINERY, LTD. AND A. V. BUGLER. Brit. 276,802, July 22, 1926.

Casting ingots. E. C. WASHBURN. U. S. 1,670,329, May 22. Cool air is used for cooling the lower portion of the ingot while retaining the heat at its top portion.

Apparatus for casting metals under pressure. A. S. BOWER. Brit. 277,124, June 12, 1926.

Apparatus for casting "brasses," bushings or other annular nonferrous metal articles. S. W. CRAWFORD. U. S. 1,669,694, May 15.

Casting ferrous or other metals of high melting point. R. B. DALE. Brit. 276,210, Dec. 9, 1926. The cooling of the charge is regulated while pressure is applied to it and addnl. metal is supplied to fill up shrinkage recesses. An app. is described.

Apparatus for charging blast furnaces, etc. W. MARLEY. Brit. 277,183, Oct. 12, 1926.

Rabble furnace for ore roasting. A. N. JETTE. U. S. 1,670,038, May 15.

Rabble furnace for roasting ores. D. BAIRD. U. S. 1,669,925, May 15.

Furnace-slugging apparatus. H. E. DUNKELBERGER and N. WITTMERS. U. S. 1,669,696, May 15.

Rotary furnace plant for direct reduction of oxide ores such as those of lead,

zinc and copper or for direct production of iron. J. W. HORNSEY. Brit. 277,325, Sept. 8, 1926.

Furnace for heat-treating sheets or other zinc-coated materials. H. W. THEISS. U. S. 1,670,754, May 22.

Continuous furnace for annealing and heat-treating metals. A. T. KATHNER. U. S. 1,669,902, May 15. U. S. 1,669,903, specifies a conveyor for heat-treating furnaces.

Silicon iron. V. B. BROWNE. Brit. 276,190, Oct. 25, 1926. A relatively large batch of the molten material is stored in a reservoir which can be heated externally for a time sufficient to allow inclusions to float to the surface, preferably assisted by agitation. After each tapping, the bath is replenished. The surface of the bath may be covered with a slag, preferably of lime and Ca silicate, and the Si content of the bath may be maintained slightly below that finally desired and the deficiency made up in the ladle. Cf. C. A. 21, 2116.

Pickling iron. O. VOGEL. Brit. 277,308, Sept. 8, 1926. Sulfite cellulose lye is added to pickling baths such as those described in Brit. 158,768 (C. A. 15, 1878) and Brit. 188,713 (C. A. 17, 1618) or to an ordinary acid bath together with waste acid from the washing of hydrocarbons and contg. N-ring compds. such as pyridyl-sulfuric acid. The condensation mixt. made with the addn. of sulfite cellulose lye in the synthesis of quinoline or quinaldine also may be used, as may also org. colloidal materials such as glue, agar-agar, gelatin or molasses.

Iron casting resistant to abrasion. L. J. BARTON. Brit. 277,004, Sept. 1, 1926. Grinding balls and the like are made of metal contg. Fe 95.72–98.22, C 0.8–1.3, Si 0.3–1, Mn 0.6–1.8 and up to 0.18% of S and P, or from similar metal contg. 0.5–3% Cr which replaces a portion of the Fe. Various details are given for forming and casting the metal and compns. are specified for coating the molds used.

Coloring iron and steel. W. H. HATFIELD and H. GREEN. Brit. 275,781, July 30, 1926. Rustless Fe or steel is immersed in a soln. contg. at least 15% each of chromic acid and H_2SO_4 at a temp. of 40–60°. Designs or patterns may be formed on the metal by the use of a resist such as paraffin.

Hardening iron or steel. DEUTSCHE GOLD- UND SILBER-SCHNEIDANSTALT VORM. ROESSLER. Brit. 277,030, Sept. 6, 1926. Articles of Fe or steel or their alloys are hardened in fused cyanide baths to which wood or animal charcoal is added to prevent frothing and to enable temps. above 860° to be employed. Material also may be used which will liberate C in the bath.

Steel. F. KRUPP A.-G. Brit. 276,615, Aug. 27, 1926. To produce a low-C steel resistant to the action of liquids such as lyes or boiler feed water or to NH_3 and other vapors and gases, molten steel is so highly deoxidized that the subsequent aging does not cause any substantial decrease in its tenacity, or the solid material is heated to above 650°, quenched and then reheated to about 730°.

Manganese steel. R. A. HADFIELD. Brit. 276,048, May 11, 1926. Mn steel contg. about 11% or more of Mn contains not more than about 0.065% P and may contain C up to about 1.6%. It may be made by adding low-P ferro-Mn (with or without ordinary ferro-Mn) to a charge of C steel which has been decarburized and dephosphorized.

Steel-hardening bath. O. KRÖNING. Brit. 276,289, May 30, 1927. Acidified and chlorinated juice of onion, garlic or leeks is used. HOAc and "calcium chloride" may be added to the juice.

Copper and copper alloys. I. R. VALENTINE. Brit. 276,341, Aug. 18, 1926. Molten Cu or Cu alloy is purified by adding an alk. earth metal such as Mg or preferably a Mg-Al alloy contg. 10–15% Al. About 0.3% of the added purifying agent may suffice.

Lead alloys. H. YOSHIKAWA. Brit. 277,199, Nov. 22, 1926. Pb alloys are formed contg. up to 4% Bi and also up to 10% of other metals such as Cu, Ni, Co, Mn, Cr and Al.

Non-magnetic iron alloys. Y. KAMISHIMA. Brit. 276,874, Jan. 3, 1927. Non-magnetic Fe alloys of high elec. resistance contain Ni 9–12, Cr 15–20 and Mn 0.3–2% and are free from Si. CaF_2 , NaF or K_2CO_3 and glass may be used as fluxes in making the alloy from its component metals.

Magnetic iron-nickel alloys. C. P. BEATH and H. M. E. HEINICKE. U. S. 1,669,649, May 15. In order to embrittle Fe-Ni alloy, Fe and Ni are heated in the presence of an oxidizing agent such as O and oxides of Fe and Ni at a temp. sufficient to cause complete fusion between the elements.

Alloy of nickel, molybdenum and chromium. T. D. KELLY. Brit. 277,170, Sept.

Vortex system for separating ore constituents, etc. R. F. GRANT, E. B. WORTHINGTON and W. L. JACOBUS. U. S. 1,669,820, May 15.

Flux. D. C. LEFF. U. S. 1,670,459, May 22. A flux for use in forming alloys such as Babbitt-metal is formed of HCl 1 gal., Zn 3 lbs., CuSO₄ crystals 12 oz. and resin 21 oz.

Flux for welding cast iron, etc. F. POLITZ. U. S. 1,669,840, May 15. A small proportion of Fe suboxide is used with K₂CO₃, Na₂CO₃, NaCl and borax.

Magnetic cores. G. W. ELMEN (TO STANDARD TELEPHONES & CABLES, LTD.). Brit. 277,289, Sept. 11, 1926. Magnetic particles such as Ni-Fe alloy are formed into a compressed mass with insulating material such as that described in Brit. 269,511 (C. A. 22, 1323) and the compressed mass is heat-treated at a temp. sufficient to increase the magnetic properties.

Magnetic core material. G. W. ELMEN. U. S. 1,669,658, May 15. In forming magnetic cores, finely divided insulated particles of magnetic material such as Ni-Fe alloy having an initial permeability substantially higher than that of Fe are compressed, and the compressed mass is heat-treated at a temp. (suitably about 500-800°) sufficient to improve the magnetic properties of the core.

Magnetic material. J. W. ANDREWS. U. S. 1,669,642, May 15. Articles such as magnet cores for loading coils for telephone circuits are formed of particles of magnetic material, *e. g.*, an alloy of Ni 78.5 and Fe 21.5%, carrying a primary insulating coating of silicic acid and waterglass and a secondary insulating coating of silicic acid and Fe₂O₃ sepg. the particles. U. S. 1,669,643 (J. W. ANDREWS and R. GILLIS) specifies an insulating material formed of 5.5 parts chromic acid, an alkali salt such as waterglass 4.5 and talc 5 parts or other filler. U. S. 1,669,644 (J. W. ANDREWS) specifies particles of a Ni-Fe alloy carrying an insulating coating such as Na silicate and formed into a compact mass with an infusible insol. binder such as synthetic resin. U. S. 1,669,645 (J. W. ANDREWS and R. GILLIS) specifies the use of Hg(NO₃)₂ or other metal nitrate as insulating material for sepg. the particles of magnetic material. Cf. C. A. 22, 1323.

Magnetic material. A. F. BANDUR. U. S. 1,669,646, May 15. In forming articles such as magnet cores for loading coils for telephone circuits particles of magnetic material, *e. g.*, Ni-Fe alloy, are used with an insulating material consisting of kaolin and a flux such as H₃BO₃ sepg. the particles. ZnO also may be used. U. S. 1,669,647 specifies placing on the particles a plurality of coatings of different insulating materials, *e. g.*, successive layers of Al(OH)₃ and H₃BO₃ and of kaolin. U. S. 1,669,648 specifies particles of magnetic material such as Ni-Fe alloy with insulating material between them consisting of constituents of the magnetic alloy and another substance, *e. g.*, Fe and Ni oxides.

Magnetic cores for Pupin coils. FELTEN & GUILLEAUME CARLSWERK A-G. Brit. 276,301, Aug. 21, 1926. Cores are formed from fine particles of an alloy of Fe with Ni 5-15% which are covered with an insulating layer of cellulose acetate and compressed in heated molds. The core may be immersed in paraffin.

Ingot mold. R. C. KRAUSE. Brit. 277,264, May 26, 1927.

Ingot mold. F. GRISSLER. Brit. 276,255, March 7, 1927.

Ingot-mold core box. J. E. PERRY. U. S. 1,670,594, May 22. Structural features.

Mold for ingot molds. C. WUNDERLICH. U. S. 1,670,331, May 22.

Ingot-casting apparatus (with an annular gallery encircling the furnace). LINO-TYPE & MACHINERY, LTD. AND A. V. BUGLER. Brit. 276,802, July 22, 1926.

Casting ingots. E. C. WASHBURN. U. S. 1,670,329, May 22. Cool air is used for cooling the lower portion of the ingot while retaining the heat at its top portion.

Apparatus for casting metals under pressure. A. S. BOWER. Brit. 277,124, June 12, 1926.

Apparatus for casting "brasses," bushings or other annular nonferrous metal articles. S. W. CRAWFORD. U. S. 1,669,694, May 15.

Casting ferrous or other metals of high melting point. R. B. DALE. Brit. 276,210, Dec. 9, 1926. The cooling of the charge is regulated while pressure is applied to it and addnl. metal is supplied to fill up shrinkage recesses. An app. is described.

Apparatus for charging blast furnaces, etc. W. MARLEY. Brit. 277,183, Oct. 12, 1926.

Rabble furnace for ore roasting. A. N. JETTE. U. S. 1,670,038, May 15.

Rabble furnace for roasting ores. D. BAIRD. U. S. 1,669,925, May 15.

Furnace-slugging apparatus. H. E. DUNKELBERGER and N. WITTIERS. U. S. 1,669,696, May 15.

Rotary furnace plant for direct reduction of oxide ores such as those of lead,

zinc and copper or for direct production of iron. J. W. HORNSEY. Brit. 277,325, Sept. 8, 1926.

Furnace for heat-treating sheets or other zinc-coated materials. H. W. THEISS. U. S. 1,670,754, May 22.

Continuous furnace for annealing and heat-treating metals. A. T. KATHNER. U. S. 1,669,902, May 15. U. S. 1,669,903, specifies a conveyor for heat-treating furnaces.

Silicon iron. V. B. BROWNE. Brit. 276,190, Oct. 25, 1926. A relatively large batch of the molten material is stored in a reservoir which can be heated externally for a time sufficient to allow inclusions to float to the surface, preferably assisted by agitation. After each tapping, the bath is replenished. The surface of the bath may be covered with a slag, preferably of lime and Ca silicate, and the Si content of the bath may be maintained slightly below that finally desired and the deficiency made up in the ladle. Cf. C. A. 21, 2116.

Pickling iron. O. VOGEL. Brit. 277,308, Sept. 8, 1926. Sulfite cellulose lye is added to pickling baths such as those described in Brit. 158,768 (C. A. 15, 1878) and Brit. 188,713 (C. A. 17, 1618) or to an ordinary acid bath together with waste acid from the washing of hydrocarbons and contg. N-ring compds. such as pyridyl-sulfuric acid. The condensation mixt. made with the addn. of sulfite cellulose lye in the synthesis of quinoline or quinaldine also may be used, as may also org. colloidal materials such as glue, agar-agar, gelatin or molasses.

Iron casting resistant to abrasion. L. J. BARTON. Brit. 277,004, Sept. 1, 1926. Grinding balls and the like are made of metal contg. Fe 95.72–98.22, C 0.8–1.3, Si 0.3–1, Mn 0.6–1.8 and up to 0.18% of S and P, or from similar metal contg. 0.5–3% Cr which replaces a portion of the Fe. Various details are given for forming and casting the metal and compns. are specified for coating the molds used.

Coloring iron and steel. W. H. HATFIELD and H. GREEN. Brit. 275,781, July 30, 1926. Rustless Fe or steel is immersed in a soln. contg. at least 15% each of chromic acid and H_2SO_4 at a temp. of 40–60°. Designs or patterns may be formed on the metal by the use of a resist such as paraffin.

Hardening iron or steel. DEUTSCHE GOLD- UND SILBER-SCHNEIDANSTALT VORM. ROESSLER. Brit. 277,030, Sept. 6, 1926. Articles of Fe or steel or their alloys are hardened in fused cyanide baths to which wood or animal charcoal is added to prevent frothing and to enable temps. above 860° to be employed. Material also may be used which will liberate C in the bath.

Steel. F. KRUPP A.-G. Brit. 276,615, Aug. 27, 1926. To produce a low-C steel resistant to the action of liquids such as lyes or boiler feed water or to NH_3 and other vapors and gases, molten steel is so highly deoxidized that the subsequent aging does not cause any substantial decrease in its tenacity, or the solid material is heated to above 650°, quenched and then reheated to about 730°.

Manganese steel. R. A. HADFIELD. Brit. 276,048, May 11, 1926. Mn steel contg. about 11% or more of Mn contains not more than about 0.065% P and may contain C up to about 1.6%. It may be made by adding low-P ferro-Mn (with or without ordinary ferro-Mn) to a charge of C steel which has been decarburized and dephosphorized.

Steel-hardening bath. O. KRÖNING. Brit. 276,289, May 30, 1927. Acidified and chlorinated juice of onion, garlic or leeks is used. HOAc and "calcium chloride" may be added to the juice.

Copper and copper alloys. I. R. VALENTINE. Brit. 276,341, Aug. 18, 1926. Molten Cu or Cu alloy is purified by adding an alk. earth metal such as Mg or preferably a Mg-Al alloy contg. 10–15% Al. About 0.3% of the added purifying agent may suffice.

Lead alloys. H. YOSHIKAWA. Brit. 277,199, Nov. 22, 1926. Pb alloys are formed contg. up to 4% Bi and also up to 10% of other metals such as Cu, Ni, Co, Mn, Cr and Al.

Non-magnetic iron alloys. Y. KAMISHIMA. Brit. 276,874, Jan. 3, 1927. Non-magnetic Fe alloys of high elec. resistance contain Ni 9–12, Cr 15–20 and Mn 0.3–2% and are free from Si. CaF_2 , NaF or K_2CO_3 and glass may be used as fluxes in making the alloy from its component metals.

Magnetic iron-nickel alloys. C. P. BEATH and H. M. E. HEINICKE. U. S. 1,669,649, May 15. In order to embrittle Fe-Ni alloy, Fe and Ni are heated in the presence of an oxidizing agent such as O and oxides of Fe and Ni at a temp. sufficient to cause complete fusion between the elements.

Alloy of nickel, molybdenum and chromium. T. D. KELLY. Brit. 277,170, Sept.

10, 1926. A malleable alloy contains Ni 33.3-90, Mo 5-33.3 and Cr 5-33.3% and may be formed by melting the metals under a flux of anhyd. CaCl_2 or MgCl_2 and C.

Forming sheets, wires, etc., of iron alloyed with silicon. O. H. DÖHNER. Brit. 276,953, Sept. 4, 1926. In forming transformer laminations or other articles the material is critically worked at temps. below 600° and then heated to recrystn. temp. (650 - 900°) to increase the size of grain and improve the elec. properties. Various specific details are given.

Alloys steels. CAMMELL, LAIRD & CO., LTD., J. M. ALLAN and A. P. HAGUE. Brit. 276,249, Feb. 26, 1927. *An alloy steel suitable for use at high temps. contains Fe 46.45-57.05, Ni 26-30, Cr 16-22, C 0.35-0.55 and Si and Mn each 0.3-0.5%.

Heat-resisting steel alloys. F. KRUPP A.-G. Brit. 276,317, Aug. 23, 1926. Heat-resisting steel alloys contain Cr 15-25, Ni 15-25 and C less than 0.2%.

Extracting "tin mixture" from lead and tin alloys. M. SPEICHERT. U. S. 1,669,580, May 15. "Tin mixt." (a eutectic contg. Sn 54.5-55, Sb not more than 3.6, Cu not more than 0.2% and the remainder Pb) is obtained from Pb and Sn alloys contg. Sb and Cu (and which may contain small quantities of other metals), by melting, cooling until only the "tin mixt." alloy remains fluid and drawing it off.

Coating aluminum and alloys. DR. O. SPRENGER PATENTVERWERTUNG JIROTKA and B. JIROTKA. Brit. 275,828, Oct. 27, 1926. In coating Al and alloys as described in Brit. 249,971 (C. A. 21, 888), the coating bath contains NaHCO_3 alone or mixed with Na_2CO_3 in addn. to the salts of the heavy metals. $\text{Na}_2\text{Cr}_2\text{O}_7$ also may be added to the bath.

Magnesium alloys. I. G. FARBENIND. A.-G. Brit. 275,985, Aug. 13, 1926. Mg alloys suitable for making pistons of internal-combustion engines contain up to 15% of Al and 1-6% Si.

Hard alloys containing carbides of refractory metals. W. SCHROBSDORFF. Brit. 276,011, Aug. 12, 1926. Alloys are formed of (a) W carbide, Fe carbide, Ta, Ni and Ir; (b) Ta, Nb, Cu, Pt, Mo-W double carbide, Fe carbide and Cr carbide; (c) W carbide, Pt, Ta and Nb carbide; (d) W carbide, Ta, Ni and Nb carbide; or of other similar components.

Coating metals surfaces. PETROLE SYNTHETIQUE SOC. ANON. AND A. FOLLIET. Brit. 277,211, Jan. 1, 1927. A refractory coating is produced by heating metals in contact with a powd. or granular mixt. of Al and a Si compd. such as SiO_2 or SiC , in the presence of a chloride such as NH_4Cl or a volatile salt such as a fluoride or bromide. The treatment may cover a period of 2-3 hrs. at 800° .

Coating metals with lead by hot-dipping. AMERICAN MACHINE & FOUNDRY CO. Brit. 276,208, Dec. 3, 1926. Sn 3% is added to a bath of molten Pb, and from time to time, small quantities of phosphor-Pb also are added.

Coating with metals applied in the vapor phase. AMERICAN MACHINE & FOUNDRY CO. Brit. 276,390, March 23, 1926. Sub-atm. pressure and a high-voltage elec. potential (to ionize the metal vapor) are utilized. An app. is described.

Coating the interior of pipes and tubes, etc., with metals by spraying. F. G. COZENS and METALLISATION, LTD. Brit. 277,071, June 4, 1926. Mech. features.

Metals from sulfides. A. B. BAGHDASARIAN. U. S. 1,671,003, May 22. Sulfides of Pb or other metals are chlorinated and the chlorides are reduced with H.

Recovery of "white metal" from boring of bronze, gunmetal, etc. J. SPENCE, C. E. COURTENAY and H. A. COURTENAY. Brit. 276,730, May 31, 1926. A charge of the material is spread on a tray having a wire gauze bottom and heated while at rest to a temp. above the m. p. of the white metal; the tray is then vibrated or oscillated. An app. is described.

Carburizing metal articles. G. W. HEGEL and G. R. BROPHY. Brit. 276,675, Aug. 26, 1926. Articles such as those formed of low-C steel are heated in a retort to a temp. above the recalcrescence point and a liquid contg. C (e. g., a mixt. of kerosene, bone oil and "oil of mirbane" or a similar mixt.) is supplied to the retort at such a rate as to maintain a uniform, gaseous atm. around the articles. Air is excluded. An app. and various details of procedure are described.

Case-hardening. A. LENNARTZ. U. S. 1,671,034, May 22. FeS is added to compns. for selective case-hardening to protect portions of the articles treated from the case-hardening action.

Apparatus for pickling metals tubes or bars, etc. WELLMAN, SEAVER ROLLING MRL CO., LTD. AND S. SMITH. Brit. 276,732, June 1, 1926.

Apparatus for determining tinned scrap. M. A. ADAM. Brit. 277,127, June 16, 1926.

Apparatus for bright-annealing of metal strip, etc., in hydrogen. SIEMENS-SCHUCKERTWERKE A.-G. Brit. 276,674, Aug. 26, 1926.

Welding heating and cooling tubes to the walls of apparatus. R. SAMERSREUTHER. Brit. 276,013, Aug. 12, 1926.

Welding rod. J. B. GREEN. U. S. 1,669,660, May 15. Welding rods are coated by dipping them in a bath contg. a binder such as Na silicate and about 325 parts CaCO_3 for each 500 parts water. U. S. 1,669,661 specifies coating welding rods and other filler material in a thin coating soln. en masse, e. g., by dipping in a soln. formed of 40°Bé . Na silicate soln. 3 lbs. and water 2 gals.

10—ORGANIC CHEMISTRY

CHAS. A. ROULLER AND CLARENCE J. WEST

Organic significance and economic importance of ethylene glycol. T. H. FAIRBROTHER. *Ind. Chemist* 4, 179-80 (1928). E. H.

Control of the molecular weight of liquid hydrocarbons produced by electrical discharge in ethane. S. C. LIND AND GEORGE GLOCKLER. **J. Am. Chem. Soc.* 50, 1767-72 (1928); cf. *C. A.* 22, 1734.—Silent, corona and high-frequency discharges all cause the condensation of C_2H_6 to a liquid with the liberation of permanent gases. The av. mol. wt. of the liquid products has been regulated between 467 and 105 by controlling the time that the 1st products, either gaseous or liquid, are allowed to stay in the discharge tube—the more secondary action the higher the mol. wt., because of further condensation. C. J. WEST

Luminescence of aliphatic Grignard compounds. R. T. DUFFORD. *J. Am. Chem. Soc.* 50, 1822-4 (1928).—The reason for the discordant observations reported for the luminescence of Grignard compds. in Et_2O solns. on reacting with O probably lies in the effect of the concn. The aliphatic compds. Bu-, Pr-, *i*-Et- and even MeMgBr , gave faint light on oxidation, none at concns. as high as 1 *M* but best at about $\frac{1}{8}$ *M*; in all cases the brightnesses were very little above the threshold of visibility. While this disproves D.'s idea that it is necessary for the Mg to be attached directly to an unsatd. C atom in order to obtain luminescence in Et_2O soln., it is true that this condition is satisfied in all the cases where any great amt. of light is obtained. It is probably not true that the brightness is proportional to the mol. wt. C. J. WEST

Condensation of cyanoacetic ester with some aryl- and alkylamines. Preparation of some aryl- and alkyl-substituted cyanoacetamides. KUVIRJI GOSAI NAIK AND YESHWANT NARAYAN BHAT. *Quart. J. Indian Chem. Soc.* 4, 547-51 (1927).—The substituted cyanoacetamides were prepd. by the method described in *C. A.* 15, 2072, the conditions being varied with the basicity of the amine. The anilide, $\text{NCCH}_2\text{CONHPh}$, obtained in 60% yield by refluxing $\text{NCCH}_2\text{CO}_2\text{Et}$ with redistd. PhNH_2 at $160-70^\circ$ for 6 hrs., m. $198-9^\circ$. *p*-Toluidide, m. 180° . *o*-Isomer, m. 125° . *m*-Compd., m. 132° . α -Naphthylamide, m. 175° . β -Isomer, m. 174° . *vic-m*-Xylidide, m. 107° . Benzylamide, obtained in 90% yield by refluxing 22 g. $\text{NCCH}_2\text{CO}_2\text{Et}$ and 22 g. PhCH_2NH_2 for 7 hrs., m. 120° . Methylamide (about 25% from 50 g. $\text{NCCH}_2\text{CO}_2\text{Et}$, 45 g. of 33% MeNH_2 and 0.2 g. NaOH shaken 1 hr. at 0° and allowed to stand 12 hrs. at room temp.), m. 101° . Ethylamide (yield, 15%), m. 74° . H. W. G.

Condensation of cyanoacetic ester with some aryl- and alkylamines. Preparation of some aryl- and alkyl-substituted cyanoacetamides. KUVIRJI GOSAI NAIK AND YESHWANT NARAYAN BHAT. *Quart. J. Indian Chem. Soc.* 4, 547-51 (1927).—Cyanoacet-*o*-toluidide, m. 125° , *m*-toluidide, m. 132° , α -naphthylamide, m. 175° , β -naphthylamide, m. 174° , *vic-m*-xylidide, m. 107° , methylamide, m. 101° and ethylamide, m. 74° , are prepd. for the first time. The methods of prepn. vary with the basic strength of the amines. In the prepn. of the substituted amides of the aromatic acids, Whiteley's method, as modified by Naik (*C. A.* 15, 2072) was used. Cyanoacetanilide, m. $198-9^\circ$, is prepd. by refluxing $\text{CNCH}_2\text{CO}_2\text{Et}$ with redistd. NH_3 at $160-70^\circ$ for 6 hrs. *p*-Toluidide, similarly prepd., substituting *p*- $\text{MeC}_6\text{H}_4\text{NH}_2$ for PhNH_2 , m. 180° . Benzylamide, m. 120° . H. W. GIBSON

Dinitroethylbenzenes. O. L. BRADY, J. N. E. DAY AND P. S. ALLAM. *J. Chem. Soc.* 1928, 978-82.—Reduction of 2,4,6-(O_2N) $_3\text{C}_6\text{H}_2\text{Et}$ with $(\text{NH}_4)_2\text{S}$ in boiling EtOH gives the 4- NH_2 deriv., m. 175° (Schultz and Sander, *C. A.* 3, 2573, give 110°); elimination of the NH_2 group gives 2,6-dinitroethylbenzene, m. 57.5° . Nitration of 2,4- $\text{O}_2\text{N}(\text{AcNH})\text{C}_6\text{H}_2\text{Et}$ gives the 2,3-di- NO_2 deriv., m. 143° , and after hydrolysis of the mother liquor, 2,5-dinitro-4-aminoethylbenzene, red, m. 125° ; the 2,3-di- NO_2 deriv.,

golden yellow, m. 121.6°. Removal of the NH_2 group gives 2,3-dinitroethylbenzene, m. 58.5°. *Me* 2,3-dinitrobenzoate, m. 134°. 2,5-Dinitroethylbenzene, pale yellow, m. 59.5°. Removal of the NH_2 group from 4,3,5- $\text{H}_2\text{N}(\text{O}_2\text{N})_2\text{C}_6\text{H}_3\text{Et}$ gives 3,5-dinitroethylbenzene, yellow, m. 41°.

Hydroquinonesulfonephthalein and some of its derivatives. W. R. ORNDORFF AND C. V. SHAPIRO. *J. Am. Chem. Soc.* 50, 1730-4 (1928).—Hydroquinonesulfonephthalein (I), dark red, does not m. at 300°, results in 20% yields by heating the anhydride of *o*-sulfobenzoic acid and $\text{C}_6\text{H}_4(\text{OH})_2$ at 150° until fluid and then at 130° for 18-24 hrs. The use of dehydrating agents gave excessive tar formation; with ZnCl_2 5% yields were obtained. At 22° 0.0117 g. I dissolved in 100 cc. H_2O and 0.0120 g. in 100 cc. abs. EtOH. NaOH and Na_2CO_3 give deep blue-purple solns., changing rapidly to a tan or brown; concd. H_2SO_4 gives an orange soln. and the I is partially pptd. when poured into H_2O . I does not absorb HCl gas, indicating an inner salt structure. I absorbs 3 mols. dry NH_3 and becomes blue-black in color; over concd. H_2SO_4 2 mols. NH_3 are lost; the mono- NH_3 salt dissolves in H_2O with a murky green color, due to hydrolysis. The di-Na salt of I crysts. with 1EtOH; the Ba salt seps. as brown flaky plates. The di-Bz deriv. is bright yellow; 0.015 g. dissolves in 100 cc. abs. EtOH at 22°; it is slowly sapond. by boiling with dil. NaOH. I does not yield any colorless lactoid derivs.

C. J. WEST

Absorption spectra of sulfonefluorescein and some of its derivatives. R. C. GIBBS AND C. V. SHAPIRO. *J. Am. Chem. Soc.* 50, 1755-62 (1928).—A comparative study of the absorption spectra of 2,4-dihydroxybenzoyl-*o*-benzoic acid and 2,4-dihydroxybenzoylbenzenc-*o*-sulfonic acid shows that they exist in the free state as ketone derivs. A comparison of the absorption spectra of sulfonefluorescein (I) in neutral alc. soln. with that of fluorescein in neutral and acid soln. leads to the suggestion that the former has an inner salt structure. The absorption spectra of I in concd. H_2SO_4 and in alc. alk. soln. bear a close relationship to the spectra of resorcinolbenzein and fluorescein in the same solvents. The absorption of I in strong aq. KOH changes progressively, indicating 2 successive chem. changes: the breaking of the pyrone ring and the probable disruption of the mol.

A general sulfonation process. L. GAY, M. AUMÉRAS AND P. MION. *Chimie et industrie* 19, 387-95 (1928).—Guyot's process for the complete sulfonation of hydrocarbons from H_2SO_4 of any concn. by distn. of the H_2O formed (C. A. 14, 404) is shown to be extremely laborious, if not impossible, in the case of hydrocarbons of low volatility (e. g., C_{10}H_8). Good results are obtained, however, by continuously introducing a volatile auxiliary liquid, which is practically non-miscible with H_2O , or an inert gas such as N or CO_2 . It is shown from theoretical considerations that the reaction vessel should not be provided with a rectifying column, whether the hydrocarbon being sulfonated is less volatile or more volatile than water, the small amount entrained with the auxiliary liquid being returned to the cycle with the latter. Sulfonation of 256 g. C_{10}H_8 with 210 g. 94% H_2SO_4 for 5 hrs. at 140-50°, with CCl_4 as auxiliary liquid, gave a reaction mixt. contg.: H_2SO_4 none, $\text{C}_{10}\text{H}_7\text{SO}_3\text{H}$ 94.6, sulfones 7.7, C_{10}H_8 0.5, volatile matter 1.7%, HCl trace. Similar results were obtained when a slight excess of C_{10}H_8 was used. Doubling the proportion of C_{10}H_8 and prolonging the heating increased the proportion of sulfone ($(\text{C}_{10}\text{H}_7)_2\text{SO}_2$) extremely slowly. addn. of HgSO_4 did not catalyze the formation of sulfone, but did catalyze the formation of HCl by action of the H_2O on CCl_4 . With 210 g. 94% H_2SO_4 and 128 g. C_{10}H_8 , the reaction product at the end of 3, 6.5 and 9.5 hrs., resp., at 160-5°, had the following compn.: free H_2SO_4 18.5, 11.3, 9.3; $\text{C}_{10}\text{H}_7\text{SO}_3\text{H}$ 39.5, 24.4, 19.9; $\text{C}_{10}\text{H}_8(\text{SO}_3\text{H})_2$ 33.5, 60.1, 67.6; insol. 0.4, 0.1, 0.1; H_2O (by difference) 8.1, 4.1, 3.1%. As excess H_2SO_4 increases production of HCl from the CCl_4 at high temps., ligroin was used instead (it caused some reduction of H_2SO_4), and the mixt. heated 12 hrs. at 130-40° and then 5 hrs. at 140-50°. At the end of 6, 12 and 17 hrs., resp., the reaction mixt. had the following compn.: free H_2SO_4 15.25, 8.8, 2.9; $\text{C}_{10}\text{H}_7\text{SO}_3\text{H}$ 32.4, 18.7, 6.25; $\text{C}_{10}\text{H}_8(\text{SO}_3\text{H})_2$ 45.1, 68.15, 86.4; H_2O (by difference) 7.2, 4.35, 4.45%. By using CO_2 , practically the same results were obtained in about 10 hrs. at 160-70° as with ligroin after 17 hrs.

Electrolytic synthesis of tetrahydrofurylethylamine. R. TAKAMOTO. *J. Pharm.*

Soc. Japan 48, 136–41 (1928).—Windaus and Dalmer's discovery (*C. A.* 15, 1490) that furylethylamine (I) and tetrahydrofurylethylamine (II) possess a strong constricting action on the uterus resulted in many attempts to improve on the method of synthesis. T.'s electrolytic method is as follows: 20 g. furylnitroethylene* (Thiel and Landers, *C. A.* 4, 1040) is dissolved in 104 cc. of a mixt. of EtOH and AcOH (2:1) and 100 cc. of H_2SO_4 (d. 1.2) is added. An amalgamated Ni plate dipped in this soln. is used as a cathode, while a Pb plate dipped in H_2SO_4 (d. 1.1) is used as an anode. The 2 solns. are sepd. by an unglazed porcelain plate. As a promoter 1 g. $CuSO_4$ is added. The temp. of the cathode soln. is kept at 30–5° and a current of 4–4.5 amps. is used. For complete reduction 76–7 amps. of electricity was used. Yield of I, 91%. Picronate, m. 204°. Oxalate, m. 171–2°. For the prepn. of II, I is reduced with H_2 and PtO_2 . Yield, 91%. Picrate, m. 129°. Oxalate, m. 145–6°. NAO UYBI

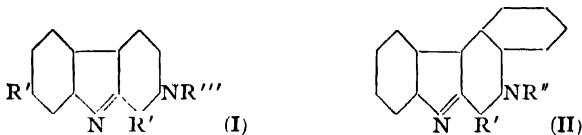

The reduction of some furan derivatives. R. TAKAMOTO. *J. Pharm. Soc. Japan* 48, 134–5 (1928).—Keimatsu and T. (*C. A.* 21, 3362) have previously reported the synthesis of tetrahydrofurfurylamine with a basic side chain. Williams (*C. A.* 22, 1155) has also reported the synthesis of the same compd. by a slightly different method. In this paper, T. comments on W.'s paper and points out the advantages of K. and T.'s method over W.'s method. NAO UYBI

Esters of α -tetrahydrofurfuryl alcohol. J. E. ZANETTI. *J. Am. Chem. Soc.* 50, 1821–2 (1928).—The following esters of α -tetrahydrofurfuryl alc. are reported: *Acetate*, b_{718} 194–5°, d_{20}^{20} 1.061; *propionate*, b_{718} 204–7°, b_2 85–7°, d_{20}^{20} 1.044; *butyrate*, b_{718} 225–7°, b_2 102–4°, d_{20}^{20} 1.012; *valerate*, b_{718} 238–40°, b_2 97–9°, d_{20}^{20} 0.999; *benzoate*, b_{718} 300–2°, b_2 138–40°, d_{20}^{20} 1.137; *furoate*, b_2 136–8°, d_{20}^{20} 1.194; the last ester becomes a thick liquid at –15° and at the temp. of solid CO_2-Et_2O it assumes the consistency of Canada balsam and at the temp. of liquid air becomes a glassy solid without any trace of crystn. Purified by distn. *in vacuo* the esters are very stable. C J WEST

Catalytic oxidation of furfural in the vapor phase. WM. V. SESSIONS. *J. Am. Chem. Soc.* 50, 1696–8 (1928).—When furfural is oxidized with air at temps. of 200–300° in the presence of V_2O_5 as a catalyst, small quantities of maleic acid and anhydride are formed, as well as $HCHO$, CO_2 and H_2O . The maleic acid formed is evidently quite pure and m. 138.5–40°. C J WEST

Syntheses in the indole series. III. Theory of anhydronium base formation and the constitution of methosulfates, with some observations on the fluorescence of 5,6-benz-4-carboline and its derivatives. WM. O. KERMAK AND R. H. SLATER. *J. Chem. Soc.* 1928, 789–97; cf. *C. A.* 22, 1355.—In support of the view that the anhydronium base formed from harmine methosulfate by the action of alkali has the constitution I (R' , OMe; R'' , R''' , Me) and is a deriv. of 4- ψ -carboline (I, R' , R'' , R''' , Me), it has been shown that the propochloride of methylharmine is not identical with the methochloride of propylharmine (*C. A.* 16, 4206), but this evidence is not quite conclusive. The anhydronium base from 5,6-benz-4-carboline methosulfate should be a deriv. of 4- ψ -carboline and should possess the constitution II (R' , H; R'' , Me) and so the methosulfate of this base ought to be identical with 1-methyl-5,6-benz-4-carboline methosulfate. This is so and proves definitely that Me_2SO_4 adds itself to the pyrrole N atom of the anhydronium base. 5,6-Benz-4-carboline, C_8H_8 and Me_2SO_4 , heated at 100° for 30 min., give the *methosulfate*, bright yellow, m. 235°, which exhibits a greenish fluorescence; solns. in H_2O , MeOH and EtOH exhibit the same fluorescence; the concd. H_2SO_4 soln. also exhibits a green fluorescence, which changes to a deep greenish blue on warming. NH_4OH in the cold gives 4-methyl-5,6-benz-4- ψ -carboline, orange, m. 205°; the EtOH and C_6H_6 solns. exhibit a brilliant green fluorescence. Both this and 1-methyl-5,6-benz-4-carboline give 1,4-dimethyl-5,6-benz-4-carbolinium methyl sulfate, chrome-yellow, m. 300°; solns. in H_2O , boiling MeOH and concd. H_2SO_4 exhibit a greenish yellow fluorescence, the last becoming greenish blue on warming. 1-Methyl-5,6-benz-4-carboline, prepd. from 3-*o*-aminophenyl-1-methylindole, forms pale pink needles, m. 142°; its solns. exhibit a brilliant green fluorescence. The HCl salt gives none of the usual indole reactions. 3-Methyl-5,6-benz-4-carboline methosulfate, bright yellow, m. 270°; solns. exhibit a vivid greenish blue fluorescence; the H_2SO_4 soln. becomes brilliant blue on warming and bluish green on diln. NH_4OH gives 3,4-dimethyl-5,6-benz-4- ψ -carboline, yellow, m. 225°; solns. exhibit a brilliant greenish blue fluorescence. This, as well as the 1,3- Me_2 deriv., gives 1,3,4-trimethyl-5,6-benz-4-carbolinium methyl sulfate, chrome-yellow, m. 292°, exhibiting a bright green fluorescence. 3-Ethyl-5,6-benz-4-carboline methosulfate, pale yellow, m. 250°; solns. exhibit a greenish blue fluorescence. A table is given showing the fluorescence of a no. of derivs. of 5,6-benz-4-carboline; a Me (or Et) group attached to the C atom in posi-

tion 3 invariably renders the fluorescence more blue. With the introduction of a Me group attached to either N atom, the fluorescence in acid soln. becomes more yellow, the effect being greater when the Me group is in position 1 than when it is in position 4. In acid soln. the effect of a Me group in position 3 is almost balanced by that of a Me group in position 4. In alk. soln. a Me group in position 1 renders the fluorescence more blue, whereas in position 4 it makes the fluorescence more green. In alk. soln. a Me group in the 4-position is much more powerful in making the fluorescence more green than 1 on position 3 is in making it blue. The compds. which contain a Me group in the 4-position fluoresce more yellow in alk. than in acid soln., whereas those compds. not possessing a Me group in this position are bluer in alk. than in acid soln. The fluorescence is usually considered stronger in acid than in alk. soln.

Action of cyanogen bromide on tertiary imidazoles. W. LANGENBECK. *J. prakt. Chem.* 119, 77-80 (1928).—1,4-Dimethylimidazole, treated with 10% BrCN in Et₂O, gives the 2-Br deriv., b_p 89-90°, m. 51-2°, HCl salt, m. 240° (decomp.); it was identified by the formation of the 5 NO₂ deriv. 2-Bromopilocarpine, oily, HCl salt, m. 240°, [α]_D¹⁸ 81.9°. 2-Bromopilocarpine-HCl, m. 201°. Pharmacol. data for 2-bromopilocarpine are given.

C. J. WEST

Rearrangements of peptide-like substances. XXIII. Histidine. Peptide formation by acyl migration. MAX BERGMANN AND LEONIDAS ZERVAS. *Z. physiol. Chem.* 175, 145-53 (1928).—When *N*-acyl derivs. of histidine are treated with amino acids the acyl migrates to the amino acid. The acyl is thus split off even more readily than by hydrolysis with H₂O. Similarly, a histidine peptide, in which the amino acid is bound to the N of the imidazole ring, loses its amino acid to a 2nd amino acid with formation of a dipeptide. Hippurylbenzoylhistidine Me ester, m. 157°, was prepd. in 50% yield by shaking benzoyl-L-histidine Me ester with BzNHCH₂COCl in dry C₆H₆. When this was shaken in CHCl₃ soln. 12 hrs. with glycine and 1 mol. *N* NaOH, 35% benzoylglycylglycine was obtained from the aq. layer and benzoylhistidine ester from the CHCl₃ layer. Acetylbenzoyl-L-histidine Me ester (I), m. 168°, was prepd. by treatment of the benzoylhistidine ester with Ac₂O. By shaking this in CHCl₃ with aq. *D*-arginine, an acyl migration occurred with formation of benzoylhistidine and 55% acetyl-*D*-arginine. In a similar manner I reacted with glycine to form 65% aceturic acid and with glycine Et ester to form Et acetate. The latter reaction occurred in the absence of H₂O. Bz migrates from benzoyltheobromine to glycine, yielding 95% free theobromine and 75% hippuric acid. The phenomenon of acyl migration observed in these expts. differs from the ordinary acyl migration in that the migration instead of being intramol. is from 1 mol. to another. It is somewhat analogous to re-esterification (*Umesterung*), except that high temp., catalyst and excess of reagent are not required. Possibly the reaction is of biol. significance. Substances other than amino acids may bring about this reaction, e.g., an acetylhistidine deriv. converted tetraacetyl- to pentaacetylglucosamine. XXIV. Note on the synthesis of a *DL*-histidylglycine. *Ibid* 154-7.—The method of peptide synthesis from acylated amino acids (C. A. 21, 61) is used in the synthesis of a histidine-glycine peptide. Acetyl-*DL*-histidine when warmed with Ac₂O is partially converted into an acetylated anhydride which unites with amino acid esters to form acetylated dipeptide esters, from which the Ac may be removed by sapon. In this manner acetyl-*DL*-histidylglycine Et ester, m. 182°, was prepd. from the acetylhistidine and glycine ester, and by refluxing with *N* HCl converted into *DL*-histidylglycine, decomp. 235°, which was isolated as the picrolonate, m. 213°. The yield was 48%. The free peptide has a sweet taste, is pptd. by phosphotungstic acid and gives a blood-red color with diazobenzenesulfonic acid.

A. W. DOX

Constitution of irigenin and iridin. I. WILSON BAKER. *J. Chem. Soc.* 1928, 1022-33.—Details are given for the isolation of iridin (I) from powd. orris root, the yield being about 18 g. from 2 kg. root. I in alc. gives with FeCl₃ a somewhat intense, dull violet color, changing to dull olive-green with excess; concd. H₂SO₄ gives a yellow soln. which, on heating to 100°, rapidly darkens and chars. Hydrolysis of 30 g. I by heating with 35 cc. H₂O, 45 cc. EtOH and 3 cc. concd. H₂SO₄ at 100° for 5 hrs. gives

17 g. irigenin (II), m. 185°; FeCl_3 gives the same color reaction as I but concd. H_2SO_4 gives a yellow soln. from which II seps. unchanged. II and an excess of BzCl give a mixt., m. 155–60°, consisting essentially of the 7,3'-di-Bz deriv. FeCl_3 gives an olive-green color (de Laire and Tiemann, *Ber.* 26, 2010, give 123–6° for the m. p.). The action of Ac_2O on II gives the *tri-Ac deriv.*, m. 127–8°; the mono-Ac deriv. of de L. and T. is really the 7,3'-di-Ac deriv., m. 169°. Alk. Me_2SO_4 and II give the *tri-Me ether*, m. 163°; decompn. with MeOH-KOH gives 3,4,5-(MeO) $_3\text{C}_6\text{H}_2\text{CH}_2\text{CO}_2\text{H}$ and 3,4,5-(MeO) $_3\text{C}_6\text{H}_2\text{OH}$. II and HI at 130° for 1 hr. gives *irigenol* (III), $\text{C}_{16}\text{H}_{10}\text{O}_8$, pale yellow, crystg. with $1\text{H}_2\text{O}$, m. 331° (decompn.); the H_2O is not lost at 140°; in the absence of air the III dissolves in aq. NaOH to a yellow, stable soln. which deposits unchanged III on acidification. In the presence of air the soln. rapidly assumes an intense crimson color and acids throw down a dark, flocculent ppt. Aq. Na_2CO_3 gives a yellow soln., turning red in the presence of air. The EtOH soln. gives an intense olive-green color with FeCl_3 , changed by excess to a deep reddish brown and when treated with a trace of Na-Hg gives green flocks. Me_2SO_4 gives the *tri-Me ether*, m. 162°; *hexa-Ac deriv.*, m. 237–8°. Soln. of III in concd. H_2SO_4 and addn. of AcOH gives the *sulfate*, orange, stable when dry at 135°, but decompd. by cold H_2O or when heated under AcOH . II (5 g.), 3 mols. MeI and 3 mols. Na in 30 cc. MeOH , heated at 100° for 16 hrs., give 1.5 g. of the 7,3'-di-Me ether, pale yellow, m. 166–7°; a trace of FeCl_3 gives an intense violet color, changing to olive-green with excess; Me_2SO_4 partially changes it into the *tri-Me deriv.*; *Ac deriv.*, m. 191°; continued methylation of II gives a *compd.* m. 154.5°, which is being examd. Alk. hydrolysis gives a mixt. of 2,4,5-(MeO) $_3\text{C}_6\text{H}_2\text{CH}_2\text{CO}_2\text{H}$ and 3,4,5-HO(MeO) $_2\text{C}_6\text{H}_2\text{OH}$. Methylation of I with CH_3N_2 , followed by hydrolysis, gives the 5,3'-di-Me ether, m. 218°, FeCl_3 gives a very faint brownish color, Me_2SO_4 gives the *tri-Me ether*. Alk. hydrolysis gives the same products as the 7,3'-di-Me ether. This work proves that II has the structure of 5,7,3'-trihydroxy-6,4',5'-trimethoxyisoflavone; the glucose in I is in the 7-position. The dyeing properties of II are very similar to those of the naturally occurring flavones and of the isoflavone genistein in particular. C. J. WEST

The formation of 2-aminopyridine from pyridine and ammonia. J. P. WIBAUT AND L. M. F. VAN DE LANDE. *Verslag Akad. Wetenschappen Amsterdam* 36, 1238–41 (1928).—When pyridine vapor is led through a quartz tube along with dry NH_3 and in presence of fine Fe as a catalyst at 550°, 2-aminopyridine is formed. Yield small.

M. ACHTERHOF

Intermolecular condensation of acetylmethylanthranilic acid by means of phosphorus pentachloride and the formation of a complex isocyanine dye. I. M. HEILBRON, S. L. HOLT AND F. N. KITCHEN. *J. Chem. Soc.* 1928, 934–41.— $\text{MeAcNC}_6\text{H}_4\text{CO}_2\text{H}$ (42 g.) in 250 cc. AcCl , treated with 25 g. PCl_5 and the reaction product esterified with EtOH , gives 62% of 3-*o*-carbethoxyphenylmethylcarbamy-1,2-dimethyl-4-quinoline (I), crystg. with $1\text{H}_2\text{O}$, m. 124° and then m. 240°; the anhyd. compd., m. 245°; the *Me ester* also seps. with $1\text{H}_2\text{O}$, m. 115° or anhyd. 244°. The intermediate chloride warmed with dil. NaOH , gives the free acid, sepg. as a hydrate, m. 130–1°; the anhyd. acid, m. 247°; *anilide*, m. 115°. The chloride and cold concd. NH_4OH give 4,4'-diketo-1,1',2'-trimethyl-1',4'-dihydro-2(3')-quinolylquinazoline, m. 260°. Acid hydrolysis of I gives 1,2-dimethyl-4-quinoline, m. 175–6°. $\text{MeAcNC}_6\text{H}_4\text{CO}_2\text{H}$ (15 g.), 150 cc. AcCl and 25 g. PCl_5 , heated until a deep red soln. resulted and then warmed with abs. EtOH , gives 50% of 4-chloro-3-*o*-carbethoxyphenylmethylcarbamy-2-methyl-quinoline-MeCl (II), m. 209° (decompn.); this also results in 66% yield from I and PCl_5 ; the free base is a yellow solid, which rapidly turns purple and forms a tar. *Methoperchlorate*, m. 244–5° (decompn.); heated, it decomp. explosively; *methiodide*, golden yellow, becomes purple-red at 210° and decomp. 215°; *methopicate*, golden yellow, decomp. 168–9°. The *Me ester*, corresponding to II, turns purple at 145°, m. 189–90°; *methiodide*, golden yellow, m. 214° (decompn.). II and PhNH_2 give 4-anilino-3-*o*-carbethoxyphenylmethylcarbamy-1-methyl-2-methylene-1,2-dihydroquinoline, orange, m. 191–2°; 4-piperidino deriv., yellow, m. 260°. 4-Anilino-3-*o*-anilino deriv., yellow powder, m. about 165°; the deep red solns. show a brilliant green fluorescence. Acid hydrolysis of II gives 4-hydroxyquinoline-MeCl. II and dil. NH_4OH in EtOH give 4'-chloro-3,3'-di-[*o*-carbethoxyphenylmethylcarbamy-1,2,1'-trimethylisocyanine iodide, brownish olive needles with a bronze reflex; the dye shows 2 well-defined bands with heads at 574 and 325 μ ; *perchlorate*, heliotrope powder; *picate*, wine-colored. 5-Bromo-methylacetylanthranilic acid, m. 204°; with PCl_5 in AcCl this gives 6-bromo-3-*p*-bromo-*o*-carbethoxyphenylmethylcarbamy-1,2-dimethyl-4-quinoline, crystg. with $1\text{H}_2\text{O}$, m. 123°, or, anhyd., m. 212°; 4-chloro-6-bromo-3-*p*-bromo-*o*-carbethoxyphenylmethylcarbamy-2-methyl-quinoline-MeCl, m. 194°; with alkali it readily gives an isocyanine dye. C. J. WEST

Cyanidin. I. Comparative investigations on cyanidin chloride and 3,5,7,3',4'-pentahydroxyflavylium chloride. T. MALKIN AND M. NIERENSTEIN. *Ber.* 61B, 791-9 (1928).—Although the work of Willstätter and his collaborators has established with certainty the presence of a pyrylium ring in cyanidin chloride (I) the orientation of the substituents in positions 2, 3 and 4 is still open to question and there are already in the literature observations that are not in harmony with the view that I and 3,5,7,3',4'-pentahydroxyflavylium chloride (II) are identical. Thus, Pratt and Robinson (*C. A.* 19, 1141) were unable to obtain from II and H_2O_2 the yellow cryst. oxidation product (III) which Willstätter and Everest obtained from I, and M. and N. have confirmed these results. They find, moreover, that III is not a flavone, as assumed by W. and R.; it is quite insol. in H_2O , its alc. soln. becomes deep red with $FeCl_3$ and it does not dye cotton mordanted with Al_2O_3 , even on addn. of alc. to the aq. suspension. I prepd. from corn flowers and from rose leaves was accordingly compared (with CHRISTINA M. FEAR) with II made by the method of P. and R. (*C. A.* 19, 2341). Qual., the substances were found to be similar to each other, but quant. methods, especially as applied to the color reactions, showed that they are different in almost all respects. That the I prepd. from rose leaves, which was used chiefly, was not contaminated with an impurity, is indicated by the similar behavior of the I from both corn flowers and from rose leaves, by the analytical results on the preps. and by the identity of the spectrum (measured by S. BARRATT and O. H. WALTERS) of the rose-leaf prepn. with that of W. and R.'s I from corn flowers and of an I from Karrer's lab. (cf. Schou, *C. A.* 22, 1101). Again, that the II did not contain an impurity (e. g., an only partially demethylated or a nucleus-methylated by-product, the possible presence of which in their synthetic anthocyanidins is suggested by P. and R.) seems to be established by the fact that the II was shown by the Zeisel method to be entirely MeO free and that a II prepd. from the AcO instead of the MeO deriv. showed the same differences from the I. The differences between I and II can hardly be ascribed to differences in mol. relations; the Menzies and Wright method of mol. wt. detns. in alc. gave 326.3 for I, 345.3 for II (calcd. for $C_{15}H_{11}O_6Cl \cdot H_2O$ 340.5), and under the ultramicroscope both I and II were found to be monomol. in $EtOH$. In view of these results, the only conclusion that can be drawn is that I has not the structure II and that the structure of other substances cannot be derived from that of I (cf. Freudenberg and co-workers, *C. A.* 20, 382, who derives the constitution of epicatechol from the reduction product of the I from cowberries). Under the microscope the crystals of I and of II are practically indistinguishable but those of II have a green, golden shimmer not possessed by those of I. X-ray photographs made (by S. II. PETER) with $Cu K\alpha$ -rays, however, show that the crystals of the 2 substances are distinctly different. The bands in the absorption spectrum of II are shifted slightly towards the longer wave lengths as compared with the bands of I. The red solns. of the ψ -base of II require much greater diln. and longer standing to become colorless than do those of the base of I; heating with HCl restores the red color in both cases. The soly. of I and II in 3% HCl after 2.5 hrs. at 90° is 18 and 68%, resp., in $EtOH$ after 4 hrs. at 18° 74 and 94%. With Na_2CO_3 I gives a pure blue color at pH 8.04, II only at pH 11.57. For the synthesis of II from the AcO deriv., 3,4-(AcO) $_2C_6H_3CO_2H$, m. 162° (obtained in 87% yield from $(HO)_2C_6H_3CO_2H$ in cold Ac_2O slowly treated with anhyd. K_2CO_3), was converted in CCl_4 with PCl_5 into diacetylprotocatechuy chloride (yield, almost quant.), m. 55° , which with CH_3N_2 in Et_2O gave 84% ω -chloro-3,4-diacetylyocatechophenone, light yellow, m. 94° ; 3 g. of this, refluxed 4.5 hrs. in $AcOH$ with anhyd. $KOAc$, cooled, treated with 2,4,6-(AcO) $_3C_6H_2CHO$ and HCl gas, allowed to stand, pptd. with Et_2O and heated with 3% HCl yielded 1.8 g. II. C. A. R.

Quinoline derivatives. VIII. Compounds of 2-phenyl-4-hydroxyquinoline. HANNS JOHN AND E. WÜNSCHE. *J. prakt. Chem.* 119, 43-8 (1928); cf. *C. A.* 22, 426.—2-Phenyl-4-acetoxyquinoline, m. 70° ; picrate. BzO deriv., m. $90-1^\circ$, picrate, 4- EtO deriv., m. $100-2^\circ$; various salts of this and the following are described. 4- PhO deriv., pale yellow, m. 252° . 4- m -Cresoxy deriv., m. $241-3^\circ$. 4- p -Nitrophenoxy deriv., m. $88-90^\circ$. 4- p -Aminophenoxy deriv., m. 81° . 4- o -Methoxyphenoxy deriv., m. 246° . 4- o -Isopropyl- m -methylphenoxy deriv., m. 252° . All but the 1st two derivs. were prepd. from the 4- Cl deriv. IX. 2-Phenyl-4-mercaptoquinoline and 2-phenylquinoline-4-sulfonic acid. *Ibid.* 49-55.—2-Phenyl-4-chloroquinoline and KHS in abs. $EtOH$ at $150-60^\circ$ for 8 hrs. give 2-phenyl-4-mercaptoquinoline, deep yellow, m. $175-6^\circ$; on standing this is transformed into di-[2-phenyl-4-quinolyl] disulfide, m. $175-6^\circ$. With MeI and $EtOH-KOH$ there results 2-phenyl-4-quinolyl Me sulfide, m. 64° ; the Et sulfide, pale yellow, m. 84.5° ; the $iso-Am$ sulfide, m. $170-1^\circ$; the allyl sulfide, m. 169° . The 4- Cl deriv. and Na_2SO_3 in H_2O , heated until the 4- Cl deriv. disappears, give 2-

phenylquinoline-4-sulfonic acid, m. above 290° ; many salts are described. The 4-HS and 4-Cl derivs., heated in EtOH-KOH at 120° for 10 hrs., give *di*-[2-phenyl-4-quinolyl] sulfide, m. 95° . X. 4-[2-Phenylquinolyl]aminobenzoic acid. H. JOHN. *Ibid* 56-60.—2-Phenyl-4-chloroquinoline and $o\text{-H}_2\text{NC}_6\text{H}_4\text{CO}_2\text{H}$ in AmOH, heated 8-10 hrs., give 4-[2-phenylquinolyl]-*o*-aminobenzoic acid, yellow, m. $232-6^{\circ}$ (decompn.); the *mesomer*, yellow, m. 273° (Et ester, m. 174°); the *p-isomer*, grayish yellow, m. 305° (Et ester, m. 92°); numerous salts of these acids are described C. J. WEST

Opening of the ring in a cyclic ammonium base. N. KISHI. *J. Pharm. Soc. Japan* 48, 141-6 (1928).—In contrast to the ease of ring rupture in *N*-methyltetrahydroisoquinoline-MeI by reduction, *N*-methyltetrahydroquinoline-MeI (I) undergoes ring rupture only with difficulty. The opening of the ring in I was studied by the following reducing reactions: (1) electrolytic, (2) Zn dust; (3) catalytic; (4) coppered Zn powder; (5) Cu_2H_2 ; (6) Na and EtOH. Among these the first 2 gave a negative result, while all the others resulted in opening the ring. Method 4, which gave the best result with recovery of $\text{Ph}(\text{CH}_2)_3\text{NMe}_2$, is described NAO UYBI

Constitution of vasicine. I. A synthesis of 2-propyl(isopropyl)-4-hydroxyquinazoline. A. K. DE AND J. N. RAY. *Quart. J. Indian Chem. Soc.* 4, 541-5 (1927).—Urethans condense readily with acylamines to give substituted quinazolines (C. A. 20, 1799). Ghose claims the active principle, vasicine (I), of *Adhatoda vasica* to be $\text{C}_6\text{H}_4\text{.N:CR.N:COH}$ (II, R = C_6H_5) (C. A. 21, 2900-1). Such a structure did not

seem very probable to D. and R. and they undertook the synthesis of II (R = Pr and iso-Pr) for comparison with the natural I. By condensing PrCONHPh with urethan in xylene, using H_3PO_4 as the condensing agent, they obtained $\text{H}_2\text{NCO}_2\text{Et} + \text{PrCONHPh} \longrightarrow \text{C}_6\text{H}_4\text{.NH CPr.N.CO} + \text{H}_2\text{O} + \text{EtOH} \rightleftharpoons \text{III}$ (II, R = Pr). The III

m. 197° ; purified natural I, m. 196° (G. gives $190-1^{\circ}$ (decompn.)); a mixt. of III and I m. indefinitely from 160° up. The picrate of III m. 184° , that of I 199° . I and III are therefore not identical. The iso-Pr analog (IV) of III m. 227° and a mixt. with I m. indefinitely from 175° ; its picrate, m. $215-6^{\circ}$ and a mixt. with that of I melts indefinitely. The crude natural I was purified by refluxing with C_6H_6 , cooling, filtering from the resinous insol. material, adding Et₂O to turbidity, again filtering, letting stand to crystallize and recrystg. from boiling alc. On dry heating it evolves a basic gas. The PrCONHPh, m. 192° , was prepd. by refluxing PrCO_2H and PhNH_2 in mol. proportions in $\text{C}_6\text{H}_5\text{N}$; 29 g. of it were gently refluxed in 50-cc xylene for 4 hrs. with 15 g. P_2O_5 , the xylene was decanted, the residue dissolved in H_2O , chilled and treated with cold NaOH and the basic ppt. (III) crystd. from boiling abs. alc. Unlike I, III forms no methiodide when refluxed in MeOH with excess of MeI. iso-PrCONHPh, prepd. like the Pr compd., m. 101° . IV does not react with MeI. The synthetic III and IV do not show the color reactions of natural I. Bischer and Lang (*Ber.* 28, 287 (1895)) give 205° as the m. p. of III, and Niemcewicz (*J. prakt. Chem.* [2], 51, 569) 240° as that of IV.

HARRIET W. GIBSON

The alkaloids of Chinese *Corydalis ambigua* Cham. et Sch. (Yen-Hu-So) I. TSAN-QUO CHOU. *Chinese J. Physiol.* 2, 203-17 (1928).—From the tubers of Chinese *Corydalis ambigua*, Cham. et Sch. (Yen-Hu-So) 5 alkaloids so far have been isolated. They are provisionally named and are described as follows: *Corydalis A*, $\text{C}_{22}\text{H}_{27}\text{O}_4\text{N}$, 6-sided prisms, m. 135° , $[\alpha]_D^{25}$ 295° ; Et sulfate, m. 162° ; HCl salt, m. 214° ; nitrate, m. 197° ; chloroplatinate, m. 227° ; methiodide, m. 228° . It is identical with corydaline. *Corydalis B*, $\text{C}_{20}\text{H}_{23}\text{O}_4\text{N}$, 6-sided plates, m. $148-9^{\circ}$, $[\alpha]_D$ 0° ; HCl salt, m. about 218° ; acid oxalate, m. 208° . It has the same m. p. as Heyl's alkaloid isolated from the roots of *Corydalis aurea*, but differs from the latter in its color reactions toward HNO_3 and Erdmann's reagent. *Corydalis C*, nodular masses or prisms, m. 201° , $[\alpha]_D$ 0° ; HCl salt, m. 248° ; acid oxalate, m. 237° ; chloroaurate, m. 195° ; HBr salt, m. 250° . This alkaloid is similar to protopine in its mol. formula, solubilities and some color reactions, but the latter m. 207° . *Corydalis D*, $\text{C}_{19}\text{H}_{17}\text{O}_4\text{N}$ (?), prisms, m. 204° , $[\alpha]_D^{25}$ -295° ; HCl salt, m. about 250° ; HBr salt, m. about 260° . *Corydalis E*, long needles, m. 219° ; HCl salt, m. 246° . *Corydalis B* has narcotic and local anesthetic properties, and increases cardiac action. *Corydalis C* is apparently a cerebral stimulant.

L. W. RIGGS

Alkaloids of Sinomenium and Cocculus. XIX. Alkaloids of *Stephania tetrandra* S. Moore. H. KONDO AND K. YANO. *J. Pharm. Soc. Japan* 48, 107-23 (1928); cf. C. A. 22, 965.—K. and Y. have isolated 3 alkaloids, i. e. *tetrandrine* (I), an Et₂O-sol. base, an Et₂O-insol. base and a phenolic base from the roots of *Stephania tetrandra*.

This paper deals with the properties of **I**, which has the compn. $C_{10}H_{22}NO_3$, *m.* 217°, $[\alpha]_D^{24}$ 263.1°; *methiodide*, decomps. 269°. It has 1 *N*-Me and 2 MeO groups. The 3rd O has a bridged structure. Wijs's reaction shows the presence of 1 double bond which resists most reducing reactions. The action of Ac_2O on **I** results in the rupture of the N ring and gives a yellow compd. *m.* 150°, $[\alpha]_D^{18}$ 55.81°. HBr on **I** gives, as a result of the demethylation of 2 MeO groups and the rupture of the O ring, *demethyltetrandriol (II)*, *m.* 228°, $[\alpha]_D^{31}$ 167.7°; *HBr salt*, decomps. 276°. Ac_2O on **II** gives *diacetyldesmethylltetrandrine*, *m.* 180°, $[\alpha]_D^{27}$ 183.8°. Zn-dust distn. of **I** gives a neutral compd., *m.* 180-5°, 3,4-(MeO)(HO)C₆H₄Me, Me₂N and a non-volatile secondary amine which resembles β -methylaminoindene. The exhaustive methylation of **I** gives an α -methine base, *m.* 196-201°, $[\alpha]_D^{18}$ 237.6° (*methiodide*, decomps. 235°) and a β -methine base, decomps. 115°, $[\alpha]_D^{18}$ 182.8° (*methiodide*, decomps. 250°). The secondary decompn. of the methine bases gives the same *non-N-compd.* $C_{13}H_{15}O_3$, *m.* 220-1°, $[\alpha]_D^{16}$ 11.69°. The fusion of **I** with KOH gives *desmonomethyltetrandrine*, *m.* 185°, while KOH fusion of **II** gives 3,4-(HO)₂C₆H₄CO₂H. The above reactions show the structure of **I** to be $C_{10}H_{14}(> NMe)(OMe)_2(> O)$. They also indicate the presence of homotetrahedral nucleus in **I**, which makes it appear that **I** belongs to the alkaloids of benzyl-tetrahydroisoquinoline type.

NAO UYEI

Further case of the spontaneous resolution of externally compensated mixtures. LEONARD ANDERSON and D. WM. HILL. *J. Chem. Soc.* 1928, 993-7. On crystal of racemized atropine sulfate from abs. EtOH several times hyoscyamine sulfate of $[\alpha]_D^{10}$ about 14° was obtained regularly and on further crystal of the collected crops of this sp. rotatory power, a sulfate of \pm about 20° was produced. The resolution is due, not to undetected traces of an optically active variety but to inoculation from the atm. The resolution could not be effected by a mixt. of MeOH and AcOH as solvent. Negative results were obtained with homatropine sulfate, atropine oxalate, atropine and tropic acid.

C. J. WEST

Volatile base in "the extract of scopolia." S. Aoyama. *J. Pharm. Soc. Japan* 48, 150-2(1928).—By distn. of Et₂O-CHCl₃ ext. of scopolia, the presence of Me₂NH was detected in the distillate. Chloroplatinate *m.* 200-3°. By steam distn. of pure atropine sulfate a volatile base was obtained which reduced KMnO₄ and its chloroplatinate, *m.* 103-8°. This was shown to be the atropamine of Schmidt (*Arch. Pharm.* 232, 430(1894)), showing that atropine (and also hyoscamine) undergoes hydrolysis by simple steam distn.

NAO UYEI

Primeveroside of salicylic acid. M. BRIDEL and P. PICARD. *Bull. soc. chim. biol.* 10, 381-5(1928); *Compt. rend.* 186, 93-9, cf. *C. A.* 19, 2514, 2838, 3289.—The primeveroside of salicylic acid is formed by the combination, with the elimination of 1 mol. of water, of 1 mol. of primeverose and 1 mol. of salicylic acid, the attachment displacing the phenolic OH of the acid. Accordingly this primeveroside has the function of a free acid. Up to the present this substance has not been found in plants. It is prepd. as the K salt by the action of KOH on monotropitoides. It crystallizes in fine colorless needles, inodorous, and with a very bitter taste, *m.* about 150°, on drying in a vacuum loses 1.42% in 3 hrs., α_D -61.6°. Chemically it is not a reducer, is acid to litmus and decomp. NaHCO₃. Its acid index in the presence of phenolphthalein is 122; theory requires 129. With oromel HCl it gives on heating the reaction of pentoses. On hydrolysis with H₂SO₄ it yields salicylic acid and an equimol. mixt. of xylose and glucose. Hydrolysis by rhamniadastase gives salicylic acid and primeverose.

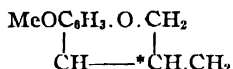

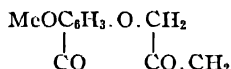

L. W. RIGGS

Saponin from *Gleditschia horrida*, Makino. Y. MATSUSHIMA and M. KUBOTA. *J. Pharm. Soc. Japan* 48, 146-50(1928).—M and K. isolated *Gleditschia saponin*, brown, softens 205°, *m.* 216-8°, from warm H₂O or dil. alc. exts. of *Gleditschia horrida* after pptg. it with 3% HCl and boiling. Its elementary analysis corresponds to C₅₀H₁₀₀O₂₀. The hydrolysis with HCl or H₂SO₄ gives arabinose and a sapogenin (*gleditschia sapogenin*), *m.* 276-8°. It has a hemolytic index of 7500, using red blood cells of the goat, and a toxicity of 40-7 mg. per kg. body wt. in dogs.

NAO UYEI

Brasilin and hematoxylin question. VII. Synthesis of trimethylbrasilone and tetramethylhematoxylylone. P. FETTER, O. ANGERN, E. HAACK and J. WILLEMS. *Ber.* 61B, 839-43(1928); cf. *C. A.* 22, 1782.—Reduction with H and Pt of the synthetic trimethylanthydrobrasilin and tetramethylanthydrohematoxylin described in papers V and VI gave the satd compds. *trimethyldeoxybrasilin (I)* and *tetramethyldeoxyhematoxylin (II)*, and oxidation of these compds with CrO₃-AcOH yielded trimethylbrasilone (III) and tetramethylhematoxylylone, identical with the products obtained

by oxidation of trimethylbrasilin and tetramethylhematoxylin. The correctness of the constitution deduced by analytical methods by Perkins and his associates for brasilin and hematoxylin has thus been proved synthetically except for the position of the alc. HO group but the whole behavior of the 2 compds. leaves no doubt that, as is generally assumed, this HO group is on the atom *C in formula I. I, begins to m. 106°, m. 107–9°, dissolves in concd. H₂SO₄ with yellow color quickly darkening and becoming greenish brown; Br vapors quickly color solid I a light pink. II, begins to sinter 147°, m. 151°, dissolves in concd. H₂SO₄ with pure yellow, in concd. HNO₃ with brown-red color, is practically unchanged by short treatment with Br vapors, becomes intensely purple on longer treatment.

 $\text{C}_6\text{H}_2(\text{OMe})_2$ (I)

 $\text{C}_6\text{H}_2(\text{OMe})_2$ (III)

C. A. R.

Dry distillation of cholesterol with activated carbon.* T. TSUKAMOTO. *J. Pharm. Soc. Japan* 48, 123–34 (1928).—Distn. of cholesterol (I) with activated C (II) gives an oil (III) mixed with crystals of chrysene (IV), m. 245° (cf. Diels, *C. A.* 21, 1649). Oxidation of IV with CrO₂ in AcOH gives chrysoquinone, m. 255°, while IV and HNO₃ give nitrochrysene, m. 207°. The distn. of the higher-boiling fractions of III with S or II also gives IV, showing that III contains hydrochrysene. In place of II, the mixt. of S and II or adsol (V) (Japanese fuller's earth) can be used in the distn. of I with the same results. A comparison of the d. of fractionated samples of III obtained by different methods with Zelinskii's data (*C. A.* 22, 89) for the product obtained with AlCl₃ showed that the product of adsol distn. resembled that of natural petroleum and that obtained without a catalyzer resembled the AlCl₃ distn. product, while the distn. product with II had the highest d. because of the dehydrogenating action of II. This fact shows that Z.'s assumption of the parallelism between the natural purification process and AlCl₃ distn. is unnecessary, but it can be assumed that fuller's earth or C might play their role in nature's process. The plotting of curves using $\Delta A/\Delta T$ (where ΔA = an increase in yield due to the rise in temp. ΔT) and temp. also showed that the product of adsol distn. resembled the fractions of natural petroleum.

NAO UYEH

The bile acids. XIX. MARTIN SCHENCK AND HENRY KIRCHHOFF. *Z. physiol. Chem.* 175, 135–44 (1928); cf. *C. A.* 22, 595. The diisoxime of bilianic acid yields 73% of a tribasic acid, C₂₄H₄₄N₂O₄, which decomps. 230–2° and is remarkable for its blue color. The reaction is not accompanied by gas formation or evolution of heat; hence the product is probably closely related to the parent substance. It differs from the diisoxime in that it contains 2 fewer H, and probably a double bond or a bridged linkage. It is probably a nitroso deriv. since it gives the Angeli and Castellana reaction (blue color with H₂SO₄ and Ph₂NH), though a not altogether typical Liebermann reaction. Further treatment with HNO₃ or with an excess of alkali converts it into a colorless substance. The diisoxime of isobilianic acid is stable to 20% HCl at ordinary temp., forming a cryst. HCl salt from which the diisoxime may be recovered, but when refluxed with 25% HCl a product, C₂₄H₃₆NO₉·HCl, is obtained which crystals with 1.5H₂O.

A. W. DOX

Röntgen rays in organic chemistry. A. KARSEN. *Chem. Weekblad* 25, 114–27 (1928).—A complete survey of the work done with Röntgen rays on structure in org. chemistry. The classes considered are carbon, graphite, hydrocarbon, fatty acids, dibasic acids, ketones and aromatic compounds. Reference is made to work done on each class.

M. ACHTERHOF

Organic substances in primitive times. OSCAR LOEW. *Z. angew. Chem.* 40, 1548–9 (1927).—It would be interesting to ascertain the 1st org. compds. which existed on the earth. Moissan, working with carbides, concluded that they must have been hydrocarbons. Metal carbides were probably formed as the nebular mass cooled. In time, when temp. conditions permitted H₂O to exist, the carbides were acted upon by it and hydrocarbons formed. By lightning, the hydrocarbon vapors and liquids were ignited and the atm. was enriched by CO₂ as a result. Evidence in favor of this theory is found in the existence of carbides and hydrocarbons in meteorites. It is possible that from CH₄, other org. compds. were produced. The oxides of Fe and Cu may have catalyzed the oxidation of CH₄ to CH₂O (I). I, reacting with NH₃, formed by the catalytic union of its elements, might ultimately have led, according to L., to the formation of

asparaginic aldehyde. This, by polymerization and condensation, might have yielded a complex which, on reduction with H_2 and H_2S , would give a substance approximating a protein in nature. It might also have polymerized to sugars, although the presence of acid vapors would have tended to make the end products simple sugars. Thus org. compds., even to the extent of relatively complex proteins, could have come into existence without the catalyzing influence of chlorophyll and light. G. A. HILL

The electron in organic chemistry. I. The electronic conception of the nature of the carbon-to-carbon bond from the standpoint of the theory of partial polarity. M. S. KHARASCH AND OTTO REINMUTH. *J. Chem. Education* 5, 404-18(1928).—A summary in simpler terms of the work already published by K. and his co-workers (cf. C. A. 19, 2297, 2483, 3081; 21, 233).

The thermal dissociation of ethane, propane, butane and isobutane. Preliminary study. R. N. PHASE. *J. Am. Chem. Soc.* 50, 1779-85(1928).—The thermal dissocn. of C_2H_6 , C_3H_8 , C_4H_{10} and Me_2CHCH_2Me has been studied at 625° and 650° and 1 atm. The total rate of dissocn. increases with the complexity of the mol. The 2 principal reactions are dehydrogenation and demethanation. The ratio of H to CH_4 decreases in the series C_2H_6 , C_3H_8 , C_4H_{10} . iso- C_4H_{10} decomp. at about the same rate as C_4H_{10} but gives relatively more H^* . The H formed undergoes no appreciable secondary reaction. The reactions seem to be somewhat more rapid than normal in the 1st few secs. but diln. expts. indicate a 1st-order reaction. The temp. coeffs. are as a min. 1.5-2 per 25°, giving a min. activation energy of 25,000-50,000 cal. An explanation of the relative rates of the reactions is given in terms of activation energies as a function of the size of the mol. and the nature of the linkages to be broken. C. J. WEST

Some derivatives of heptane. R. T. DILLON AND H. J. LUCAS. *J. Am. Chem. Soc.* 50, 1711-4(1928).—4-Heptanol results in 63% yield from 370 g. $PrBr$, 72 g. Mg , 110 g. HCO_2Et and 650 g. Et_2O , b_{740} 153.4-4.4° (cor.), m . -37.2° to -41.5°, d_4^{26} 0.8175, n_D^{20} 1.4199, n_D^{26} 1.4173. 3-Heptanol results in 40% yield from 155 g. $BuBr$, 27.5 g. Mg , 65.6 g. $EtCHO$ and 500 g. Et_2O , b_{740} 152.7-4°, n_D^{20} 1.4201. 3-Chloroheptane, b_{751} 143.4-4.4°, n_D^{20} 1.4237; 4-Cl deriv., b_{751} 143.1-4.4°; 3-Br deriv., b_7 84.5-5.5°, n_D^{20} 1.4507, 4-Br deriv., b_{72} 73.8-4.0. 1.4506. The reaction of HCO_2Et with $BuMgBr$ and $EtMgBr$ gave 2-pentanol and 4-nonanol but not 3-heptanol. The similarity in the phys. properties of the 2 pairs of isomers makes it impossible to differentiate between them. C. J. WEST

Catalytic hydrogenation of different types of unsaturated compounds. II. The hydrogenation of conjugated systems. S. V. LEBEDEV AND A. O. YAKUBCHIK. *J. Chem. Soc.* 1928, 823-37. In the catalytic hydrogenation of conjugated systems, the process may be of 4 types: I. In the 1st phase the addn. of H is directed exclusively into the 1,4-position; in the 2nd phase, which proceeds at a different rate, 2,3-addn. occurs. II. In the 1st phase the addn. of H takes place primarily in all the possible directions (1,2, 3,4 and 1,4) and subsequently until a fully satd. compd. is formed. All these reactions proceed simultaneously. The 1st phase ends with the consumption of the conjugated system at the "critical point of hydrogenation." For the several substances investigated, the critical point corresponds to 68-77% of H absorbed. In the 2nd phase are hydrogenated those monoethylenic compds. which are formed in the 1st phase. III. One mol. of a conjugated system absorbs simultaneously 2 mols. of H, giving a satd. compd. directly. IV. The addn. of H is directed exclusively into the 1,2- and 3,4-positions. The double linkages of the conjugated system are hydrogenated independently. The process of hydrogenation of $CH_2:CHCMe:CH_2$ belongs to type II. The 1st phase, which proceeds at a const. rate, embraces several processes—the addn. of 1 mol. of H in the 1,2-, 3,4- and 1,4-positions—which lead to the formation of 3 amylenes, viz., $Me_2CHCH:CH_2$, $MeEtC:CH_2$ and $Me_2C:CHMe$. At the same time some Me_2CHI is formed. The 1st phase ends at the "critical point," corresponding to the addn. of 70-1% of H necessary for complete hydrogenation, at this point the whole of the $CH_2:CHCMe:CH_2$ has been consumed. In the 2nd phase the accumulated amylenes are consecutively hydrogenated: first the $Me_2CHCH:CH_2$, then the $MeEtC:CH_2$ and finally the $Me_2C:CHMe$. The hydrogenation curve of $CH_2:CHCMe:CH_2$ is horizontal in its 1st phase, but turns upwards at the critical point, denoting an increase in the rate. In the 2nd phase the curve shows 3 more or less horizontal sections corresponding to the 3 amylenes. In the hydrogenation of $CH_2:CHCMe:CH_2$ with ethylenic compds. the critical point retains its position. C. J. WEST

Hexa-tertiary-butylethynylethane. P. L. SALZBERG AND C. S. MARVEL. *J. Am. Chem. Soc.* 50, 1737-44(1928).— $(Me_3CC:C)_tCOH$, m . 100-2.2°, gives a cryst. complex

with SnCl_4 , $\text{C}_{19}\text{H}_{23}\text{O} \cdot \text{SnCl}_4$. With H_2SO_4 there results a yellow compd., m. 109.5–10.5° (cor.), to which is assigned the structure $(\text{Me}_2\text{CC}:\text{C})_2\text{C}:\text{CHCOOCMe}_3$. *Tri-tert-butylethynylbromoethane*, m. 69–70°, from the carbinol and PBr_3 ; there is also formed an isomer, m. 177–8°; the *acetate*, m. 144.5–5.5°. The bromide and mol. Ag give 46% of *hexa-tert-butylethynylethane*, m. 130–1°, which is undissoc. at room temp. and undergoes rearrangement at 140°, giving an isomer, m. 174–5°. Cleavage by alkali metals indicates that the stability of the central ethane linkage is intermediate between that of the corresponding linkages in $(\text{PhCH}_2)_2$ and $(\text{Ph}_3\text{C})_2$. C. J. WEST

Rearrangement of the triple bond. H. H. GUEST. *J. Am. Chem. Soc.* 50, 1744–6 (1928).—True acetylenes, $\text{RC} \equiv \text{CH}$, are changed into isoacetylenes, $\text{R}'\text{C}:\text{CR}'$, in the absence of EtOH , by vapor-phase thermal rearrangement. The rearrangement of heptene into isoheptenes is described. A general method for the synthesis of the higher

homologs of C_2H_2 is: $\text{RMgBr} + \text{CH}_2:\text{CHCH}_2\text{Br} \longrightarrow \text{RCH}_2\text{CH}:\text{CH}_2 \xrightarrow{\text{Br}} \text{RCH}_2\text{CH}:\text{CHBr} \xrightarrow{\text{KOH}} \text{RCH}_2\text{C} \equiv \text{CH}$. C. J. WEST

Polymerization of acetylene. I. CHIKO FUJIO. *J. Soc. Chem. Ind. Japan* 31, 77–86(1928).—Purified C_2H_2 is passed into a glass tube filled with a catalyst such as charcoal, pumice, clay, Japanese acid clay and brick heated at 400–700°. The yield and chem. nature of the tar produced depend upon the temp., rate of passing C_2H_2 and the nature of the catalyst; the max. yield is about 82% of theory by passing 5 l. of the gas per hr. over the clay heated at 650°. The tar is fractionally distd. The fraction b. under 175° consists of C_6H_6 and other aromatic hydrocarbons and the fraction b. 175–250° mostly of C_{11}H_8 . The yield of the gasoline-fraction of the tar is greatest when charcoal is used as catalyst. When a metallic tube such as Fe, Ni, Cu, Al, Fe coated with enamel, Sn and FeS , is used instead of a glass tube, the decompn. of C_2H_2 into C, H_2 and other gaseous substances takes place more abundantly than the polymerization. The tar thus produced is quite different in its chem. nature from that obtained by using a glass tube. A porcelain tube, however, serves like a glass tube in the polymerization of C_2H_2 . The gaseous substances such as CO, CO_2 , H_2 , CH_4 and coal gas generally found in the waste gas have not only a serious effect upon the chem. nature of the tar but an advantage in carrying out the reaction smoothly. In the polymerization of C_2H_2 into tar, the catalyst and C, the latter being formed by the decompn. of C_2H_2 and piled upon the former, seem to play an important role in the reaction. K. K.

Action of nascent thiocyanogen upon isoprene and dimethylbutadiene. H. A. BRUSON AND WM. A. CALVERT. *J. Am. Chem. Soc.* 50, 1735–7(1928).—Isoprene and $(\text{SCN})_2$ (prepd. from NaSCN in AcOH with Br) give a *dithiocyano addn. product*, m. 76–7° (cor.); it possesses a faint, disagreeable odor; its solns. cause blistering of the skin and its dust creates a sickening metallic taste in the mouth when inhaled. 2,3-Dimethylbutadiene gives a similar product, $\text{C}_8\text{H}_{10}\text{S}_2\text{N}_2$, m. 130°. These addn. products may be used to characterize these hydrocarbons. C. J. WEST

Unsaponifiable matter from the oils of elasmobranch fish. IV. Establishment of the structure of selachyl and batyl alcohols as monoglyceryl ethers. I. M. HEILBRON AND WM. M. OWENS. *J. Chem. Soc.* 1928, 942–7; cf. C. A. 21, 1112.—Batyl alc., m. 69–70°, for which an improved method of prepn. is given, forms a *phenylurethan*, m. 98° and a *p-nitrobenzoate*, pale yellow, m. 53–4°. While the alc. contains an alkyloxy radical, no test could be obtained for the MeO group. Heated with HI for 1 hr., octadecyl iodide results, identified by reduction to $\text{C}_{18}\text{H}_{38}$, and the formation of *octadecyl Me ether*, m. 30–1°. While the Me_2CHI was not isolated there is no doubt but that batyl alc. is a monoglyceryl ether of $\text{C}_{18}\text{H}_{37}\text{OH}$, probably of the formula $\text{C}_{18}\text{H}_{37}\text{OCH}(\text{CH}_2\text{OH})_2$. In a similar manner, selachyl alc. would be related to oleyl alc. and chimyl alc. to cetyl alc. C. J. WEST

Catalytic preparation of methylamine from methyl alcohol and ammonia. T. L. DAVIS AND R. C. ELDERFIELD. *J. Am. Chem. Soc.* 50, 1786–9(1928).— MeNH_2 is formed when MeOH and NH_3 are passed over a hot ThO_2 catalyst. The best temp. appears to be 325–30° and the best relative concn. about 0.80–0.83 mole of NH_3 per mole of MeOH. Under the best conditions nearly 33% of the MeOH is converted into MeNH_2 . The product contains no *sec-* or *tert-*amine. C. J. WEST

The identity of "carnirine" with trimethylamine oxide. F. A. HOPPE-SYLVÉR. *Z. physiol. Chem.* 175, 300–3(1928).—"Carnirine," the base isolated by Suzuki, Inouye and Bharatkar (*J. Coll. Agr. Tokio* 5, 9(1912)) from ext. of the Japanese giant crab and assigned the formula $\text{C}_6\text{H}_{11}\text{O}_2\text{N}_2$ is believed to be Me_3NO . The HCl salts and picrates of both have the same m. ps., and the elementary compn. of the HCl salt, chloroplatinate and picrate would be practically the same for Me_3NO as for $\text{C}_6\text{H}_{11}\text{O}_2\text{N}_2$.

Both bases are optically inactive and incapable of forming esters. Me_2NO is known to be a constituent of certain marine fishes.

A. W. DOX

Optically active α -arsonocarboxylic acids. II. J. BACKER AND C. H. K. MULDER. *Verslag Akad. Wetenschappen Amsterdam* 37, 289-91 (1928).—If K_2AsO_3 is allowed to react with an α -Br fatty acid, compds. of the general formula $\text{K}_2\text{O}_3\text{AsCHRCO}_2\text{K}$ are obtained from which the acids $\text{H}_2\text{O}_3\text{AsCHRCO}_2\text{H}$ are easily sepd. by HCl . α -Arsonobutyric acid, m. 127° ; α -arsonovaleric acid, m. 119° . Both are dibasic and may be titrated with phenolphthalein. The acids in C_3 , C_4 and C_5 are optically active. Their constituents may be sepd. by crystrn. of their diquinine salts in dil. alc. These salts contain resp. 6, 5 and 4 mols. H_2O ; their solubilities in H_2O at room temp. are, resp., 0.8, 0.7 and 0.6%. The optically active acids are obtained by transforming the quinine salts into the Ba salts with $\text{Ba}(\text{OH})_2$, then treating with strong HCl . They are more stable in alk. than acid soln. The Ba salts are stable in H_2O even at 100° . The racemization is a monomol. reaction. The following are the rotations for λ 674.0, 626.5, 589.3, 560.5, 536.5, 516.0, resp.: α -arsonopropionic acid, 31.5, 36.1, 41.0, 46.0, 52.2, 58.9° ; α -arsonobutyric acid, 19.7, 22.7, 25.7, 29.1, 32.5, 36.3° ; α -arsonovaleric acid, 16.7, 19.3, 22.1, 24.8, 28.3° ; Ba α -arsonopropionate, -6.5 , -7.3 , -8.5 , -9.7 , -10.5 , -11.7 ; Ba α -arsonobutyrate, -9.4 , -10.5 , -11.9 , -13.1 , -14.3 , -15.6 ; Ba α -arsonovalerate, -10.2 , -13.7 , -15.6 , -17.7 , -20.0 , -22.0° .

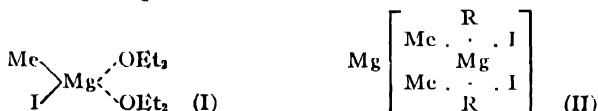

A. L. HENNE

The Grignard reaction. JAKOB MEISENHEIMER. *Ber* 61B, 708-20 (1928).—In the prepn. of alkylmagnesium halides from alkyl halides and Mg in Et_2O there is always formed some Mg dihalide; this side reaction can be repressed but never completely prevented by diln. and slow addn. of the alkyl halide. The quantity of alkylmagnesium halide can be detd. by the method of Gilman and his co-workers (titration with acid of the $\text{Mg}(\text{OH})_2$ formed by decompn. with H_2O). If, in addn., the halide ion liberated in the decompn. is titrated by the Volhard method, the extent of the above side reaction can also be detd. If it is desired to det. only the relative extents of the main and side reactions 3-4 cc. of the clear Et_2O soln. is poured into a measuring flask, decompd. with H_2O and a known quantity of HNO_3 and made up to the mark and the excess of HNO_3 is titrated in 1 aliquot and the halogen is detd. in the same or another aliquot. The ratio of HNO_3 used up to that of Ag soln. required should be 1.1 if alkylmagnesium halide has been formed exclusively. In 1 expt. with 0.9 g. Mg, 25 cc. Et_2O and 4.5 g. MeI the ratio $\text{I}^-:\text{OH}^-$ was found to be 1.10:1; with the MeI added dropwise, 1.03:1; in a EtMgI soln. prepd. without any special precautions, 1.2:1; in an EtMgBr soln., 1.1:1 (with the EtBr added dropwise, 1.05:1). With alkyl chlorides, the MgCl_2 , on account of its insoly. in Et_2O , seps. practically quant. and the Et_2O soln. contains pure alkylmagnesium chloride ($\text{Cl}^-:\text{OH}^- = 1$). Naturally, the method gives reliable results only if moisture and atm. O are rigorously excluded. Surprisingly enough, diln. of the Et_2O soln. alters the results. Thus, a soln. of MeMgI which gave an $\text{I}^-:\text{OH}^-$ ratio of 1.005:1 gave a value of 1.1:1.4 when dild. with about 20 vols. of the purest, carefully dehydrated Et_2O . The generally accepted formula $\text{RMgX} \cdot 2\text{Et}_2\text{O}$ for the alkylmagnesium halides has hitherto never been confirmed by direct analysis of cryst. compds. M. has now analyzed Ziegler's cryst. $\alpha\text{-C}_{11}\text{H}_{23}\text{MgBr}$ compd. and found it contains 3 mols. Et_2O but 1 mol. is so loosely held that the crystals deliquesce when pressed between filter paper, with effervescence and formation of a viscous oil, and lose 1 mol. Et_2O in *vacuo* in a few min., the rest of the Et_2O being given off only after several days at 100° under 20 mm. The crystals dissolve readily in Et_2O and if the soln. is allowed to evap. slowly it yields a solid glassy mass of the dietherate. In the hope of obtaining a similar cryst. deriv. of EtMgI concd. Et_2O solns. were allowed to stand in well-closed vessels; beautiful transparent crystals did, in fact, sep. after a few days but they proved to be the ethylate, often having the compn. $\text{EtOMgI} \cdot \text{Et}_2\text{O}$ but sometimes contg. less I and more Mg, i. e., they contained MgO , probably in the form of a strongly basic salt (see below). After each removal of this substance, the mother liquors yielded more crystals much more rapidly. This was at first ascribed to the introduction of O on opening the flask, but the succeeding crops of crystals did not increase in O content and numerous analyses showed that the atm. moisture, along with the O, is responsible for the more rapid crystn.; the crystals show a progressive increase of I (e. g., up to 53.8%), an increase in the ratio $\text{I}^-:\text{OH}^-$ (1.38:1) and a decrease in C and H (to 22.4 and 5.1%, resp.), i. e., the crystals gradually become contaminated with $\text{MgI}_2 \cdot 2\text{H}_2\text{O}$. On the other hand, if the EtMgI soln. was not allowed to stand quietly but was treated 2-3 hrs. with a rapid current of air, the crystals contained an excess of MgO (e. g., 1 42.2%, $\text{I}^-:\text{OH}^-$ 1:1.78). The ethylate is also obtained by adding the calcd. quantity of abs. EtOH to EtMgI or MeMgI in Et_2O . The auto-oxidation of MeMgI solns. proceeds less smoothly; rapid oxidation with a current

of air yields an oil which crystd. only once, the crystals having approx. the compn. $3(\text{McOMgI} \cdot \text{Et}_2\text{O}) + \text{MgO}$; as with the Et compd., practically no peroxide O could be detected iodometrically. Air oxidation of EtMgBr gave no products analogous to those obtained with the iodide. The Et_2O soln. on long standing yields crystals, to be sure, but these are $\text{HOMgBr} \cdot \text{Et}_2\text{O}$; when they are removed (and consequently air is admitted) the succeeding crops (which sep. more rapidly) contain increasing quantities of $\text{MgBr}_2 \cdot 2\text{H}_2\text{O}$. The $\text{HOMgBr} \cdot \text{Et}_2\text{O}$ is also formed when cold alkylmagnesium bromide solns. are treated with moist Et_2O contg. less than the calcd. quantity of H_2O . On the other hand, McMgI (and also MeMgBr) with H_2O in $\text{C}_6\text{H}_5\text{N}$ or Am_2O reacts with both H atoms of the H_2O , as found by Zerevitinov. A repetition of his expt. in Am_2O under exactly the conditions given by him yielded crystals which certainly consisted chiefly of $\text{MeI}_2 \cdot 2\text{Am}_2\text{O}$ with varying quantities of MeMgI , presumably as $\text{MeMgI} \cdot 2\text{Am}_2\text{O}$, and decompn. products; by passing dry air through an Am_2O soln. of McMgI were obtained crystals having approx. the compn. $\text{McOMgI} \cdot \text{Am}_2\text{O}$, which, of all the substances obtained, most closely resembled the product described by Z. as being $\text{McMgI} \cdot \text{Am}_2\text{O}$. With MeMgBr were obtained products consisting of $\text{MeMgBr} \cdot 0.5\text{Am}_2\text{O} + \text{MgBr}_2 \cdot 0.5\text{Am}_2\text{O} + \text{MgO}$. $o\text{-Cl}(\text{CH}_2)_3\text{C}_6\text{H}_4\text{Cl}$, $\text{Cl}(\text{CH}_2)_3\text{C}_6\text{H}_4\text{I}$, $\text{I}(\text{CH}_2)_3\text{C}_6\text{H}_4\text{Cl}$ and $\text{I}(\text{CH}_2)_3\text{C}_6\text{H}_4\text{I}$ do not react with Mg in Et_2O under any conditions (boiling for days with Mg powder or shavings, with etched Mg, in the presence of I or EtBr , in dry or moist Et_2O); in boiling C_6H_6 the di-I compd. and in boiling (iso-Am) $_2\text{O}$ all 4 of the substances do react, the di-I compd. quant., but under such drastic conditions the side reaction becomes more pronounced and after decompn. with H_2O the ratio $\text{I}^- : \text{OH}^-$ is considerably greater than 1:1 (around 3:1). $\text{Ph}(\text{CH}_2)_3\text{I}$, $o\text{-PrC}_6\text{H}_4\text{I}$ and $o\text{-BrC}_6\text{H}_4\text{CH}_2\text{Br}$ react readily with Mg, and at present the lack of reactivity of the 4 compds. above cannot be explained. The $o\text{-}[\gamma\text{-chloropropyl}]\text{chlorobenzene}$, obtained in 40–50% yield from $o\text{-Cl}(\text{CH}_2)_3\text{C}_6\text{H}_4\text{NH}_2 \cdot \text{HCl}$ in HCl with NaNO_2 and then CuCl , $b_{20} 112^\circ$, gives with NaI in boiling alc. 50–55% of the $\gamma\text{-iodopropyl analog}$, $b_{20} 142^\circ$. $o\text{-}[\gamma\text{-Chloropropyl}]\text{iodobenzene}$, from diazotized $\text{Cl}(\text{CH}_2)_3\text{C}_6\text{H}_4\text{NH}_2$ and KI (yield, 50–55%), oil quickly becoming brown, $b. 102^\circ$ in a high vacuum; $\gamma\text{-iodopropyl analog}$, golden yellow, $b. 132\text{--}4^\circ$ in a high vacuum. $o\text{-Propyl iodobenzene}$ (70% from diazotized $o\text{-PrC}_6\text{H}_4\text{NH}_2$ and KI), light brown, $b_{20} 121^\circ$. $(\text{CH}_2\text{Br})_2$ and Mg in Et_2O give under all conditions pure C_2H_4 and $\text{MgBr}_2 \cdot 2\text{Et}_2\text{O}$. C. A. R.

Molecular weight and constitution of the Grignard magnesium compounds. JAKOB MEISENHEIMER AND WALTER SCHLICHENMAIER. *Ber.* 61B, 720–9 (1928).—The structure I proposed by M. and Casper for the Grignard compds. has been attacked by Terentiev (C. A. 21, 504), who suggests the structure II ($\text{R} = \text{Et}_2\text{O}$) because in 3 mol. wt. detns. in boiling Et_2O (all at about the same concn.) he obtained values 2.2–2.3 times those corresponding to I. M. and S. believed the close agreement with each other of T.'s results to be accidental and that his high values were the result of assocn. Expt. has confirmed this view and shown, moreover, that T.'s results are unreliable for still another reason. In the 1st detns. T.'s method was followed closely, i. e., the Grignard soln. was evapd. *in vacuo*, then heated 2 hrs. at 75° *in vacuo* to remove all excess of MeI and the sirupy, turbid residue taken up in 20 cc. Et_2O and filtered through a glass filter from the flocks which deposited. With solns. so prepd. the mol. wts. found ranged in general from 1.3–1.6 times that calcd. for I in 1.5–2.0% soln. to 2.5 times in 11.5% soln. but the variations in the individual detns. were considerable. It was noticed, moreover, that on dilg. the Grignard reagent for the mol. wt. detn. it became quite turbid, even though the diluent Et_2O was dried with the greatest care with perfectly fresh Na wire or over P_2O_5 , whereas a fresh Grignard soln. prepd. in the usual way did not become turbid when dild. with the same Et_2O ; evidently, in the heating of the Grignard reagent at 75° it undergoes some change. Accordingly, for the later detns. a large excess of Mg was employed (2 g. for 2.7 g. EtBr and 15 cc. Et_2O) to insure the absence of any unchanged EtBr in the product, and the evapd. soln. was heated only 1 hr. at 25° *in vacuo*. Such a product gave only a very few flocks when taken up in 20 cc. Et_2O and dildn. of the filtrate with more Et_2O produced only a very slight turbidity. The mol. wts. now obtained increased perfectly regularly with increasing concn. from 179 in 1% soln. to 250 in 5.5% soln. (calcd. for EtMgBr , 133.3). With McMgI the turbidity produced on dilg. with Et_2O was somewhat greater; the mol. wts. found were 248, 289 and 329 for 1.343 g. in 30.33 g. solvent, 2.013 g. in 32.07 g. and 3.268 g. in 33.26 g., resp., and whereas the ratio $\text{I}^- : \text{OH}^-$ in the original soln. was almost exactly 1:1, in the (dild.) solns. after the mol. wt. detns. the ratio was shifted strongly in favor of the HO ions (see preceding abstr.). PhMgBr showed a mol. wt. of 294 in 3.6% soln. and 279 in 2.1% soln.; the solns. remained almost clear during the detns. and the ratio $\text{Br}^- : \text{OH}^-$ was shifted only from 1.10:1 to 1.06:1 on 10-fold

diln. with Et_2O . The results taken as a whole, indicate that alkylmagnesium halides are not dimol., as assumed by T., but, in not too concd. Et_2O soln., are chiefly monomol., and, as the concn. increases, become more and more associated; a very small proportion is dissociated into ions (EtMg^+ and Br^-), as indicated by the elec. cond. of the solns. Entirely similar results were obtained with $\text{MgI}_2 \cdot 2\text{Et}_2\text{O}$ (mol. wt., 296 and 392 for 0.5897 g. MgI_2 in 26.99 g. Et_2O and 1.557 g. in 31.66 g.). The fallacies in the evidence adduced by Ivanov (C. A. 21, 3893) and by Kierzek (C. A. 22, 573) in favor of the Jolibois formula, $\text{MgEt}_2 \cdot \text{MgI}_2$, for the Grignard compds. are briefly discussed.

C. A. R

Structures of convolvulinolic and jalapinolic acids. Synthesis of 11-hydroxypentadecanoic and 11-hydroxyhexadecanoic acids. LETHA A. DAVIES AND ROGER ADAMS *J. Am. Chem. Soc.* 50, 1749-55 (1928).—Me 10-aldchyddodecanoate and AmMgBr give 33% of Me 11-hydroxyhexadecanoate, b_p 183-6°, m. 40.5-1.5°; the free acid (I) m. 68-9°; oxidation with CrO_3 gives 11-ketohexadecanoic acid, m. 74-5°, identical with the acid obtained from jalapinolic acid. 11-Hydroxypentadecanoic acid, m. 63.5-4°; Me ester, b_p 166°, m. 29-32°; 11-ketopentadecanoic acid, m. 70-1°. 9-Ketohexadecanoic acid, m. 73.5-4.5°. Jalapinolic acid has been shown to be the *d*-form of I, through oxidation of both substances to the same keto acid and also by the reduction of the keto acid derived from the acid to a substance identical with the synthetic I. Convolvulinolic acid has been shown to have a structure different from that of I.

C. J. WEST

The butenoic amides. P. BRUYLANTS AND A. CASTILLE. *Bull. sci. acad. roy. Belg.* 13, 767-81 (1928).—Crotonamide (I), m. 159-60°, and isocrotonamide (II), m. 100-1°, have been prep'd. by hydrolysis with concd. H_2SO_4 of the corresponding nitriles. The lower boiling nitrile (b. 108°) gives a mixt. of I and II, and the higher-boiling nitrile (b. 121°) gives I exclusively. The spectrographic detn. in the ultra-violet of the two amides in H_2O are given. Vinylacetonitrile gives vinylacetamide (III), m. 74°, on hydrolysis with H_2SO_4 only if the acid is exactly neutralized. If excess alkali is used I is the only product obtained. Spectrographic detns. are also given, and III in alk. soln. is almost completely converted to I after 15 days at room temp. Alk. hydrolysis of cyclopropanonitrile gives cyclopropionamide, m. 123-4°. Methylacrylamide, m. 102-6°, is obtained by hydrolysis of the nitrile. On boiling in C_6H_6 it slowly polymerized to an amorphous mass.

D. H. POWERS

Resolution of racemic α -sulfonedibutyric acid. R. AHLBERG. *Ber.* 61B, 811-7 (1928); cf. C. A. 18, 2497.—It had been shown that the active $\text{SO}_2(\text{CHEtCO}_2\text{H})_2$ (I) are inactivated rapidly in H_2O but only preliminary expts. had been made on the inactivation velocity of the impure active forms and, on account of the relatively great rearrangement velocity it had not been attempted to prep. the different stereoisomeric forms of the free acid in pure form. The present paper deals with the prepn. of these active forms and with their properties. Of the Ba salts, that of the *dl*-I is the least sol., the rearrangement of the simple configurations into each other proceeds very rapidly in alk. soln. and in neutral or faintly acid soln. the different forms are relatively stable. It is best to dissolve the cryst I in moderately cooled, about 2 N $\text{Ba}(\text{OH})_2$, add $\text{Ba}(\text{OH})_2$ to strong alk., filter after a couple of days and recrystallize. In the recrystn., in order to render the free $\text{Ba}(\text{OH})_2$ harmless, not too small quantities of free I or of AcOH are added to disappearance of the alk. reaction. At around 40-50° the air-dry salt dissolves in 4 parts H_2O ; after 2-3 crystns. it seps. on cooling in (apparently rhombic) tables with 8 H_2O , stable in the air at 5-10° but losing 5 H_2O at room temp. and more at 30-40° or in very dry air; over H_2SO_4 it retains 0.5 mol. H_2O which it loses at 110°. Approx. soly. of the salt: at 12.9°, 0.25 M ; at 25.0°, 0.38 M . The *dl*-acid forms with alkaloids salts contg. 2 mols. base per mol. of I. With brucine and cinchonine, the salt of the (+)-acid is the less sol., with cinchonidine that of the (-)-acid. Resolution of the brucine salt by the method previously described but so modified as to avoid rearrangement as much as possible yielded 80% of the (+)-acid, $[\alpha]_D$ 107.7° (Et_2O at 14°), 91.1°, 88.6° (Me_2CO at 14° and 25°, resp.), 89.2°, 84.4° (EtOH at 14° and 25°), 41° (H_2O after 15 min. at 14° and 9 min. at 25°), about 44° (H_2O at 12°), soly. in 100 cc. Et_2O , 4.30 and 5.50 g. at 13° and 25°. $[\text{M}]_D$ of the

Ba salt, 63° and 55° (0.0485 *M* soln. in H₂O at 14° and 25°, resp.); after standing 3 days in the neutral soln. it regenerates a I with $[\alpha]_D^{14}$ 104°. In aq. H₂O the acid is 42% racemized after 190 days at 12–6°. (–)-I, obtained from the mother liquors of the brucine salt of the (+)-I (72% yield) or by resolution of the *dl*-I through the cinchonidine salt (yield, 11–2%), $[\alpha]_D^{14}$ –106.5°. C. A. R.

Kinetic studies on the rearrangement of the active α -sulfonedibutyric acids. R. AHLBERG. *Ber.* 61B, 817–26(1928).—The inactivation of the active α -sulfonedicarboxylic acids may be considered as a keto-enol rearrangement $\text{SO}_2(\text{CHR}\cdot\text{CO}_2\text{H})_2 \rightleftharpoons \text{SO}(\text{OH})(\cdot\text{CRCO}_2\text{H})\text{CHRCO}_2\text{H}$. The velocity of the inactivation decreases with increasing mol. wt. Thus the half-time for the inactivation of $\text{SO}_2(\text{CH}\cdot\text{EtCO}_2\text{H})_2$ (I) in H₂O at about 20° had been found to be about 4 hrs., and for $\text{SO}_2(\text{CH}\cdot(\text{CHMe}_2)\text{CO}_2\text{H})_2$ about 70 hrs.; for $\text{SO}_2(\text{CMeEtCO}_2\text{H})\text{CHMeCO}_2\text{H}$ (cf. following abstr.) it is 2.5–3 hrs. and for $\text{SO}_2(\text{CHMeCO}_2\text{H})_2$ Backer and Meijer (*C. A.* 21, 1964) found 1.9 hrs. The present investigation has confirmed the earlier observation that the rearrangement of the free I in H₂O within the range of concn. then studied increases with the diln.; as the concn. is still further decreased the velocity of inactivation passes through a max. (about 0.1 *M* soln.). For solns. 0.1 *M* with respect to I and contg. varying quantities of HCl (0.01–2.0 *M*), there is a slight max. with 0.01 *M* HCl, the inactivation velocity then decreasing steadily with increasing quantities of HCl. In 0.1 *M* solns. of I partially neutralized with NaOH a slight max. appears when the acid is $1/8$ neutralized; when more than about $1/4$ is neutralized the rearrangement velocity decreases almost linearly with the decrease in free acid and at complete neutrality becomes practically zero. The rearrangement velocity remains about the same (or is slightly increased) when the I is partly replaced by a corresponding quantity of H₃PO₄. The numerical data of the large no. of expts. made are given in full.

C. A. R.

α -Ethyl- α,α' -sulfonedipropionic acid. R. AHLBERG. *Ber.* 61B, 827–9(1928).—This work was carried out in 1923 but was not published on account of its incompleteness and is now reported because of the appearance of Backer's paper (*C. A.* 21, 1964). As in all his earlier work, the temps. given by A. for his kinetic measurements are only approx. as he did not have a reliable thermostat at that time. Oxidation of a mixt. of the *dl*-HO₂CCMeEtSCHMeCO₂H gave a mixt. of sulfone acids yielding, when worked up hot, a moderately sol. Ba salt, the free acid of which was resolved through the brucine salt (with the quinine salt is obtained another of the 4 active forms). For the 1st, α_D 2.50° for a 0.23 *M* soln. in a 1-dm tube at 18°, *k* for the rearrangement velocity at 25° was found to be 0.30 (time in hrs.); for the 2nd, α_D –2.26° for a 0.63 *M* soln. at 25°, *k* was 0.26.

C. A. R.

Configuration of pentaerythritol. J. BOESEKEN AND B. B. C. FELIX. *Ber.* 61B, 787–90(1928).—Recent Röntgenological studies indicate that in solid pentaerythritol (I) the central C atom does not lie at the center of a tetrahedron but at the apex of a pyramid. It should be comparatively easy to det. whether this is true of I in liquid (or dissolved) form, for I combines without difficulty with 2 mols. of an aldehyde or ketone or ketonic acid to form compds. of the type $\text{C}(\text{C}_2\text{H}_4\text{O}\cdot\text{CRR}')_2$, and if the central C atom is at the center of a tetrahedron the structure is asym. and should be resolvable into 2 enantiomorphic isomers, whereas if the C atom is at the apex of a pyramid then the compd. should be capable of existing in *cis-trans* isomeric forms. In 1 case Felix was able to obtain an optically active *dibenzal*pentaerythritol (II), apparently formed by spontaneous resolution of the racemate, which, by analysis, mol. wt. detn. and racemization with CHCl_3 contg. HCl, was shown with certainty to be an optical isomer of ordinary II, but it has never been possible to repeat the resolution. Nor has it ever been possible to resolve any of the acid condensation products of I with 2 mols. of an aldehyde or ketonic acid into optical components. The tetrahedral configuration is therefore possible but very labile. Similarly, no indication of *cis-trans* isomerism was ever obtained, so that the pyramidal configuration must also be very labile. The active II m. 188–9°, mol. wt. in camphor 296, mixed m. p. with ordinary II (m. 160°) 165–78°, $[\alpha]_D$ 30° (CHCl_3). *Dichloral*pentaerythritol (106 g. from 40.8 g. I and 120 g. $\text{CCl}_3\text{CHO}\cdot\text{H}_2\text{O}$ with concd. H_2SO_4 at 65–70°), m. 275°. *Di-Et diacetoacetate*-pentaerythritol, $\text{C}(\text{C}_2\text{H}_4\text{O}_2\cdot\text{CMeCO}_2\text{Et})_2$, from the components in boiling alc. HCl, *b*_D 145–50°; free acid, cryst. powder, mol. wt. (by titration) 305, loses CO₂ about 100° with quant. formation of $\text{C}(\text{C}_2\text{H}_4\text{O}_2\cdot\text{CMe})_2$, m. 115–6°. *Di-Et diacetylacetoacetate*-pentaerythritol, *b*_D 145°. mol. wt. (by sapon.) 338; free acid, m. 238°. Along with the above ester, the yield of which is 60%, is obtained a fraction *b*_D 145–65°, m. 95°, mol. wt. (by sapon.) 223 (calcd. for the monoether $\text{C}(\text{CH}_2\text{OH})_2(\text{C}_2\text{H}_4\text{O}_2\cdot\text{CMeCO}_2\text{Et})_2$, 222. *Dilevulinic acid*-

pentaerythritol, m. 186–8°, was similarly obtained, and *di-[m-benzaldehydesulfonic acid]-*, *di-[m-terephthaldehydic acid]*, and *di-[m-dimethylaminobenzaldehyde]-pentaerythritol* have been prepd. C. A. R.

Influence of groups and associated rings on the stability of certain heterocyclic systems. IV. Substituted butyro- and valerolactones. S. S. GUHA-SIRCAR. *J. Chem. Soc.* 1928, 898–903; cf. *C. A.* 21, 2877.— β -Substituted butyrolactones are prepd. by heating the dry Ag salt of a glutaric acid with I, a mixt. of the acid anhydride and the lactone with 1 less C atom than the original acid being formed; the yield is 30–40%; butyrolactone, b_{12} 89°, b. 206°; β -Me deriv., b_{12} 88°; β -Et deriv., b_{12} 99°; β -Me- β -Et deriv., b_{10} 98°; β , β -di-Et deriv., b_{12} 117°; β -cyclopentanespirobutyrolactone, b_{11} 120 1° (20% yield); β -cyclohexanespiro deriv., b_{11} 138° (45% yield). Valerolactones were obtained by reducing the anhydride with Na in abs. EtOH, the yields varied between 25 and 45% β -Methylvalerolactone, b_{12} 90°; β -Et deriv., b_{13} 104°; β -Me- β -Et deriv., b_{10} 122°, β , β -di-Et deriv., b_{15} 143–4°; β -cyclopentanespiro deriv., b_{12} 146°; β -cyclohexanespiro deriv., b_{10} 158 9°. The hydrolysis consists of these lactones in *N*/200 soln. at 25° in the presence of an equiv. quantity of NaOH are reported and show that, although the tendency is towards greater stability as each series of lactones is ascended, there are some deviations, such as the greatest stability of diethylbutyrolactone in the 1st series and of cyclopentanespirovalerolactone in the 2nd series. C. J. WEST

Preparation of *dl*-glyceraldehyde. H. A. SPOHR AND W. G. YOUNG. *Carnegie Inst. Washington Yearbook* 25, 175–7 (1925–6), *Expt. Sta. Record* 57, 817.—Synthesis was made through the following steps, which are reported in detail: The prepn. of β -ClCH₂CH₂CH(OEt)₂ from acrolein; its conversion into CH₂CHCH(OEt)₂; the prepn. from the latter of HOCH₂CH(OH)CH(OEt)₂ by a procedure specified; and glyceraldehyde from its acetal. H. G.

Ketazines of levulinic acid and of levulinic hydrazide. C. W. BENNETT. *J. Am. Chem. Soc.* 50, 1747–8 (1928).—Attempts to prep. the hydrazone of levulinic acid resulted in the formation of the *ketazine* of the acid, m. 119–20° (cor.); similarly, attempts to prep. the hydrazone of the hydrazide gave the *ketazine*, m. 219–20° (cor.). C. J. WEST

Action of organo-magnesium derivatives on some oxamides. R. BARRÉ. *Ann. chim.* 9, 204–75 (1928); cf. *C. A.* 21, 2888, 22, 579.—The chloride of oxanilide was prepd. and its action tried with EtMgBr, EtMgI, iso-BuMgCl, PhMgBr and PhMgI. The yields were very poor and the products unstable, being usually resinous. Et *N*-diethyloxamate (I), Et₂NCOCOOEt, 75% yield from (CO₂Et)₂ and anhyd. Et₂NH, b_{14} 127°, b. 250°. Condensation of I with EtMgBr gave α -ethyl- α -hydroxybutyric diethylamide (II), Et₂C(OH)CONEt₂, and propionylformic diethylamide (III), in quantities varying with the conditions of the expt. In Et₂O at 0° the yield was 70–80% of II and 20% or less of III; at -15°, 70% of III; in C₆H₆ at 70° the product was chiefly II together with a little (EtCO)₂. At -15° the action of the organo-magnesium deriv. on the ester function could be stopped at the intermediate ketone stage. The amide function was not attacked. II, b_{11} 120°, is not sapon. by acid or alkali. III, b_{11} 99–100°, sol. in concd. HCl. The following derivs. of III were prepd.: semicarbazone, α -form, m. 140–1°, obtained by prepn. in AcOH, and β -form, m. 170–1°, obtained by shaking III a long time with a concd. soln. of semicarbazide-HCl, or by adding a few drops of HCl to a soln. of the α -form in hot H₂O; phenylhydrazone, m. 101–2°; *p*-nitrophenylhydrazone, yellow, m. 124–5°. III, hydrolyzed by energetic stirring with a large excess of concd. HCl dild. with an equal vol. of H₂O, gave propionylformic acid (IV), (70% yield), m. 31–2°, b_{21} 85°. Semicarbazone of IV, m. 190°, instantaneous fusion 210°; phenylhydrazone, m. 152°, instantaneous fusion 161°; oxime, m. 161°, instantaneous fusion 167°. I with BuMgBr in Et₂O at -15° gave 90% valerylformic diethylamide (V), b_{11} 120 2°. Semicarbazone of V, m. 160°, instantaneous fusion 163°. V, hydrolyzed by HCl, gave a 60% yield of BuCOCOOH (VI), b_{14} 93–4°, m. 15°. Derivs. of VI: oxime, m. 140°; phenylhydrazone, m. 89°; semicarbazone, m. 180°, instantaneous fusion about 200°. When I is condensed with PhMgBr at -15° the products vary with the conditions of the expt, and may be either benzilic diethylamide (VII), (63% yield), or phenylglyoxylic diethylamide (VIII), PhCOCONEt₂, (63% yield). VII, m. 95 6°, with concd. H₂SO₄ gave a red color which soon changed to green. VII is not sapon. by alkalis. Hot HCl converted it into benzilic acid. VII, yellow, b_{18} 183 5°. Semicarbazone, instantaneous fusion, 204–5°. VIII is not sapon. by hot 30% KOH, is hydrolyzed by concd. HCl to BzCO₂H, m. 64–5°. Condensation of I with PhCH₂MgCl in Et₂O at -15° gave 70% of benzylglyoxylic diethylamide (IX), and 15% of dibenzylglycolic diethylamide. IX, yellow, b_7 155–7°. Semicarbazone, m. 202°, instantaneous fusion 211–2°. IX, hydrolyzed by HCl, gave PhCH₂-

COCO_2H , m. 155°. This work furnishes a general method for the prepn. of α -ketonic acids by the condensation at -15° of I with the organo-magnesium deriv. of the acid desired. The products are pure and the yields usually about 60%. From $(\text{CO}_2\text{Et})_2$ and Et_2NMgBr was obtained $(\text{CONEt}_2)_2$ (X) (70–5% yield), yellowish, m. 31–2°, b₄ 142°. The chief products formed by the condensation of X with EtMgBr were α -diethylaminobutyric diethylamide (XI) and III. Condensation in Et_2O gave 20% XI and 70% III; in C_6H_6 at 70°, 36% XI and 55% III; in PhMe at 90° in an atm. of H and with mech. stirring, 60% XI and 28% III. Condensation of X with PhMgBr in PhMe in an atm. of H and with mech. stirring gave some VII and 75% of diethylaminodiphenylacetic diethylamide, b₃ 182–4°. Organo-magnesium derivs in reacting with X attacked only 1 of the amide functions. The yields were increased by a rise in temp. and by mech. stirring.

LOUISE KELLEY

Action of cuprous cyanide on methyl iodide. H. G. J. HARTLEY. *J. Chem. Soc.* 1928, 780–1. —Very little combination between CuCN and MeI occurs at the b. p. of MeI; at 100° the compd. $(\text{CuCN})_3 \cdot \text{MeI}$, is formed, which can be dried in the air without decompu. but gradually loses MeI *in vacuo*; at 100° the CuCN is recovered almost unchanged. In the presence of excess MeCN, CuCN and MeI at 100° give almost quant. the compd. $\text{CuCN} \cdot \text{MeI}$, which may be crystd. from MeCN; this also results from MeI and CuCN at 135° but the yield is poor, because of formation of tarry products and CuI. Mol. wt. detns. indicate the formula $3(\text{CuCN} \cdot \text{MeI})$. Ag_2SO_4 decomps. the compd., giving AgI, Ag, CuSO_4 and $\text{Cu}(\text{NCMe})_2\text{SO}_4$; AgNO_3 behaves similarly. The $\text{Cu}(\text{NCMe})_2\text{SO}_4$ complex has not been isolated. CuCN and MeCN combine with evolution of heat to form the unstable compd. $\text{CuCN} \cdot \text{MeCN}$; the MeCN is gradually given off on exposure to the air. Other insol. cyanides give similar compds.; AgCN and $\text{Zn}(\text{CN})_2$ do not react in this way.

C. J. WEST

Chloroaurates of nuclein bases. F. A. HOPPE-SEYLER AND WERNER SCHMIDT. *Z. physiol. Chem.* 175, 304–10 (1928). —Guanine and hypoxanthine, like adenine, form stable cryst. AuCl_3 salts. The difficultly sol. hypoxanthine Au salt is especially easy to obtain. The recognition of adenine as Au salt along with other nuclein bases is often difficult and uncertain without analysis of the product. Guanine chloroaurate is easily distinguished from adenine chloroaurate on account of its soly. and cryst. form. However, these 2 differ in compn. by only 2 H. The regular hypoxanthine Au salt may be utilized for identification. When this is converted into the irregular salt (+HCl), the drop of 3% in Au content is a useful characteristic. A. W. DOX

Sugar cleavage by the action of very dilute alkali. F. FISCHLER AND A. F. LINDNER. *Z. physiol. Chem.* 175, 304–47 (1928). —Distn. of monoses and bioses (glucose, fructose, galactose, lactose, maltose) with dil. alkali ($M/50 \text{ Na}_2\text{CO}_3$) results in the formation of 3.8–6.5% AcCHO , the highest yields being obtained in the presence of Na_2SO_4 and an atm. of CO_2 . The loss in reducing power of the sugar and the increase in acidity are so uniform as to make it seem probable that the different sugars undergo the same type of cleavage. $\text{CO}(\text{CH}_2\text{OH})_2$, which behaves in the same way except that it is more reactive, or else the closely related glyceric aldehyde, is probably the 1st cleavage product of both monoses and bioses through the action of alkali. With all the sugars there is greater formation of acid at 0.1 N than at 0.01 N or 0.5 N alkali. For each mol. of hexose 1.35–2.00 equivs. of acid are formed, as would be expected from a cleavage of hexose into trioses. The identical behavior of $\text{CO}(\text{CH}_2\text{OH})_2$ in this respect validates the assumption of triose formation from hexose. The loss in reducing power of the sugar is not a reversible reaction, since addn. of acid has no effect after the alkali treatment.

A. W. DOX

Synthesis of cyclic compounds. II. Ethyl *dl*- and *meso*- β,γ -diphenylbutane- $\alpha,\alpha,\delta,\delta$ -tetracarboxylate. Synthesis of a truxinic acid. ISRAEL VOGEL. *J. Chem. Soc.* 1928, 1013–22; cf. *C. A.* 21, 3603. —Reduction of $\text{PhCH}_2\text{C}(\text{CO}_2\text{Et})_2$ by moist Al-Hg gives, in addn. to 50–5% of $\text{PhCH}_2\text{CH}_2(\text{CO}_2\text{Et})_2$, 35–40% of a mixt. of 2 esters of which about 40% is *Et dl-\beta,\gamma*-diphenylbutane- $\alpha,\alpha,\delta,\delta$ -tetracarboxylate (I), m. 88°, the remainder being the *meso*-ester (II), viscid red oil. Hydrolysis of I gives the *dl*-acid, m. 219–20° (decompn.); the *meso*-acid, from II, m. 182–3°. Both esters form di-Na compds., II more readily than I, on treatment with a suspension of MeONa in dry Et_2O . The di-Na compd. from I reacts with Br to give a *di-Br deriv.*, m. 180°. The di-Na compd. from II reacted with the calcd. quantity of Br to give a viscid, dark red ester, hydrolyzed to a 2,3-diphenylcyclobutane-1,4-dicarboxylic acid (truxinic acid), m. 239° (less than 1% yield), analyzed as the di-Me ester, m. 117°; this is very probably the γ -truxinic acid. The very small yield is doubtless due to stereochem. influences such as are postulated by the modified strain theory but the possibility that a polarity factor may play some part must not be overlooked.

C. J. WEST

Δ^2 -Cyclopentenylethylalkylacetic acids and their bactericidal action towards *B. leprae*. XII. J. A. ARVIN and ROGER ADAMS. *J. Am. Chem. Soc.* **50**, 1790-4 (1928); cf. C. A. **22**, 228.— **Δ^2 -Cyclopentenylethyl bromide (I)**, from the alc. and PBr_3 in PhMe, b_{16} 71-2°, n_D^{20} 1.4995, d_4^{20} 1.2869. The Grignard reagent of I, with $(\text{C}_2\text{H}_5)_2\text{O}$ gives 38% of **Δ^2 -cyclopentenylbutanol**, b_{24} 118-23°, n_D^{20} 1.4723, d_4^{20} 0.9317; **bromide**, b_8 82-6°, n_D^{20} 1.4942, d_4^{20} 1.2229 (47% yield). With $\text{CHO}(\text{CH}_2)_2\text{CO}_2\text{Me}$ the Grignard reagent of I gives **Me 9-hydroxyhydnoic acid**, b_2 177-9°, n_D^{20} 1.4720, d_4^{20} 0.9874; sapon. gives **9-hydroxy di-hydnoic acid**, m 62.0-2.8°. The following *di-Et* **Δ^2 -cyclopentenylethyl alkylmalonates**, $\text{C}_6\text{H}_7(\text{CH}_2)_2\text{C}(\text{CO}_2\text{Et})_2\text{R}$, were prepd: R = C_6H_{13} , b_2 152-5°, n_D^{20} 1.4598, d_4^{20} 0.9742 (this order will be used below); C_7H_{15} , b_1 159-62°, 1.4602, 0.9649; C_8H_{17} , b_2 178-81°, 1.4605, 0.9624; C_9H_{19} , $b_{1.5}$ 1.4609, 0.9567; $\text{C}_{10}\text{H}_{21}$, $b_{2.1}$ 183-7°, 1.4613, 0.9531; $\text{C}_{11}\text{H}_{23}$, $b_{2.1}$ 190.4°, 1.4616, 0.9486; $\text{C}_{12}\text{H}_{25}$, $b_{2.2}$ 197.201°, 1.4618, 0.9460. *Di-Et* **Δ^2 -cyclopentenylalkylmalonates**, $\text{C}_6\text{H}_7\text{C}(\text{CO}_2\text{Et})_2\text{R}$: R = $\text{C}_{10}\text{H}_{21}$, $b_{1.5}$ 180-2°, 1.4616, 0.9642; $\text{C}_{11}\text{H}_{23}$, b_1 176-80°, 1.4622, 0.9598; $\text{C}_{12}\text{H}_{25}$, b_2 193-6°, 1.4627, 0.9559. *Di-Et* **ω - Δ^2 -cyclopentenylbutylmalonate**, $\text{C}_6\text{H}_7(\text{CH}_2)_4\text{CH}(\text{CO}_2\text{Et})_2$, b_3 152-5°, 1.4598, 1.077. **Δ^2 -Cyclopentenylethylalkylacetic acids**, $\text{C}_6\text{H}_7(\text{CH}_2)_2\text{CH}(\text{CO}_2\text{H})\text{R}$: R = C_6H_{13} , $b_{2.3}$ 160.3°, 1.4679, 0.9426; C_7H_{15} , $b_{2.3}$ 166-8°, 1.4698, 0.9358; C_8H_{17} , $b_{1.5}$ 174.6°, 1.4700, 0.9315; C_9H_{19} , b_2 183-5°, 1.4701, 0.9269; $\text{C}_{10}\text{H}_{21}$, $b_{1.5}$ 186.8°, 1.4702, 0.9227; $\text{C}_{11}\text{H}_{23}$, $b_{1.3}$ 190.3°, 1.4703, 0.9196; $\text{C}_{12}\text{H}_{25}$, m 30-1.5°, $b_{1.5}$ 199.203°. **Δ^2 -Cyclopentenylalkylacetic acids**, $\text{C}_6\text{H}_7\text{CH}(\text{CO}_2\text{H})\text{R}$: R = $\text{C}_{10}\text{H}_{21}$, $b_{1.5}$ 183.6°, 1.4692, 0.9319; $\text{C}_{11}\text{H}_{23}$, $b_{1.5}$ 188.90°, m 36-8°; $\text{C}_{12}\text{H}_{25}$, b_2 202-4°, m 38-9°. **ω - Δ^2 -Cyclopentenylethylacetic acid**, b_4 125.6°, 1.4718, 0.9904; the *Bu* deriv., b_6 149-54°, 1.4740, 0.9862. The yields of the malonates were 58-60% of the acids, 90%. Those acids contg 16-18 C atoms showed a high bactericidal action towards *B. leprae*. The olefin linkage does not produce any sp. effect. C. J. WEST

The condensation of cyclohexene with some aromatic hydrocarbons in the presence of aluminum chloride. DANIEL BODROUX. *Compt rend* **186**, 1005-6 (1928).—Cyclohexene condensed in the presence of AlCl_3 gives (a) with toluene, 63% of **cyclohexyl-toluene**, d_{16} 0.938, n_D^{16} 1.527, b_{758} 255.61°; (b) with *p*-xylene, 45% of **2-cyclohexyl-1,4-dimethylbenzene**, d_{18} 0.936, n_D^{18} 1.529, b_{760} 261.2°, and a small amount of **dicyclohexyl-1,4-dimethylbenzene**, m 156.7°; (c) with *m*-xylene, 81% of **5-cyclohexyl-1,3-dimethylbenzene**, d_{18} 0.931, n_D^{18} 1.525, b_{764} 266.8°; (d) with mesitylene, 35% of **2-cyclohexyl-1,3,5-trimethylbenzene**, turns yellow on exposure to the air, d_9 0.946, n_D^9 1.535, b_{746} 283.4°; (e) with cymene, 40% of **cyclohexyl-1-isopropyl-4-methylbenzene**, d_{24} 0.916, n_D^{24} 1.517, b_{739} 279-83°, and a small amount of **dicyclohexyl-1-isopropyl-4-methylbenzene**, a thick yellowish liquid, b_{22} 210-20°. J. S. REICHERT

Some derivatives of quinitol. I. PALFRAY and B. ROTHSTEIN. *Compt. rend* **186**, 1007-8 (1928).—The pure *cis*-isomer of quinitol with AcCl or Ac_2O gives quant. a mixt. of the *cis*- and *trans*-di Ac derivs. The pure *trans*-isomer gives only the *trans*-di-Ac deriv., m. 101-2°. An attempt to prepare the mono-Ac compd. gave the di-Ac compd. and a small quantity of *bis*-[4-hydroxycyclohexyl] oxide, a colorless, viscous, liquid, b_{16} 132-3°, d_4^{19} 1.0920, n_D^{18} 1.4578, n_D^{19} 1.4574, R_D 57.91. The pure *cis*-isomer with BzCl gives 2 solids (m. 116° and 157°) at elevated temps. while in the cold the *cis*- and *trans*-compds. give only one solid each (m. 116.7° and 151°, resp.). Isomerization is not due to the halogen, since it occurs also with Ac_2O and HOAc . J. S. R.

Derivatives of butylbenzene. R. R. READ and D. B. MULLIN. *J. Am. Chem. Soc.* **50**, 1763-5 (1928).—Nitration of PhBu with HNO_3 - H_2SO_4 at 0° gives a mixt. of the *o*- NO_2 deriv., b_{15} 131-3°, d_4^{20} 1.071 and the *p*- NO_2 deriv., b_{15} 143.5°, d_4^{20} 1.065; nitration with fuming HNO_3 in AcOH gives 70% of the *p* isomer with only very small quantities of the *o*-isomer. *o*-Butylaniline, b_{12} 122.5°, d_4^{20} 0.953; *HCl* salt, m. 137°; the *p*-isomer, b_{11} 133-4°, d_4^{20} 0.945. *p*-Butylphenol, b_9 121.3°, b_{751} 746.50°, d_4^{20} 0.978; *p*-nitrobenzoate, yellow, m 67-8°. *o*-Butylphenol, b_{14} 113.5°, b_{760} 234-7°, d_4^{20} 0.975. *2-Nitro-4-butylphenylglycidide*, yellow. *m*-Butylphenol, b_{768} 247-9°, d_4^{20} 0.974. These phenols have a high phenol coeff. C. J. WEST

Melting point of *m*-dinitrobenzene. FRANCES McCAMISH and ALBERT SALATHE. *J. Am. Chem. Soc.* **50**, 1785 (1928).—The m. p. of m - $\text{C}_6\text{H}_4(\text{NO}_2)_2$ is 89.57°. C. J. W.

Derivatives of benzyl-*p*-phenylenediamine. J. REILLY and J. J. MOORE. *J. Soc. Chem. Ind.* **47**, 116T (1928).—The diazo salt from sulfanilic acid was added to PhNH Bz in AcOH , and the red dye so obtained was reduced with SnCl_2 and HCl , when benzyl-*p*-phenylenediamine (I), m. 37°, was obtained. Diazotization of I with 2

mols. HNO_2 gave a sol. nitrosodiazonium chloride, which coupled with β -naphthol to give a nitroso- β -naphthol deriv., red prisms, m. $169-70^\circ$. When I is diazotized and coupled with chromotropic acid, a dye is obtained which gives purple shades on wool.

T. S. CARSWELL

Thermal decomposition of nitrites. The nitrites of triphenylethylamine and diphenylethylamine. LESLIE HELLERMAN, M. L. COHEN AND R. E. HOEN. *J. Am. Chem. Soc.* 50, 1716-29 (1928).— β,β,β -Triphenylethylammonium nitrite (I), decomp. 128° , results from the amine-HCl and NaNO_2 ; the nitrate (II), from the HCl and 50% HNO_3 , decomp. 239° . The principal product of the action of heat upon I in aq. suspension is $\text{Ph}_2\text{C}:\text{CHPh}$; I, heated in the dry state, gives also II. An hypothesis to account for the product of thermal decompn. and to interpret the action by which it is produced has been developed. This hypothesis, which involves diazotization of the amine and subsequent formation of a transitorily existing methylene intermediate, is useful in the interpretation of various amine nitrite decompns. which have been recorded in the literature. The thermal decompn. of the nitrite of $\text{Ph}_2\text{CHCH}_2\text{NH}_2$ leads to $\text{Ph}(\text{PhCH}_2)\text{CHOH}$ or to $\text{PhCH}:\text{CHPh}$, depending upon the conditions. β,β -Diphenylethyl nitrosourethan, stable, viscous, straw-colored oil, from the urethan and nitrous gases; with EtONa at -15° this gives an impure β,β -diphenyldiazoethane; this spontaneously decomps into a yellow resinous mass at 0° ; heated with acid, stilbene results, while in alkali, $\text{Ph}_2\text{CHCH}:\text{N}_2\text{CHCH}:\text{H}$ results. The action of HgO upon I at 135° gives Ph_2CCHO in addn. to $\text{Ph}_2\text{C}:\text{CHPh}$. PhCOCH_2Ph and HgO at 100° give 74% of benzil and very little $\text{Ph}_2\text{C}:\text{CO}$.

C. J. WEST

Chloramines as halogenating agents. Iodination by a chloramine and an iodide. A. E. BRADFIELD, K. J. P. ORTON AND I. C. ROBERTS. *J. Chem. Soc.* 1928, 782-5.—The iodinating reagent (I) is formed by adding NaI (finely powd.) to dichloramine-T in glacial AcOH (HI may also be used, or HCl and I); this is added slowly to the aniline in AcOH . PhNH_2 with 1 equiv. I gives $p\text{-IC}_6\text{H}_4\text{NH}_2$; with 3 equivs. I, $1,3\text{-C}_6\text{H}_2\text{NH}_2$, $2,4\text{-Cl}_2\text{C}_6\text{H}_3\text{NH}_2$ and 2 equivs. I give $2,4,6\text{-Cl}_3\text{IC}_6\text{H}_2\text{NH}_2$ (*Ac deriv.*, m. $198-9^\circ$). $2,4\text{-ClBrC}_6\text{H}_3\text{NH}_2$ gives 2-chloro-4-bromo-6-iodoaniline, m. $95-6^\circ$; *Ac deriv.*, m. 213° . PhNHAc , heated with 2 equivs. I, 15 min., gives 80% $p\text{-IC}_6\text{H}_4\text{NHAc}$; bromination with twice the calcd. amt. of Br in 70% AcOH at 70° for 20 min gives 2-bromo-4-iodoacetanilide, m. 143° , hydrolyzed to 2-bromo-4-iodoaniline, m. $75-6^\circ$. Chlorination with dichloramine-T and HCl gives 2-chloro-6-bromo-4-iodoaniline, m. $113-4^\circ$; *Ac deriv.*, m. 221° . $o\text{-Cl}_2\text{NC}_6\text{H}_3\text{NH}_2$ and 1.5 equivs. I give the 4-I deriv. (II); further heating with more I gives the 4,6-I₂ deriv. Chlorination of II gives 2-chloro-4-iodo-6-nitroaniline, orange, m. 124° (*Ac deriv.*, straw-colored, m. 227°); 2-Br deriv., orange, m. $117-8^\circ$ (*Ac deriv.*, straw-colored, m. 222°). Heating $4,2\text{-Cl}(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{NH}_2$, 3 hrs. at 100° with 2 equivs. I gives 4-chloro-2-iodo-6-nitroaniline, orange, m. $137-8^\circ$ (*Ac deriv.*, very pale straw-colored, m. 207°); 4-bromo-2-iodo-6-nitroaniline, orange, m. $146-7^\circ$ (*Ac deriv.*, pale yellow, m. 215°).

C. J. WEST

Chlorination of anilides. III. N-Chlorination and C-chlorination as simultaneous side reactions. K. J. P. ORTON, F. G. SOPER AND GWYN WILLIAMS. *J. Chem. Soc.* 1928, 998-1005, cf *C. A.* 4, 3216.—The earlier conclusions regarding the conversion of chloramines into nuclear substituted anilides has received further confirmation by actual measurements of the velocities of the 2 individual reactions, N- and C-chlorination, in 40% AcOH . The use of a new method of analysis has shown that, in the reaction between Cl and anilides, the ratio of the quantities of chloramine and chloroanilide formed at a given moment is independent of the time. Wegscheider's test (*Z. physik. Chem.* 30, 593 (1899)) is thus satisfied and chloramine formation and nuclear chlorination are therefore simultaneous. The position of equil. in 40% AcOH allows chloramine formation to be treated as though it were an irreversible reaction. The reaction is followed by transferring known vols. of the (already acid) reacting mixt. alternately to aq. KI, which gives the Cl + chloramine concns. and aq. $p\text{-MeC}_6\text{H}_4\text{OH}$, which removes Cl, whereupon the chloramine is detd. by addn. of KI and titration. The values for k_N and k_C at 18° in 40% AcOH are reported for 7 compds.: $o\text{-ClC}_6\text{H}_4\text{NHAc}$, 286, 27.5; m -isomer, 172, 3140; p -isomer, 115, 135; $p\text{-BrC}_6\text{H}_4\text{NHAc}$, 123, 116; $o\text{-MeC}_6\text{H}_4\text{NHAc}$, 140, 1390; $p\text{-MeC}_6\text{H}_4\text{NHAc}$, 2540, 18,500; PhNHAc , 96, 11,000. IV. The significance of velocity measurements in relation to the problem of benzene substitution. A. E. BRADFIELD AND BRYNMOR JONES. *Ibid* 1006-12.—The velocity coeffs. for the chlorination of a no. of substances of the type p - and $o\text{-ROC}_6\text{H}_4\text{X}$ in 99% AcOH at 20° are reported. The velocity of chlorination of phenolic ethers increases rapidly with increasing H_2O content of the medium, the increase for an alteration from 1 to 2% of H_2O being almost as great as for a rise in temp. of 10° ; the velocity coeffs. are slightly altered by a change in the relative concns. of Et_2O and Cl. If r_1 represents the

ratio of the total *o*-compd. formed to the total *p*-compd. at the temp. T_1 , then by means of the equation $\log_{10} (r_1/2)/\log_{10} (r_2/2) = T_2/T_1$, r_2 for a temp. T_2 may be evaluated; in a similar manner the ratio *o*:*m*:*p* for a reaction yielding all 3 isomers, at any 1 temp., can be calcd. from the values at another temp. Examples are given, which suggest the adoption of the working hypothesis that the primary factor deciding the proportions of the isomers formed in aromatic substitution reactions is the energy of activation corresponding to the different positions available and not the phase relationships of the mol. A discussion of the introduction of a 3rd substitute shows that the relative directive powers of 2 groups, OR_1 and OR_2 , as measured by the ratio of the velocity coeffs., should be independent of the nature of the group X. Results are given which support this conclusion.

C. J. WEST

Semicarbazides substituted in the 1- and 2-positions. 1-Benzylsemicarbazide and 2-benzylsemicarbazide. J. BOUGAULT AND J. LEROUCQ *Compt. rend.* **186**, 957-60 (1928). The semicarbazide, m. 135°, prep'd by Curtius (cf. *J. prakt. Chem.* [2], **62**, 97 (1900)) from KCN and $\text{PhCH}_2\text{NHNH}_2$ reacts with BzH to form benzalbenzyl semicarbazide, m. 159.5-160°, and with excess KCN to form benzylhydrazodicarboxamide, $\text{PhCH}_2\text{N}(\text{CONH}_2)\text{NHCONH}_2$, m. 256°, proving it to be 2-benzylsemicarbazide instead of the 1-substituted comp'd. as stated by Curtius. This is in agreement with the idea that negatively substituted hydrazines (Ph, tolyl, etc.) yield carbazides substituted in the 2-position, whereas more positive groups (Me, Et, etc.) yield 1-substituted carbazides.

A. S. CARTER

The coupling of benzene nuclei with the aid of the diazo reaction. W. BRYD. *Roczniki Chem.* **7**, 436-45 (1927). CuCl_2 (15 g.) in 80 cc. conc'd. HCl was added at 0° in small portions and with efficient stirring to a diazo soln. prep'd. from 10 g. $m\text{-ClC}_6\text{H}_4\text{NH}_2$, 24 g. 35% HCl, 40 g. H_2O and 5.4 g. NaNO_2 . The reaction was completed in 10 min., yielding 45% $p\text{-C}_6\text{H}_4\text{Cl}_2$ and 33% $(m\text{-ClC}_6\text{H}_4\text{N})_2$. The following compds. were obtained in a similar manner: 62% $p\text{-C}_6\text{H}_4\text{ClBr}$ and 20% $(p\text{-BrC}_6\text{H}_4\text{N})_2$; 55% $o\text{-C}_6\text{H}_4\text{ClBr}$ and 28% $(o\text{-BrC}_6\text{H}_4\text{N})_2$; 45% $o\text{-ClC}_6\text{H}_4\text{Me}$ and 33% $(o\text{-MeC}_6\text{H}_4\text{N})_2$; 82% $p\text{-ClC}_6\text{H}_4\text{OMe}$; 82% $p\text{-C}_6\text{H}_4\text{ClCO}_2\text{H}$, 74% $m\text{-C}_6\text{H}_4\text{ClCO}_2\text{H}$, 87% $o\text{-C}_6\text{H}_4\text{ClCO}_2\text{H}$. The reduction of 12 g. stable $p\text{-O}_2\text{NC}_6\text{H}_4\text{N}_2\text{Cl}$ in 15 g. glacial AcOH with 30 g. anhyd HCO_2H first at room temp., then on the water bath and finally over the open flame yielded 20% PhNO_2 , 20% *p*-nitrophenol and 20% of a substance, m. 175°, probably a hydroxyazo comp'd. The brown alkali-sol. substance obtained by the reduction of $m\text{-O}_2\text{NC}_6\text{H}_4\text{N}_2\text{HSO}_4$ with $\text{Cu-HCO}_2\text{H}$ could not be identified. The reduction of $p\text{-MeC}_6\text{H}_4\text{N}_2\text{HSO}_4$ with HCO_2H and $\text{HCO}_2\text{H-Cu}$ yielded 20% *p*-cresol and a large quantity of resin. *p*-Chlorodiazofluorene was reduced by anhyd HCO_2H to 50% 2-hydroxyfluorene. Isodiazoo compds. were reduced with ale. $p\text{-O}_2\text{NC}_6\text{H}_4\text{N}_2\text{ONa}$ (prep'd. by adding at 5° to the diazo soln. from 10 g. *p*-nitroaniline 33% NaOH to an alk. reaction) was stirred with 120 cc. EtOH at 5°, then left at room temp. until the complete disappearance of the diazo reaction (R salt). Yield: 28% PhNO_2 , 44% $(p\text{-O}_2\text{NC}_6\text{H}_4)_2$. Similarly were obtained: 33% PhNO_2 and 42% $(m\text{-O}_2\text{NC}_6\text{H}_4)_2$; 51% anisole and 20% *p*-azoanisole; 22% C_{10}H_8 and 50% $(\alpha\text{-C}_{10}\text{H}_7\text{N})_2$; 22% C_{10}H_8 and 45% $(\beta\text{-C}_{10}\text{H}_7\text{N})_2$; 50% benzene and 25% Ph_2 ; 25% cinnamic acid and 50% $(m\text{-HO}_2\text{CCH}_2\text{CHC}_6\text{H}_4\text{N})_2$; 28% MeCOPh and 44% *azo-p-acetophenone* (unknown in the literature, properties not described); 77% $o\text{-HOC}_6\text{H}_4\text{CO}_2\text{H}$; 80% $p\text{-HOC}_6\text{H}_4\text{CO}_2\text{H}$; 80% $m\text{-HOC}_6\text{H}_4\text{CO}_2\text{H}$. Conclusions: The coupling of benzene nuclei is inhibited by the presence of a NO_2 group, promoted by other substituents. The behavior of unsubstituted aniline varies.

MARY JACOBSEN

New synthesis of 4-amino-3-hydroxyphenylarsonic acid. I. E. BALABAN. *J. Chem. Soc.* **1928**, 809-13. $\sim 3,4\text{-Cl}(\text{O}_2\text{N})\text{C}_6\text{H}_3\text{NH}_2$ (51.75 g.) in 103.5 cc. conc'd. HCl and 103.5 cc. H_2O , diazotized at 0° with 21 g. NaNO_2 in 63 cc. H_2O and added to Cu arsenite soln., gives 45% of 3-chloro-4-nitrophenylarsonic acid, pale yellow, m. 200° (decompn.); Ba salt, rods; Ca and Mg salts, amorphous. Boiling 28.2 g. of this acid with 300 cc. 4 *N* KOH for 3 hrs. gives 73% of the 3-HO acid, pale yellow; Mg and Ba salts; reduction with glucose gives 68% of the 4-NH₂ acid. The following arsenobenzenes, which are all yellow, amorphous powders sol. in NaOH, were prep'd. at 55-60° by the well-known $\text{Na}_2\text{S}_2\text{O}_4$ method from the resp. phenylarsonic acid or from mixts. of 2 of them. 4-Amino-4'-acetaminino-3,3'-dihydroxy, 49% yield; 3,4'-diamino-4,3'-dihydroxy, 43.7% yield; 4,4'-diacetaminino-3,3'-dihydroxy, 37.5% yield; 3,4'-diacetaminino-4,3'-dihydroxy, 40.6% yield. 2-Nitro-4-amino-3-hydroxyphenylarsonic acid crysts. from H_2O in red plates which, dried at 100°, form a brown monohydrate, the H_2O in which is not lost at 110°. 2-Amino-4-acetaminino-3-hydroxyphenylarsonic acid, obtained in 73.8% yields by reduction with FeSO_4 at 30°, is sol. in excess 2 *N* HCl, in cold 80% HCO_2H and gives an insol. diazo-oxide, yellow. 2,4-Di-Ac deriv., silky needles. 3-

Chloro-6-nitrophenylarsonic acid, m. 250° (64.1% yield); reduction with FeSO₄ gives almost quant. the 6-NH₂ deriv., whose *Ac deriv.* (57.5% yield) is sol. in 15 parts H₂O. *6-Glycinamide-3-chlorophenylarsonic acid*, m. 195° (81% yield); soly. in boiling H₂O, 1:30. Results of toxicity tests are reported. C. J. WEST

Salts of pentaphenylchromium hydroxide (C₆H₅)₅CrOH. FR. HEIN, O. SCHWARTZ-KOPFF, K. HOYER, K. KLAR, W. EISSNER AND W. CLAUSS. *Ber.* 61B, 730-53 (1928).—Pentaphenylchromium hydroxide has the formula Ph₅CrOH·4H₂O, but when it combines with an acid, the salt obtained is of the general form Ph₄CrX. Numerous acids, chiefly org. ones, have been investigated in order to obtain the penta-Ph salt. Only the following ones have given a successful result: (Ph₅Cr)₂C₆·6H₂O; Ph₅CrCO₂H·3H₂O; Ph₅CrOAc·4H₂O; Ph₅CrO₂CCH₂Cl·HO₂CCH₂Cl·3H₂O; *o*-Ph₅CrO₂CC₆H₄NH₂·*o*-HO₂CC₆H₄NH₂; (Ph₅Cr)₂SO₄·4H₂O; Ph₅CrOPh·PhOH, m. 127°; *m*-Ph₅CrOC₆H₄Cl·*m*-HO₂C₆H₄Cl, m. 129.5°; 2(Ph₅CrOC₆H₄CN)·HO₂C₆H₄CN; *m*-Ph₅CrOC₆H₄NO₂·*m*-HO₂C₆H₄NO₂. A. L. HENNE

Organic compounds of arsenic. XI. The action of thionyl chloride on primary and secondary arsonic acids. WILHELM STEINKOPF AND SIEGFRIED SCHMIDT. *Ber.* 61B, 675-8 (1928); cf. *C. A.* 20, 2994.—The reaction between 20 g. PhAsO(OH)₂ and 200 g. SOCl₂ yields 10.5 g. PhCl and 9.5 g. PhAsCl₂. 1-Anthraquinonylarsonic acid and SOCl₂ give only 1-chloroanthraquinone, m. 162°; the corresponding dichloroarsine, C₁₄H₇O₂AsCl₂, m. 237°, is obtained from the arsonic acid and HCl in AcOH by reduction with SO₂. If the operation is carried out entirely in a CO₂ atm., Ph₂AsO(OH) and SOCl₂ give Ph₂AsCl, m. 191°. The action of 77 g. PCl₃ on 35 g. HO₂CCH₂AsO(OH)₂ in CHCl₃ yields 13-14 g. HO₂CCH₂AsCl₂, m. 123-5°, sol. in cold Et₂O, AcOEt, MeOH, Me₂CO and hot C₆H₆, ligroin and CCl₄; its Me ester, b_p 78°. XII. **Action of acid chlorides on diphenylarsine.** WILHELM STEINKOPF, ILSE SCHUBART AND SIEGFRIED SCHMIDT. *Ibid.* 678-82.—Ph₂AsAc, b_p 167-8°, is obtained from AcCl and Ph₂HAs in a CO₂ atm., its oxidation is easy and gives Ph₂AsO(OH) and AcOH. The same arsine, treated with ClCH₂COCl, COCl₂, PCl₃ or BrCH₂COBr gives only Ph₂AsCl or Ph₂AsBr. The arsine and PhSO₂Cl yield Ph₂AsCl, Ph₂S and Ph₂AsOOSO₂Ph, m. 106.8 (cloudy), 109° (completely transparent), sol. in cold alc., Me₂CO, CHCl₃ and hot C₆H₆. The same compd. (2.5 g. pure product) is obtained from 10 g. Ph₂AsO(OH) and 10 g. PhSO₂Cl. PhAsCl₂ and ClSO₂OH give pure PhSO₂Cl. Ph₂AsCl and ClSO₂OH give PhSO₂Cl, Ph₂AsO(OH)·HCl, and 2[PhAsO(OH)]·HCl, m. 114°. Ph₂AsCl and FSO₃OH give PhSO₂F and 2[Ph₂AsO(OH)]·H₂SO₄, m. 117°. The latter compd. is obtained also, with a better yield from 15 g. PhAsO(OH) and 250 cc of 50% H₂SO₄. A. L. HENNE

The action of light on diazo derivatives. A. SEYEWETZ AND D. MOUNIER. *Compt. rend.* 186, 953-5 (1928).—The decompn. of *diazobenzenesulfonic acid* and *Na 1,2,4-diazonaphtholsulfonate* by exposure in Pyrex to ultra-violet light has been studied relative to *p*_{II} of the soln. In acid soln. they are sensitive to light but relatively stable to heat; in alk. soln. sensitivity to light is decreased and the effect of heat greatly increased. The effect of light increases slightly with increase of temp. and is increased by negative substituents which decrease heat sensitivity; thus the following are in the order of decreasing sensitivity to ultra-violet: *p*-O·C₆H₄·N₂, *p*-O·SO₂·C₆H₄·N₂, *p*-

O·CO·C₆H₄·N₂, *p*-ClC₆H₄·N₂Cl, *φ*-O₂NC₆H₄·N₂Cl, PhN₂Cl. The position of the sub-

stituent has no effect in *o*-, *m*- and *p*-nitrodiazobenzene. Ultraviolet decompn. of *p*-diazobenzoic acid gives *p*-HO₂C₆H₄CO₂H and *p*-ClC₆H₄CO₂H; the diazonitrobenzenes yield *di-p*-nitrophenyl ether, and in the other examples studied, the products were the same as formed by heat.

Equilibrium in the binary systems: ethylenediamine-phenols. N. A. PUSHIN AND LJUDMIR SLADOVICH. *J. Chem. Soc.* 1928, 837-43.—C₂H₄(NH₂)₂ (I) and PhOH give 2 eutectics, 35 mol. % PhOH and -14° and 88.5 mol. % PhOH and 20.2°; 2 compds. are formed, I. 2PhOH, m. 53.5° and I. 4PhOH, m. 31.6°. I and *o*-MeC₆H₄OH also show 2 eutectics: 32.5 and 85 mol. % *o*-MeC₆H₄OH and -17 and 8.5°; the compd. I. 2C₆H₇OH, m. 48°. I and *p*-MeC₆H₄OH give 3 eutectics, 27, 82 and 92 mol. % *p*-MeC₆H₄OH and -13°, 28.2° and 24°; 2 compds. are formed, I. 2C₆H₇OH, m. 54°, and I. 6C₇H₇OH, m. 31°. I and *o*-C₆H₄(OH)₂ give 3 eutectics, 15, 60 and 80 mol. % *o*-C₆H₄(OH)₂ and 2°, 60° and 64°, and a 4th, which could not be accurately detd.; 3 compds. are formed, I. C₆H₅O₂, m. 73°; I. 2C₆H₅O₂, m. 71°; I. 3C₆H₅O₂, m. 39.2°. I and *o*-MeOC₆H₄OH give 3 compds., I. 6C₇H₅O₂, m. 66.5°; I. 2C₇H₅O₂, m. 57.5°; I. C₇H₅O₂, m. 51.5°, which forms a eutectic with I at 5° and 11 mol. % of *o*-MeOC₆H₄OH. Curves are given for these systems. C. J. WEST

Acyl derivatives of *o*-aminophenol. III. R. E. NELSON, N. W. SHOCK AND W. H. SOWERS. *J. Am. Chem. Soc.* **49**, 3129-31 (1927).—The *Bu* carbonate of *isoamyl o*-hydroxycarbonyl, in 77°; the *iso-Bu* deriv., in 61.5°; the *Pr* carbonate of *benzoyl-o*-aminophenol, in 55°; *o*-isocarbopropoxyaminophenylbenzoate, m. 82°. The heavier isocarbopropoxy group replaces both the *n*- and isocarbobutoxy from the N in diacyl derivs. of *o*-H₂NC₆H₄OH. The Bz group does not behave the same with the *n*-carbopropoxy and the isocarbopropoxy groups in diacyl derivs. of *o*-H₂NC₆H₄OH; in the case of the *n*-deriv. the Bz group goes to the N, but in the case of the *iso*-deriv. the Bz group goes to the O.

C. J. Weger

The mutual exchange of aromatically bound hydroxyl and halogen. III. W. BORSCHKE AND E. FESKE. *Ber.* **61B**, 690 702 (1928); cf. *C. A.* **21**, 1639.—It had been shown that although 3,5,6-Me(O₂N)₂C₆H₂OH with *p*-MeC₆H₄SO₂Cl and PhNEt₂ gives Me(O₂N)₂C₆H₂SO₂SC₆H₄Me almost exclusively, about 70% of it can be converted into Me(O₂N)₂C₆H₂Cl by adding the ester to C₆H₅N and decomp. the pyridinium compd. with 5 *N* HCl. Styphnic acid (I), however, forms no pyridinium toluenesulfonate with MeC₆H₄SO₂Cl and C₆H₅N, but a S free 2,4,6-trinitro-3-hydroxyphenylpyridinium betaine (II or III), obviously formed by elimination of MeC₆H₄SO₃H from the C₆H₅N addn. product of the I toluenesulfonate, for 1,3,4,6-C₆H₂(OH)₂(NO₂)₂ (IV) under the same conditions gives the 2,4-dinitro-5-hydroxyphenylpyridinium betaine (V) obtained from C₆H₅N and 1,3,4,6-C₆H₂(NO₂)₂Cl₂, and 1,3,2,4-C₆H₂(OH)₂(NO₂)₂ (VI) yields an isomer (VII) of V. On the other hand, 3,2,4,6-HO(O₂N)₂C₆H₂NHPh (VIII) does not yield a pyridinium betaine but the normal pyridinium toluenesulfonate (IX), which is decompd. by hot 2 *N* HCl into MeC₆H₄SO₃H, C₆H₅N and 2,4,6-trinitro-3-chlorodiphenylamine (X), also obtained directly from VIII by Ullmann and Nadai's method (heating with MeC₆H₄SO₂Cl in PhNEt₂). Under these latter conditions the HO groups in aminopieric acid (XI) and in IV can be replaced by Cl but not in VI, which behaves like I. I, m. 174-5°, was obtained in about 100 g. yield by sulfonating 50 g. *m*-C₆H₄(OH)₂ in 300 cc. concd. H₂SO₄ on the H₂O bath and then nitrating below 10° with 100 cc. of HNO₃ of d. 1.395 and afterwards with 100 cc. of fuming acid (d. 1.54). II or III (yield, almost quant.), yellow crystals insol. in most org. solvents, sol. in about 60 parts boiling PhNO₂, darkens about 270°, m. around 330° (decompn.), sol. almost without color in concd. H₂SO₄ and HNO₃ (d. 1.4) on gentle warming and reprecip. unchanged by ice H₂O, only very slowly sol. in dil. NaOH, rapidly, with deep red color, on heating, acids pptg. red-brown amorphous flocks, readily sol. in cold fuming HCl with yellow color (presumably as the pyridinium chloride) but at once reprecip. on diln. with H₂O, alc. or 50% AcOH, gives indefinite decompn. products with 5 *N* HCl at 190°, dissolves with light yellow color in HCl-AcOH at 145° and on cautious diln. with H₂O yields yellow leaflets, m. 159-60°, having approx. the compn. of the pyridinium chloride but decompd. by NaOH like the betaine itself and possibly they are the isomeric chloride (O₂N)₃C₆H(OH)N ClCH CHCH:CHCl formed from the pyridinium chloride by rearrangement; with hot C₆H₅N it regenerates the betaine and with boiling PhNH₂ gives VIII just as readily as the betaine itself. With HCl-AcOH at 170-80°, the betaine yields impure I. With secondary aliphatic amines, NHR₂, the betaine yields salts of a substance 3,2,4,6-HO(O₂N)₂C₆H₂NH.NHR₂ClCH CHCH ClNR₂, giving HO(O₂N)₂-C₆H₂NH₂ with hot mineral acids, whereas with PhNH₂ and its homologs it forms VIII, again probably through a glutacetaldehyde deriv. The product from the betaine and piperidine in boiling MeOH is obtained in 2 forms: α, garnet-red needles, m. 124-5°, and β, orange-yellow leaflets, m. 127-8°. Both can be recrystd. unchanged from MeOH, the needles, however, only when the soln. is protected from inoculation with the leaflets, on the other hand, a hot satd. MeOH soln. of the leaflets deposits the needles when boiled with a trace of piperidine. Both forms have the compn. C₆H₁₀NH₂·HO(O₂N)₂C₆H₂NH ClCH CHCH:CHNC₆H₁₀. Neither is decompd. in MeOH by AcOH. Mineral acids (best dil. H₂SO₄) convert them first into a substance sepg. in dark red prisms with bluish surface luster, m. 139° (which does not regenerate the original compds. with piperidine), and then rapidly into XI. With *p*-MeC₆H₄NH₂, the betaine gives 4-methyl-2',4',6'-trinitro-3'-hydroxydiphenylamine (if, in decompn. the reaction mixt., too little HCl is used or it is not boiled, there is obtained, instead of the free amine, its *p*-toluidine deriv., C₂₀H₁₆O₇N₆, bright red, m. 191-3° (decompn.)). X, yellow, m. 141-2°. IX, orange, m. 206-8°. 2,4,6-Trinitro-3-chloroaniline, from XI, brownish leaflets with violet luster, m. 185-6°. VI, m. 147-8°, is obtained in about 4 g. yield from 15 g. of the di-NO deriv. slowly added to ice-cold HNO₃ (d. 1.3) and allowed to stand at 0°. 2,2-Dinitro-3-hydroxyphenylpyridinium toluene-*p*-sulfonate, from VI, C₆H₅N and MeC₆H₄SO₂Cl, yellow, m. 134°; the chief product of the reaction (the pyridinium betaine (VII)), red-brown, easily sol. in fuming HCl, blackens about

300°, decomps. explosively around 325°, gives with HCl-AcOH at 145°, 2,?-dinitro-3-chlorophenol, brownish yellow, m. 112-4°. The product, $C_{11}H_9O_3N_2$ from VII and piperidine exists in 2 forms, m. 144-6° and 171-2°, decompd. by HCl into 3,2,?- $H_2N \cdot (O_2N)_2C_6H_3OH$, m. 220-2°. 2,4-Dinitroresorcinol monololuene-*p*-sulfonate, yellowish white, m. 126-7°, slowly converted by C_6H_5N at room temp. into VII, by boiling $PhNH_2$ into 2,?-dinitro-3-hydroxydiphenylamine, brownish yellow, m. 124-5°. 3-Anilino-2,?-dinitrophenylpyridinium loluene-*p*-sulfonate, light brown, m. 216-8°. 3-Anilino-2,?-dinitrophenylloluene-*p*-sulfonate, brown-yellow, m. 151°. 3-Amino-4,6-dinitrophenol, from V with piperidine or $PhNH_2$, brownish yellow needles with violet surface luster, m. 226-7°. 4,6-Dinitroresorcinol monololuene-*p*-sulfonate, m. 135°; *N*-diethylaniline salt, yellow, m. 109-10°. With 2 mols. $MeC_6H_4SO_2Cl$ in $PhNEt_3$, IV gives a mixt. of 2,2',2'',4'-tetranitro-5,5'-dichlorodiphenyl ether, m. 232-4° and 1,3,4,6- $C_6H_2(NO_2)_4Cl_2$.

C. A. R.

A reaction of phenacetin and acetaldehyde. OTTORINO CARLETTI. *Giorn. chim. ind. applicata* 10, 66 (1928).—In the presence of concd H_2SO_4 , phenacetin gives with $AlCl_3$ a characteristic red color. If a small quantity of a sample contg phenacetin is moistened with AcH , 2-3 cc of concd H_2SO_4 are added, and the mixt. is agitated, the acid becomes red, the color being visible with only 0.001 mg of phenacetin. The intensity of the color increases on standing and is accelerated by warming. On diln., a bluish brown substance seps., which, filtered and redissolved in concd H_2SO_4 , imparts a red color to the latter. With concd. H_2SO_4 phenacetin forms 2,5- $HO(H_2N)C_6H_3SO_3H$, but *p*- $HO-C_6H_4OH$ does not give the characteristic color, nor can this color result from profound decompn. of phenacetin because *p*-phenetidine does not give the color. A colored condensation product of phenacetin and AcH is probably formed. Phenacetin gives no color with $HCHO$ and concd. H_2SO_4 , and therefore the reaction may be utilized to distinguish AcH from $HCHO$. Paraldehyde and metaldehyde also give the reaction, whereas trioxymethylene and hexamethylenetetramine give no color. C. C. DAVIS

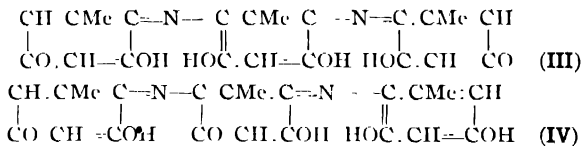

Derivatives of phenolmonosulfonyl chlorides. E. G. FULNEGG AND ALEXANDER SCHLESINGER. *Ber.* 61B, 781-4 (1928).—Aromatic phenols with $ClSO_2H$ do not give phenolmonosulfonyl chlorides which have hitherto been obtained from the carboxyphenolsulfonic acids with PCl_5 . It has now been found, however, that they can be quite generally obtained directly from the carboxyphenols with $ClSO_3H$ although not from phenols in which the HO group is protected by other substituents than OCO_2Et . Thus, *m*- $MeC_6H_4OCO_2Et$ slowly added to 5 parts cold $ClSO_3H$ and, after 3 hrs., poured upon ice gives almost quant the oily *sulfonyl chloride*, presumably 2,4- $Me(EtO_2CO)C_6H_3SO_2Cl$, identified as the *anilide*, m. 149°. From 1- $C_{10}H_7OCO_2Et$ is obtained 80% 1,4- $C_{10}H_6(OCO_2Et)SO_2Cl$, m. 83°, identical with the product obtained by Zincke from 1,4- $C_{10}H_6(OCO_2Et)SO_3H$. Treated in H_2O with $PhNH_2$ and sapond. with boiling KOH , it yields 1-naphthol-4-sulfonanilide, m. 198°; *sulfon- β -naphthylamide*, m. 204°. 2,8- $C_{10}H_6(OCO_2Et)SO_2Cl$ from 2- $C_{10}H_7OCO_2Et$ and $ClSO_3H$, m. 118°, is identical with the product obtained from 2,8- $C_{10}H_6(OH)SO_3H$ by carboxylation and subsequent chlorination with PCl_5 ; reduction with Zn dust and H_2SO_4 in Me_2CO gives the 2-naphthol 8-mercaptan, isolated as the deep yellow *Pb* salt. C. A. R.

Splitting off the dioxymethylene ring. F. MAUTHNER. *J. prakt. Chem.* 119, 74-6 (1928).—The CH_2O_2 group is readily removed by heating with $AlCl_3$ in $PhCl$. By the same reaction guaiacol-*o*-carboxylic acid yields *o*-protocatechuic acid.

C. J. WGR

Orcein-like dyes. F. HENRICH AND W. HEROLD. *Ber.* 61B, 767-70 (1928).—Amino-orcein, 2,3,5- $HO(H_2N)C_6H_3Me$ (I), in H_2O , C_6H_6 or xylene is not altered by dry air either at room temp. or at the b. p. of the solvent but in hot Me , Et or Am alc. it soon undergoes oxidation, the reaction in $AmOH$ being apparently different from that in $MeOH$ or $EtOH$; in the absence of O , the I remains unchanged in these solvents also. From 5 g. I in 150 cc. $EtOH$ on the H_2O bath was obtained about 4 g. of a dark pulverulent substance (II), sol. in faintly alk. H_2O with blue to blue-violet color, reprecipitated by acids, and having the compn. $C_{21}H_{18}O_6N_2$. The expts. of H. and H. indicate that in the 1st phase of the reaction the I is oxidized to a quinone imide, 2 mols. of which react with 1 mol. of unchanged I with elimination of 1 mol. each of H_2O and NH_3 and formation of a complex indophenol for which is provisionally suggested the structure III or the desmotropic form IV. That indophenols are really formed in this type of oxidation

is shown by 2 expts.: (1) free 5,2,4- $\text{H}_2\text{N}(\text{HO})_2\text{C}_6\text{H}_2\text{Me}$ (V) treated as above in alc. gives only the yellow indophenol dye previously obtained as an intermediate product in the formation of the phenoxazone from V in alk. soln. (C. A. 19, 2649); (2) a dil. alc. soln. of 1 mol. each of *p*- $\text{H}_2\text{NC}_6\text{H}_4\text{OH}$ and PhOH and 1 atom Na treated with air soon becomes blue-green and shows with alkalis and acids indophenol reactions. III boiled with 1:2 H_2SO_4 gives a small quantity of a yellow Et_2O -sol. compd. which it has as yet not been possible to crystallize. Conc'd HCl likewise yields no definite degradation product. Heated at 180–200° with $\text{SnCl}_2\text{-HCl}$ it yields about 10% of a mixt. of HCl salts consisting chiefly of I HCl, considerably larger quantities of another substance which soon oxidizes but then no longer gives the reaction of the original III, and a sirupy substance apparently contg. a N-free phenol. Orcem (only a small quantity of an old prepn. was available) behaves very similarly on treatment with $\text{SnCl}_2\text{-HCl}$.

C. A. R.

Synthesis of partially acylated glycerides. II. B. HELFERICH AND H. SIEBER. *Z. physiol. Chem.* 175, 311–5 (1928); cf. C. A. 22, 59.—The β -benzoylglycerol previously obtained as a sirup has now been prepd. in cryst. form and its constitution established. α, α' -Ditritylglycerol (I), m. 174–6°, was prepd. by heating glycerol with 2 mols. of Ph_3CCl in dry pyridine. When treated with *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{COCl}$ in pyridine this yielded α, α' -ditrityl- β -*p*-nitrobenzoylglycerol, m. 188°. The Ph_3C groups were then removed by shaking with HBr in AcOH and the resulting β -*p*-nitrobenzoylglycerol, m. 120–1°, finally obtained cryst. by repeated extus. with Et_2O and EtOAc and pptn. by petroleum ether. Benzoylation with BzCl and pyridine converted it into α, α' -dibenzoyl- β -*p*-nitrobenzoylglycerol, m. 89°. Treatment of I with $\text{C}_{16}\text{H}_{33}\text{COCl}$ in dry CHCl_3 gave α, α' -ditrityl- β -palmitylglycerol, m. 70–2°.

A. W. DOX

Nitrogen trichloride and unsaturated ketones. II. G. H. COLEMAN AND DAVID CRAIG. *J. Am. Chem. Soc.* 50, 1816–20 (1928); cf. C. A. 21, 3888.— $\text{PhCH}:\text{CHAc}$ (130 g.) in 500 cc. CCl_4 , treated at -10° with 500 g. of a soln. of NCl_3 in CCl_4 contg. 480 mg. moles NCl_3 during 2 hrs., the soln. filtered after 5 hrs. and then allowed to stand 3 days at room temp., gives 5% of the HCl salt, m. 176–7° (decompn.), of 1-amino-2-chloro-1-phenylbutan-3-one, the intermediate product, $\text{PhCH}(\text{NCl}_2)\text{CHClAc}$, being reduced by conc'd HCl in 30 min. or by dl. HCl after 3 days. BzCl in C_6H_6 gives the *Bz* deriv. (I), m. 160–1°; the Schotten Baumann procedure gives I and a 2nd product, m. 204° (decompn.). Reduction of I with Na-Hg in EtOH gives 67% of the *Bz* deriv., m. 150–1°, of 1-amino-1-phenylbutan-3-ol, m. 74–6° (dl. *Bz* deriv., m. 139–41°). Reduction of $\text{PhCH}_2\text{CH}(\text{NH}_2)\text{Ac}$ gives 2-amino-1-phenylbutan-3-ol, m. 62–4° (HCl salt, m. 114–6°; *Bz* deriv., m. 177–9°). The NCl_3 reaction also produces about 45% of PhCHClCHClAc , m. 93–4°, b₂₅ 159–60°; the impure product decomps. on standing, giving 1-chloro-1-phenylbuten-3-one, b₂₅ 155–6°.

C. J. WEST

Physical properties of salicylaldehyde. T. S. CARSWELL AND C. E. PFEIFFER. *J. Am. Chem. Soc.* 50, 1765–6 (1928).—*o* $\text{HOC}_6\text{H}_4\text{CHO}$, purified through the NaHSO_3 compd., b₇₆₁ 196.4–6.5°, b₂₅ 93°, crystg. pt. 1–6°, d₂₀²⁰ 1.1690.

C. J. WEST

Catalytic oxidation of aromatic hydrocarbons and their derivatives by means of air. E. B. MAXTED. *J. Soc. Chem. Ind.* 47, 161–5T (1928).— Sn vanadate is an excellent oxidation catalyst, and is prepd. by drying the pptd. salt. With *PhMe*, a 50% yield of BzOH is obtained; with *PhEt*, the yield is about 40%; the temp. of max. activity is 280–90°. The oxidation of $\text{C}_6\text{H}_4\text{Me}_2$, C_{10}H_8 and tetrahydronaphthalene all yields $\text{C}_6\text{H}_4\text{CO.O.CO}$. The oxidation of *PhCH₂OH* and *BzH* also yielded BzOH ;

in the latter case the % yield and the space-time yield were about the same as for the *PhMe* oxidation, which indicates that the limiting factor is a process inherent in the catalyst itself. Bi vanadate gives results similar to the Sn salt, although the temp. of activity is 100° higher. *o*-Cresol could not be oxidized to salicylic acid, nor could amino acids be obtained from aminotoluenes.

T. S. CARSWELL

Benzoic esters and electronic affinities of radicals. I. AHMAD ZAKI. *J. Chem. Soc.* 1928, 983–9.—Nitration of benzoic esters and estn. of the proportion of the *m*-isomers afford a convenient auxiliary method for the estn. of the electron affinities of various groups, BzOMe being taken as the standard of reference. At 0° the following

% of *m*-NO₂ deriv. was formed: Me, 72.6; Et, 69.9; Pr, 71.8; Bu, 67.9; *Am* (*b*₁₅ 138-9°), 68.3; hexyl, 63.7; *heptyl* (*b*₁₀₀ 216-7°), 62.8; octyl, 60.2; cetyl, about 52; iso-Pr, 64.1; iso-Bu, 69.4; *sec*-Bu, 65.2; *tert*-Bu, 59.4; *sec*-octyl, 59.4; at 25°: Me, 69.7; Et, 66.3; Pr, 68.6; Bu, 65.1. *tert*-*Am* ester, *b*₂₂ 127-8° (60% yield), is decompd. on nitration. These results indicate that aliphatic radicals with a branched chain produce less *m*-isomer than a normal chain radical with the same no. of C atoms and that the nearer the branching in the alkyl group to the Bz residue, the smaller is the % of the *m*-isomer. The anticipated effect that as one ascended the series alkyl esters would give a smaller % of the *m*-isomer was not realized for the 1st 5 members, a zigzag curve being obtained. The method of analysis of the nitration mixt. is given.

C. J. WEST

Sodium salts of aromatic nitriles. I. MARY M. RISING AND TSON-WU ZEE. *J. Am. Chem. Soc.* 50, 1699-707 (1928).—A new field of investigation of nitride-carbide tautomerism is outlined. The Na salt of PhCH₂CN and that of PhEtCHCN have been prepd. Their behavior with acid suggests the nitride structure (PhHC.C:N⁻)Na⁺ and (PhEtC.C:N⁻)Na⁺ for the 2 salts. The behavior of the salts in substitution reactions suggests for them the carbide structure (Ph(CN)HC⁻)Na⁺ and (PhEt(CN)C⁻)Na⁺. The double behavior of the salts indicates a tautomeric relationship between the nitride and carbide forms. The salts are considered to be unstable intermediate products in the aldol-like condensation reactions described by E. von Meyer.

C. J. WEST

Phenylbromoacetonitrile. ALEXANDER NEKRASSOV. *J. prakt. Chem.* 119, 108 (1928). cf. Steinkopf, *C. A.* 14, 3658.—Phenylbromoacetonitrile, described by S. as an oil, *b*₁₆ 137-9°, m. 25.4°.

C. J. WEST

Chemical individuality of humulene. A. CHASTON CHAPMAN. *J. Chem. Soc.* 1928, 785-9. —In this first study of humulene C. (*J. Chem. Soc.* 67, 54 (1895)) concluded that humulene (I) was not identical with carophyllene (II), which conclusion was confirmed by Kremer, Schreiner and James (*Pharm. Arch.* 1, 209 (1898)). Later Deussen (*C. A.* 6, 137) stated that I was "inactive α-II." While D. claimed that fractional distn. brought about a sepn. of the 2 forms of II, repetition on a fraction of II from clove oil showed that with rising *b. p.* the *l*-rotation showed a small but steady increase; at no point was any fraction obtained which was inactive or which did not show approx. the steady rise referred to. I does not appear to form a solid compd. with HCl, while II readily forms the cryst. di-HCl salt. While II gives a large yield of a solid alc., I, treated in the same manner, gives no solid product. The nitrosite from II, m. 115°; from I, 114°, but a m. p. of the mixt. is depressed about 20°. Other results indicate that the crude sesquiterpene from clove oil consists substantially of II with a rotation of about [α]_D -8° and that this crude hydrocarbon contains 5-10% I. D.'s α- or inactive II is neither more nor less than I.

Orientation effects in the diphenyl series. VI. Supposed isomerism of the dinitrotoluidines. R. J. W. LE FEVRE AND E. E. TURNER. *J. Chem. Soc.* 1928, 963-9; cf. *C. A.* 22, 1349.—When diacetyl-*o*-toluidine is nitrated (cf. Cain and Micklethwait, *C. A.* 8, 3416), there results the 5,5'-di-NO₂ deriv. (I), m. 268-9°, and from the mother liquors a compd., m. 200-5°, which is really an impure specimen of the 6,6'-di-NO₂ deriv., which is also formed in the nitration of 6-nitrodiaacetyl-toluidine. I, diazotized in concd. H₂SO₄ at -5° and treated with Br in HBr, gives 4,4'-dibromo-5,5'-dinitro-3,3'-dimethyldiphenyl, pale yellow, m. 271-2°; 4,4'-dipiperidino compd., bright yellow, m. 226-7°. 4,4'-Dibromo-6,6'-dinitro-3,3'-dimethyldiphenyl, m. 230-3°; this does not react with boiling piperidine. 4,4'-Di-Cl deriv., yellow, m. 211-2°. C. J. WEST

Reactivity of atoms and groups in organic compounds. III. First contribution on the carbon-chlorine bond: the rate of the reaction between diphenylchloromethane and ethyl alcohol. J. F. NORRIS AND A. A. MORTON. *J. Am. Chem. Soc.* 50, 1795-803 (1928); cf. *C. A.* 21, 3887.—A method is reported for the detn. of the velocity consts. of the reaction between Ph₂CHCl and EtOH based on the measurement of the elec. cond. of the soln. as the reaction proceeds; data are given for the % lowering of the sp. cond. of HCl in EtOH produced by non-electrolytes (C₆H₆, PhCl, PhBr, C₁₀H₈, C₈H₄Br₂, Ph₂, Ph₂CH₂ and C₁₀H₇PhCH₂). The reaction between Ph₂CHCl and EtOH is reversible; *k*₁ is 0.00301, *k*₂ 0.00250; the temp. coeff. is 4630. •IV. The rates of the reactions of certain derivatives of diphenylchloromethane with ethyl alcohol and with isopropyl alcohol. J. F. NORRIS AND CLIFFORD BANTA. *Ibid* 1804-8.—*p*-Phenyl-diphenylchloromethane, m. 71-2.5°; *p*-Cl deriv., *b*₈ 172-3°; *p*-Me deriv., *b*₂ 147-8°; *o*-Cl deriv., decomp. 90°; *p*-Br deriv., *b*₁₀ 188-91°; *p,p*-di-Me deriv., m. 41-3.5°. The following velocity consts. of the reversible reaction between EtOH and the derivs. at 25° are reported; Ph₂CHCl, 0.00266; *o*-Cl, 0.0000254; *p*-Cl, 0.00107; *p*-Me, 0.0433;

p-Ph, 0.362; *p,p'*-Cl₂, 0.00040; Ph(PhCH₂)CHCl, 0.000000112. Halogen atoms depress reactivity, the greatest effect resulting from substitution in the *o*-position. The Me and Ph radicals increase reactivity, the greatest effect resulting from substitution in the *p*-position. V. The rates of the reactions of certain derivatives of diphenylchloromethane with ethyl alcohol. J. F. NORRIS AND J. T. BLAKE. *Ibid* 1808-12.—*o*-Methyldiphenylchloromethane, m. 40-40.5°; *m*-Me deriv., oil; *o*-MeO deriv., pale pink oil; *p*-MeO deriv., red oil; *p,p'*-di-Me deriv., m. 45-6°; *p*-PhO deriv., pale orange, m. 49-50° (from the carbinol, m. 75°); *p*-Et deriv., b₁₋₂ 122° (from the carbinol, m. 33°); *m*-Cl deriv., oil, *p*-Br deriv., oil. α -Naphthylphenylchloromethane, m. 64-4.5°. The 1st-order velocity consts. of the reaction between EtOH and these derivs. at 25° are as follows: *m*-Cl, 0.0000593; *p*-Br, 0.000883; *m*-Me, 0.00554; *o*-Me, 0.00764; *p*-Et, 0.0558; *o*-MeO, 0.247; *p*-PhO, 0.843; *p,p'*-Me₂, 1.10; Ph(α -C₁₁H₉)CHCl, 0.0193. VI. The rates of the reactions of benzoyl chloride and certain of its derivatives with isopropyl alcohol. J. F. NORRIS AND D. V. GREGORY. *Ibid* 1813-6.—The 1st-order velocity consts. of the reactions of Me₂CHOH with BzCl and its derivs. at 25° are reported as follows: BzCl 0.00365, *p*-Cl deriv., 0.00559; *p*-Br, 0.00650; *p*-I, 0.00528; *o*-NO₂, 0.00694; *p*-NO₂, 0.036; *p*-Me, 0.00235. The negative atoms (Cl, Br, NO₂) increase the lability of the bond in acyl chlorides and decrease the lability of the bond in derivs. of PhCHCl; the positive Me group increases reactivity in the acyl and decreases it in the alkyl compds. C. J. WEST

Absorption spectra of hydroquinonephthalein and hydroquinonesulfonephthalein C. V. SHAPIRO. *J. Am. Chem. Soc.* 50, 1772-8(1928).—Evidence is submitted from a study of absorption spectra which provisionally confirms a conclusion previously arrived at from the chem. behavior of the compds., that hydroquinonephthalein (I) and hydroquinonesulfonephthalein (II) can exist in the *m*-quinoid state. It is also established that II has an inner salt structure. Data and curves are presented showing the absorption of I and II in neutral, acid and alk. solns. A comparison of the absorption spectra of the di-Bz derivs. of I and II shows that the latter is to be considered as a quinoid deriv. C. J. WEST

Decomposition of diacetone alcohol by NaOH in water mixtures of organic solvents (ÅKERLÖF) 2. The decomposition of *p* phenetylcarbanide on heating in aqueous solution (TAUFEL, *et al*) 2. Boiling points of the normal paraffins at different pressures (YOUNG) 2. Structure and dimensions of the benzene ring (MORSE) 3.

Side-chain aromatic compounds. F. GÜNTHER. U. S. 1,670,505, May 22. An aromatic compd. such as C₁₀H₈ or C₆H₆ is acted on with an acid sulfuric acid ester, *e. g.*, with acid sulfuric acid Bu or Pr ester, or other similar ester of an alc. contg. at least 3 C atoms, to obtain compds. such as propylated benzenes or similar substitution products.

1,8-Aminonaphthol-3,6-disulfonic acid. I. GUBELMANN and J. M. TINKER. U. S. 1,670,406, May 22. 1-Naphthylamine-3,6,8-trisulfonic acid is fused with caustic alkali in the presence of added NH₃ which serves to facilitate the reaction.

Butyric acid, etc. SOC. DES BREVETS ÉTRANGERS LEFRANC ET CIE. Brit. 276,617, Aug. 27, 1926. Salts of alkali or alk. earth metals such as the crude Ca butyrate obtained from fermentation processes of producing butyric acid are treated with slightly less than a reaction proportion of HCl. The reaction mixt. seps. into 2 layers, the upper of which contains most of the butyric acid of about 80-90% strength, while the lower layer contains aq. CaCl₂, HOAc, etc. The upper layer may be sepd. and rectified over Al₂(SO₄)₃ or fused CaCl₂, while the lower layer may be distd. with steam. The HCl used should be free from Cl and may be preliminarily treated with Fe or Zn to remove free Cl.

2-(3',4'-Diaminobenzoyl) benzoic acid. R. ADAMS, J. M. DAVIDSON and I. GUBELMANN (to Newport Co.). Brit. 277,285, Sept. 13, 1926. This compd. is made by reduction of 2-(3'-nitro-4'-aminobenzoyl)benzoic acid with Fe powder and HOAc. Other similar compds. may be prepd. in an analogous manner from related starting materials. Cf. C. A. 22, 1693.

Hydrogenating phenols. CHEMISCHE FABRIK AUF AKTIEN, VORM. E. SCHERING. Brit. 276,010, Aug. 16, 1926. Thymol, its isomers or homologs, and their hexahydro compds. are prepd. by catalytic hydrogenation of the condensation products of alkylated phenols and ketones such as those described in Brit. 273,684 (C. A. 22, 1982) until 4 or 16 at proportions of H are taken up.

Separating mono- and di-alkyl-arylamines. R. W. EVERATT and E. H. RODD. U. S. 1,670,850, May 22. A mixt. such as that of mono- and di-ethylanilines is treated with phosgene in the presence of water, and an alkali such as NaOH is added gradually to neutralize the amine hydrochlorides formed, until all the secondary amine present has been acted upon by the phosgene and HCl is then added to dissolve the dialkyl compd.

Hydrogenated naphthylamines. SOC. ANON. POUR L'IND. CHIM. A BÂLE. Brit. 276,571, Feb. 24, 1927. *ar*-Tetrahydronaphthylamine derivs. are made by subjecting *N*-substituted naphthylamines to catalytic hydrogenation, and the hydrogenated naphthylamines themselves may be made by using an acetyl deriv. as the starting material and subsequently saponig. Examples are given for the production of *ar*-*N*-ethyl-tetrahydronaphthylamine, *ar*-acetyl-tetrahydro- β -naphthalide, *ar*-*N*-phenyltetrahydro- α -naphthylamine and acetylated *ar*-tetrahydro-*N*-ethyl- α -naphthylamine.

Hydrocyclic ω -amino compounds. H. RUPE. U. S. 1,670,990, May 22. α -Cyanocamphor or other hydrocyclic cyanoketones are reduced with H in the presence of catalysts such as Ni. Camphomethylamine, b_{11} 126–8°; its hydrochloride, m. 243°.

Basic bismuth salts of arylarsonic acids. R. W. E. STICKINGS. U. S. 1,669,542, May 15. A soln. of a Bi salt such as Na bismuthyl tartrate is pptd. with the addn. of Na *N*-phenylglycinamide-*p*-arsonate or other salt of an arylarsonic acid in excess, under the influence of heat, to form corresponding Bi compds. Cf. C. A. 21, 3711.

Methylene chloride. E. R. BRODTON, R. H. HOLLIS and H. A. MINER. Brit. 276,383, Feb. 22, 1926. "Wood alc" or a mixt. of MeOH and acetone is chlorinated and the product is rectified to produce a liquid, b. 40–60°, consisting mainly of methylene chloride and suitable for driving engines or motors, extinguishing fires or for use in thermostats.

Unsaturated aldehydes. H. RUPE. U. S. 1,670,825, May 22. In the manuf. of cyclohexylidene-acetaldehyde or other unsatd. aldehydes, acetylene alcs. such as 1-ethinylcyclohexanol-(1) which contain a free H atom in the acetylene group are treated with formic acid or other suitable sol. compd. contg. an acid radical.

Quinaldines. BRITISH DYESTUFFS CORPORATION, LTD. AND M. WYLER. Brit. 276,156, Sept. 6, 1926. Quinaldines are sepd. from the reaction mixt. obtained in the Dohner-Miller or other process for prepg. quinaldines, in the form of their ZnCl₂ double salts, which are subsequently treated with alkali to obtain the base or are subjected to distn. to distil the hydrochloride of the base.

Monobenzoyldiaminoanthraquinones. I. G. FARBENIND. A.-G. Brit. 276,692, Aug. 30, 1926. Benzoyl chloride is caused to react with a diaminoanthraquinone, which may be dissolved in an org. solvent such as PhNO₂, in the presence of an acid-binding agent such as pyridine, quinoline, Na₂CO₃ or magnesia. The products may be sepd. by fractional crystn. from an alc. soln.

2-Mercaptobenzothiazole. L. B. SEBRELL and J. TEPPEMA. U. S. 1,669,630, May 15. *o*-Nitrochlorobenzene is caused to react, under the action of heat and pressure, with an aq. soln. of a basic sulfide or hydrosulfide such as NaHS in the presence of H₂S and CS₂. Cf. C. A. 22, 1366.

Urea. L. CASALE. U. S. 1,670,341, May 22. Synthetic NH₃, immediately after its formation and while still highly heated and under pressure, is mixed with CO₂ to produce urea. An app. is described.

Mixing apparatus for polymerizing constituents of solvent naphtha, etc. S. P. MILLER. U. S. 1,670,593, May 22.

Anthraquinone derivatives. I. G. FARBENIND. A.-G. AND R. BERLINER. Brit. 277,109, June 10, 1926. The process described in Brit. 244,462 (C. A. 21, 329) for producing stable condensation products from 4-substituted-1-aminoanthraquinones or their derivs. is carried out in H₂SO₄ soln. in the presence of metallic reducing agents such as Cu, Al or Zn. Heating is not required. Examples are given of the condensation of 1-aminoanthraquinone, 1-amino-4-hydroxyanthraquinone and 1-amino-2-bromo-4-hydroxyanthraquinone with polymerized CH₃O in H₂SO₄ with use of Cu or Zn as reducing agent. Brit. 277,110 specifies a modification of the process described in Brit. 244,463 (C. A. 21, 329) by using HNO₂, HNO₃ or a nitrite and an acid for effecting oxidation of the condensation products described in Brit. 244,462.

Benzanthrone derivatives. I. G. FARBENIND. A.-G. Brit. 277,342, Sept. 10,

1926. Benzanthrone substituted in the Bz-positions are prepd. by condensing such reduction products of anthraquinone and its derivs. as contain O in the *meso*-position with maleic acid, ester or anhydride or with fumaric acid or ester. By simple heating of the reacting compds. intermediate products are formed which may be converted into benzanthrone derivs. by further treatment with acid condensing agents. Several examples are given.

Benzanthrone derivatives. I. G. FARBENIND. A.-G. Brit. 275,927, Aug. 10, 1926. Benzanthrone or its derivs. such as 2-chloro- or 2-methyl-benzanthrone are treated with MnO_2 in the presence of "moderately dil." H_2SO_4 , which may be of a strength of 66% or higher, to produce products which are sol. in alkali and bisulfite solns. and yield anthraquinone-1-carboxylic acids by the action of alk. oxidizing agents. In some cases, CrO_3 or a chromate may also be used as oxidizing agents.

Naphthalene derivatives. I. G. FARBENIND. A.-G. Brit. 276,126, July 28, 1926. 8-Cyanonaphthalene-1-sulfonic acid, its derivs. substituted in the sulfonic group and its nuclear substitution products (obtainable from 8-aminonaphthalene-1-sulfonic acid and its nuclear substitution products by diazotizing and treating with $CuCN$, according to Sandmeyer's reaction) is treated (a) with acid sapon. agents to yield 1-sulfonaphthalene-8-carboxylic acid, its inner anhydride and their nuclear substitution products, which may be converted into 1,8-hydroxynaphthoic acid and its nuclear substitution products by treating with alkalies, or, (b) with alk. reagents to yield 1,8-aminonaphthoic acid, naphthostyryl and their nuclear substitution products. Numerous examples are given.

Naphthalene derivatives. I. G. FARBENIND. A.-G. Brit. 277,098, June 8, 1926. Naphthylalkyl ethers are aralkylated in the nucleus by treating them with aralkyl halides such as benzyl chloride or xylyl chloride, preferably in the presence of a catalytically acting metal such as Fe. The products may be sulfonated to obtain wetting agents for use on animal or vegetable fibers. An example is given of the treatment of β -naphthol-isoamyl ether with benzyl chloride in the presence of Fe filings and sulfonation of the product thus formed.

The action of x-rays on the organism. M. T. BURROWS, L. H. JORSTAD AND E. C. ERNST. *Proc. Soc. Exptl. Biol. Med.* **24**, 311-2(1927).—In small doses x-rays stimulate the mol. disintegrations which are the source of the normal energy of life. Larger doses cause disintegration of the more important mol. constituents of the cell.

C. V. B.

Studies on the enzyme action of yeast. M. SOMOGYI. *Proc. Soc. Exptl. Biol. Med.* **24**, 320-1(1927).—An adsorption-like combination takes place between yeast and fermentable sugars as soon as they come in contact; non-fermentable sugars are not adsorbed. Substances which prevent enzyme action also prevent this selective adsorption.

C. V. B.

Arginine and its possible relation to the physiological activity of insulin. M. SANDBERG AND E. BRAND. *Proc. Soc. Exptl. Biol. Med.* **24**, 373-6(1927).—By enzymic hydrolysis, insulin yielded approx. 12% of arginine. Insulin is a protein of simpler structure than gelatin. Possibly the guanidine group of arginine is the active principle in the insulin mol.

C. V. B.

Protein and non-protein colloids as bioelectric models. R. BEUTNER AND A. MENITOFF. *Proc. Soc. Exptl. Biol. Med.* **24**, 462-4(1927).—As far as gelatin or other proteins may serve as a model for bioelec. currents, their action is identical with that of agar agar, starch paste or kaolin.

C. V. B.

A formula expressing a general relationship between blood pressure and body weight. H. K. FABER. *Proc. Soc. Exptl. Biol. Med.* **25**, 77-80(1927).—The relationship between body wt. and blood pressure was studied in 1000 approx. normal children between 4 and 16 yrs. of age. A formula was derived from these observed figures and the values found and calcd. for blood pressure were shown to be very similar.

C. V. B.

Thyroxine. BICE NEPPI. *Giorn. chim. ind. applicata* **10**, 67-72(1928).—A crit. review, from the historical point of view, of the isolation, identification and ultimate

synthesis of thyroxine, and its physiol. action. Quant. differences in the physiol. action of thyroxine and of thyroid ext. on the nervous system make it doubtful whether the thyroid hormone has a univocal action. Since the constitution of thyroxine requires an asymmetric C atom, the hypothesis is advanced that the difference between synthetic thyroxine and thyroid ext. depends upon the existence of 2 isomers with differing physiol. action, thyroxine extd. from the gland being *d*- or *l*-rotatory and the synthetic product being inactive. Analyses of the *I* content of bovine thyroid in each month of the yr. are tabulated. The following data show the av. % I (based on dry thyroid extd. with Et_2O) from Feb. to the next Jan., inclusive: 0.126, 0.130, 0.1686, 0.2020, 0.2016, 0.1825, 0.1523, 0.1510, 0.1471, 0.1781, 0.1960. A slight increase in early summertime is evident. Eleven references are included.

C. C. DAVIS

The specificity of animal proteases. XIII. The specificity and the method of action of erepsin, trypsin and trypsin kinase. ERNST WALDSCHMIDT-LEITZ AND WILHELM KLEIN. *Ber.* 61B, 640-5(1928).—The peptides are as a rule split by trypsin enterokinase but not by erepsin while opposite results were obtained with amides. Trypsin-enterokinase gave positive results with the following: β -naphthalenesulfonyl-glycyltyrosine, carbethoxyglycylleucine, acetylglycylglycine, acetyl[phenylalanyl]-alanine, benzoyldiglycine, benzoyltriglycine and phthalylglycylglycine. Erepsin caused the hydrolysis of the following: glycylleucine amide and tetraglycine amide. Benzoylpentaglycine and carbethoxytetraglycine amide gave negative results with both enzymes.

H. J. DEUEL, JR.

The specificity of peptidases. II. Comparison of the peptide-sugar condensation with the working of erepsin. ERNST WALDSCHMIDT-LEITZ AND GERTRUD RAUCHALL'S *Ber.* 61B, 645-56(1928). A condensation of glycylglycine and glucose occurred when mixed in the proportion of 1 to 50 mols. (37% after 4 or 24 hrs.) or in the ratio of 1 to 4 mols. (13% after 2 hrs. and 24% after 7 hrs.) at p_H 7.6-7.8. With leucylglycine and glucose in proportion of 1 to 5 mols., 27% was condensed after 28 hrs., while in the ratio 1:10, 28% was condensed after 17 hrs. The decreases in the amt. of peptide and glucose in these cases were the same in the solus. No condensation of leucylglycine and fructose occurred. These condensation products were entirely hydrolyzed in periods of 6-20 hrs. by intestinal erepsin preps., pancreatic erepsin and by yeast erepsin.

H. J. DEUEL, JR.

Report on plant proteases in the series of experiments begun by R. Willstätter and his collaborators. XI. On the specificity of yeast peptidase. WOLFGANG GRASSMANN AND HANNS DYCKERHOFF. *Ber.* 61B, 656-70(1928), cf. C. A. 22, 1984.—Yeast dipeptidase which had been freed from polypeptidase and protease caused the hydrolysis of *dl*-alanylserine, *l*-leucyl-*d*-glutamic acid and *d*-alanyl-*l*-tyrosine, while it was ineffective with a number of other polypeptides. Likewise dipeptidase-free polypeptidase was ineffective with the above dipeptides but was effective with a number of polypeptides, while control expts. with the same prepn. from which the polypeptidase had been removed showed no effect. The ethyl ester of glycylglycine was decomposed only slowly in water with an acid reaction. None was decomposed at p_H 5.3 in 24 hrs., while at 6.4, 2% was decomposed in 2 hrs. and 12% in 24 hrs. At p_H of 6.9, 12% was decomposed in 1 hr., 20% in 2 hrs., 28% in 4 hrs. and 43% in 24 hrs., although no free acid was formed. At p_H 9.4, 91% was hydrolyzed in 20 min., although less than 1% of free acid was formed. The polypeptidase preps. were effective in causing a sapon. of glycine, alanine, and leucine esters within 1 to 2 hrs., while polypeptidase-free dipeptidase or protease gave exactly the same results as the controls without the enzyme. The polypeptidase preps. also caused the hydrolysis of the esters of di- and polypeptides, an appreciable effect being noted in 1 hr. in many cases (esters of glycylglycine (1), glycyl-*dl*-alanine (2), glycyl-*dl*-leucine (3), leucylglycine (4), diglycylglycine (5), and *dl*-leucylglycylglycine (6)), while polypeptidase-free protease was without any action on 1, 2, 4, 5, 6, even after 24 hrs. and dipeptidase was ineffective with 6. Expts. on the other peptides were not carried out with these enzymes. Polypeptidase caused a slight hydrolysis of glycine amide-HCl (7), a pronounced effect on glycyl-*dl*-leucine (8) and *dl*-leucine amide-HBr (9), and some effect on glycyl-dicarboxyleucine (10) but was inactive with diglycyl[*p*-aminobenzoic acid] (11). Polypeptidase-free protease was inactive on 7, 8, 9, 10, as was dipeptidase on 9. Large amts. of yeast dipeptidase over long periods of time caused no certain effects on benzoylglycylglycine, glycylglycine-carboxylic acid, carbethoxyglycyl-*dl*-leucine, naphthalenesulfonylglycyltyrosine, acetyl-phenylalanylalanine or benzoyldiglycylglycine.

H. J. DEUEL, JR.

Stimulation experiments with the sucrase of *Penicillium glaucum*. Z. I. KERTESZ.

Fermentforschung 9, 300-5(1928).—The mold grows well on a medium contg. 5% glycerol as the only source of C but produces no sucrose in the absence of sucrose. With the addn. of as little as 0.01% sucrose the presence of the enzyme is demonstrable. With increasing concn. of sucrose the enzyme increases very rapidly at first, then between 1 and 30% sucrose the enzyme formation is directly proportional to the substrate concn., so that the curve is a straight line. Above 30% sucrose the enzyme formation diminishes, probably because of increasing inhibition of fungus growth. On an invert sugar medium no sucrose is formed, and on lactose only traces. Raffinose, however, gives nearly as good a yield of enzyme as sucrose. Hence the formation of sucrose is dependent on the presence of an α -fructoside grouping in the nutrient medium.

A. W. DOX

The enzymic cleavage of starch. KNUT SJÖBERG. *Fermentforschung* 9, 329-35 (1928).—A review of recent investigations by Pringsheim, Euler, Kuhn, Leibowitz, Sjöberg and others.

A. W. DOX

Behavior of oxidizing enzymes in the intermediary realm according to experiments on angiotomized dogs. N. I. SCHÖCHOR. *Fermentforschung* 9, 375-81 (1928).—All of the organs examd. (muscle, intestine, liver, pancreas, spleen and kidney) have the power both of producing and of destroying catalase. Functional exhaustion of the organ results in a diminution of the catalase content of the blood. Peroxidase originates in the blood itself. However, no relationship exists between the peroxidase content and the erythrocyte count of the blood.

A. W. DOX

Influence of acid reaction and boiling temperature on enterokinase. I. P. RASNIKOW. *Fermentforschung* 9, 382-8(1928).—Concns. of HCl up to 0.5% have no destructive action on enterokinase. Up to 0.3% the acid does not interfere with the activation of non-activated pancreatic juice. In the presence of acid the enterokinase is more resistant to boiling.

A. W. DOX

The natural porphyrins. XXII. Preparation of hemin from yeast. H. FISCHER AND F. SCHWERITEL. *Z. physiol. Chem.* 175, 248-60(1928), cf. *C. A.* 21, 591.—By plasmolyzing yeast with satd. NaCl soln., treatment of the residue with pyridine, extr. with H_2O and pptn. with H_2O , hemin was eventually obtained in crystalline form and identified by the Teichmann and other reactions. This is the first instance of the occurrence of animal hemin in the plant organism.

A. W. DOX

The anaerobic resynthesis of phosphocreatine after stimulation of isolated frog muscles. HENRIETTE GORODISSKA. *Z. physiol. Chem.* 175, 261-91(1928).—The observation of Eggleton and Eggleton (*C. A.* 22, 454) that phosphocreatine (phosphagen) diminishes when the isolated frog gastrocnemius is subjected to tetanic stimulation of brief duration is confirmed. With subsequent recovery of the muscle in O the phosphocreatine is again built up to a considerable extent. If, however, the stimulation is sufficiently moderate the resynthesis occurs also under anaerobic conditions. After less sparing stimulation where the resynthesis still occurs in the presence of O , it may fail altogether in an atm. of H_2 . The behavior of phosphocreatine is analogous in this respect to lactacidogen. If the cleavage of phosphocreatine is actually exothermic, then the resynthesis during subsequent resting of the muscle under anaerobic conditions would be an example of an intravital anaerobic process of endothermic type.

Reversibility of enzyme action. I. BUNSUKE SUZUKI AND TSUTOMU MARUYAMA. *Bull. Agr. Chem. Soc. (Japan)* 4, 10-2(1928).—Formation of isomaltose from glucose by the action of β -glucosidase free from maltase and prepd. from yeast cell was observed. Also in *Proc. Imp. Acad. Tokyo* 3, 533-5(1927).

K. GORO

Catalase. ARAO ITANO AND SATIYO ARAKAWA. *Bull. Agr. Chem. Soc. (Japan)* 4, 24-7(1928).—*Clostridium thermocellum* and thermophilic cellulose-fermenting bacteria give vigorous catalase action in the cellulose medium at 65°. The catalase action is inhibited in the glucose broth at 65°, while at 23° no action occurs. In the glucose broth, pH changes from 6.75 to 4.98 within 48 hrs. at 65°. This increase seems to be one of the inhibitory factors. The catalase action increases with the age of culture so old as 60 hrs. The catalase test by titration with permanganate is influenced by the presence of K_2H_4 phthalate in the buffer soln. while the phosphate mixt. gives uniform result. The optimum reaction for the catalase is pH 8.64. The velocity const. is proportional to the concn. of the catalase, i. e., a typical unimol. reaction. The catalase resists higher temp. than other bacterial products, viz., thirty min. heating at 60° is the optimum; even 100° does not destroy the action entirely.

K. GORO

Biological significance of the unsaponifiable matter of oils. IV. The absorption of higher alcohols. H. J. CHANNON AND G. A. COLLINSON. *Biochem. J.* 22, 391-401 (1928); cf. *C. A.* 22, 1985.—The rat absorbs the following substances in the order

given, the degree of absorption being greatest for the first: phytol, oleyl alc., cetyl alc. and cholesterol. The soly. of these substances in bile salt solns. may also be placed in this order. Unsaponifiable substances in the diet increase the unsaponifiable fraction of the liver.

BENJAMIN HARROW

Physical factors on the sandy beach. II. Chemical changes—carbon dioxide concentration and sulfides. J. R. BRUCE. *J. Marine Biol. Assocn.* 15, 553-65 (1928).—The presence of living organisms and their metabolic products introduce a further series of biochem. factors into the physical conditions of life on the sandy beach. The gaseous exchanges of animals and plants lead to changes in the p_H of the interstitial waters of the beach, but the calcareous matter associated with the sand acts as an alkali reserve, preventing undue rise of acidity, and incidentally widening the potential range of C assimilation of the surface flora. The conditions leading to the formation of the "black layer" are surveyed and discussed, with special reference to Port Erin beach. An iodometric method for the detn. of sulfides in sand is described, and is used to demonstrate the rate of oxidation when the black sand is exposed to the air. It is concluded that the formation of FeS in the beach is associated with diminished circulation of air and water in the mass of the sand, due either to gross obstruction or to fineness of grade, or both. The presence of org. detritus, usually of an algal nature, appears to be essential to the reaction, and bacteria play an important role in the sequence of changes. S, in common with other elements, passes through a cycle of reactions on the sea-bottom and in the sandy beach.

N. KOPELOFF

Clinical and experimental contributions to the lipid problem. ALBRECHT LENHARTZ. *Z. Immunitäts.* 52, 157-90 (1927).—The paper consists of a classification and a review of the chemistry of lipoids, of a report of expts. on the pptn. of lipoids with alkaloids and a discussion of the clinical application of these facts.

J. H. LEWIS

The action of luminous radiation on glucemia. G. CERUTI. *Boll. soc. ital. biol. sper.* 3, 30-2 (1928).—Albino rats were exposed to the direct rays of a mercury vapor lamp for 15, 30 and 60 min. Another lot of rats was exposed for an equal length of time to rays of the same lamp except that a Wood filter was placed between the animals and the lamp. A third lot was exposed to the direct rays of the sun. The glucemic titer was detd. before and after irradiation. In the first group there was an av. diminution of the titer of 10% for 15 min., 25% for 30 min. and 31% for 60 min. In the 2nd group the values were 8, 13 and 18%, resp. In the 3rd group the diminution was 6, 9 and 12%, resp. Rats exposed to Wood's light for one hr. for one week showed a diminution of 35%. A 4th group kept in the dark for 48 hrs. showed an increase of 9%.

PETER MASUCCI

The chlorohemoglobin reaction in the tissues of cadavers. A. DALLA VOLTA. *Boll. soc. ital. biol. sper.* 3, 37-40 (1928).—If a satd. aq. soln. of NH_2OH is injected into the subcutaneous tissues of a cadaver which has not yet putrefied, the tissues in contact with the soln. assume a reddish brown color. If the cadaver is in an advanced state of putrefaction, the injection of hydroxylamine produces a green color. The NH_2OH in the presence of NH_3 and H_2S transforms Hb into Chl-Hb, which being unstable forms sulfohemoglobin. The reaction is accelerated if $Na_2S_2O_4$ is injected before the hydroxylamine. The reaction is of practical value from the medicolegal standpoint as an index of death and invasion of putrefactive organisms.

P. M.

Protease and amylase of *Aspergillus oryzae*. KOKICHI OSHIMA. *J. Coll. Agr. Hokkaido Imp. Univ.* 19, Pt. 3, 135-243 (1928).—The optimum conditions for formation and activity of protease and amylase of *Aspergillus oryzae* are studied with reference to the industrial application. O. uses adaptations of the usual methods for testing amylolytic and proteolytic action (cf. C. A. 15, 103; 17, 2120). A study of the factors which influence enzyme production leads to the conclusions: (1) Amylase and protease are obtained on synthetic and natural culture media simultaneously and in optimum quantity after two days growth; (2) amylase and protease production on artificial culture is stimulated by a mixt. of casein or peptone and starch or glucose; (3) amylase and protease are extra-cellular after sporelation; (4) different species of *Aspergillus* show variation in activity of enzyme. The protease of *Aspergillus oryzae* is more stable at neutrality and 40° than trypsin and is most resistant to heat at p_H 6.4. It shows optimum activity at 50° and is active between p_H 3.5 and 9.0 with optimum at p_H 5.2 to 5.3. It digests natural proteins and peptones. The reaction velocity follows approx. Schütz, but not the monomol. formula. *Aspergillus* amylase shows optimum saccharogenic and amylolytic activity at p_H 4.8 to 5.2 and is most stable toward heat at p_H 6.4, is destroyed at 65° in 1 hr. but at neutrality and below 40° keeps its activity, is inhibited by NaCl and by alc. and is more stable than protease of the same source. The reaction velocity follows monomol. formula. It is

preserved best with cresol at 0.15 to 0.4%, lysol at 0.5 to 2%, phenol at 0.4 to 1.5%, thymol at 0.05 to 0.2%. A complete bibliography is included. N. M. NAVLOR

Medicinal muds of Crimean salt lakes. A. F. SAGAIACHNUII. *Trans. State Inst. Applied Chem. (Moscow)* 1927, No. 5, 25-52.—Numerous tables of compn. of the waters of Moinak lakes are given. Very intensive biochem. processes are taking place without interruption by the action of the salt water of the lakes on the vegetation. The formation of the mud is due to aggregation of particles of colloidal hydroxides of Fe and Al and their mixt. with sands and org. debris. The necessary condition for the formation of the mud, as well as for its regeneration, is a low concn. of salt in the lake, which favors the development of bacterial life and the transformation of colloids into the state of gels. For the preservation of the mud it is, on the contrary, necessary that the salt concn. of the lake waters should increase so as to suppress the biochem. processes which tend to form non-colloidal CaCO_3 . The salt concn. of the lakes is lowest in spring, commences to increase in summer and to drop off in winter. BERNARD NELSON

Purification of cozymase from muscle. HANS V. EULER AND SVEN GARD. *Svensk Kem. Tids.* 40, 99-100(1928). (In German).—Fat-free muscle hash extd. with 2 parts boiling NaCl (1%) for 5 min. and deproteinized with AcOH gave a cozymase yield of 10% which retained all its activity over 18 days. **Lactic acid formation from glycogen by dried muscle activator.** HANS V. EULER AND EDVARD BRUNIUS. *Ibid* 100 2. (In German).—Enzymes in dried muscle when activated by boiling yeast press juice caused marked lactic acid formation from glycogen, also from glucose when Meyerhof's activator was present. Cozymase failed to activate these muscle enzymes. A. R. ROSE

The treatment of nursing mothers with ultra-violet rays. C. CHISHOLM AND M. MCKILLOP. *Lancet* 1927, 11, 227; *Expt. Stu. Record* 57, 793(1927).—The systematic irradiation of mothers whose breast milk had been failing was found to be of general benefit in all of the 53 cases in which the treatment was continued for some time and of aid in improving or retaining the milk supply in all but 11 of these cases. C—BACTERIOLOGY

A. K. BALLS

Carbohydrate-like specific substance in the colon-aerogenes group. J. TOMCSIK. *Proc. Soc. Exptl. Biol. Med.* **24**, 810-2(1927).—Protein-free hapten was isolated from a strain of *B. lactis aerogenes*. This substance consists chiefly of polysaccharides, but in spite of several attempts at further purification, its N content could not be reduced below 0.9%. Similar substances obtained from several other aerogenes strains and from encapsulated *B. coli* showed a strict individual specificity; no cross reactions were observed. C. V. B.

The influence of the concentration of the different neutral salts on the agglutinating affinity of bacteria. AKIRA ICHIKAWA. *Sei-i-kwai Med. J.* **46**, No. 8, 1-8(1927).—The greatest agglutination occurred at a definite salt concn. This concn. is approx. isotonic with univalent and bivalent cations. Only K_2SO_4 and Na_2SO_4 are effective in hypotonic solns. of the first group and $CaBr_2$ and CaI_2 of the second group while no influence was found with the concn. of $MgSO_4$. With trivalent cations the expts. were not possible since coagulation of the serum usually occurred. $AlCl_3$ gave a good result with a hypotonic soln. H. J. DEUEL, JR.

A contribution to the biochemistry of microorganisms. W. GRIMER AND H. BRANDT. *Milchwirtschaft. Forsch.* **4**, 547-563(1927).—A study was made of the action of *Bacillus mesentericus* and *Paralectrum foetidum* in symbiosis on a medium composed of casein and nutritive salts. The data cover the N distribution, volatile and non-volatile fatty acids, and also the amino acids formed by splitting of the protein.

GEORGE R. GREENBANK

The nature of the action of ultra-violet light on microorganisms. T. H. BEDFORD. *Brit. J. Exptl. Path.* **8**, 437-41(1927).—Ultra-violet light is capable under ordinary conditions of producing H_2O_2 . The destruction of microorganisms by ultra-violet light is due and is directly proportional to the production of this substance. The relative susceptibility of different microorganisms to ultra-violet light is of the same order as their relative susceptibility to H_2O_2 as tested *in vitro*. Ordinary visible light has only a very mild effect upon microorganisms. It is, however, possible to sensitize them and produce an abnormal condition in which visible light is as active as ultra-violet light. It is suggested that photodynamic sensitizers, such as fluorescent dyes, may act through the agency of H_2O_2 or some org. peroxide production, and that the typical sensitizer acts (1) by selective adsorption on to the organism concerned and (2) by peroxide formation when visible light falls upon the organism-sensitizer combination. HARRIET F. HOLMES

The permanent preservation of bacteriological nutrient solutions. WILHELM PLAHL. *Z. Untersuch. Lebensm.* **54**, 371-3(1927).—Nutrient solns. are protected from evapn. and contamination by placing the tube inside a larger tube corked and sealed with a soln. contg. 10% of gelatin and 1% of salicylic acid. WILLIAM J. HUSA

Effect of hydrogen ions and undissociated molecules on bacteria. F. TEKELENBURG. *Nederland. Tijdschr. Hyg. Microbiol. Serol.* **2**, 176-94(1927); cf. *C. A.* **19**, 91; **20**, 219.—Modern research demonstrates to an increasing extent the importance of the concn. of the undissoc. acid and the nature of the anion on the viability of bacteria. Given 2 cultures of equal H-ion concn. one in a medium of high, the other in one of low buffer capacity, the total acid concn. of the former, x , will necessarily be higher than that of the latter, y , and the following equation will obtain: $[H] = [H_1A_1]/(x - [H_1A_1]) = ([H_2A_2])/(y - [H_2A_2])$. Many results published in the literature could be easily explained with the aid of this equation. A study in this direction was made with *B. coli*, *B. pyocyaneus*, and *Staph. pyog. aureus*. The cultures were well shaken with NaCl and filtered through paper. The following acids were studied alone or in combination with their Na salts: HCl, HCO_2H , AcOH, glycine, propionic, butyric, isobutyric, valeric, isovaleric, oxalic, malonic, succinic, tartaric, malic, tartaric, citric, glycolic, α - and β -hydroxybutyric, fumaric and maleic. The temp. was 37°, the acid concn. 0.1 N, for HCl, also 0.01 N. Mixts. of acids and salts had the same concns. Buffer solns. were tested at 40-55°. For p_H 1.42-5.11 the buffers used were HCl-glycine, HCl-Na citrate, Na citrate; for p_H 8.24-13.00 the buffers used were 0.1 N NaOH + glycine, 0.1 mol. Na_2CO_3 + 0.1 N HCl and 0.15 mol. Na_2HPO_4 + 0.1 N NaOH. A slight effect of the undissocd. acid was brought out by the fact that in acid buffer solns. the p_H limit of viability was somewhat lowered for all organisms by dilg.

the soln. 10 times. However the disinfecting effect seemed to be detd. chiefly by the p_H and the temp. For the alk. buffers a certain p_H , 11.36–11.77, slightly varying with the nature of the cation, seemed to be particularly toxic. The temp. too had a decisive effect. The tabulated results demonstrate the high toxicity of the $[H]^+$ at a concn. of 0.01 *N*. At 0.001 *N* the effect is slight. The resistance to acids decreases in the order: colon, staph., pyocyanus, the last being highly sensitive. The toxicity of undissocd. acids is borne out by the expts. with solns. of a non-toxic H-ion concn., especially with acid-salt mixts. The nature of the anion seems to be of importance. α -Hydroxy acids, glycolic, lactic and hydroxybutyric acids are highly toxic. Fumaric and malic acids and the higher fatty acids (valeric and isovaleric) have also a marked bactericidal effect, the alkali salts alone showed no marked bactericidal effect within 2 hrs. The expts. demonstrate the increase in the germicidal effect of H ion by undissocd. acid and *vice versa*. By proper choice of acids sterilization can be attained at a much higher p_H value than is usually considered to be necessary. MARY JACOBSEN

Intensive bacterial oxidation; oxidation of ammonia to nitric acid. G. J. FOWLER, Y. N. KOTWAL, R. V. NORRIS, S. RANGANATHAN and M. B. ROY. *J. Indian Inst. Sci.* **10A**, 97–116(1927).—Expts. were made to det. how far intensive nitrification can be carried, by using the principle of the activated-sludge process; the possibility is also indicated of employing activated-sludge tanks for producing nitrates from various nitrogenous raw materials as a preliminary to their application for agricultural purposes. The results show the necessity of carefully cultivating organisms of special activity; the speed of nitrification decreases with increasing concns. of nitrate; with dil solns. of NH_4 salts and with $CaCO_3$ in quantity necessary to neutralize the resulting acid, but employing no nutrient salts, a concn. of 5.56% of $Ca(NO_3)_2$ was obtained, only about 96% of the nitrogen added was recovered as nitric nitrogen, potassium phosphate and $FeSO_4$ exercise a beneficial effect while $CaSO_4$ and $MnSO_4$ exert a retarding influence; the rate of nitrification could be increased by adding such substances as silt and animal charcoal which increase the area of oxidation surface during aeration; the theoretical quantity of $CaCO_3$ required to neutralize the acid produced is sufficient for efficient nitrification; the nitrifying organisms grow at a p_H from 5.8 to 8.0, but function best at p_H 7.0–8.0. N. A. LANGE

D—BOTANY

THOMAS G. PHILLIPS

The mechanical action of crustaceous lichens on substrata of shale, schist, gneiss, limestone and obsidian. E. JENNIE FRY. *Ann. Bot.* **41**, 437–60(1927).—Previous work (*Ann. Bot.* **40**, 397(1926)) being continued it is shown that swelling of the thallus or apothecial tissue produces an arching of the thallus which lifts with it a portion of the substratum. On a laminated substratum, as shale, the laminae are sepd. and lifted bodily; on schist, gneiss, obsidian and limestone, small isolated fragments of the stone are torn away by the arching of the thallus, but the hardness of these rocks greatly reduces the amt. of disintegration so produced. JOSEPH S. CALDWELL

Studies in the energy relations of plants. II. The effect of temperature on increase in area of leaf surface and in dry weight of *Cucumis sativus*. 1. The effect of temperature on the increase in area of leaf surface. F. G. GREGORY. *Ann. Bot.* **42**, 469–507(1928).—Earlier work (cf. *C. A.* **15**, 2296) showed that with const. high temp. and low light intensity the rate of increase in leaf area of the cucumber fell off with time in a definite manner. In the present expts. light intensity and humidity were held const. while the temp. was varied from supra- to sub-optimal (90.3–63° F.). The relation of these factors to leaf growth is here discussed; their relation to assimilation rate and dry weight increase is to be taken up in a subsequent paper. The expts. were continued 16 days. At sub-optimal temps., growth rate is controlled by light intensity. Reduction of light intensity reduces the leaf area. At supra-optimal temps. the leaf growth rate falls off with time, partially through depressing the rate of cell division in the leaf primordia, partially by causing a redistribution of material in the plant with resulting increase in stem growth. The growth curves of the foliage leaves at all the temps. employed conform to a simple parabolic function; those for the cotyledons do not. The results obtained at various temps. may be accounted for by the hypothesis of a photochem. action upon a nitrogenous substrate, independent of the rate of C assimilation. JOSEPH S. CALDWELL

The effect of increased atmospheric carbon dioxide on the growth of plants. I. B. D. BOLAS and F. Y. HENDERSON. *Ann. Bot.* **42**, 509–23(1928).—By using cucumber seedlings at various temps. between 27° and 36.2° and CO_2 concns. from 25.8 to 42.4

parts per 10,000, the increase in dry weight over controls in CO₂ concns. between 3.6 and 4.3 parts per 10,000 ranged from 42 to 86% in cultures continued from 8 to 14 days. An improved open system type of app. for growing plants under controlled temp., humidity and CO₂ supply is illustrated and described in detail. J. S. C.

Chemical studies in the physiology of apples. IX. The chemical composition of mature and developing apples and its relationship to environment and to the rate of chemical change in store. H. K. ARCHBOLD. *Ann. Bot.* 42, 541-66(1928); cf. C. A. 22, 1378.—Analyses of fruits of Bramley's Seedling apple were made at intervals of 2-4 weeks from June 22 (at which time the fruits were 1 month old and weighed 8 g.) to Oct. 21. The detns. included titratable acidity, total and reducing sugars, N, alc.-insol. constituents, dry wt. and sp. gr. of juice. Total wt. per fruit increased rapidly up to Sept. 15, then remained nearly const. Percentage of total solids and of sol. carbohydrate showed only a very slight increase with age up to Aug. 5, after which both increased rapidly up to Sept. 21. Alc.-insol. residue increased up to July 15, then decreased. Total N and titratable acidity were highest in aurt. on June 22 and decreased rather steadily throughout the period of development. N accumulation in the apple ceases about 7 weeks after setting of fruit; max. accumulation of starch and acid occurs in the seventh to ninth weeks, max. increase in dry wt. and in sol. carbohydrate, twelfth to fourteenth week, rapid hydrolysis of starch and accumulation of sucrose, fourteenth to nineteenth week. Comparisons of apples of the same variety from widely sepd. orchards upon various types of soil continued over several years showed large differences in dry wt., N and acid content which seemed to be characteristic of the various orchards, as they persisted from year to year. The variations in dry wt., N and acidity in the same variety from a single orchard year after year were considerable but were smaller than those between orchards. Climatic conditions affect the chem. compn., low temp. and low sunshine being productive of high acidity and low sucrose content. During storage for 100 days at 1°, the rate of loss of sugar and acid from fruits of high N content was much higher than from those having lower N, thus confirming A.'s earlier conclusion that a high respiratory rate is directly correlated with high N content (cf. C. A. 19, 1881). A further study of the relation of initial compn. to changes in storage is promised. JOSEPH S. CALDWELL

The problem of copper as a normal component of plants. A. QUARTAROLI. *Ann. chim. applicata* 18, 421-53(1928).—Previous studies have shown that when Cu is present in plants, the seeds contain a relatively high proportion. The Cu content of seeds from a large no. of various common horticultural and agricultural plants was detd. to ascertain whether Cu is a normal component of plants. Analysis of such minute quantities is only made possible by means of the new method of Q. for detg. traces of Cu (cf. C. A. 22, 927). Various soils were also analyzed for their Cu content to ascertain whether when Cu and other metals, particularly Mn, are present in the soil, the plants contain disproportionately high quantities of Cu and therefore require Cu in their normal metabolism. The method adopted for the detn. of Cu in soils was to calcine lightly 2-10 g. of soil, decomp. with hot concd. HCl contg. a little HNO₃, evap., dissolve in very dil. HCl, filter, evap., dissolve in 10 cc. of concd. HCl and 90 cc. of water, boil, pass through H₂S, filter, wash with H₂S water, incinerate the filter paper, treat the ash with HNO₃, and det. Cu by the method cited. Frequently seeds contain more Cu than Mn when the soil contains 10 times as much Mn as Cu. The Mn and Cu contents of 90 varieties of seeds and a large variety of nuts, leaves, bulbs, flowers, stems and roots of various plants are tabulated. Of the 90 seeds, 44 contained more Cu than Mn, and in cases where the Mn content was higher than the Cu content, it was because the Mn was unusually high rather than because the Cu content was low. Cereals contain in general a relatively low Cu content, in contradiction to the reports of some authors that the Cu content of cereals is high. Legumes contain a relatively high Cu content. Garden flowering plants are also particularly rich in Cu. Seeds which are of special importance to birds as foods are rich in Cu, which may be related to the high Cu content of bird feathers. In general Cu is far higher in the seeds than other parts of a plant. The expts. indicate that Cu is an element essential to the life of plants, and probably acts as an activator of oxidation processes, i. e., as an oxidase. C. C. DAVIS

Influence of caffeine on the germination of seeds. G. B. ZANDA. *Arch. farm. sper.* 44, 278-86(1928).—Addn. of caffeine in small quantities has a marked influence on the germination of seeds of *Zinnia elegans* in Sachs nutrient soln. and on the subsequent development of the seedlings. In a concn. of 0.01% it accelerates the germination and favors the development of the plant to a greater size than the control. A concn. of 0.02-0.03% hastens the initial stage of the germination but does not stimulate further growth beyond normal. A 0.1% soln. has an inhibitory effect on germination and stunts

the growth of the plants, while 0.2-0.3% solns. are decidedly toxic. However, the germinating power which has been suppressed by caffeine may be restored by transferring the seeds to a caffeine-free nutrient medium, and the normal growth of the dwarfed seedlings resumed by the same treatment. A. W. DOX

The mechanism of carbohydrate splitting during anaerobic respiration in plant organs. J. STOKLASA AND J. BARŠ. *Ann. Czechoslovak Acad. Agr.* 1, No. 1, 1-46; *Fr. and Ger. abs.*, 42-4(1926); *Expt. Sta. Record* 56, 425.—Results are given of studies carried out during 25 years on aerobic respiration in plants with references to related literature. S. and B. have not been able to confirm the view that alc. is always formed from AcH. They hold that AcH may be formed as a secondary product in the process of oxidation of EtOH. All changes in the plant cell are processes involving reduction or oxidation. H. G.

An examination of nostoc for nuclear materials. F. A. MCKERIDGE. *Brit. J. Exptl. Biol.* 4, 301-4(1927); *Physiol. Abstracts* 12, 137.—Nucleic acid itself was not found, but its constituents were extd. and identified—phosphate, pentose, adenine, guanine, cytosine and uracil. In the absence of a highly developed nucleus, nuclear materials may more readily diffuse out of the cell and promote growth, as do *Saccharomyces* and *Azotobacter*. H. G.

The acidity of root secretions (in Russian with English summary). E. G. MININA. *Bull. inst. recherches biol. Univ. Perm.* 5, 233-58(1927); *Physiol. Abstracts* 12, 189.—Roots of plants in a soil of low buffering displace the p_H value of the soil soln. As the plants develop the soil soln. first acidifies, then becomes more alk. and finally more acid. The plants investigated, placed in order of their acidifying action on the soil soln., are bean, lupine, buckwheat, cereals. Roots in distd. water for 24 hrs. excrete non-volatile buffers. This excretion takes place most vigorously when the plants are transferred to distd. water after growing for 3 to 5 weeks in nutrient soln. The plants investigated fall into the following order in respect to buffer excretion: lupine, bean, buckwheat, cereals. Titration shows that the non-volatile buffers are org. acids. The coincidence of the period of max. excretion of non-volatile org. acid buffers with that of max. acidification of the soil indicates that the acidification is due to org. acids. H. G.

Absorption of carbon dioxide by leaf material. H. A. SPOEHR AND W. NEWTON. *Carnegie Inst. Washington Yearbook* 25, 177-80(1925-6); *Expt. Sta. Record* 57, 817.—Investigations of the capacity of dried and powd. leaf material to absorb CO_2 (*Carnegie Inst. Washington Yearbook* 24, 137-69(1924-5)) were extended to include (besides sunflower) nettle, spinach, hydrangea, turnip, alfalfa, rhubarb, grass and *Ramilina reticulata*. Only sunflower and nettle leaf material gave pos. results. It appeared that the larger part of the absorption of CO_2 by *Helianthus annuus* dried leaf material and the alc. ppts. obtained therefrom could be ascribed to bicarbonate formation. The sunflower and nettle material is noteworthy because both the dried leaf material and the alc. ppts. absorb more CO_2 than can be accounted for by the soly of this gas in the water added to the dried or pptd. material. . . There is, however, no direct relation between the absorption capacity and the amt. of ash in the leaves and alc. ppts. H. G.

Some observations on the distribution of calcium oxalate crystals in plant tissues, and their probable role in plant metabolism. GIRIJA PRASANNA MAJUMDAR. *Indian Sci. Cong. Proc. [Calcutta]* 12, 187(1925); *Expt. Sta. Record* 57, 215.—Ca excess is supposed to be utilized in pptg. oxalic acid and sol. oxalates. In oxalate-free plants oxalic acid or oxalate either is not produced or is produced in a quantity insufficient to cause harm to the plant system. It is inferred from the disappearance of oxalate crystals from the lower vegetative regions of certain plants, from water culture expts., and from the study of the proportion of oxalate crystals formed and Ca salt present in certain plants, that Ca oxalate is reintroduced into the metabolic cycle and that a limited supply of Ca may be sufficient for the life of the plants. H. G.

Relations of Sphagnaceae and some submerged water plants to calcium carbonate. P. DAHM. *Jahrb. wiss. Bot.* 65, 314-50(1926); *Physiol. Abstracts* 12, 409-10.—Winkler's method can be used for detg. respiration of Sphagnaceae. O pressure has no influence on respiration. Photosynthesis of Sphagnaceae in water contg. $CaCO_3$ at first increased and then gradually declined. In phosphate soln. some Sphagnaceae endured a reaction corresponding to p_H 8.0, but not one corresponding to p_H 7.5. In 2 cases the carbonate was utilized, so that the soln. developed an alky. corresponding to p_H 9.5; such utilization was found also in other submerged plants, and cannot be invoked as the cause of the calciphobic character of Sphagnaceae. H. G.

The reactions of root saps of some plants, and alterations of reactions in various

nutrient media by the plants. GROH. *Landw. Jahrb.* 63, 483-500(1926); *Expt. Sta. Record* 57, 215-6.—Plants vary in p_H values relatively rapidly in a weak KCl soln. Apparently no physiol. influence of KCl is here involved. Acid materials are given up by peas, horse beans, lupines and wheat; basic by oats, barley, rye and mustard. Heat and soil and fertilizing are noted. Supposedly a certain role in nutrient uptake may be played by a difference in potential which has been shown to exist between soil and plant. H. G.

Preliminary report on the relations between pigment formation, leaf area and dry weight of corn grown in sand cultures. H. B. SPRAGUE. *New Jersey Sta. Report* 1925, 332-7; *Expt. Sta. Record* 57, 24.—This expt. was started for the study of relations between the formation of the pigments, chlorophyll A and B, carotin and xanthophyll, and the development of leaf area and dry wt. in strains of corn during growth. The results are detailed and tabulated for the period. Chlorophyll content was more closely related to leaf area than to wt. of leaf. On the other hand, carotin formation was more closely connected with dry wt. of leaf than with leaf area. Xanthophyll content corresponded to the values of carotin. Further expts. are planned to test the validity of these and other observations. H. G.

The effect of solutions of eosin, erythrosin and methylene blue on germination and growth of some plants. J. C. VAN DER M. MOHR. *Rec. trav. bot. Néerland.* 23, 245-62(1926); *Expt. Sta. Record* 57, 416.—The germination and further development of rice, maize, wheat, soy beans, *Arachis*, cassava and sugar cane are influenced by 0.5% solns. of eosin and erythrosin in ways which are specified H. G.

Composition of gases in tree trunks. D. T. MACDOUGAL. *Carnegie Inst. Washington Yearbook* 25, 160-2(1925-6); *Expt. Sta. Record* 57, 815.—Detns. of the compn. of the included gases were made on wood late in the season of 1925. Samples were extd. from radial bores by means of a Hg column set to give suction of 0.6 to 0.8 atms., and the pressures are tabulated of O, of CO₂ and of N with possibly other gases H. G.

The chemistry of leaves lacking chlorophyll. A. GRANDSIRE. *Ann. sci. nat. bot.* [10], 8, 221-98(1926); *Expt. Sta. Record* 57, 514.—A systematic report is given, with bibliography of more than 100 titles, on studies with higher plants more or less deficient in chlorophyll as regards material present in the fresh state, dry matter and ash. Such contents show a tendency to be characteristic, though modified at least by disease, autumnal changes, etiolation and albinism. H. G.

Physiology of *Rhizopus* species. TEIZO TAKAHASHI, KINICHIRO SAKAGUCHI AND TOSHINOBU ASAI. *Bull. Agr. Chem. Soc. (Japan)* 3, 87-92(1927); cf. *C. A.* 22, 1380.—The verification of the occurrence of either zymase or carboxylase in the *Rhizopus* species by the measurement of CO₂ evolution by Einhorn's tube ended in negative results. By the detn. of alc. produced from glucose by acetone-*Rhizopus*, i. e., fungus growth treated with acetone, the presence of zymase in this fungus was concluded. The production of alc. from AcOH by acetone-*Rhizopus*, and from malic acid ether by the fungus itself or by the dead fungus, was observed. K. Goto

Physiology of *Rhizopus* species. TEIZO TAKAHASHI AND TOSHINOBU ASAI. *Bull. Agr. Chem. Soc. (Japan)* 4, 15-8(1928); cf. preceding abstract.—The verification of the occurrence of zymase and carboxylase in *Rhizopus* species by the formation of CO₂ from glucose and pyruvic acid failed in using Einhorn's tube, but succeeded when Lohmstein's tube was used. K. Goto

Some nitrogenous constituents of the leaves of kuzu (*Pueraria hirsuta*, Matsum). RINJIRO SASAKI. *Bull. Agr. Chem. Soc. (Japan)* 4, 1-5(1928).—From the soln. after pptn. of protein by neutralizing the alk. alc. ext. of the leaves, were isolated adenine, asparagine, glutamic and butyric acids and a base yielding a chloroaurate, m. 117-8° K. Goto

The crystallite orientation of cellulose in some plants. R. O. HERZOG AND W. JANCKE. *Naturwissenschaften* 16, 238(1928).—Several x-ray diagrams were made of bast fibers of negative double refraction. In none of them any other identity period was found than that already known and explained by spiral structure, the period being tangential to the spiral. B. J. C. VAN DER HOEVEN

Respiration of the soy bean. A. L. HAFENRICHTER. *Botan. Gaz.* 85, 271-98(1928).—With 2 varieties of soy bean, Manchu and Midwest, it is shown that (1) the rate of respiration, at all temps., varies greatly during the development of the seedlings; (2) there is a great difference between the 2 varieties with respect to the intensity and the fluctuation of the rate of respiration; and (3) the max. rate of respiration occurs early in the development of the seedlings, with the exception of that of the Manchu variety at 15°. Temp. is an important factor in the degree and relative rate

of variation in respiration. Beans grown in the dark show a marked increase in the rate of respiration preceding the complete exhaustion of the plants. B. H.

Water solubility of dry matter in relation to calcium nutrition of normal orange and lemon leaves. A. R. C. HAAS. *Botan. Gaz.* 85, 334-40 (1928).—The ash of normal citrus leaves of the same age shows practically no difference in compn. for the citrus varieties examd. When the dry matter of these leaves is extd. with water, the ash and the Ca of the sol. fraction of mature normal Washington Navel and Valencia orange leaves are greater than those of Eureka lemon. The large water soly. of the K in citrus leaves and the different degrees of soly. of the Ca may throw new light on the mottled-leaf problem. •

Stimulating effect of amino acids on sugar metabolism of plant and animal cells. W. E. BURGE, G. C. WICKWIRE, A. M. ESTES AND MAUDE WILLIAMS. *Botan. Gaz.* 85, 344-7 (1928), cf. *C. A.* 21, 3393.—Optically active amino acids stimulate sugar metabolism in the plant cell, *Sparogyrus*, and the animal cell, *Paramecium*, while the optically inactive ones do not. Insulin increases the rate of utilization of the sugars. B. H.

Chemical data relative to the silver leaf disease. C. M. ALBIZZATI. *Anales soc. cient. Argentina* 103, 38-42 (1927).—Ciferri has confirmed Masee's and Petri's hypothesis that the silver leaf disease of peaches is due to hydrolysis of the pecto-cellulose complex in the middle stratum of the leaf by diastases. An analysis of normal (I) and diseased (II) leaves of *Prunus armeniaca* from the Expt. Sta. of La Plata lends support to this hypothesis: reducing sugars (I) 3.690, (II) 3.825, celluloses (I) 18.16, (II) 18.125; acids (as $C_4H_4O_6$) (I) 0.647, (II) 0.843, sol. $C_2H_2O_4$ (I) 0.647, (II) 0.056; insol. $C_2H_2O_4$ (as C_2O_4Ca) (I) 5.226, (II) 5.217. Diastases: The difference between the sugars formed by I and II increased from 0.0027 on the 1st to 0.0978 on the 6th day. Unlike Ciferri, A. has not noticed a decline of hydrolysis by (I) on the 5th day. M. J.

The seed and oil of *Jatropha curcas*. F. A. SOLIVEN. *Philippine Agr.* 16, 587-96 (1928).—The pulp and kernels of the fruit of *Jatropha curcas* contain H_2O 65.10, 6.80; ash 9.03, 4.82 and protein 2.81 and 23.35%, resp. The ashes of the pulp and kernels consist of SiO_2 3.34, 1.02, CaO 5.42, 21.03; P_2O_5 3.12, 6.03; Al_2O_3 0.66, 0.16; Fe_2O_3 0.40, 1.04, K_2O 36.91, 17.88; Na_2O 23.54, 16.59; MgO 6.00, 9.42 and SO_3 1.32 and 9.75%, resp. The av. yield of oil was 22.23% of the whole seed or 51.89% of the kernels. It has the following properties: color, light yellow; sp. gr. 0.9141 at 27.5°; n_D^{20} 1.4698 at 20.9°, m_p -9°; sapon. value 195.89; I no. (Hanus) 101.8; hydroxyl value 2.15; acetyl value 2.16; acid no. 10.2; unsaponifiable 0.5. The neutral oil contains glycerides as follows: linolenic acid none, oleic 36.79, linolic 50.50 and satd. fatty acids 13.80%.

Chemotropism in the cotton plant. F. HARDY. *Trop. Agr. (Trinidad)* 4, 102-3 (1927)—Work indicating that NH_3 and trimethylamine may be responsible for the attraction of certain insects by cotton plants is discussed. A. L. MEHRING

Quantitative variations of the products of photosynthesis in the leaves of green plants in one day (24 hours). P. P. STĂNESCU. *Ann. sci. univ. Jassy* 14, 383-510 (1927); cf. *C. A.* 21, 2292.—After a review, with bibliography of 86 references, S. gives a very detailed account of his work (particularly on mono-, di- and polysaccharides, glucosides and dextrins), including the technic used. Elaboration of starch during the daytime and its resorption at night are not continuous and progressive, but can exhibit a clearly marked rhythm, alternately increasing and decreasing a variable no. of times per 24 hrs. Disappearance of starch during the night is the more rapid according as the starch content is lower; in summer the min. is generally reached shortly after sunrise and can sometimes last till 10 o'clock or later. Fairly frequently, with certain plants the min. cannot be detected by staining with I, all the portions of the leaf removed for testing being uniformly stained blue. Diurnal accumulation of starch never begins before 7 A. M., even in summer. Max. starch content (when there is only 1 max.) is generally reached at or shortly after noon and can last 1 hr. or more, but usually till sunset; it is sometimes reached quite early in the forenoon and can then last only a short time or till well on to sunset. When there are several max., the highest and most sustained is generally the one reached shortly after noon, while the lowest min. is the one reached about noon (the only one when, as is most frequent, there are only 2 max.). At times, but only seldom, the starch content increases at night time (through recondensation of sol. carbohydrates). In all cases the individuality of the leaf is a most important factor. During warm and luminous seasons on the whole production of starch is favored by moderate rather than by strong light; but towards the end of autumn the optimum light seems to be direct insolation. At max. starch contents I stains the leaves a deep blue, while at min. contents the color is more violet-blue. Occasionally at night time degradation of the starch into erythrodextrins can

be detected. Solarization depends on light together with other factors, and can be observed even when the sky is more or less overcast and the temp. relatively low. Appearance of anthocyanins, in the spring and particularly in the fall, can decrease the formation of starch to 0, and evidently renders solarization impossible. At the higher altitudes solarization is not so easily detected as at low, and sometimes cannot be detected at all; plants growing at the summit (and in general all mountain plants, except forest trees) are typically heliophilic and do not develop properly except under high luminous intensity. Reducing matter (directly or after inversion by acids or under pressure) also undergoes rhythmic variations; the amplitude of the variations are greater in daytime during the summer, while at night time they are much smaller and even sometimes practically nil. Reducing matter after acid inversion (disaccharides) show the largest variations. In typically amylophylic plants the directly reducing substances (chiefly monosaccharides) exhibit but very slight variation (*Medicago sativa*); while in saccharophylic plants (*Polyanthes tuberosa*), the smallest variations are those of the substances inverted under pressure or by prolonged boiling with mineral acids (chiefly polysaccharides); in the other plants investigated (amylophylic) all the constituents which were detd. showed appreciable variations. The curve of the total variations of all the substances detd. resembles most the curve for the substances present in largest amts. or showing the largest variations. The curve of total variations rapidly falls towards evening, but it can also fall considerably earlier. The partial curves (for the sep. constituents) can continue to show variations during the night. The several curves of the reducing substances, both directly and after hydrolysis, can vary either in the same or in opposite direction, and in the latter case the phenomenon is particularly noticeable in the daytime. The max. of the several constituents, as well as that of the total amt. of substances investigated, is generally reached long before sunset, though at times just a short time before sunset. Conclusion: Photosynthesis is a rhythmic phenomenon, which can doubtless be related to other rhythmic phenomena such as growth, periodical variations in turgescence and respiration.

A. PAPINEAU-COUTURE

Photosynthesis. P. P. STĂNESCU. *Ann. sci. univ. Jassy* 15, 161-212(1928); cf. preceding abstr.—Condensation of starch apparently is favored by moderate luminous intensity, diffused daylight in summer and direct sunlight in fall and winter. Leaves which grow in the sunlight are stained deep blue by I, particularly at max. starch contents, while those growing in the shade are stained a more or less reddish blue. Leaves which assimilate under luminous conditions either above or below the optimum are similarly stained, and the same is true of the leaves of plants grown in pots as compared with those in the ground. In the morning, starch generally appears earlier in leaves in the sun, while the max. is generally reached earlier in leaves in the shade. As a rule, the warmer and more luminous the season, the smaller the starch content of leaves exposed to the south, as compared with those exposed to other points of the compass; but with advancing fall the reverse is true. Leaves exposed to the east are usually the first to have newly formed starch in the parenchyma. The 2 portions of leaves which are curled into a trough shape behave differently in the production of starch, as though they belonged to leaves facing in different directions. As a rule young leaves and those which have just reached their full growth produce the largest amt. of starch and the max. last longer than in others. The disappearance of starch in older leaves is more rapid, and solarization is more easily found in the older leaves. Starch disappears more rapidly at night in leaves growing in the shade; sometimes it disappears first along the principal veins, while at other times it persists longer along these veins. Very frequently, particularly during the summer, the leaves do not lose all their starch in a single night. In the morning the basal portion of the leaves can contain more starch than the tips of comparable leaves of the same species. During the summer, the largest amt. of starch is generally found immediately under the lower side of the leaves on very warm and luminous days; while the production of starch is approx. the same at both sides of the leaves when the sky is overcast in summer or as autumn advances. Leaves which are cut during the max. starch content are stained a more or less deep blue by I, while leaves cut during the min. or when the starch is being solubilized are stained a violet blue, or even reddish violet. During the night the solubilization of starch can be clearly detected by the red color (erythro-dextrins) produced by I. Starch can be recondensed from its several stages of solubilization in the same leaf during a single night. Under natural conditions temps. up to 41° seem to favor the condensation and accumulation of starch in leaves during luminous summer days. Production of starch is very slight, or negligible, in leaves which have been faded by heat. In the leaves studied, the largest amts. of starch were found in summer (June-Sept.). Towards the end of the vegetative period the differences in the amts. of starch

in leaves growing in the sun and in the shade are very pronounced, to the advantage of the former. As the season advances, it becomes increasingly difficult to distinguish a max. starch content in the leaves, which are stained a more or less uniform violet to brownish blue. The lower the temp. and the more overcast the sky, the lower the starch content, and under these conditions staining with I shows starch only along the main veins. At this season young leaves always contain more starch than adult leaves. On the whole, leaves facing towards the south are more frequently and more clearly solarized than others. Solarization is generally most pronounced in leaves showing an av. starch production. No definite relation was found between the appearance of solarization and luminous intensity: the differences in the intensity of staining of the solarized and unsolarized portions of the same leaf are nearly always less at the under side of the leaf (which is less strongly illuminated than the upper side). Leaves which remain red or violet during the whole period of growth (because of the presence of anthocyanins) always synthesize and accumulate some starch, but in much smaller quantities than in green leaves of neighboring species: if the leaves have these colors only in the spring and fall, the deeper the color the less the amt. of starch produced, and under these conditions solarization of the leaves was never observed. Sub-alpine plants, which are typically heliophylic, never exhibited a perfectly characterized solarization, and the leaves of such plants showed the highest starch contents on days in which there were sudden and considerable variations in temp. and luminous intensity and in which the atm. was highly electrified. When leaves, which have not been cut from the twigs, are emptied of their starch content by keeping in the dark sufficiently long, and are again exposed to light they assimilate and accumulate starch much more actively than normal leaves; if exposure to light has not been too greatly delayed, the transient max starch content is almost equal to that of normal leaves, is reached at the same time (or almost), and frequently lasts longer. If the leaves are re-exposed to light at a time when, under normal conditions and considering climatic and atm. conditions, the starch content of normal leaves is decreasing, the reappearance of the starch may be retarded, or, if it takes place, the small quantity of freshly elaborated starch is immediately solubilized; but the definite re-elaboration of starch starts in somewhat sooner than in normal leaves. The rate of disappearance of starch from leaves which have been cut and left to stand either in the air or on water increases as the leaves have been cut earlier, and is greater when they are left in the air than when they are placed on water. If the leaves are cut before evening, the starch disappears more rapidly than in leaves remaining on the plant, while if they are cut at night the starch frequently disappears more slowly than in leaves remaining on the plant. During the disappearance of starch from cut leaves, on staining with I the main veins frequently stand out exceptionally well as though the products of solubilization were recondensed along these veins.

A. PAPINEAU-COUTURE

Anthraquinones in Rhamnaceae. H. MAURIN. *Bull. sci. pharmacol.* **35**, 236-8 (1928); cf. *C. A.* **18**, 1878; **22**, 1289.—In the bark from the stems of 10 species of *Rhamnus* the anthraquinone derivs. ranged from 1.15% in *R. cathartica* to 2.3% in *R. frangula*. In the leaves of 8 species there was less than 1% except in *R. alternus* in which the derivs. were 2.3%. In 2 species these derivs. in the fruit were 0.9 and 1.1%, resp. Three species of *Hovenia* yield from 1.25 to 2.2% in the bark, 0.45 to 1.25% in the leaves, and *H. dulcis* gave 1.35% in the bark of the root. Species of 4 other genera yielded generally less than 1% and several species none or traces. The fruit of *H. dulcis* may be substituted for raisins in food and proves an agreeable laxative.

L. W. RIGGS

A new nitrogenous principle in plants, allantoic acid. R. FOSSE. *Rev. gén. Sci.* **38**, 635-9 (1927); *Bull. soc. chim. biol.* **10**, 301-7 (1928); cf. *C. A.* **21**, 943, 3070, 3385; **22**, 612.—Identification of allantoic acid in the leaves of *Acer pseudoplatanus*. R. FOSSE AND A. HIEUILLÉ. *Ibid* 308-9; see *C. A.* **21**, 3070. **Mercuric compound of allantoic acid identifying this ureide in the green legume Phaseolus vulgaris.** *Ibid* 310-2; see *C. A.* **22**, 612. **Estimation of allantoic acid as xanthyl urea. Applications to the leaves of *Acer pseudoplatanus*.** R. FOSSE AND (MILLÉ.) V. BOSSUYT. *Ibid* 313-50; see *C. A.* **21**, 3385.

L. W. RIGGS

Amylogenesis and amyolysis in plant cells. A. MAIGE. *Bull. soc. chim. biol.* **10**, 422-8 (1928).—The amylogenic and amyolytic actions in plant cells are 2 distinct phenomena both as to origin and cause. The first is produced by the plastids and if due to a catalytic agent, this agent is secreted by the plastids. The second is the work of the amylase which is secreted by the non-plastidal cytoplasm, and of which the dissolving action is exercised across the plastidal cortex during the hydrolysis.

L. W. RIGGS

The energy of growth. XII. Energy yield of different sugars in the development of molds. LUIGI DE CARO. *Bull. soc. chim. biol.* 10, 456-9(1928).—See C. A. 22, 1613.

Biochemical synthesis of glycerides. Reversibility of the fermentative activity of the cytoplasm of Ricinus seeds. ALBERT MOREL AND LEON VELLUS. *Bull. soc. chim. biol.* 10, 478-88(1928); cf. C. A. 22, 1176.—The synthesizing power of *Ricinus* seeds is due to the enzymic activity of the cytoplasm of the seeds. By the action of a dil. acid on the cytoplasm placed in suspension in oil it is possible to prep. an enzyme which hydrolyzes olive oil, without the addn. of electrolytes to the reacting mixt. The synthesizing power of this same agent indicates a complete reversibility of the enzymic activities.

Levulosans of the iris. H. COLIN AND A. AUGEM. *Bull. soc. chim. biol.* 10, 489-94 (1928), cf. C. A. 21, 3930.—This paper reports a study of irisin and more particularly the levulosans of *Iris pseudacorus*, *I. germanica* and *I. foetidissima*. The irisin was sepd. as a Ba compd. (cf. C. A. 21, 937). These species of *Iris* differ widely in their carbohydrate and levulosan content, also in the nature of their levulosans which appear to be different compds. in different species.

Biochemical differences between sexes in mucors. V. Quantitative determinations of sugars in (+) and (-) races. S. SATINA AND A. F. BLAKESLEE. *Proc. Nat. Acad. Sci.* 14, 308-16(1928); cf. C. A. 21, 2015.—Detns. were made in pairs, each pair contg. a (+) and a (-) race of a given species in order to compare the amts. of sugar present in the 2 sexes. The reducing sugars were detd. in 70(+) and (-) races included in 20 species and 11 genera and the total and the non-reducing sugars, in 6(+) and (-) races included in 18 species and 10 genera. The reducing and total sugars were greater in the (+) races in about 74% of the cases and the non-reducing sugars in about 66%. The av. for (+) races was higher for all kinds of sugars. The amt. of reducing sugars present, however, was not sufficient to be chiefly responsible for the reduction reaction previously demonstrated with KMnO_4 .

Preliminary study of the nutrition of the cultivated mushroom. J. F. STYER. *Am. J. Botany* 15, 246-50(1928).—*Agaricus campestris* when grown upon a paper medium, with mineral nutrients and an NH_4 salt, required the addn. of no other carbonaceous material. The addn. of various sugars and salts of org. acids gave no greater vigor of growth, and resulted in a lack of vigor when above about 0.05 M concn. NH_4 salts, urea, glycine and asparagine, peptone and proteins are all useful as sources of N, the most complex being slightly the most effective. Vigorous growth was obtained when the phosphate concn. was between 0.015 M and 0.1 M; and when the sulfate, K and Mg concns. were each between 0.005 N and 0.1 N. These, with the exception of the lower figure for P, are not definite limits, and the organism can probably tolerate concn. outside these limits.

Mineral nutrition and chlorophyll development in seedlings. C. G. DEUBER. *Am. J. Botany* 15, 271-6(1928).—The dwarfing of soy-bean seedlings grown in distd. water is accompanied by a higher concn. of chlorophyll particularly in the first leaves and to a lesser extent in the cotyledons. This condition accounts for the tops of such dwarfed seedlings appearing dark green as compared with the normal green color of seedlings better nourished. This condition probably results from the fact that the growth processes in seedlings given a low plane of mineral nutrition are impaired to a greater extent than the processes controlling chlorophyll formation.

Relation of hydrogen-ion concentration to the growth of plants. W. J. ROBBINS. Missouri Sta., *Bull.* 244, 30(1926).—Further studies of the effect of H-ion concn. of potato tuber tissues on elodea and on 3 fungi, *Gibberella saubinetii*, *Fusarium oxysporum* and *Rhizopus nigricans*, have been made. Elodea (*Anacharis canadensis gigantea*) responded in many ways as though it had an isoelec. point of p_H 6.0 to 6.2. In buffer mixts., the acid dyes, eosin and martius yellow, are more toxic to elodea in solns. more acid than p_H 6.0 or 6.2 than in more alk. solns.; the basic dyes, safranin, methylene blue and dahlia are more toxic in solns. more alk. than p_H 6.0 or 6.2 than in more acid solns. Cultures on liquid and solid media contg. uniform concns. of toxic acid or basic dyes but differing in H-ion concn. show that the toxicity of the acid dyes is markedly increased for *R. nigricans* in solns. acid to about p_H 5.0; for *G. saubinetii* in solns. acid to about p_H 6.4. The basic dyes are decidedly more toxic in solns. alk. to these points. *F. oxysporum* responds much like *G. saubinetii*. These results are correlated with the isoelec. points previously reported for the first 2 organisms but not with that found for the third.

Nitrogenous metabolism of Pyrus malus L. III. The partition of nitrogen in the leaves, one and two year branch growth and non-bearing spurs throughout a year's

cycle. WALTER THOMAS. *Plant Physiology* 2, 109-37(1927); cf. *C. A.* 21, 1994.—The march of total N, total water-sol. N, ammonia N, mono- and di-amino N, free and also combined amide N, humin N and "rest" N was followed throughout a year's cycle in the parts of a Stayman Winesap tree indicated in the title. The total water-sol. N, the non-protein N and the amino N parallel the total N in all tissues throughout the cycle, but the amide N and the "rest" N tend to vary inversely with the total N and the amino N. Amino N appears to be connected with protein synthesis and the "rest" N in protein degradation but no evidence was found to support the theory that amino acids act as catalyzers in accelerating the rate of growth. During the period of bud swelling the reserve proteins are transferred to the actively growing parts as amino acids. In the aerial parts nitric N was found only at 1 period, viz., just as the buds were opening (*C. A.* 21, 3386). The importance in metabolism of the role of the "rest" N compds. is pointed out.

WALTER THOMAS

The current mineral nutrient content of the plant solution as an index of metabolic limiting conditions. B. I. GILBERT, F. T. MCLEAN AND W. L. ADAMS. *Plant Physiology* 2, 139-51(1927).—The expressed plant soln from various tissues of spinach, beets, turnips, corn, cabbage and carrots growing in the Rhode Island Expt. Sta. plots was examd. at stated periods for nitrate N, phosphate P and K_2O ; and in spinach and beets for Mn also (*C. A.* 21, 3652). Three types of inhibited metabolism were noted, the conditions responsible for which were (1) a decreased supply of available Mn in a neutral soil, resulting in marked chlorosis in beets and spinach; (2) limiting amts. of P_2O_5 and N applied to the soil; (3) unfavorable weather conditions.

WALTER THOMAS

Growth studies on fruits. An explanation of the shape of the growth curve. F. G. GUSTAFSON. *Plant Physiology* 2, 153-61(1927); cf. *C. A.* 21, 3652.—The probable influence of nutrition in producing the S-shaped form of the growth curve of fruits is discussed. Decrease in growth is due partly to insufficiency of nutrient material for all the fruits as well as for vegetative growth, and partly to poor conduction of material to the growing parts of fruits.

WALTER THOMAS

Chemical changes accompanying the Western Yellow Blight of tomato. J. T. ROSA. *Plant Physiology* 2, 163-9(1927).—In the leaves total N, alc.-insol. N and diastatic activity decrease, but reducing sugars, sucrose, starch and alc.-sol. N increase progressively with the development of external symptoms of blight. In the stems and roots of blighted plants there is also accumulation of carbohydrates, but total N and alc.-sol. N increase, especially in the roots. Diastatic activity in healthy stems is very low and has disappeared altogether in blighted stems. Conclusion: N starvation is not the cause of blight, but inability to translocate N within the plant and inability to synthesize higher N compds. may be more directly connected with the inception of blight.

WALTER THOMAS

The fruits of kirondro and their chief constituting elements. Y. VOLMAR AND B. SAMDAHL. *J. pharm. chim.* 6, 295-9, 346-53(1927).—The seeds contain in addn. to kirondrin (A) (*C. A.* 21, 1666, 2134) 13.8% fatty oil, 11.4% reducing sugar, 1.75% sucrose, 25% starch, a resin, 18.1% proteins and 3.1% ash contg. Cu, Fe, Mn, Ca, Mg, K, Na, Cl, S, P and Si. The pericarp of the fruit is practically free from A; it contains a reddish essential oil having a slight odor of orange, (d_{20} 0.8860, $[\alpha]_D^{20}$ -4.9 (alc. soln.), n_D^{20} 1.399, probably aldehydes and non-satd. compds.); 4.4% of gum sol. in H_2O (1 in 4), and contg. about 50% of arabinogalactan; starch and 2.5% reducing sugars, a fatty oil n_D^{16} 1.4265, a resin, oxalic, tartaric, citric and malic acids and 3.5% ash devoid of Cu. The fatty oil of the seeds is viscous, slightly fluorescent, shows intensely blue luminescence in Wood's light, is feebly drying, limpid at 20°, clouding at 12°, semisolid at 5°; d_4^{20} 0.9288, f. p. + 11.5, Zeiss index at 25° 65.8, n_D^{25} 1.4733, acid no. 56.45, sapon. no. 200.35, I no. 94.06, Ac no. 0, volatile sol. acid no. (Leffmann-Beam) 2.59, volatile insol acid no. 0.49. The oil contains phytosterins 0.7%, non-volatile fatty acids 94.7% (palmitic 16.5%, oleic 58.1%, linoleic 18.8%), and very little butyric acid.

S. WALDBOTT

Mechanism of the degradation of fatty acids by mold fungi. I. T. K. WALKER AND P. D. COPPOCK. *J. Chem. Soc.* 1928, 803-9.—*A. niger* may be cultivated readily on dil. aq. solns. of Ca propionate together with the requisite indrg. salts. When incubated at 32° such cultures gave positive thiophene tests for lactic acid on or about the 9th day; thereafter this test became fainter or disappeared and about the 12th or 13th day $AcCO_2H$ was detected. The $AcCO_2H$ probably arises from the oxidation of the lactic acid and is found in the action of the mold on Ca lactate after 10 days; $(CO_2H)_2$ is also formed. In the fermentation of both pyruvic and lactic acids, $EtOH$ is detected.

WILLSTÄTTER, RICHARD, AND STOLL, ARTHUR: *Investigations on Chlorophyll. Methods and Results.* English translation by Frank M. Schertz and Albert R. Merz. Washington, D. C., 1305 Farragut St. N. W.: Frank M. Schertz. • 385 pp. \$4.50.

E—NUTRITION

PHILIP B. HAWK

New dietary deficiency with highly purified diets. II. Supplementary requirement of diet of pure casein, sucrose and salt. H. M. EVANS AND G. O. BURR. *Proc. Soc. Exptl. Biol. Med.* 25, 41–8(1927); cf. *C. A.* 22, 796.—A diet of casein, sucrose and salt mixt., supplemented by very high levels of vitamins A, B, D and E, was inadequate for normal growth of young rats. In some cases ovulation was irregular and lactation was unsuccessful. The growth and ovulation deficiencies were corrected by inclusion of small daily doses of lettuce, liver or lard in the diet. With the inclusion of lettuce, females produced good litters and weaned them successfully if the yeast dose was adequate. The second generation animals after weaning repeated the performance of their parents on the "pure" diets. Either the animals on this "pure" diet require very large amts. of one or another of the known vitamins, or else a new and unknown vitamin is lacking. The authors favor the latter view. C. V. B.

Evaluation of dry yeast with respect to its biological action. WOLFGANG WEICHARDT AND HERMANN UNGER. *Pharm. Ztg.* 73, 526–7(1928).—Protocols and curves are presented showing the successful results obtained in feeding young doves stricken with beriberi 0.1 and 0.5 g. daily of dry yeast along with their regular food. W. O. E.

Butter vs. oleomargarin in rickets control in pigs. H. L. ANTHONY. *J. Dairy Sci.* 11, 66–8(1928).—Rachitic symptoms in pigs were held in check by either oats or butter added to the ration, but not by oleomargarin (nut margarin). R. C. ERB

Basal metabolism and specific dynamic action of foods in children in various conditions of nutrition. A. F. MORGAN AND G. D. HATFIELD. *Am. J. Diseases Children* 32, 516–23(1926); *Physiol. Abstracts* 12, 168.—Out of 16 children investigated, 10 gave basal metabolisms within 10% of the weight and surface area standards of Benedict and Talbot. A protein meal produced more than twice as much increase as a carbohydrate meal in both normal and overweight children. H. G.

The value of elementary phosphorus in rickets. A. F. HESS AND M. WEINSTOCK. *Am. J. Diseases Children* 32, 483–96(1926); *Physiol. Abstracts* 12, 156.—Feeding white rats on a standard rickets-producing diet with the addn. of P dissolved in linseed oil to the extent of 0.2 mg. per day led to the production of rickets and also to a definite "P band" of abnormally dense bone near the epiphyseal lines. The P alone, or P combined with an inadequate dose of cod-liver oil, had no protective action whatever against rickets. H. G.

Fruit and vegetable juices used in infant feeding. E. M. DAVIS AND H. A. STILLMAN. *Am. J. Diseases Children* 32, 524–9(1926); *Physiol. Abstracts* 12, 157.—Feeding expts. with young white rats showed that carrot, spinach or tomato, and possibly spring cabbage juice, may be substituted for the conventional orange juice in supplementing a basal diet contg. vitamin A but not vitamin B. H. G.

Calcium balance with hydrochloric acid milk. R. G. FLOOD. *Am. J. Diseases Children* 32, 550–3(1926); *Physiol. Abstracts* 12, 158; cf. *C. A.* 20, 2006.—Feeding expts. on normal and on rachitic babies showed that the addn. of HCl to the milk increased the CaCl_2 retention in the rachitic infant, but had no effect on the Ca metabolism of the normal, thus having some prophylactic action against rickets. The probable explanation of this action is discussed. H. G.

Protein requirement as determined in diabetic children. W. M. BARTLETT. *Am. J. Diseases Children* 32, 641–54(1926); *Physiol. Abstracts* 12, 158.—The min. protein requirement in children was taken as that amt. of protein which will establish a pos. N balance, and prove adequate for growth, normal development and increase of wt. Between the ages of 4 and 14 years 0.6 to 1 g. of protein per kg. body wt. was adequate. The protein requirement varied inversely with age and with caloric intake, and was directly proportional to the rate of growth; there was no relationship to the fatty acid: glucose ratio. H. G.

The effect of various supplementary lunches on the plasma carbon dioxide capacity of children. A. F. MORGAN AND G. D. HATFIELD. *Am. J. Diseases Children* 32, 655–66(1926); *Expt. Sta. Record* 57, 689.—During the course of the investigation previously noted (*Am. J. Diseases Children* 32, 839–49(1926)) of the effect of supplementary feeding of oranges, figs or milk to undernourished children, detns. were made of the CO_2 -combining capacity of 12 of the children, 5 of whom were from 5 to 17%

underweight, one 33% overweight and 6 practically normal in wt. by the Baldwin-Wood standards. The 6 normal wt. children had alk. reserve figures of from 42 to 65% (cc. of CO₂ per 100 cc. of plasma), 4 of the 5 underweight children had values of from 38 to 51 and 1 child receiving pulled figs as supplementary lunch made more than 3 times the expected gain in wt. and showed an increase of 5.5% in CO₂-combining power of the plasma at the end of 43 days. Five children receiving oranges showed increases in CO₂-combining power of from 1.7 to 11.19, the lowest gains being for the 2 subjects who failed to gain in wt. Two of the 3 children who were changed from oranges to milk after a 28-day interval showed a decrease in alk. reserve of 3 and 7.78%. The third showed an increase of 1.37% after a 43-day interval on milk. H. G.

Iron in the diet of normal children. M. S. ROSE. *Am J Pub. Health* 17, 89-91 (1927). *Expt. Sta. Record* 57, 688-9 —A report of the study of the influence of prolonged administration of egg upon the hemoglobin content of children's blood. The Fe in the egg is efficiently utilized, but with no special stimulation of the blood-forming organs. Eggs form a very valuable reinforcement for the diet of the young child even when the diet is not lacking in any known dietary essential. H. G.

Preliminary analyses of the tissues and of the metabolism of animals suffering from dietary sterility. E. M. ANDERSON. *Anat. Record* 32, 227 (1926); *Expt. Sta. Record* 56, 664. —No differences have been revealed in the N and fat metabolism on pure-food diets, with and without wheat germ oil, which would account for the fertility of the mothers receiving vitamin E. H. G.

Amount of exchange in fasting homeothermics and notion of active mass. E. F. TERROINE, S. TRAUTMANN AND J. SCHNEIDER. *Ann. physiol. physicochim. biol.* 2, 468-87 (1926). *Physiol. Abstracts* 12, 294. —In the rabbit, guinea pig, fowl and pigeon during starvation the amt. of gaseous exchanges per kg. of body wt. shows certain differences in the initial and terminal stages. In the initial phase with low respiratory quotient (R. Q.) heat production is much diminished in the fowl and the pigeon, not in the others. In the final stage, when the R. Q. is 0.8 or more, there is generally a sharp fall in the exchanges. Over nine-tenths of the total period of survival the R. Q. is about 7.4, and heat production is remarkably const. The law of surface cannot be applied to the variations in one and the same individual, here it is the tissue mass which counts. Whether nucleoproteins preponderate in the metabolism of inanition or not, the total proteins represent the active mass, their proportion being as const. as the heat production. H. G.

Chinese diet in the light of modern knowledge of nutrition. H. WU. *Chinese Social and Polit. Sci. Rev.* 11, No 1, 56 81 (1927); *Expt. Sta. Record* 56, 793 —Discussion of the adequacy of the Chinese diet based upon the dietary studies of middle-class families in north China reported by Adolph (C. A. 19, 1728; 21, 781) and a similar study of the compn. of Peking dietaries made by W. H. G.

Nutrients required for growth production with Indian food stuffs. F. J. WARTH AND I. AHMAD. *India Dept. Agr. Mem., Chem. Ser.* 8, 211-33 (1926); *Expt. Sta. Record* 57, 169. —A continuation of work previously noted (C. A. 20, 3180). H. G.

A study of the effect of nutrition on mental growth. A. J. SMITH AND A. M. FIELD. *J. Home Econ.* 18, 686-90 (1926); *Expt. Sta. Record* 56, 897. —While this study was of too short duration and with too few subjects to be conclusive, it would indicate that the assumption that improved nutrition, as measured by gain in weight, will bring about improved mentality is at least not yet proved. H. G.

The influence of diet on the physiologic assay of insulin. A. STASIAK. *J. Lab. Clin. Med.* 12, 256-8 (1926); *Physiol. Abstracts* 12, 165 —By using the method of Shaffer and Hartmann, it was found that the actual range through which the blood sugar is lowered by insulin is approx. the same in fed rabbits and in rabbits starved for 24 hrs. H. G.

The content of vitamin C in Japan sand pear (Pyrus serotina Rehder), kaki (Diospros kaki L.) and Satsuma orange (Citrus unshiu). Y. IWASAKI. *J. Okitsu Hort. Soc.* No. 22, 1-10 (1927). *Expt. Sta. Record* 57, 197. —Forty-five cc. of the juice of the flesh of the Japan sand pear does not suffice to cure guinea-pig scurvy, but a slightly smaller quantity of the juice of the entire pear contg. the rind cures scurvy in 40 days. The ripe kaki fruit in amts. of 10 cc. daily is said to cure scurvy completely in 30 days and the Satsuma orange in amts. of 4 to 5 cc. daily in 50 days. In the expts. reported the basal diet consisted of equal vols. of wheat bran and rolled oats *ad lib.*, together with 40 cc. of milk autoclaved for an hour at 120°. H. G.

Ergosterol and its action in infantile rickets. H. BEUMER AND C. FALKENHEIM. *Klin. Wochschr.* 6, 798, 799 (1927); *Expt. Sta. Record* 57, 693. —Further evidence is given of the curative action of irradiated ergosterol in infantile rickets. Six children

from 3.5 months to 2 years of age were treated with irradiated ergosterol, dissolved in rape oil or triolein, in doses of from 2 to 3 mg. daily. Healing, both as judged by changes in the blood Ca and P and by x-ray examn., was evidenced as early as 10 days in two cases, and was rapid in all but one case. H. G.

The vitamin A content of butter under the influence of common feeds. A. SCHREUBERT. *Milchw. Forsch.* 3, 117-21(1926); *Expt. Sta. Record* 56, 472-3.—Using rats, S. has compared the amts. of vitamin A in butter from cows receiving rations contg. fodder beets with other grains, corn silage with similar grains and pasture only. In making the tests, vitamin A-deficient rations were supplemented with 0.1, 0.25 and 0.5 g. of butterfat from the different sources. The results show that the butter from the cows receiving beets was lowest in its vitamin A content, as 0.5 g. daily was not sufficient to allow normal growth in the rat after 53 days. The butter from the pasture-fed cows was the richest source of vitamin A, as normal growth was maintained with 0.25 g. of butter, while 0.5 g. of butter from the silage-fed cows was necessary for normal growth. H. G.

Color reaction of the Japanese acid clays with liver oils and vitamin A on the market. K. KOBAYASHI AND K. YAMAMOTO. *Mem. Facult. Sci. Eng. Tokyo* 4, 23-4(1927); *Analyst* 52, 553.—Japanese acid clays, Florida earths and fuller's earth gave bluish green sediments with cod-liver and many other liver oils, and with vitamin A, oils extd. from cheese, Kazunoko and eels. Japanese clay, if dried at 100-50°, gives a more intense reaction, and suitable solvents are benzene, CCl_4 and CS_2 . The relative content of coloring principle in liver oils may be detd. by dilg. 1 g. of sample with 10 cc. of benzene, and adding this soln., drop by drop, to a series of test tubes, each contg. 10 cc. of benzene, and, after mixing, adding to each 1 g. of fine clay. The min. no. of drops required to form the blue coloration is compared with the no. used for the standard cod-liver oil. Anhyd. ZnCl_2 , AlCl_3 , P_2O_5 and H_3PO_4 give the same color reactions as the Japanese clays. H. G.

The phosphorus intake of pre-school children as shown by a dietary study made by the individual method. H. MCKAY. *Ohio Sta. Bull.* 400, 387-425(1926); *Expt. Sta. Record* 56, 493-4.—The primary purpose of this study was to det. the P intake of normal healthy children. Calcs. were also made of the intake of protein, fat, carbohydrate, Ca and iron during the period under investigation, which in all cases consisted of 4 consecutive days. The subjects included 25 children from private homes and 30 from an orphanage, all selected as being in normal phys. condition and within 4% of the "commonly accepted standard of weight for height." The ages of the children ranged from 2 years to 5 years 11 months. The calcs. were made on the daily consumption of food by each child and averaged for the 4 days of the expt. H. G.

Vitamin studies in Porto Rico. D. H. COOK. *Porto Rico Health Rev.* 2, 22-3 (1927); *Expt. Sta. Record* 57, 690.—Two native Porto Rican foods, the plátano, or plantain (*Musa paradisiaca*) and the yautia, a starchy root belonging to the same family as the taro and dasheen, were tested for vitamin A and vitamin B. In comparison with other materials which have been tested by the same methods, the plátanos are equal to tomatoes, green peas and yellow sweet potatoes as a source of vitamin A, and to carrots, white potatoes and turnips as a source of vitamin B. Yellow yautias, which ranked first of the 3 materials tested in vitamin B potency, have about the same value as spinach and canned navy beans as a source of vitamin B. H. G.

Rickets in chicks. I. G. F. HEUSER AND L. C. NORRIS. *Poultry Sci.* 6, No. 1, 9-17(1926-7); *Expt. Sta. Record* 56, 869-70.—Different brands of cod-liver oil vary significantly in their vitamin content when measured by means of chicks. With plenty of Ca and P in the ration the amt. of cod-liver oil necessary to protect against rickets depends upon the antirachitic potency of the oil and the amt. of this factor stored in the body of the chick at the time of hatching. H. G.

Fat-soluble A requirements for growing chicks. S. M. HAUGE, C. W. CARRICK AND R. W. PRANGE. *Poultry Sci.* 6, 135-40(1927); *Expt. Sta. Record* 57, 368-9.—P. found that 25% of yellow corn was sufficient to meet the needs of growing chicks up to 10 weeks of age. Chicks fed a ration deficient in vitamin A began to show the results of this deficiency at about 4 weeks of age. H. G.

Mineral metabolism of the growing chick. F. E. MUSSEHL, M. J. BLISH AND C. W. ACKERSON. *Poultry Sci.* 6, 239-42(1927); *Expt. Sta. Record* 57, 664.—This test was undertaken at the Neb. Expt. Sta. to det. the effect of feeding excessive amts. of Ca and P to growing chicks. Five lots of 25 Single Comb White Leghorns each were used in the expt. All lots were irradiated twice a week for about one hour with a quartz Hg vapor lamp. The lots were fed by the all-mash method. The basal ration consisted of yellow corn meal, ground wheat, yeast, cod-liver oil, meat and bone meal

and cornstarch. The total Ca and P content of this ration was 3.018 and 2.147%, resp. A second lot received in addn. 4 parts of a min. mixt. composed of 60% raw bone meal, 20% CaCO_3 and 20% common salt. A third lot received 8 parts of raw bone meal, and a fourth and fifth lot 4 and 8 parts of CaCO_3 , resp. The feeding period lasted 8 weeks. The rate of growth in the basal ration group was quite satisfactory, indicating that it was complete for vitamins, proteins and minerals, though one case of rickets did develop. The addn. of the mineral mixt. did not improve the ration, but actually retarded growth. There were 4 deaths in this group. Adding raw bone meal still further retarded growth, and 19 cases of typical rickets and 1 death appeared. Four parts of CaCO_3 proved to be a check on the rate of growth and 8 parts showed but little growth. The mortality in these last two lots was 10 and 19, resp. H. G.

Do growing chicks require a vitamin B supplement to a mixed grain ration? T. S. HAMILTON, I. E. CARD AND C. H. KICK. *Poultry Sci.* 6, 243-8(1927); *Expt. Sta. Record* 57, 664; cf. *Illinois Sta. Report* 1925, 77-83.—The addn. of yeast and alfalfa leaves did not improve the ration for chicks grown outdoors. There was an indication that yeast improved the ration slightly for the lab. chicks, though alfalfa leaves were without appreciable effect. H. G.

Glucose as a factor in metabolism. A. N. BRONFENBRENNER. *Proc. Soc. Exptl. Biol. Med.* 24, 269-73(1926); *Physiol. Abstracts* 12, 110.—While the industrial efficiency of the feeble-minded is definitely lower than that of the mentally normal, the caloric requirements of the former are hardly lower than those of the latter. The demand of the feeble-minded for carbohydrates, especially breads and sweets, is striking. Substitution of meat, eggs and butter for bread and cereals leads to emaciation. A reduced relative quantity of carbohydrate in the diet of individuals with impaired metabolism renders their metabolic mechanism inefficient. Circulating glucose is a factor in the metabolic mechanism. The paper is fully illustrated by tables. H. G.

A study of the pellagra-preventative action of the tomato, carrot and rutabaga turnip. J. GOLDBERGER AND G. A. WHEELER. *Pub. Health Reports* 42, 1299-1306 (1927); *Expt. Sta. Record* 57, 295.—In continuation of the investigation at the Georgia State Sanitarium of the pellagra-preventing action of various foods (C. A. 20, 1431), tomatoes, carrots and rutabaga were tested. Daily supplements of either cooked carrots or cooked rutabaga in amts. equiv. to 453 g. (1 lb.) of the dressed raw vegetable were of no value as a pellagra preventive. The expressed juice of canned tomatoes in amts. of approx. 1200 g. had a well-marked preventive action. It is considered probable that if larger amts. of carrots and rutabaga could have been fed they would have shown some pellagra-preventing action in harmony with the present belief that the pellagra-preventing factor is identical with one of the constituents of vitamin B, which is known to be present in these vegetables. In localities where pellagra is endemic, a more liberal use of tomatoes, particularly during late winter and spring, is recommended as a preventive measure. H. G.

Growth on a synthetic ration containing small amounts of sodium. J. I. SR. JOHN. *J. Biol. Chem.* 77, 27-32(1928).—Rats maintained on diets, adequate except for the fact that they contained quantities of Na below 0.3%, failed to show normal growth or health. The animals grew rapidly for a few weeks but then declined in wt., many dying in 10 to 12 weeks. ARTHUR GROLLMAN

Insects as test animals in vitamin research. I. Vitamin requirements of the flour beetle, *Tribolium confusum* Duval. M. D. SWEETMAN AND L. S. PALMER. *J. Biol. Chem.* 77, 33-52(1928).—*Tribolium confusum*, a common pest of cereals, was found to be suitable for nutrition expts. by using essentially the procedure followed with ordinary lab. animals. The insect can be rapidly reared on a ration of protein, salts, dextrin and a small fraction of yeast, wheat germ or their alc. exts. The addn. of fat, with or without vitamin A, accelerates the growth rate. The distribution of the necessary growth-promoting substance is similar to that of vitamin B as defined by mammalian expts. The insect is sensitive to as low as 0.5% of a source of this substance and makes a quant. response to its addns. over a certain range. Growth on fractions of wheat, corn, oats, barley and rice indicates no absolutely limiting factor in any fraction tried. The embryo and the adjacent portion of the kernel are more abundantly supplied with this factor than other parts of wheat. ARTHUR GROLLMAN

A new differentiation between the antineuritic vitamin B and the purely growth-promoting vitamin B. H. M. EVANS AND G. O. BURR. *J. Biol. Chem.* 77, 231-40 (1928).—A differentiation between the antineuritic and the growth-promoting vitamin B was demonstrated by the use of a highly purified diet contg. only *Van Slyke* casein, recrystd. sucrose and highest purity salts, to which various vitamin-contg. substances were added. *Tikiiki*, a dil. alc. ext. of white rice polishings though rich in the anti-

neuritic vitamin B, is almost lacking in the growth-promoting vitamin. Corn-starch and casein contain both.

ARTHUR GROLLMAN

The effect of high protein diets on the remaining kidney of rats. HENRY JACKSON, JR. AND OLIVE J. MOORE. *J. Clin. Investigation* 5, 415-25 (1928).—High protein diets produced damage to the remaining kidney of unilaterally nephrectomized rats. Individual susceptibility and age detd. the degree of this damage.

ARTHUR GROLLMAN

Value of whole potato in human nutrition. S. K. KON AND ANIELA KLEIN. *Biochem. J.* 22, 258-60 (1928).—Two adults were kept in N equil. and in good health for a period of 167 days in which the N was practically solely derived from the potato. This confirms the views of Hindhede that the potato is a valuable source of N for the human adult (see Hindhede: Protein and Nutrition).

BENJAMIN HARROW

Nutritional value of tuberin, the globulin of potato. S. K. KON. *Biochem. J.* 22, 261-7 (1928).—The tuberin was prepd. by the method described by Sjollesma and Rinkes (*C. A.* 6, 1445). Its biological value was found to be equal to 71 as measured at an 8% level of intake by Mitchell's method (cf. *C. A.* 20, 2005). The protein was also fed to rats at levels of approx. 8, 10 and 12%, and a max. gain of 2 g. body weight per g. of protein ingested was found at a 7.8% level of intake by the method of Osborne, Mendel and Ferry (*C. A.* 13, 2553). Tuberin appears to be a "complete" protein.

BENJAMIN HARROW

Antineuritic yeast concentrates. III. The curative pigeon test: A critic. H. W. KINNERSLEY, R. A. PETERS AND VERA READER. *Biochem. J.* 22, 276-91 (1928); cf. *C. A.* 22, 447.—Conditions for obtaining good results with the curative pigeon test are enumerated.

BENJAMIN HARROW

Physical curd character of milk and its probable relation to infant nutrition. R. L. HILL. Utah Agr. Expt. Sta., *Circ.* 66, 1-4 (1927).—The character of the curd formed by treating milk with pepsin and CaCl₂ soln. was tested with a specially designed app. Milk from some cows formed a curd 10 times as hard as that from others. The character of the curd seemed to be uniform for any one cow and apparently permanent except at the beginning and ending of a lactation period, when it was variable. The phys. curd character of the milk was a transmitted hereditary characteristic in the few cases observed, and was unaffected by feeding and independent of the fat content. The curd from unboiled milk was approx. 3 times as hard as that from boiled milk.

A. L. M.

The influence of cholesterol feeding on the number of erythrocytes and their resistance in splenectomized guinea pigs. M. DORLE. *Biochem. Z.* 191, 95-105 (1927).—Long-continued cholesterol feeding does not cause an increase in the number of erythrocytes in splenectomized guinea pigs, nor does it increase their resistance. On the contrary, in normal animals one feeding of cholesterol is sufficient to raise the number of red cells, the hemoglobin value and the cell resistance.

S. MORGULIS

Vitamins as factors in health and in food values. II C. SHERMAN, et al. *Am. J. Pub. Health* 18, 331 (1928).—Report of committee on Nutritional Problems. Since the last report dealing with vitamins A, B and C, recognition has been made of a fat-sol. antirachitic vitamin D, and a fat-sol. vitamin E essential to reproduction. Scientific work has emphasized the need of choosing a diet with regard to its vitamin content and of conserving the vitamin values in the prepn. of foods. Vitamin A only is discussed. Expts. have indicated the advisability of using a supply of vitamin A sufficient to insure a reserve store of the vitamin. The need of vitamin A through adult life, as well as during the growth period, is demonstrated by increased vigor and longevity, resistance to lung disease and successful reproduction shown by exptl. animals fed a diet of high vitamin A content throughout a complete life cycle.

N. M. NAYLOR

Vitamin B—a question of nomenclature. S. L. SMITH. *Science* 67, 494-6 (1928).—A review of the work on vitamin B and the present confusion leads to the recommendation that the term be retained in its original sense of a water-sol., appetite-stimulating, growth-promoting substance; that the heat-labile factor (antineuritic factor, B-P, B₁) be called *vitamin F*; and that the heat-stable factor (antipellagic factor, maintenance or functioning factor, P-P, B₂) be called *vitamin G*.

AUSTIN M. PATTERSON

Nucleic phosphorus and phosphorus balance of mice deprived of the liposoluble factor. M. JAVILLIER, H. ALLAIRE AND (MLLÉ.) S. ROSSEAU. *Bull. soc. chim. belg.* 10, 294-300 (1928); cf. *C. A.* 21, 3667.—The total P per 100 g. of dry matter is much larger in the mice lacking the liposol. factor in their diet and this excess appears in the insol. fraction. Further work is in progress.

L. W. RUGGS

The development of an infant fed eight months on a soy-bean milk diet. ERNEST TSO. *Chinese J. Physiol.* 2, 33-40 (1928).—In spite of the pronounced deficiency of Ca in this diet and the occurrence of rickets which healed imperfectly until more Ca was introduced into the diet, the child in 8 months grew 20.7 cm. and gained 4.1 kg. in wt.,

a growth record which compares favorably with the av. development of breast-fed infants. **L. W. RIGGS**

The gas and sugar metabolism of the vivi-perfused stomach. TSANG-GI NI AND R. K. S. LIM. *Chinese J. Physiol.* **2**, 45-86(1928).—The vivi-perfused stomach is a stomach connected by vessel-anastomosis to the neck vessels of an unanesthetized dog by which it is perfused. An increase in blood flow is not an essential accompaniment of secretion. The quiescent vivi-perfused stomach consumes O at the rate of about 0.007 cc. per g. per min. Assuming from Lovatt Evans' measurement that the O coeff. of plain muscle is 0.002 cc. the basal coeff. of the gastric mucosa is estd. to be 0.013 cc. With secretion, the O intake increases 3 to 9 fold. Other metabolic factors were detd. but the results were too irregular to warrant conclusions. **L. W. RIGGS**

Influence of the amount of glucemia on the quantity of exchanges, the problems of specific dynamic action and the excess consumption. E. P. TERROINE AND R. BONNET. *Compt. rend.* **186**, 896-8(1928).—Expts. were made for the most part with rabbits. The sugar was given by single ingestion or injection, and by injections repeated at intervals of 1 to 5 days for about a month, with doses varying from 12.17 g. to 30.42 g. the limit of tolerance. The factors detd. were respiratory quotient and intensity of exchanges per kg.-hr. in cal., both fasting and after the absorption of sugar. A considerable increase in the glucemia did not modify these factors to any great extent. **L. W. RIGGS**

Immediate physiological action of a vitamin. N. BEZSSONOV. *Compt. rend.* **186**, 914-6(1928).—Ten adult guinea pigs were fed a scurvy-producing ration for 48 hrs., then were allowed 48 hrs. repose, and during the next 48 hrs. were fed the same scurvy-producing ration supplemented by cabbage, prepn. of vitamin C or lemon juice. During the period without vitamin the animals lost wt. or gained but little as compared with the consistent gains in wt. during vitamin feeding. The Br taken up by the urine generally was more than doubled during the 48 hrs. of vitamin feeding. Cabbage and prepn. of vitamin C were better antiscorbutics than lemon juice. The wt. increase of adult guinea pigs and the increased Br absorption by the urine may be considered measures of vitamin C efficiency. **L. W. RIGGS**

Influence of the quantity of heat output on the endogenous nitrogen metabolism. ÉMILE F. TERROINE AND (MME.) HÉLÈNE SORG-MATTER. *Compt. rend.* **186**, 1017-9(1928); cf. *C. A.* **20**, 2355.—Studies with mice and pigeons indicate that in homeotherms for all variations of external temp. involving an increase of energy consumption, there is a proportional increase in the output of endogenous N. **L. W. RIGGS**

Vitamins A, D and E and the oxidation of fats and oils. GEORGE E. HOLM. *Science* **67**, 424-5(1928).—A review. The potency of oils and fats in vitamin deficiency appears to be closely related to their unsatn. It is possible that certain oils protect the vitamins from oxidation, while others favor vitamin destruction by oxidation. **L. W. RIGGS**

Effect of fertilizers on vitamin B content of wheat. ANON. Ohio Agr. Expt. Sta., *Bull.* **402**, 93(1927).—Rations must contain 60-70% of wheat as the only source of vitamin B if reproduction and growth of rats are to be normal. Climate and other factors affect the vitamin B content of wheat. **J. J. SKINNER**

Chemical and nutritive properties of the mung bean. V. G. HELLER AND N. B. GUERRANT. Oklahoma Agr. Expt. Sta., *Rept.* 1925-26, 14 pp.; cf. *C. A.* **22**, 799.—Chem. analysis of mung beans shows that the quantity and quality of protein are good. Vitamins A, B and D are present in sufficient amts. for normal functioning of animals. Rats fed mung bean as the sole source of protein (60% of the ration) grew and matured normally and produced normal young. **J. J. SKINNER**

Vitamin content of canned spinach. E. PIERSON. South Dakota Agr. Expt. Sta., *Ann. Rept.* 1926, 23.—Canning spinach by blanching for 15 min., processing for 90 min. after placing in cans is very destructive to its vitamin C. Ten g. spinach canned by this method when fed as the sole source of vitamin C failed to delay the onset of scurvy or prolong the life of exptl. animals. Animals fed spinach merely blanched for 15 min. lived longer than those fed the pressure-canned spinach. The results suggest that the greater part of vitamin C is destroyed in the blanching process. **J. J. S.**

Antirachitic content of canned oysters. H. L. RUSSELL, F. B. MORRISON AND W. H. EBLING. Wisconsin Agr. Expt. Sta., *Bull.* **368**, 124-5(1926).—The feeding of individual doses of canned and raw oysters to vitamin-starved rats caused a deposit of lime in the growing points of the long bones of the rat, which indicates the presence of the antirachitic vitamin in oysters in appreciable amts. **J. J. SKINNER**

Changes in the composition of protoplasmic tissue by partial starvation. A. G. HOGAN, W. S. RITCHIE AND J. E. HUNTER. Missouri Agr. Expt. Sta., *Bull.* **244**, 19-20

(1928); cf. *C. A.* 21, 3636.—Two sets of samples were taken from the lean of the loin of a yearling steer and an 8-yr.-old steer, one set being removed from the left loin immediately after killing and the other from the right loin after 12 days in the cooler. Previously developed methods were used for the protein extn. and subsequent pptn. of protein fractions. The analyses are given in a table. F. F. SNYDER

ROBINSON, ANNA BELLE AND KING, FLORENCE M.: *Learning Exercises in Food and Nutrition*. Boston and New York: D. C. Heath & Co. 164 pp.

II—PHYSIOLOGY

E. K. MARSHALL, JR.

Concerning the origin of glucuronic acid. MARY ADELINE. *Proc. Soc. Exptl. Biol. Med.* 25, 8-9(1927).—Rabbits were fed menthol and various amino acids to discover the effect on glucuronic acid formation. Glycocoll, alanine and arginine had a tendency to increase the glucuronic acid output, while leucine, isoleucine, cystine and glutamic acid seemed doubtful in their action. Valine, phenylalanine and tryptophan, non-sugar-formers, had little effect on glucuronic acid increase. Tyrosine and histidine appeared to have great influence in increasing glucuronic acid output. C. V. B.

Movements of the isolated uterus and reaction of liquid containing it. GIUSEPPE TRUFFI. *Boll. soc. ital. biol. sper.* 2, 839-43(1927).—The uterus of a rabbit or guinea pig was immersed in Ringer-Locke soln. at 37.5°, and the p_H value of the bath varied by adding NaOH 0.1719 *N* and HCl 0.1644 *N*, which are isosmotic with the Locke soln. At p_H 9.1 the magnitude and frequency of contractions are normal; p_H 9.6 diminishes the magnitude of the contractions; p_H 10.3 diminished the contractions and increase in tone, return of p_H to normal restores contractility; at p_H 11.6 contractions stop and tone greatly increases; the return of the p_H values does not restore contractibility. At p_H 8.2 down to p_H 3.4 the movements are arrested, but with diminished tone and return of p_H to normal does not restore the movements. An isolated intestine reacts exactly the same way to variations in p_H values. A. W. CONTIERI

Nervous influence on assimilation and equilibrium in degenerated muscle. T. CAHN. *Ann. physiol. physicochem. biol.* 3, 4-60(1927); *Physiol. Abstracts* 12, 349.—The water content of fat-free muscle is the same in normal as in atrophied muscles. Atrophy and starvation produce a decrease in muscle mass by different processes. The mobilization of fat in the atrophied muscle is brought about by a humoral mechanism. In atrophy and in starvation there is a change in the N content of muscle albumin because of a rearrangement of the amino acid constituents. There is no trophic nerve effect which conditions the size of the muscle but the activity of the muscle itself is the regulator. H. J. DEUEL, JR.

The occurrence of ergosterol in beef blood. WILLIAM KÜSTER AND OTTO HORTH. *Ber.* 61B, 809-11(1928).—From 18 l. of blood of a 5-year ox, 0.0279 g. of almost pure ergosterol was sepd. Its identity was proved by the reaction of Salkowski, in which the chloroform layer remains colorless in distinction to cholesterol. Likewise its cryst. form (hexagonal plates) was identical with that of ergosterol prepd. from yeast. The possibility that sterols other than cholesterol exist in blood has not previously been considered. H. J. DEUEL, JR.

Cardaissin: a new cardiac accelerator extracted from the suprarenal gland. H. G. CAMERON. *Endocrinology* 10, 577-601(1926); *Physiol. Abstracts* 12, 298.—C. claims that he has extd. a new substance which he calls "cardaissin" from the adrenal body. A neutral acetone ext. of ox adrenal bodies was boiled down and the fats were removed by ether. The residue was then redissolved in alc. or acetone and purified by fractional pptn. The substance increases heart rate. It does not affect any other organ, with the possible exception of the adrenal medulla. Cardaissin and adenine differ in their phys. and physiol. properties, except that both increase heart rate. H. G.

Ovarian hormone. M. HARTMANN. *Klin. Wochschr.* 5, 2152-4(1926); *Physiol. Abstracts* 12, 116; cf. *C. A.* 21, 426.—H. describes the method he has used in an attempt to isolate the ovarian hormone from the ext. obtained by Fräkel and Herrmann's method. After removal of several inactive fractions, the residual substances were distd. in a high vacuum (b. p. about 185°). The distillate was very active. On sapon. it gave a no. of unsatd. acids of the C_{18} series. These were all inactive, but an unsapon. fraction still possessed considerable activity. In high vacuum it b. 145° and contained: C, 81.65 to 82.00%; H, 11.11 to 11.75%. It was unsatd., but its structure has not yet been detd. H. G.

Potassium and calcium in blood. L. KAUFHEIL AND F. KIRCH. *Klin. Wochschr.*

6, 1328-30(1927), *Physiol. Abstracts* 12, 483; cf. *C. A.* 22, 624.—The amt. of K in whole blood varies directly with the no. of erythrocytes. The K in the serum has no direct relation to that in the whole blood. It shows a tendency to increase with breakdown of erythrocytes, and may serve to distinguish between aplastic and hemolytic anemias. Blood Ca is almost always below normal in anemia, and it has no obvious relation to the amt. of K in the blood. H. G.

Metabolism in rats and rabbits after removal of the suprarenals. A. ARTUNDO. *Rev. soc. Argentina biol.* 3, 29-39(1927); *Physiol. Abstracts* 12, 452 3; cf. *C. A.* 21, 3667. When the animals are kept at 20° to 25°, unilateral adrenalectomy causes no modification of the basal metabolism, while with double adrenalectomy there is only a temporary fall. When kept at 15° to 18°, there is increased heat production. H. G.

The reaction against cold in suprarenalectomized rats. A. ARTUNDO. *Rev. soc. Argentina biol.* 3, 40 6(1927), *Physiol. Abstracts* 12, 453.—Rats kept at 0° produce 19.8 calories per hour per kg. of body weight, while after removal of the suprarenals they only produce 15.9 calories. H. G.

The phosphorus metabolism and the influence of the testes upon it. I. J. BLACHIER. *Trans. Lab. Expt. Biol. Zoopark Moscow* 1, No. 1, 231-4(1926); *Expt. Sta. Record* 56, 664.—The detn. of the P metabolism of 4 guinea pigs before and after castration indicated that the removal of both testicles resulted in a reduction in the amt. of phosphorus excreted. The P balances were neg. before castration but pos. after the operation. H. G.

The occurrence of labile phosphorus in various kinds of muscles. I. IRVING AND P. H. WELLS. *J. Biol. Chem.* 77, 97-113(1928).—Labile P was found in the mammalian skeletal muscle by the methods defined by its discoverers. It was not found in the striated muscle of fish, or grasshoppers, in smooth muscle generally, or in heart muscle.

ARTHUR GROLLMAN

The transformation of creatine into creatinine by the male and the female human organism. W. C. ROSE, R. H. ELLIS AND O. C. HELMING. *J. Biol. Chem.* 77, 171-84(1928).—Feeding expts. on 2 human subjects indicated that the power of transforming creatine into creatinine was independent of sex. Approx. $\frac{1}{3}$ of the retained creatine was recovered as creatinine. In the female subject creatine appeared unchanged in larger amts. following its oral administration than in the male subject. A. G.

Studies upon calcification in vitro. III. Inorganic factors determining calcification. D. H. SHELLING, B. KRAMER AND E. R. ORENT. *J. Biol. Chem.* 77, 157-70(1928).—The effect of modifying the compn. of the fluid medium on the calcification of rachitic cartilage was studied. At a p_H of normal blood the optimum results were obtained. An increase in the total ionic strength of the medium inhibited calcification. This occurred at lower concns. of either NaCl or KCl if the $[Ca^{++}]$ and $[HPO_4^{--}]$ were at the same time also lowered. Mg also inhibited calcification but its effect could be overcome by the addn. of $[HPO_4^{--}]$.

ARTHUR GROLLMAN

The variability of basal metabolism. G. M. WISHART. *Quart. J. Med.* 20, 193-7(1927).—The day-to-day variability of both metabolism and respiratory quotient, with 1 observation per day, can be expressed by a coeff. of 4 or 5, meaning that in a series of observations the max. and min. may differ as much as 30%. Three apparently healthy individuals had a metabolism rate uniformly lower than Dubois' standard.

JOHN T. MYERS

The influence of previous muscular activity and other factors on the basal metabolism. G. M. WISHART. *Quart. J. Med.* 20, 199-204(1927).—One hour of moderately severe muscular work causes an av. increase in the basal metabolic rate of the following day of 1 to 2%, with a slight lowering of the respiratory quotient. These differences are very slight as compared with normal variability. A high-protein diet will markedly increase the metabolic rate of the following day. A fairly high correlation coeff. (0.7) between the total N excretion and the metabolic rate was found in a subject whose diet was much varied in the amt. of protein component. During the first few days of starvation, despite the rapidly falling respiratory quotient, the daily variations in metabolic rate were very small. There was a closer correlation between the metabolic rate and total N excretion than uric acid excretion. J. T. M.

The fixation of calcium in the organism. C. SERONO. *Presse médicale* No. 90, 1363(1927); *Bull. soc. hyg. aliment.* 16, 33-4(1928).—See *C. A.* 21, 3662. A. P.-C.

Analysis of the effect of adrenaline upon purine metabolism. GERT TAUDMANN. *Arch. exptl. Path. Pharmacol.* 129, 43-51(1928).—In dogs a subcutaneous injection of adrenaline causes a definitely increased excretion of uric acid and allantoin, while the total N is as a rule not greatly changed. Apparently the increased purine value of the

urine is in no casual way connected with adrenaline leucocytosis. After section of the splanchnic nerves the injection of adrenaline does not augment allantoin excretion.

G. H. S.

Cholesterol and lipid phosphorus of the bile. Changes due to differences in administration, to "blockade" of the reticulo-endothelial system, and to splenectomy. SAMUEL LEITES. *Arch. expil. Path. Pharmacol.* **129**, 108-21(1928).—Administration of olive oil, olive oil and cholesterol, or oleic acid to dogs is not followed by significant changes in the cholesterol of the bile. Meat and lecithin administration moderately raise the cholesterol value within the first 6 hrs. Lecithin, or olive oil, may increase the total and lipid P of the bile during the first 4-6 hrs. Blockade of the reticulo-endothelial system augments the bile cholesterol, and splenectomy reduces both the cholesterol and lipid P of the bile.

G. H. S.

Does the thyroid secrete hormones other than thyroxine? KARL CSÉPAI AND JOSEPH FERNBACH. *Arch. expil. Path. Pharmacol.* **129**, 256-60(1928).—There is no reason for assuming that, aside from thyroxine, the thyroids secrete addnl. hormones, since along with its other effects thyroxine itself sensitizes to the action of adrenaline and pituitrin in increasing blood pressure.

G. H. S.

Behavior of the human organism during deprivation of mineral substances. II. FRIEDRICH THIELMANN. *Arch. expil. Path. Pharmacol.* **129**, 367-9(1928).—Tabulated data supplementing the paper previously published (*C. A.* **21**, 448).

G—PATHOLOGY

H. GIDEON WELLS

The precipitin content of the protein fractions of immune serum. H. H. KROGER AND I. HEKTOEN. *Proc. Soc. Exptl. Biol. Med.* **24**, 352(1927).—Rabbits were immunized against crystd egg albumin. The antiserum was sepd. into protein fractions. A contact precipitin test was made on the whole serum and on each fraction. The precipitin was carried down with the euglobulin fraction, but during dialysis the pseudo-globulin was split off by hydrolysis and the precipitin remained in this H₂O-sol. fraction.

C. V. B.

An explanation of the two forms of bilirubin demonstrated by the Van den Burgh reaction. G. A. COLLINSON AND F. S. FOWWEATHER. *Brit. Med. J.* **1926**, **I**, 1081-3; *Physiol. Abstracts* **12**, 104.—Expts. with free bilirubin, which is an acid, and its alkali salts showed that all the results of the Van den Burgh reaction can be closely imitated. The pigment of fresh bile and of the serums of obstructive jaundice is readily dialyzable; the pigment of the serums of hemolytic jaundice does not pass through the membrane unless alc. is added, so that the former is in true soln. and the latter in colloidal suspension. The authors consider the substance in true soln. to be an NH₄ salt of bilirubin.

H. G.

A contribution to the nature of diabetes: A mathematical derivation of the blood glucose curve. D. M. ERVIN. *J. Lab. Clin. Med.* **12**, 318-25(1927); *Physiol. Abstracts* **12**, 165.—A math. equation for the blood glucose curve of the blood is derived from the three factors, absorption from the intestinal tract, formation of glycogen and oxidation; by detn. of these const. the effect on each function on the curve can be investigated. The curve in diabetes differs from that derived from failure to burn glucose.

H. G.

Methods of preventing agglutination of blood by glucose solutions. W. R. PENDLETON. *J. Lab. Clin. Med.* **12**, 369-73(1927); *Physiol. Abstracts* **12**, 143.—The agglutination which occurs with glucose, sucrose or glycerol may be responsible for the reaction sometimes obtained to a glucose injection. It can be diminished by using a hypertonic or a non-acid soln., or by injecting very slowly to allow of admixt. with a large vol. of blood. The addn. of NaCl, K₂NPO₄, KH₂PO₄ or alkali prevents the agglutination.

H. G.

Cause of hemophilia and its treatment. E. FRANK AND E. HARTMANN. *Klin. Wochschr.* **6**, 435-9(1927); *Physiol. Abstracts* **12**, 345.—By treating centrifuged oxalate plasma with a gelatinous suspension of Ca₃PO₄, the authors removed the proserozyyme. This prepn. they call "plasma phosphaté." It is a soln. of fibrinogen in a physiol. medium free from Ca, cytozyme and proserozyyme. If treated with cytozyme (platelet suspension or syphilitic antigen), proserozyyme (oxalate plasma minus its fibrinogen) and CaCl₂, "plasma phosphaté" clots. Bordet's observation that the change from proserozyyme into serozyyme, which is preliminary to the formation of thrombin, and takes

about 30 min., is confirmed. Cytozyme accelerates this change. In hemophilic plasma the proscrozyme is normal and the platelets are normal, but something is present which retards the conversion of proscrozyme into serozyme. "Plasma phosphaté" from a normal person brings about this conversion quickly, but "plasma phosphaté" from a hemophilic individual takes several hours to effect it. The injection of 20 cc. of normal "plasma phosphaté" in cases of hemophilia will bring the coagulation time to the normal and keep it there for 48 hours, thus enabling surgical procedures to be undertaken.

H. G.

Cause of spontaneous venous thrombosis. W. STARLINGER AND S. SAMETNIK. *Klin. Wochschr.* 6, 1269-72(1927); *Physiol. Abstracts* 12, 486.—S. and S. have attempted to find the factors which cause clumping of blood platelets, this being considered to be the prime cause of spontaneous thrombosis. By microscopic cataphoresis expts. and the use of $\text{La}(\text{NO}_3)_3$ as an agent for neutralizing the charge on the platelets, the last-named are found to be neg. charged. They have an isoelec point between p_{H} 5.4 and 4.7. The platelets have a much stronger neg. charge than the serum globulin and fibrinogen. When the latter are increased in amt. they are considered to cause lowering of the charge on the platelets and these tend to agglutinate. If this takes place along with localized stasis of the blood stream then thrombosis occurs.

H. G.

Resynthesis of lactic acid in circulatory diseases. H. PERGER. *Klin. Wochschr.* 6, 1324-6(1927); *Physiol. Abstracts* 12, 509-10.—It has been shown by Groag and Schwarz that in some patients with circulatory diseases exercise causes a greater production of lactic acid, and that its disappearance from the blood is slower than in normal persons. It is now shown that in patients who are unable to take exercise the same lag in resynthesis of lactic acid may be demonstrated by intravenous injection of Na lactate. The blood lactic acid in such cases, after the injection of 200 cc. 2% Na lactate, may increase to 3 times the initial value within 5 min., and after 20 min. is still nearly double. In a normal person the same amt. of Na lactate causes practically no change in the blood lactic acid, and in cases of compensated heart diseases only a slight increase is observed.

H. G.

The presence of hemolytic, cytolytic and complement-binding substances in extracts of Entameba histolytica. C. F. CRAIG. *Science* 65, 620(1927); *Physiol. Abstracts* 12, 463.—Alec. exts. of *Entameba histolytica* are hemolytic and cytolytic, and capable of binding complement when mixed with the serum of individuals harboring the parasite. The hemolytic properties are destroyed by heating to 80° for 1 hr., the hemolytic substance is sol. in abs. and 50% alc., but practically insol. in normal salt soln. The hemolytic substance is contained in the bodies of the ameba, and is only present in the living organisms. It is not specific for human red cells. Exts. do not contain a bacteriolytic substance. The complement-binding substance is only active when brought in contact with the blood serum of infected individuals.

H. G.

The sensitization of normal guinea pigs with serum plus tuberculin. WALTER KELLER AND WERNER DOLTER. *Z. Immunitäts.* 52, 1-24(1927).—Guinea pigs sensitized with mixts. of tuberculin (old tuberculin or dried tuberculin) and hog serum or hog serum globulin will give skin reactions and anaphylactic shock on reinjection with tuberculin alone. Such sensitized animals will also give a fatal anaphylactic shock with the reinjection of mixts. of protein and tuberculin in amts. which are too small to kill the sensitized animals when given alone.

JULIAN H. LEWIS

The role of ecto- and endoplasm of mouse typhoid bacilli. E. SPRINGUT. *Z. Immunitäts.* 52, 25-49(1927).—Two sorts of antigen can be demonstrated by agglutination and complement-fixation tests in mouse typhoid bacilli, endoplasm and ectoplasm. Accordingly in an antiserum for this organism there are 2 antibodies corresponding to the antigens. Endoplasmic antibodies are the more important in the bactericidal action of the antiserum, although mice immunized with both antigens are better protected than when immunized with endoplasm alone.

JULIAN H. LEWIS

The content of the organs of animals in heterogeneous antigen. K. A. FRIEDRICH AND F. T. GRÜNBAUM. *Z. Immunitäts.* 52, 50-60(1927).—The organs of animals of the guinea pig type contain not only the heterogeneous antigen of the sheep but also that of the chicken, turtle and cat, and if one of these antigens is missing all are missing. The organs of animals of the rabbit group contain antigen for any of the animals of the guinea-pig group.

JULIAN H. LEWIS

An augmentable substance in red cells which changes their agglutination properties. OLUF THOMSEN. *Z. Immunitäts.* 52, 85-107(1927).—In some red cells of all 4 types there is a substance that develops on standing 14-25 hrs. which permits them to be agglutinated by serum of any type. The agglutination depends on the presence in all human sera of an agglutinin which can combine only with the changed red cells. The

change is thought to be due to the development of a latent receptor which is specific for the so-called third agglutinin. Absorption tests show that this 3rd substance is independent of α - and β -agglutinin. These facts point to the error that can arise by using only Type II and III sera in grouping red cells.

JULIAN H. LEWIS
The Sachs-Georgi, the Meinicke and the Wassermann reactions. N. GASIOROWSKI. *Z. Immunitäts.* 52, 138-56(1927).—The Wassermann and Sachs-Georgi reactions are compared in 23,729 sera and the Wassermann, Sachs-Georgi and Meinicke reactions in 3408 sera. All are equal as to specificity but they differ as to sensitivity. In general the order of their sensitivity is Sachs-Georgi, Wassermann, Meinicke. In the primary stage of syphilis the Wassermann is most sensitive and in secondary and latent syphilis the Sachs-Georgi is most sensitive. In tertiary syphilis all 3 tests have about the same sensitiveness. In treated patients the Sachs-Georgi is more sensitive than the Wassermann. The Wassermann reaction disappears sooner than the Sachs-Georgi. In all 3 tests there is a great dependence on the method of prepn. of the antigen.

JULIAN H. LEWIS
The influence of the Bayer substances on anaphylactic shock. W. A. COLLIER. *Z. Immunitäts.* 52, 191-201(1927).—Animals sensitized with normal serum show a much weaker or no reaction when reinjected with serum to which is added Bayer 205. Bayer 1910 acts not only qual. but quant. more strongly. If Bayer 205 is injected into the sensitized animals before reinjection of antigen the anaphylactic shock is also inhibited. Bayer 1910 has no such action. Bayer 205 mixed with the sensitizing dose of horse serum destroys to some extent the specificity of sensitization in as much as there is also sensitization to beef serum. Precipitin reactions are not influenced by the Bayer substances.

JULIAN H. LEWIS
Further experiments on the theory of antibody formation. E. FRIEDBERGER AND S. SEIDENBERG. *Z. Immunitäts.* 52, 202-13(1927).—Small amts. of killed typhoid bacilli given intravenously to rabbits very slowly and over a long injection period (90 min.) by means of a motor-driven syringe produce considerably smaller amts. of antibodies than when the same dose is given quickly. There is no difference in the 2 methods of administration when large doses of antigen are given. These facts are explained on the basis of Pfeiffer's irritation theory. The minimal amt. of antigen in order to produce a response must exert its complete stimulative action on the body receptors, which is possible only when it is introduced in undivided amts. The fact that antibody formation proceeds after immediate removal of the site of injection as reported in a no. of papers means that in these instances the minimum active dose of antigen escapes from the site of injection before removal of the depot. It was noticed that after slow injection of antigen the agglutinin produced a fine agglutination of typhoid bacilli, while after quick injection the type of agglutination was of the coarse variety. **Influence of the period of a single injection of antigen on anaphylaxis in guinea pigs.** *Ibid* 214-20.—Guinea pigs prep'd. with small doses of antigen were much more sensitive when the antigen was given subcutaneously very slowly. The difference was not so marked with moderate doses, and with large doses the sensitization was less than when given quickly. The action of pathogenic bacteria after slow injection and the curative value of serum after protracted injections. E. FRIEDBERGER AND T. IKEDA. *Ibid* 221-6.—The protracted injection of the El Tor vibrio and typhoid bacilli produced a more severe infection than a quick injection and curative serum was more active. **J. H. L.**

Conceptions of antibodies and the constellation of serum proteins. G. KAPSENBERG AND Th. E. RISPENS. *Z. Immunitäts.* 52, 227-327(1927).—The relations of agglutinins to the globulins of antiserum were studied in a similar manner as the Wassermann and Sachs-Georgi antibody was studied in a preceding paper (*C. A.* 19, 1894). It was found that the total globulin fraction contained all and the albumin fraction none of the agglutinin. By quant. measurements it was learned that if equiv. quantities of pseudoglobulin, euglobulin and total globulin were taken, as det'd. by the N content, these fractions contained identical amts. of agglutinin. From these results a theoretical discussion of the constellation of serum proteins and the relation of antibodies to serum fractions is presented, the chief idea of which is that antibodies are the disintegration products of body cells and like other disintegration products of cells they are absorbed by the serum globulins, the various fractions of which are equally active. **J. H. L.**

The experimental production of syphilitic changes in the blood of men and rabbits. HERMANN FÖRTIG. *Z. Immunitäts.* 52, 328-33(1927).—Patients injected intramuscularly with lipoid from human serum mixed with hog serum, with milk, with aolan(?) and with an ext. of the spirochete of syphilis did not develop a positive Wassermann reaction while rabbits injected intravenously with milk, aolan and omnadin(?) did develop a positive reaction.

JULIAN H. LEWIS

The antigenic properties of anatoxin. M. ISABOLMSKII AND V. GITOVICH. *Z. Immunitäts.* 52, 334-8(1927) - -See C. A. 22, 808. JULIAN H. LEWIS

The heterogenetic complement-fixing antibodies. J. I. KRITSCHESKI AND R. E. MASSIK. *Z. Immunitäts* 52, 339-58(1927) —The heterogenetic antigen of sheep, hen, turtle and cat from red cells as well as from organs is alc.-sol. and produces complement-fixing antibodies on injection into animals. The stroma of the red cells contains all of the antigen, although some preps. of hemoglobin were active, probably in consequence of the inability completely to sep. stroma and hemoglobin. JULIAN H. LEWIS

The presence of the antigen of isoagglutinin groups in human organs. E. WIREBSKY AND K. OKABE. *Z. Immunitäts* 52, 359-69(1927).—In the alc. ext. of human organs from group A is found the same lipid antigen as is found in red cells. This lipid antigen which is sp. for group A is found not only in normal organs but also in malignant tumors of individuals belonging to this group. The antigen is found in the blood serum but it must first be extd. with alc. in order to be demonstrated. An exception among the organs is the brain which in spite of its high lipid content does not contain the group A antigen. In group B individuals the lipid sp. for this group is found only in the liver. The isoagglutinins represent not merely blood groups but cell groups. These findings extend to legal medicine the possibility of identifying the origin of individuals from organ ext. reactions as well as from red cell reactions. J. H. L.

The action of diphtheria antitoxin in vitro and in vivo. BECKER. *Z. Immunitäts.* 52, 402-20(1927) —Diphtheria bacillus growing in diphtheria antitoxin very rapidly loses its toxin-forming properties. Normal serum does not affect the infection of guinea pigs with washed toxic diphtheria bacillus, while $1/10$ unit hinders the infection slightly. One unit decreases it markedly, and 10 units completely arrest it. Antitoxin (10 units) given 20 hrs. after infection shortens the course of the disease and 40 hrs. after infection the antitoxin is yet able to cure the animal. The presence of antitoxin stimulates the auto-immunization with toxin-laden organisms. JULIAN H. LEWIS

Value of the nonspecific protein treatment of typhoid immune syphilitics of the latent stage. M. MELCZER AND O. DAHMEN. *Z. Immunitäts.* 52, 469-96(1927) —Various protein substances had no appreciable effect on the total serum proteins, the rate of settling of red cells, and on the normal agglutinins and amboceptor for typhoid bacilli in syphilitics. But if these patients were immunized with typhoid bacilli an effect was found which was different for latent syphilis and tabes. There is produced a negative phase of the agglutinins which begins in 8-10 hrs. In latent syphilis the positive phase begins on the 3rd or 4th day and in tabetics it begins on the 5th day. In latent syphilis the curve rises suddenly but in tabetics it goes up slowly. The negative phase of the typhoid amboceptor lasts 12-24 hrs. longer than that of the agglutinins. From these expts. a mode of treatment for latent syphilis is suggested and of the nonspecific substances tried omnadin(?) and turpentine given subcutaneously are considered the best. JULIAN H. LEWIS

Further studies on the metabolism of fatty substances in pathological conditions. C. CIACCIO. *Boll. soc. ital. biol. sper.* 2, 1027-9(1927) —The factors which inhibit liposis by steatogenous agents were investigated. The administration of phosphorylated oil to animals previously injected with certain suspensions did not give rise to liposis. PETER MASUCCI

A. N. RICHARDS

Pressor effect of guanidine salts on the non-anesthetized rabbit. R. DOMINGUEZ. *Proc. Soc. Exptl. Biol. Med.* 25, 57-60(1927) —The effects on blood pressure, pulse rate and other effects of guanidine salts on the rabbit are discussed. C. V. B.

Physiologic doctrine of the action of poisons which excite the nerve centers. S. BAGLIONI. *Atti accad. Lincei* [6], 6, 562-7(1927).—A crit. review of the doctrine of the selective action of various poisons, together with new expts., leads to certain generalizations concerning the effect of poisons on various centers and their progressive effects. All poisons which in a selective manner increase the irritability of the central coordinated

elements of the posterior cornua of the spinal medulla cause an abnormal increase of the reflex activity, culminating in typical tetanic convulsions of central origin. To this class of poisons belong strychnine, nicotine, hydroxynicotine, caffeine, picrotoxin and KCN. All poisons which in a selective manner increase the irritability of the central elements of the anterior cornua (motor neurons) increase the reflex irritability, culminating in clonic convulsions of central origin. To this class of poisons belong phenol, eosin, hexetone and camphorated oil. Conversely all poisons which, however administered, excite abnormally the spinal nervous system, with eventual tetanic convulsions, have a selective action in that they attack the central nervous elements of the posterior cornua, increasing their excitability. Likewise all poisons which provoke clonic convulsions of central spinal origin have a selective action in that they attack the central motor elements of the anterior cornua, increasing their excitability. This selective action of various poisons demonstrates that the neurones of the posterior and anterior cornua have specifically different functions (physiol. differentiation of the functional central elements).

C. C. DAVIS

Researches on the physiological action of alcohol. IV. Further observations on rats fed on a diet deficient in proteins and carbohydrates but hyperlipinic. Importance of the intestinal tract in resistance to fasting. A. GALAMINI. *Atti accad. Lincei* [6], 7, 251-4 (1928); cf. Baglioni and G., *C. A.* 21, 2319.—A continuation of the earlier expts. showed that EtOH diminishes the resistance of rats on a hyperlipinic diet which at the same time is deficient in proteins and carbohydrates, with gradual loss of wt. culminating in death. Rats fed only lard died after losses of 43-46% wt., whereas rats fed on a mixt. of lard and cellulose to maintain normal intestinal activity died only after 48.9-64% losses of wt. Therefore death probably depends not only on a deficiency of certain nutrients but also upon intestinal intoxication, which is rendered less intense by increasing the activity of the intestines.

C. C. DAVIS

Pharmacological researches on the mercuric salt of *p*-aminophenylarsonic acid (aspirochyl). II. Anatomic pathological alterations of some organs of animals dead from acute and subacute poisoning by aspirochyl. PIERO TESTONI. *Arch. farmacol. sper.* 44, 225-40 (1928); cf. *C. A.* 22, 458.—Autopsies performed on rabbits after intravenous and subcutaneous injections of aspirochyl showed lesions localized mainly in the kidneys, liver and suprarenals. With large doses followed by quick death the lesions were hemorrhagic; with smaller doses over a period of several days they were degenerative. The symptoms did not differ essentially from those produced by other arsenicals and mercurials.

A. W. DOX

The behavior of ethyl diethylacetacetate in the organism. EDGARDO PACE. *Arch. farmacol. sper.* 44, 265-72 (1928).—When injected into the dorsal sac of the frog, $\text{AcCF}_2\text{CO}_2\text{Et}$ has the same general effect as $\text{AcCH}_2\text{CO}_2\text{Et}$ (*C. A.* 22, 458) but its action is much more intense. When administered by stomach sound to rabbits it does not decomp. into MeAc but is conjugated with glucuronic acid and thus eliminated in the urine.

A. W. DOX

Alkaloids of cinchona and amylolytic action of the pancreas. G. M. PICCININI. *Arch. intern. pharmacodynamie* 32, 225-38 (1926); *Physiol. Abstracts* 12, 88-9.—Quinine is capable of inhibiting or exciting amylolytic activity. The inhibitory effect is the regular effect. The prolonged excitatory effect is shown only with small doses in diln. of 1/2000 to 1/500,000. Cinchonine, quinidine and cinchonidine are capable of the same action as quinine on amylolytic function. In equiv. molar doses to quinine their inhibitory action is less, while the activating effect is distinctly greater. In concns. of 0.054 millimol. (0/00) the ascending scale of activating power of the four alkaloids is thus represented: quinine 100, cinchonine 125, quinidine 128, cinchonidine 134. The exciting action of small doses of quinine should not be considered as an example of the general law by which symptoms vary in function of dose, but are to be interpreted as an effect of *subsensitive* doses—that is, doses lower than those called. to bring out the sp. effects of the drug.

H. G.

Antidotal effects between barium and sulfates. L. SCREMIN. *Arch. intern. pharmacodynamie* 32, 207-15 (1926); *Physiol. Abstracts* 12, 125.—The expts. were performed on rabbits in winter at a temp. of 5° to 8°. The toxicity of BaCl_2 in function of the velocity of injection was first ascertained. The lethal dose proved to be independent of the rate of injection. At low velocities of injection of BaCl_2 and Na_2SO_4 antidotal effects are slight. The sulfate is rapidly excreted by the kidneys, while the Ba salt is not. With intravenous injection of BaCl_2 (0.02 N) and Na_2SO_4 (0.02 N) the lethal dose of the Ba salt differs very little from that when it is used alone. With injection of BaCl_2 (0.02 N) and Na_2SO_4 (0.1 N) the dose of Ba necessary to kill the animal is about twice as great as if it were used alone.

H. G.

Clinical and experimental study of colloidal sulfur. M. MONTAGNANI. *Arch. intern. pharmacodynamie* 32, 269-310(1926); *Physiol. Abstracts* 12, 124.—Colloidal S in small intravenous or hypodermic doses causes increase of hemoglobin and of the corpuscular mass in fowls and rabbits. The increased hemopoietic activity is due especially to a stimulation of the bone marrow. It can be attributed not to the special phys. state of the drug (colloidal), but to the substance *per se*. The drug also increases oxidation in the organism, and augments the output of urea, etc. It probably liberates O from HbO, and seems to possess special anabolic function. In man also the use of colloidal S (hypodermic) has hemopoietic and oxidative effects. H. G.

The effects of anisotonic solutions on peristalsis in the small intestine of rabbits. W. F. NORTTINGEN AND T. SOILMANN. *Arch. intern. pharmacodynamie* 32, 327-339 (1926); *Physiol. Abstracts* 12, 154.—The effects of anisotonic solns. are similar inside and outside the intestine, whether excised or in the living animal. The longitudinal and circular fibers react alike. Hypotonic solns. increase tone and peristalsis. Water, coffee, etc., taken on an empty stomach are promptly laxative. In excised intestine excessive hypotonicity may cause rigidity. Hypertonic solns. affect peristaltic rate in two opposite directions: there is a short period of acceleration, and in 2-4 min. progressive slowing. The primary stimulus spreads rapidly ahead of the fluid, and tends to empty the lower intestine. If the hypertonic soln. be rapidly absorbed through the serous coat, the depression may occur without stimulation. H. G.

Comparison of mercurous with mercuric salts. P. TESTONI. *Arch. intern. pharmacodynamie* 32, 239-54(1926); *Physiol. Abstracts* 12, 124-5.—Whether *in vitro* with egg albumin or *in vivo* with rabbits, normal or previously treated with NaI, a distinct difference was always noted in chem. and toxicol. properties between mercurous and mercuric salts. The salts were injected in solns. of NaNO₃ slightly acidulated with HNO₃. The acid added plus that resulting from hydrolysis was much inferior to the lethal dose. The effects of the nitrates are attributable to the activities of the cations Hg⁺ and Hg²⁺, which can react in the circulation with proteins or with the salts of the plasma. If albuminates are formed, Hg ions coexist with them. There is a reaction with the chlorides, carbonates and phosphates. HbCl, being slightly sol., becomes colloidal, and so probably do both oxides. H. G.

The effects of anisotonic solutions on intestinal muscle. B. SIAULIS AND T. SOLL-MANN. *Arch. intern. pharmacodynamie* 32, 340-51(1926); *Physiol. Abstracts* 12, 154.—Hypo- and hypertonic solns. applied directly to intestinal nerves tend to increase the tone of the intestine, and sometimes to produce inconst. changes of rate and amplitude of peristalsis. These changes are so much smaller than those produced by contact with the intestine that it is improbable that osmotic changes in nerve fiber play an important part in the functional response of the intestine to anisotonic fluid. H. G.

The action of opium and related alkaloids on nerve and muscle preparations. J. V. SUPNIEWSKI AND D. I. MACIIT. *Arch. intern. pharmacodynamie* 32, 352-9(1926); *Physiol. Abstracts* 12, 179.—Alkaloids of the piperidine-phenanthrene group diminish slightly the irritability of frog nerve and muscle and the height of the contraction curves. The alkaloids of the benzylisoquinoline group are more toxic and markedly diminish the curves. Pantopon, a mixt. of the two groups, is more toxic than piperidine and less so than isoquinoline. Benzyl alc. has a pronounced depressor effect, probably owing to the free OH group. Benzyl phosphate causes only slight depression. Phenanthrene sulfate gave no effect, but piperidine-HCl is depressor. Isoquinoline and quinoline are both toxic. H. G.

A comparison between the action of quinine and quinidine on smooth muscle. I. The action on the uterus. E. E. NELSON AND F. W. THOMAS. *Arch. intern. pharmacodynamie* 32, 455-60(1926); *Physiol. Abstracts* 12, 181.—Quinidine, like quinine, stimulates the uterus to increased rate and amplitude of contractions in the pregnant as in the non-pregnant state. The stimulating action occurs through a relatively narrow range of concn. so far as the isolated uterus is concerned, and the toxic depressor effect is very readily obtained. A marked or persistent increase in tonus was rarely seen in isolated uterus, and not at all *in situ*. In isolated uterus quinidine stimulates in smaller dose than quinine. In the intact animal very little difference was noted. No exptl. data have been obtained to show that quinidine might be more effective as an oxytocic than quinine. H. G.

Chemical and pharmacological properties of mixtures of sodium salts of halogens and salts of strychnine. J. SIMON. *Arch. intern. pharmacodynamie* 33, 62-72(1927); *Physiol. Abstracts* 12, 307-8.—The addn. of aq. solns. of NaBr, NaI and NaCl to aq. solns. of salts of strychnine gives rise to ppts. This property of the halogen salts of Na increases with increase of the at. wt. of the halogen. The ppt. consists of the salt of strychnine,

and is due to a diminution of soly.; it is not a mol. complex. There exists no relation between the property of pptn. and the antitoxic action of the halogen salts towards strychnine in the animal organism. The NaBr is the most active in the latter respect. The pharmacol. effect of NaI is least, but its pptg. power is highest. NaCl, which pre-exists in the organism, is intermediate between the other two. H. G.

Comparative action of quassia in vertebrates and insects. A. ANTONIBON. *Arch. intern. pharmacodynamie* 33, 77-84 (1927); *Physiol. Abstracts* 12, 309.—The minimal lethal dose of quassia for the rabbit is four times greater when introduced into the stomach than that required intravenously. Its soly. is slight (1%), and it is with difficulty dissolved in and absorbed from the stomach. Comparing the lethal dose for insects like the silkworm and for the rabbit, they are found to be closely alike. The supposed greater toxicity for insects is due to an error of calcn. of the dose absorbed. The seat of action is the same in all cases. The nervous system is attacked, and, according to its development, there is torpor and muscular relaxation with rapid apparent death in the insects, while in the rabbit there is muscular tremor all over the body and later paralysis. H. G.

The pharmacology of colloidal sulfur. M. MONTAGNANI. *Arch. intern. pharmacodynamie* 33, 85-113 (1927); *Physiol. Abstracts* 12, 310.—Colloidal S more than any of the other oxygenated derivs. may in special conditions of administration exhibit the property of being anti-anaphylactic, completely annulling all signs of shock. It is necessary to give the S daily intravenously over the latent or incubation period. A single large dose given soon after the procedure detg. shock has but a very slight preventive effect. This immunity conferred by S in the desired conditions is temporary, and the animal may present typical shock if the detg. injection be made 15 to 20 days after treatment with S. H. G.

Action of mistletoe on the circulatory system. U. G. BIJLSMA. *Arch. néerland. physiol.* 11, 142-5 (1926); *Physiol. Abstracts* 12, 308.—In the cat a single intravenous injection gives a temporary fall in blood pressure, due to dilatation of the coronary vessels, and occasionally of those in the periphery, plethysmographic and perfusion expts. being almost uniformly neg.; intra-arterial injection may be followed by no fall in pressure, whereas intravenous is effective; further expts. excluding the pulmonary vessels and the cardiac muscle show that the effect must be due to coronary dilatation. Repeated injections produce a permanent fall in pressure, and finally death, due to cardiac failure. The anesthetic or the presence or absence of the nervous system is without influence on these results. In the dog similar results are obtained, but the causes of the temporary fall in pressure from a single injection are different; peripheral vasodilatation, stimulation of the vagus center, and a toxic effect on the heart all contribute. Intra-arterial injection produces a more rapid fall than intravenous. The drug acts on the vessel wall itself. H. G.

Action of α -aminopyridine and its derivatives. F. DINGEMANSE. *Arch. néerland. physiol.* 11, 160-4 (1926); *Physiol. Abstracts* 12, 308-9.—Natural nicotine is a deriv. of β -aminopyridine, from which an intermediate compd., a nicotyrine, can be synthesized. From α -aminopyridine also α -pyridylpyrrole and a nicotyrine can be formed, from which an isomer of nicotine may later be synthesized; 0.01 g. α -aminopyridine injected into frogs produced convulsions like those of strychnine, and death in a few hours; 0.5 to 1.0 mg. produced symptoms. Acetyl, benzoyl and urethan derivs. were less toxic; the acetyl had a slight anesthetic action on the cornea; 0.01 g. of the α -pyridylpyrrole and of nicotyrine was also toxic, and produced death in a day, the former with paralysis and the latter with convulsions. All the compds., including nicotine, possess a local anesthetic action on the frog skin, but neither α -aminopyridine nor the nicotyrynes have any action on the rabbit's cornea. Hence these α -compds. produce effects similar to those of the natural β -nicotine. H. G.

Sodium thiosulfate and calcium salts in prevention of the sequelae of illuminating gas poisoning. W. H. ZEIGLER. *J. Lab. Clin. Med.* 12, 109-14 (1926); *Physiol. Abstracts* 12, 183.—The delayed effects of CO poisoning can be prevented in dogs by intravenous injection of $\text{Na}_2\text{S}_2\text{O}_3$ and subcutaneous injection of Ca salts. It is suggested that the treatment might be effective for human subjects. H. G.

Adrenaline and muscle tonus. E. FREUDENBERG. *Klin. Wochschr.* 6, 634-5 (1927); *Physiol. Abstracts* 12, 348.—It has been shown by Duzar and by Sieghelm that intravenous injection of adrenaline in a condition of alkemia causes tetany. F. now demonstrates that if 0.25 mg. adrenaline be injected intramuscularly into the ball of the thumb and an alkemia be produced by hyperventilation, the muscles of the thumb develop a marked spasm which is much greater than on the opposite side. This points to a peripheral action of adrenaline on the muscles. H. G.

The zytropy and parasitotropy of arsphenamine. F. T. GRÜNBAUM. *Z. Immunitats.* 52, 61-84(1927)—Arsphenamine adsorbed on sheep erythrocytes has a higher activity than arsphenamine *per se*. It would seem that the combination of cells and arsphenamine gives rise to a product which enhances the therapeutic action of arsphenamine. These facts are thought to agree with Ehrlich's theory of the relation of organotropy and parasitotropy in the chemotherapeutic action of substances. J. H. L.

Quantitative observations on thyroxine and allied substances. I. The use of tadpoles. J. H. GADDUM. *J. Physiol.* 64, 246-54(1927) — Natural thyroxine added to the water (1 to 10 parts per ten million) in which tadpoles lived produced characteristic effects among which a decrease in the length of the tadpoles is regarded as a sp. quant. test for thyroxine. Synthetic and natural thyroxines, both in racemic condition, were equal in effect. K1 in high concns., 200 parts K1 to 1 million, resulted in a slight decrease in tadpole size, but 50 parts K1 per million had no such effect. Diiodothyroxine, which has only 2 of the 4 I atoms of thyroxine, showed about 2.5% as much activity in the test as did thyroxine. Desiodothyroxine, representing thyroxine deprived of all its I atoms, showed no specific thyroxine action. β - β -DI(3,5-diiodo-4-hydroxyphenyl)-alanine, an isomer of thyroxine, had no activity. 3,5-Diodotyrosine had little or no effect. The amines (amino acid minus CO₂) corresponding to thyroxine and diiodothyroxine seemed to have specific effects similar to that of the same concn. of the corresponding amino acid, but these results were inconclusive. J. F. LYMAN

Is digestive leucocytosis caused by the absorption of the chlorine ion? G. SOLARINO. *Boll. soc. ital. biol. sper.* 2, 1036-9(1927) — The administration *per os* of 100 cc. NaCl soln 0.85% or 20 cc. NaCl 4.25% to dogs starved for 24 hrs. gives rise to a definite, though variable, leucopenia, which reaches the max. 60-120 min. after administration. The same amt. of NaCl given intraperitoneally also causes leucopenia. Also, 1.5 mg. HCl per kg. wt. given intraperitoneally causes leucopenia, whether the blood is drawn from the heart or from the ear veins. PETER MASUCCI

Influence of temperature on the action of ferrous sulfate on red blood corpuscles. M. MESSINI. *Boll. soc. ital. biol. sper.* 2, 1043-5(1927). — In high concns. and at a temp. not higher than 17°, FeSO₄ has a fixative action; in lower concns. it changes the structure of the red corpuscles, breaks them, but does not produce hemolysis. At a temp. of 22° or above, FeSO₄ has a hemolytic action; the higher the temp. the smaller is the amt. necessary to produce hemolysis. Co(NO₃)₂ and NiCl₂ at 37° did not produce hemolysis, although they did injure the corpuscles and in large doses had a fixative action. ZnSO₄ at 37° produced neither hemolysis nor fragmentation of the corpuscles. MnCl₂ behaved likewise. PETER MASUCCI

The inhibiting action of polysaccharides on glucose hyperglucemia. G. SOLARINO. *Boll. soc. ital. biol. sper.* 2, 1039-42(1927). — Sol. rice and wheat starch in 2.5 g. doses given to dogs starved for 24 hrs. produce a variable hyperglucemia (0.012 to 0.048%). If the starch is administered soon after or one-half hr. after the glucose, the glucose hyperglucemia is inhibited—the blood sugar is always less than when glucose is administered alone. The inhibiting action of starch is, however, less than that of sucrose or fructose. PETER MASUCCI

New experimental data on the biochemistry of the heart. M. MESSINI. *Boll. soc. ital. biol. sper.* 2, 1049-52(1927). — The pharmacodynamic relations between Ca ions and certain principles known to act on cardiac innervation were studied. Physostigmine and pilocarpine were used as exciters and atropine and methylene blue as inhibitors of the parasympathetic nervous system. Physostigmine salicylate, in a dil. 1:4000 soln. which does not modify the rhythm or strength of the frog heart, has a definite negative inotropic action if the Ca is removed from the perfusing liquid. The phenomenon disappears if the heart is perfused with physostigmine in Goethlin's liquid contg. Ca. A similar phenomenon was observed with pilocarpine. In a diln. of 1:8000 there are no appreciable modifications, but if the same amt. is added in a liquid free from Ca there is a definite negative inotropic action. Likewise, negative inotropic action was obtained with atropine and methylene blue in liquids free from Ca. M. proposes that as a basis of these results, a new pharmacological test may be introduced to recognize the autonomic orientation of alkaloids, hormones and animal exts. PETER MASUCCI

The distribution of boric acid in human organs in six deaths due to boric acid poisoning. Wm. D. McNALLY and C. A. RUST. *J. Am. Med. Assocn.* 90, 382-3(1928). — Analysis of the organs of 6 infants who had received by mistake from 60 to 150 cc. of satd. H₃BO₃ (3 to 6 g. per infant) showed that the brain and liver accumulate about the same and the higher percentages of H₃BO₃. The bowel contains an intermediate amt. while the stomach, heart, lungs, kidneys and diaphragm contain lower percentages.

H_3BO_3 is distributed through the body by osmosis as well as by the circulation.

L. W. RIGGS

Mode of action of arsenic and of related elements. II. Role of oxygen in the hemolytic activity of hydrogen phosphide, or its lowest stages of oxidation. RICHARD LARBS. *Arch. expll. Path. Pharm.* 129, 150-8(1928); cf. C. A. 22, 1407.—As with AsH_3 , hemolysis with P_2H_4 is dependent upon the presence of O. **III. Hemolytic action of hydrogen sulfide under an increased supply of oxygen.** *Ibid* 159-75. Mammalian red blood cells are hemolyzed by H_2S , the action being dependent upon the supply of O. Serum exerts an inhibitory influence. **IV. Hydrogen sulfide hemolysis: action of the colloidal sulfur.** *Ibid* 176-92.—Colloidal S preps. are also hemolytic. **V. Hemolysis by salts of hydriodic acid.** *Ibid* 193-201.—Through oxidation changes I becomes hemolytic.

G. H. S.

Effect of muscular convulsions on the gas relations and reaction of the blood, in connection with the mechanism of death due to strychnine. S. DIETRICH AND H. FÜSTER. *Arch. expll. Path. Pharm.* 129, 339-53(1928).—The difference in O_2 -satd. and reduced blood as regards capacity to bind CO_2 is the same in the rabbit as in man. After cardiazole convulsions the CO_2 content, the CO_2 binding power, and the CO_2 tension of the blood are reduced. The blood becomes more acid and the acidity of the urine is increased. In strychnine tetany a paralysis of the heart occurs, and in the intoxication the suffocation effect is augmented by the acidosis consequent to muscular activity.

G. H. S.

Effect of synthalin on the physiology of metabolism: Chemical analyses of organs. A. BOEDEKER AND P. JUNKERSDORF. *Arch. expll. Path. Pharm.* 129, 354-66(1928).—Synthalin administered to adequately nourished dogs caused an initial fall in blood sugar followed by a rise in sugar and a fall in the hypoglucemic value. Individual animals showed considerable variation as to the time of occurrence, the intensity, and the duration of these changes. The most striking feature of the organ analyses was the almost complete disappearance of glycogen from the liver, with a concomitant fat infiltration. Many animals revealed an inflammatory condition of the intestinal mucosa.

G. H. S.

Antithyreoidin-Moebius. A. GURBER AND OTTO GESSNER. *Arch. expll. Path. Pharm.* 129, 370-9(1928).—The active principle of antithyreoidin-Moebius is not sol. in either EtOH or ether. It is not weakened by exposure to light or by heating at 56° , and it is not dialyzable. It is either a protein itself or is closely bound to protein as is shown by pptn. reactions, and the euglobulin fraction has by far the greatest antithyroid action. Normal sheep serum contains something which inhibits the metamorphosis of tadpoles, but its action is less marked than that of antithyreoidin. The metamorphosis of amphibia larvae is stimulated by phenol in concns. of 1:20,000 to 1:40,000.

G. H. S.

Treatment of inoperable tumors with isamin blue. H. BERNHARDT AND C. B. STRAUCH. *Z. Krebsforschung* 26, 361-9(1928).—Intravenous injection of isamin blue reduces rate of growth and decreases cachexia in some cases of inoperable cancer, especially of the ovary.

Relationship of chemical structure to pharmacological action (BAUER) 17.

HANZLIK, P. J.: **Actions and Uses of the Salicylates and Cinchophen in Medicine.** Medicine Monographs. Vol. 9. Baltimore, Md.: Williams and Wilkins. London: Baillière, Tindall and Cox. 200 pp. 16s., net. Reviewed in Supplement to *Nature* 121, 382(1928).

I—ZOOLOGY

R. A. GORTNER

Advanced development of some echinoid plutei. A. R. MOORE. *Proc. Soc. Exptl. Biol. Med.* 25, 37-8(1927).—The method of rearing and details of development are described for 3 Pacific coast forms. The sea urchins, *Strongylocentrotus purpuratus* and *S. franciscanus*, developed to advanced pluteus stage and the sand urchin, *Dendraster eicentricus*, readily underwent metamorphosis.

C. V. B.

Chemical analysis of incubated non-fertile eggs. G. W. PUCKER. *Proc. Soc. Exptl. Biol. Med.* 25, 72-3(1927).—Fresh eggs from white leghorn chickens were analyzed before incubation and the non-fertile ones at various periods of time, up to 20 days, during incubation, for carbohydrate and non-protein N constituents. All (99.2%) of the free sugar of the egg white is fermentable, while 7 to 12% of the total sugar of the yolk is non-fermentable. The hydrolyzable sugar content of the white is greater than that of the yolk. The free amino acid and non-protein N content of the yolk is very much

higher than that of the white. Incubated, sterile, non-fertile eggs do not undergo any appreciable changes in free sugar, hydrolyzable sugar or non-protein N constituents, over an incubation period of 20 days. C. V. B.

Glycogen of the edible mussel, *Mytilus edulis*, L. MARGARET McDOWELL. *Proc. Soc. Exptl. Biol. Med.* **25**, 85-6(1927).—Glycogen from the edible mussel, prep'd and purified by a method described, contained about 0.035% of P_2O_5 , as compared with 0.721% of P_2O_5 found in dog-liver glycogen by previous workers. Whether the difference is due to variations in methods used or to innate differences in the glycogen is not known. C. V. B.

Are the protozoan faunae of termites specific? S. F. LIGHT AND M. F. SANFORD. *Proc. Soc. Exptl. Biol. Med.* **25**, 95-6(1927).—A colony of *Porotermes froggatti* in normal condition, but which an examn. of nearly 100 intestines showed to have lost its protozoan fauna, was studied, in an attempt to refaunate these individuals with the protozoa from species belonging to other genera of termites. All attempts to accomplish this by keeping the individuals of the various species in close assocn., by feeding defaunated *Porotermes* individuals with intestinal contents of the other species of termites, and by applying to the anal aperture a drop of the intestinal contents of the infective species, were failures. Persistence of infection for several hrs. and even days was observed in several cases when injection by pipet through the anal aperture was tried, and in 1 case apparently successful transfaunation lasting for at least 12 days was noted. C. V. B.

Action of picric acid on living protoplasm. H. POLLACK. *Proc. Soc. Exptl. Biol. Med.* **25**, 145(1927).—These expts. indicate that picric acid solns which coagulate proteins in the test tube have no such action on the interior of the living ameba. However, if there is a local injury, the picric acid will act on the injured cytoplasm, resulting in coagulation. While picric acid is non-toxic to the internal healthy cytoplasm it is extremely toxic when applied to the surface of the ameba. C. V. B.

Determination of the p_H of developing *Fundulus* eggs. P. B. ARMSTRONG. *Proc. Soc. Exptl. Biol. Med.* **25**, 146-7(1927).—By injection of indicator dyes into developing *Fundulus* eggs, the p_H values of the contents were det'd. The color of the subchorionic space indicated a p_H identical with that of sea water, if the eggs were immersed in sea water; if in dist'd. water, the p_H of the subchorionic space was found to be that of the surrounding medium. The p_H of the pericardial cavity was also found to approach that of sea water, but its p_H did not change when eggs were immersed in dist'd. water as in the former space, nor did the dye diffuse out of the embryo. The brain vesicles had the same p_H as that of the pericardial cavity. The yolk was distinctly acid to cresol red and phenol red. Since the subchorionic space changes so readily in p_H with changes in p_H of the environment but without change within the embryo, it is suggested that it is not at the membrane but at the cellular wall of the embryo that the acid-salt antagonism takes place. C. V. B.

Expulsion of injected solute by contractile vacuole of ameba. R. B. HOWLAND AND H. POLLACK. *Proc. Soc. Exptl. Biol. Med.* **25**, 221-2(1927); cf. C. A. **22**, 1192.—If aq. or alc. solns. of picric acid are injected into an ameba, some of the solute diffuses through the endoplasm into the vacuole. When large amts. of the solute are taken up, as observed by the intense yellow color, the vacuoles become very flaccid and are easily changed in shape by stress caused by endoplasmic currents. Systole of these flaccid vacuoles is delayed, and a new vacuolation center appears and functions. The original vacuole gradually becomes more turgid and spherical, and finally contracts. The yellow fluid is finally ejected until both endoplasm and vacuole have lost the yellow color. C. V. B.

Nature of pigment in intestine of the marine worm *Chaetopterus*. W. C. ALVAREZ, C. SHEARD AND G. M. HIGGINS. *Proc. Soc. Exptl. Biol. Med.* **25**, 302-3(1928).—The absorption bands produced by chlorophyll solns. and by solns. of the green pigment from the intestinal tract of the worm *Chaetopterus* were so similar as to warrant the statement that they were produced by the same pigment or related pigments, i. e., by chlorophyll a or b, or both. Histological studies of the intestine suggested that the green structures observed are primitive plants living in symbiotic relationship with the worm. C. V. B.

Aerobic and anaerobic metabolism of the common cockroach (*Periplaneta orientalis*). III. J. G. DAVIS AND W. K. SLATER. *Biochem. J.* **22**, 331-7(1928); cf. C. A. **21**, 2337.—Lactic acid accumulates during anaerobiosis and returns to the resting value slowly during the recovery process. If it is assumed that all the lactic acid is burned without recovery, then the excess lactic acid agrees with that calcd. from the oxygen debt. BENJAMIN HARROW

Anaerobic metabolism of the earthworm (*Lumbricus terrestris*). J. G. DAVIS

AND W. K. SLATER. *Biochem. J.* **22**, 338-43(1928).—For methods (cf. Slater, C. A. **21**, 2337). The oxidation process is deferred during anaerobiosis until O is readmitted, when the products of metabolism are removed by an excess of O equal to that, which would have been used had the normal metabolism continued undisturbed. These results are compatible with the breakdown of glycogen to lactic acid followed by the oxidative removal of the latter.

BENJAMIN HARROW

Guanidine determinations on some invertebrates by a colorimetric phosphotungstic acid method. M. M. ELLIS. *Biochem. J.* **22**, 353-61(1928).—Guanidine was detd. by the nitroprusside reaction and Marston's reagent (C. A. **19**, 664), as modified by Weber (*Proc. Soc. Exptl. Biol. Med.* **24**, 712(1927)). Guanidines, or substances giving the scpn., pptn. and nitroprusside reactions of guanidines, were found in the dog whelk, *Purpura lapillus*; the pelagic copepod, *Ealanus helgolandicus*; the marine isopod, *Ligia oceanica*; and the shore crab, *Carcinus maenas*.

BENJAMIN HARROW

Chemical changes in muscle. II. Invertebrate muscle. III. Vertebrate cardiac muscle. ERIC BOYLAND. *Biochem. J.* **22**, 362-80(1928); cf. C. A. **22**, 2182.—Crustacean muscle converts glycogen into lactic acid in activity, but the glycogen content of the muscle and the lactic acid formed in fatigue, in rigor or in buffer solns. are all less than are usually found in amphibian or mammalian muscle. While all the molluscan muscles examd. produce lactic acid, they show differences in behavior. The muscles of *Lumbricus* and *Holothuria* are like those of the frog in respect of the change of glycogen to lactic acid. The extra lactic acid production of mammalian cardiac muscle is not accompanied by a decrease in lower carbohydrates.

BENJAMIN HARROW

The absorption of glucose by *Ostrea edulis*. C. M. YONGE. *J. Marine Biol. Assoc.* **15**, 643-53(1928).—Normal healthy oysters with openings drilled in both inhalant and exhalant chambers remove considerable quantities of glucose from the soln. When such openings are plugged, very little or practically no glucose is removed in 36 hrs. However, at the end of 8 days such "bleeding oysters" did remove some glucose. During the exptl. period there was no evidence of bacterial decompn. of glucose. The results of this and previous investigations demonstrated that the ciliated epithelia of Lamellibranchs cannot absorb. Absorption takes place in the tubules of the digestive diverticula within the alimentary canal and in the mantle cavity, only through the agency of phagocytes, which are extruded in great numbers when Lamellibranchs "bleed" as a result of bad conditions. These conclusions are contrary to those of Ranson and Marenzin that other sol. matter is absorbed directly by the ciliated epithelia in the mantle cavity.

N. KOPELOFF

Changes in oxygen consumption during metamorphosis induced by thyroid administration in the axolotl. J. BĚLEHRÁDEK AND J. S. HUXLEY. *J. Physiol.* **64**, 267-78(1927).—The metabolic rate (O_2 consumption) in larval *Amblystoma tigrinum*, kept under slight standard anmytal anesthesia, was not affected immediately after injection of thyroid, but was increased after a refractory period of about 8 to 14 days at 23°. The increase in metabolism occurred at about the metamorphic crisis (shedding of larval skin), but a no. of morphogenetic changes and considerable wt. loss occurred before it took place.

J. F. LYMAN

Studies on the physiology of the kidneys of certain fishes. LUIGI CONDORELLI AND EDWARDS. *Boll. soc. ital. prol. sper.* **3**, 126-34(1928).—The blood and urine of two groups of fishes were analyzed for various constituents. The fishes studied were *Siganatus*, *Lophius piscatorius*, *Hippocampus* and *Muraena*. The data cover cryoscopic delta, Na, K, Ca, Mg, Cl, P and protein N. Another table includes d., urea, NH_3 , creatine, creatinine, uric acid N, creatinine N and amino acids. The Mg and P contents of the blood were much higher than in mammals; amino acids and NH_3 N were also high. The urine had a high Mg content.

PETER MASUCCI

Investigations on Cetacea. XXIV. The composition of the urine. T. ICHIMI, S. MORIMURA, Y. MASUMIZU AND T. YAZAWA. *Jap. J. Med. Sci. Sect II* **1**, 119-24 (1927); cf. C. A. **20**, 1672.—Urine samples from *Bal. borealis* and *Bal. physalus* were analyzed; the compn. seems to be rather const. It resembles the urine of carnivores. 100 cc. contained an av. of 1.75 g. total N. Of this total N, urea formed about 90%, creatinine 1 to 1.5%, amino acids 0.4 to 2.0%, NH_3 3 to 4.5%, allantoin 2.2-3.3%, hippuric acid 0.2 to 0.35%, creatine 0.05 to 0.3%, uric acid 0.03 to 0.7%. The ratio between total N and H_2SO_4 was 4 or 5:1. Of the S 25 to 30% was present as neutral S. No rare N-contg. substances could be found. No albumin was present, when analysis was done shortly after the death of the animal. XXV. The oxalic acid content of the urine of *Balaenoptera borealis*. YOSHIO OKAHARA. *Ibid* **125-6**.—About 20-40 mg. oxalic acid was found in 3 analyzed urine samples of *Balaenoptera borealis*. XXVI. Further researches on the conditions of relation between

the different species of the whale. KYO HAYASI. *Ibid* 127-9.—H examd. blood samples of *Balaenoptera physalus*, *B. borealis*, *Physeter macrocephalus*, *Delphinus delphis*, *B. musculus* and *Orcinus orca* serologically and came to the conclusion that all examd. species are related by blood. Ascoli's modification of the precipitin reaction was used for the tests. XXVII. The milk of different species of the whale. KIVOO TAKEMURA. *Ibid* 131-4. Milk of *Bal. physalus*, *Bal. borealis* and *Physeter macrocephalus* was analyz'd. It is white and of sirupy consistency. p_H (of *Bal. physalus* milk) 6.65, total N 1.420-1.887, non protein N 0.152-0.180, albumin 3.73-4.51%. The total solids were 28.59-44.63%. The fat content ranged between 23.76 and 37.38. The fat of the sperm-whale milk had acid no. 9.8, sapon. value 182.7, Hehner's no. 93.0, I value 115.0, Reichert-Meissl no. 1.0, acetyl value 35.6, ester no. 172.8, glycerol 7.5. The lactose content of the sperm-whale milk was 0.120-0.133%. XXVIII. Total base content of the urine. YUTAKA FURUHASHI. *Ibid* 135-6.—The base content of the urine of *Bal. borealis*, *Bal. physalus* and *Physeter macrocephalus* was detd. according to Fiske's method. It ranges between 0.403 and 0.443 N. Besides this, Cl, S as H_2SO_4 and total P were detd. One hundred cc contained 0.99-1.28% Cl and 0.014-0.019% inorg. S. The total P content was 0.049-0.078%, 80-90% of which was present as phosphate. XXIX. Alkalies and alkaline earths in different horny tissues. A contribution to the question of keratinization. HIROKICHI HAYASHI. *Ibid* 137-49.—In 4 specimens of *Balaenoptera borealis*, scalp, tail skin, mucous membrane of the first stomach and whalebone were analyzed for water content, fat, total N, ash, alkalies and alk. earths. In the epidermis and the mucous membrane of the first stomach, K was the chief ingredient among the bases. In whalebone very little K was found. H. believes these conditions due to the fact that the epithelium cells of the epidermis and the mucous membrane of the first stomach are in a much more active state than in the whalebone, and normally functioning cells require a considerable amt. of K. The large Ca content in the fishbone is supposed to be responsible for the dry and hard state of this tissue, as it causes the collods to gelatinize and to become firm. The Mg content is nearly the same in all tissues examd. The values for Na are rather irregular. The ratio alkalies:alk. earths in the fishbone was 0.8-1.1 (in equivs.), the ratio Na:K = 10.1 and Ca:Mg about 1.1. In the rest of the tissues examd. the ratio alkalies:alk. earths ranged between 2.1 and 7.5, while Na:K was about 1 and Ca:Mg about 1. XXX. A preliminary examination of the liver function. YUTAKA FURUHASHI and TEIJIRO YAZAMA. *Ibid* 151-2.—Report on analysis of 2 liver samples for non-protein N, glycogen and free sugar before and after autolysis. The liver was examd. 10 hrs. after the death of the animal. XXXI. Further studies on the synovial fluid. KIVOO TAKEMURA. *Ibid* 153-7.—The synovial fluid of the whale is very viscous and contains a peculiar viscous albuminous compd., $\Delta = 0.6712$. It has small reducing power corresponding to 0.008-0.0013% sugar. Analysis of the synovial fluid of a specimen of *Balaenoptera borealis* for some inorg. substances gave the following results: 201.2 mg. Na, 3.8 mg. K, 62.5 mg. Ca; trace of Mg and 371.3 mg. Cl per 100 g. fluid. H_2SO_4 could not be detected. Total N in synovial fluid from the articulation of the skull and the shoulder joint ranged between 0.27 and 0.3%. The non-protein N (proteins removed by CCl_3CO_2H) was 0.089-0.104%. Albumin N, 0.19%. The albuminous compd. characteristic of the synovial fluid is pptd. by dil. AcOH at room temp. It is easily dissolved in HCl; less easily in an excess of AcOH. The filtrate from the AcOH ppt. gave no further pptn. with NaCl in the heat or with CCl_3CO_2H . The synovial fluid, therefore, seems to contain only one albuminous substance; at least it does not contain any globulin or albumin. XXXII. Organic acids in the urine. TEIJIRO YAZAWA and TAKEO SASAKI. *Ibid* 159-62.—Large quantities of org. acids are excreted in the urine of the whale; in 3 out of 5 samples analyzed, quantities equiv. to 2400-2750 cc of 0.1 N acid were found. The detns. were made by the method of Van Slyke and Palmer. Y. and S. conclude that fats, carbohydrates and the N-free part of the protein mol. undergo a different decomposition than in the other mammals, while the N-contg. part of the protein is decompd. in the same manner. XXXIII. Glycogen content of the liver of Cetacea. YOSHITUMI MASUMIZU. *Ibid* 163-4.—Technical difficulties prevented the immediate detn. of the liver glycogen; 5 to 20 hrs. after the death of the animal values ranging between 0 and 10.0% were found. The glycogen was estd. nephelometrically; no details of the method are given. XXXV. Time of appearance of sexual maturity in the Sei whale and on the follicular fluid content of the ovary of *Balaenoptera borealis*. KYO HAYASI. *Ibid* 221-34.—The follicular fluid is colorless, scarcely viscous. Sp. gr. is 1.0395 to 1.04080 at 20°. p_H is 6.2 to 6.4. On standing a small ppt. separates, giving the reactions for albumin. Probably it is fibrinogen. Water is content 91.4-92.1%, total N 1.1%, N in CCl_3CO_2H ppt. 1%. By heat coagulation 6.2% albumin was

found. The diff. proteins were fractionated by Howe's method, with Na_2SO_4 as the pptg. agent. The ratio between albumin and globulin is about 3:1. The non-protein N was detd. by using HPO_3 or $\text{CCl}_3\text{CO}_2\text{H}$. The values ranged between 175 and 499 mg. % with the former substance, while with the latter reagent values from 87 to 232 mg. % were found. Amino acid N is 58 to 66 mg. %. Ether-sol. material was 8.3 to 9.3 mg. %. The follicular fluid contained 475-754 mg. % Na, 148-282 mg. % K; 32-51 mg. % Ca; 31-52 mg. % Mg; 152-69 mg. % Cl; 21-7 mg. % inorg. S; 13-7 mg. % inorg. P. XXXVI. Bile. MAKI TAKATA. *Ibid* 235-9.—The bile from *Bal. borealis* is watery, of brownish green color, reacts slightly alk. toward litmus and has a faint fishy odor. $\Delta = 1.683^\circ$. Sp. gr. is 1.027 at 19° . Dried residue is 3.9%. One hundred g. bile contained 0.06 g. urea, 0.003 g. creatinine, 0.002 g. creatine, 0.0015 g. S as ethyl-sulfuric acid, 0.0023 g. free and 0.025 g. bound cholesterol. The fats and phosphatides amounted to 0.5 g. Hammersten's method was used for cstg. the relative quantities of cholates. One hundred cc. bile was evapd., the residue dissolved in abs. alc. and pptd. with ether. An analysis of the ether-insol. material showed a S content of 0.13% bound as ethylsulfuric acid and 2.46% S apparently present solely as taurocholic acid. The 2.46% S would represent 41.7% taurocholic acid. The ratio between taurocholic acid and glycocholic acid is about 6:4. No scymnolsulfuric acid could be detected in the bile. XXXVII. The behavior of alcoholic heart extract against syphilis. MITSUKIYO MATSUURA. *Ibid* 241-4.—Alc. exts. of the muscle of the ventricle from *Bal. borealis* and *Berardius bairdii* St. gave a strongly positive ppt. when reacting on syphilitic serum, while the tests made with exts. from the sperm whale were only slightly positive or negative. The third modification of the Meinicke reaction was employed for the test. M. concludes that the lipoids of the heart muscle of the sperm whale are of different structure than those of *Bal. borealis* and the *Berardius*. XXXVIII. Calcium, magnesium and phosphorus content in different organs. HIYOE KUSAKARI AND HIKOYA TSUTSUI. *Ibid* 245-6.—Different organs of *Bal. physalus*, as pancreas, spleen, liver, kidneys, testicles, ovary, brain and mammary gland, were analyzed for Ca, Mg and P. XXXIX. A red dye from ambra, the ambra-porphyrin. A contribution to the spectroscopic investigation of porphyrins. YOSHIO OKAHARA. *Ibid* 247-66.—The red dye isolated by Suzuki (C. A. 20, 1671) from the ether-insol. part of ambra by means of dil. HCl, giving the spectrum of the porphyrins in amyl alc. soln., was purified by different org. and inorg. solvents, until a homogeneous substance was obtained, as seen by the constancy of the spectrum, when the process of purification was repeated. In ether soln., the dye resembled the coproporphyrin of H. Fischer; in alk. soln., however, it deviated from the latter considerably. A cryst. ethyl ester of the substance was prepd. G. SCHWOCH

12—FOODS

F. C. BLANCK AND H. A. LEPPER

The chemical composition of rice chaff. L. BORASIO. *Giorn. risicoltura* 81, 48-50(1928).—The by-product of the first milling operation on rough rice is composed of the paleacae enclosing the grains. This is 18-20% of the original wt. Analyses of 5 samples (from 4 varieties of rice) gave 9.80-11.00% H_2O , 15.68-18.24 ash, 14.50-17.50 HCl-insol. ash, 2.94-3.62 crude protein, 0.88-1.20 Et_2O ext., 41.10-42.90 crude cellulose and 24.70-27.90 non-nitrogenous ext. The ash of the chaff from *Originario* analyzed 94.50% SiO_2 , 0.25 CaO, 0.23 MgO, 1.10 K_2O , 0.78 Na_2O , 0.53 P_2O_5 , 1.13 SO_3 and traces of Cl, Fe and Mn. Rice chaff cannot be used for feeding, has little value as fertilizer or bedding for animals and is useless for making paper. It is used to some extent as fuel. The best possible utilization is for the production of gas, charcoal, tar and AcOH by dry distn. ALBERT R. MERZ

The silica content of Italian rice meals. L. BORASIO. *Giorn. risicoltura* 18, 8-10 (1928).—Av. analyses are given of "pula" from the first and second pearling machines and of "farinaccio" from the third and fourth (3 samples of each). These are compared with those of Indochinese, American and Japanese meals. Italian com. "pula," contg. 18-24% protein and fats, is always adulterated. The SiO_2 in unadulterated Italian "pula" is 1.00-1.40% and in "farinaccio" 0.30-0.40%. Com. Italian meals ("pula") contain 5.80-9.20% SiO_2 . ALBERT R. MERZ

A method for testing moisture in dried prunes. E. H. WIEGAND AND D. F. BULLIS. Oregon Agr. College Expt. Sta., *Circular* 82, 1-8(1927).—The usual methods for detn. of H_2O in fruit are inadequate for dried prunes. The app. for the proposed method

consists of a distn. flask, connected to a graduated tube serving as the receiver of a reflux condenser, 200 cc toluene and 20 g. hashed prune flesh are introduced into the flask and boiled vigorously for 30 mins. The % H_2O is read off directly from the graduations. Accuracy to within 0.25% is readily obtained. Most samples collected during 2 yrs. contained 15-25% H_2O . Of those samples given storage tests at 86 F. and relative humidities below 75%, all contg. less than 20% H_2O remained in good condition, while most samples contg. more than 20% H_2O molded.

Perfumes used in the food industry. F. SCHMITT. *Rev. prod. chim.* **30**, 161-6, 203-7, 321-6(1927).—A review. A. L. MEHRING

United States grades, color standards and packing requirements for honey. E. L. SECURIST, J. I. HAMBLETON AND H. W. SAMSON. U. S. Dept. Agr., *Circ.* **24**, 1-32(1927).—A full description of the new honey grades. C. R. FELLERS

Report on (the detection of artificial invert sugar prepared by enzyme conversion in) honey. H. A. SCHUETTE. *J. Assoc. Official Agr. Chem.* **11**, 164-6(1928).—Preliminary study of the Anerbach and Bodlander method (C. A. **18**, 2565), based on the resp. glucose: fructose ratios in honey and artificial invert sugar showed that the time of 1 reaction of glucose (3-4 hrs. required to reach equil.) should be clearly specified, and 2 hrs. is suggested. Analysis of a small no. of American honeys indicated that the 1:1.06 glucose: fructose ratio given by Anerbach and Bodlander as a min. for genuine honey is also applicable to American products. Addn. of as little as 2% com invert sugar was clearly shown. A. PAPINEAU-COUTURE

Determination of citric acid in fruits and fruit products. B. G. HARTMANN AND F. HILLIG. *J. Assoc. Official Agr. Chem.* **11**, 257-6(1928); cf. C. A. **21**, 2451.—A technique is worked out and described in detail for the application of the previously described method to fruit products, without removal of sugars. The main points are: use of a definite quantity of solids in the portion taken for conversion of citric acid into pentabromoacetone so as to make the vol. of $KMnO_4$ used const. (12.5 g. is the limit for max. recovery of pentabromoacetone); presence of at least 80 mg. citric acid (smaller quantities give unduly low results) and preferably not much over 100 mg.; deficiency of citric acid in the sample being made up by adding known amts and correcting; the above conditions allow of specifying definite and const. amts. of the several reagents; instead of correcting for the soly. of the pentabromoacetone by adding 1.7 mg. citric for every 100 cc. of reaction mixt., the citric acid corresponding to the pentabromoacetone weighed is multiplied by the const. factor 1.14. Results obtained by this method on a variety of fruits and fruit products are tabulated, and showed good agreement between the known and found citric acid in samples of known compn. Concord grape juice contained a small quantity of citric acid, confirming Nelson (C. A. **19**, 1586). A. P.-C.

Fruit jellies. III. Jelly measurements. L. W. TARR. Univ. of Delaware Agr. Expt. Sta., *Bull.* **142**, 1-33(1926); cf. C. A. **17**, 1849; **19**, 1740; **21**, 3688, 3988.—A jelly-strength tester is described. The total acid required to produce a jelly as well as the optimum jelly varied with the acid, being greatest with citric, intermediate with tartaric and least with H_2SO_4 . The strength of the optimum jelly varied with the acid in the reverse order. Increasing the concn. of acid increased the strength up to a certain optimum after which the strength decreased. The relation of H_2SO_4 , tartaric and citric acids in jelly formation was 1:2:3 which indicated a combining relation. Jelly was produced at the same pH with each acid. The H-ion concn. at which the optimum jelly formed varied according to the acid employed, which indicated a salt effect. The strength of the jelly was decreased by added sugar and increased by pectin within certain limits. Boiling the pectin with acid before adding the sugar reduced its strength. The length of boiling did not appreciably affect the strength, but it was decreased by increasing the temp. The skin effect was small in fruit jellies, probably because of the small amt. of free H_2O . A. L. MEHRING

The banana. P. DE SORNAY. *Rev. agr. Maurice* **5**, 1-4(1928); cf. C. A. **17**, 2460.—Attention is again called to the economic value of the banana. A method of sun drying is described, also another procedure with the use of an artificial drier, which is illustrated. In the prepn. of banana flour it is necessary to use fruit of the proper degree of maturity. Very green bananas give bitter flour, and those that are too ripe yield a dark colored, acid product. It is advisable to add vanilla or a similar material to improve the flavor. F. W. ZERBAN

The pineapple industry. C. A. O'CONNOR. *Rev. agr. Maurice* **5**, 4-9(1928).—A report on the culture and com. preserving of the pineapple in South Africa. F. W. Z.

Some technical phases of the ice cream improvement program. H. C. SMITH, R. W. NEWMAN AND K. W. NIELSEN. Calif. Dept. Agr., *Mo. Bull.* **17**, 239-46(1928).—California ice cream must contain not less than 1.6 lb. of food solids per gallon, not less

than 10% milk fat nor over 100,000 bacteria per g. A shipping case for ice cream samples is figured. Chem. and bacteriol. methods of lab. examn. are given. C. R. F.

Estimation of buttermilk or milk product in a mixed feed by* determination of the lactose present. M. R. COE. *J. Assoc. Official Agr. Chem.* 11, 251-7(1928).—A modification of the picric acid method for the colorimetric detn. of lactose (described in detail) was used in the analysis of a large no. of samples of dried buttermilk, which, when manufd. in warm weather (June), had high ash (10.13-14.26%) and lactic acid (3.72-8.93%) contents and low lactose (7.10-23.73%), and when manufd. in cold weather (Feb. and March) had low ash (7.79-11.76%) and lactic acid (0.77-6.00%) and high lactose (22.55-42.17%). Comparison of the picric acid and Cu reduction methods on buttermilk contg. about 30% lactose gave practically identical results (av. of 7 samples, 29.48, 29.65%, resp.). A method (described in detail) is proposed for detn. of lactose in feeds, consisting essentially in fermenting the other sugars by yeast and then detg. lactose either colorimetrically by picric acid or by Cu reduction. Apparently the only feedstuffs contg. interfering substances that render the method inapplicable are cottonseed meal and soy-bean meal, which are not generally present in buttermilk feeds. When the lactose content of the buttermilk used in the feed is known, the buttermilk content can be calcd. with reasonable accuracy, and as little as 0.5% can be detected. When the lactose content of the buttermilk is not known, the max., approx. or min. buttermilk content can be calcd. from the min. (8%), av. (26%) or max. (40%) lactose content of buttermilk powder. The usefulness of the picric acid method lies in its accuracy in detg. small quantities of lactose. A. P.-C.

Critical factors in the determination of solids in milk. G. KOESTLER AND W. LORTSCHER. *Landwirtschaftliche Jahrb. der Schweiz* 41, 822-60(1927).—K. and L. point out the variations due to the form in which the ingredients occur, such as the hydration of the sugar and the influence of the proteins on the hydrates. A valuable formula is given for detg. sp. gr. of solids-not-fat. GEORGE R. GREENBANK

A comparison of the methylene blue reduction test and the agar plate count for determining quality of milk. H. B. ELLENBERGER, M. C. BOND, A. H. ROBERTSON AND RUTH I. MOODY. Vermont Sta., *Bull.* 264, 32 pp (1927).—The methylene blue reduction test shows much less ($\frac{1}{10}$ as much) variability between check or duplicate tests than does the agar plate method. The methylene blue reduction time correlates much more closely with the keeping time of the milk than does the agar plate count. The methylene blue reduction test is a more reliable index of milk quality than is the agar plate count. E. F. SNYDER

Determination of starch in bread, particularly in so-called "gluten bread." P. MEURY AND G. BOVELDIEU. *Ann. fals.* 21, 124-30(1928); *J. pharm. chim.* [8], 7, 207(1928).—From a discussion of the relative merits of Pb subacetate and HgSO₄ as defecating agents, it is concluded that the latter gives more accurate results in bread analysis. From the results of a study of the technic of the detn., the following procedure is recommended: to 3 g. of finely ground, previously dried (to const. wt. at 100-5°) bread in a 100-cc. volumetric flask add 95 cc. of 2% (by wt.) of 66° Bé. H₂SO₄, hydrolyze 20-5 min. in the autoclave at 120°, cool, make to 100 cc. with 2% H₂SO₄, filter, to 25 cc. of filtrate add 10 cc. HgSO₄ (yellow HgO 200 g., 66° Bé. H₂SO₄ 175 cc., H₂O to 11.), nearly neutralize with 36° Bé. NaOH (about 6 cc.), cool, make to 50 cc., filter into a flask contg. 3-4 g. Zn powder, let stand 30 min. with occasional shaking, filter, det. dextrose in the filtrate either polarimetrically or (preferably) by reduction *via* Lehmann modified by F. and Boutot (*C. A.* 16, 4222). A. P.-C.

The analytical detection of the bleaching of wheat flour. HOLGER JØRGENSEN. *Separate* (Copenhagen) 1928, pp. 47-70.—This is an English summary of the Danish article on pages 1-47. Since bleaching of flour is prohibited in Denmark, a method of detecting it is important. The Pekar "water test" for color is not suitable, since it is a measure of the bran particles, while the carotin in the fat is the constituent affected by bleaching. An adaptation of the gasoline color value, developed by Winton, has proved satisfactory. If the color of a $\frac{1}{200}$ % soln. of K₂CrO₄ is given a value of 100, unbleached flour that has not been stored has a value above 95. Some weakly bleached flours may be missed by this method. Bleaching by HNO₃ is detected by the Griess-Ilosvay's color test with sulfanilic acid and α -naphthylamine. Unbleached flours may show 10⁻⁴ g. nitrite nitrogen per kg. flour. In flour bleached with Cl the Cl content of the fat detd. with NH₄CNS is more than 15 mg. per kg. Exposure of unbleached flour to salt spray does not affect this. Flour bleached with NCl₃ may give the same test. Benzoyl peroxide can be detected when first added, but soon changes to benzoic acid. Four tables and specific directions for making the tests are given. AMY LÉVESCONTÉ

Preparation of butter samples for analysis. J. A. NEWLANDER AND H. B. ELLEN-

BERGER. Vermont Sta., *Bull.* **263**, 31 pp. (1927).—The official method of prepg. butter samples for analysis gives satisfactory and accurate results if either procedure A, B or C as outlined, is used. The opening of the softened sample at a temp. of 31–34°, and the mixing of same with a malted milk mixer, results in an appreciable loss of moisture. The factory or open-cup method allows considerable moisture to escape from the sample. If butter samples are carefully prepd. and accurately tested, about 90% of the duplicate detns. of moisture should check within 0.05%. There should be few variations greater than 0.10%. Two standard methods are suggested for the prepn. of butter samples for analysis. **E. F. SNYDER**

The effect of various rations on the storage quality of eggs. **R. M. SHERWOOD.** Texas Agr. Exp. Sta., *Bull.* **376**, 12 pp (1928).—Eggs laid by hens receiving a mash contg. 20 to 30% of 43% protein cottonseed meal began to deteriorate in color at the end of 4 weeks in cold storage while 9% of 43% protein cottonseed meal produced eggs which kept a good color as long as 28 weeks in cold storage. Hens fed an all mash ration contg. approx 9 or 12% of 43% protein cottonseed meal laid eggs that deteriorated in color after being held in cold storage 4 weeks. Fresh succulent green feed improves the storage quality of eggs. **J. J. SKINNER**

Studies on the Coccaceae. VIII. A study of the cocci resisting pasteurization temperatures. **G. J. HUCKER.** N. Y. Agr. Expt. Sta., *Tech. Bull.* **134**, 1–30 (1928).—*Streptococcus thermophilus* Orla-Jensen was the predominating coccus in pasteurized milk. *S. lactis* was never found in freshly pasteurized milk. **C. R. FELLERS**

Soy-bean meal and ground soy beans as protein supplements for dairy cattle. **A. J. TOMHAVE.** Delaware Agr. Expt. Sta., *Bull.* **148**, 9 pp (1927).—Soy-bean meal when fed with a basal ration of 200 lbs. hominy, 200 lbs. bran and 5 lbs. of salt, in such proportion as to give a mixt. with a nutritive ratio of 1:3.52, was about 3% less efficient than peanut meal and gave as good physiol. results. When substituted lb. for lb., ground soy beans were about 2% less efficient than peanut meal for milk production. Soy beans are a valuable source of protein for the dairy ration. Comparing the results obtained in this expt. in feeding soy-bean meal and ground soy bean as protein supplements in the dairy ration, a lb. of digestible protein in ground soy beans is slightly more efficient for milk productions than a lb. of digestible protein in soy-bean meal. Because of the high protein content of soy-bean meal, it has a higher value per ton than ground soy beans. **J. J. SKINNER**

Bacteriology and chemistry of oysters, with special reference to regulatory control of production, handling and shipment. **A. C. HUNTER AND C. W. HARRISON.** U. S. Dept. Agr., *Tech. Bull.* **64**, 1–75 (1928).—Analyses are given of the solids, ash and NaCl content of the meats, liquor and entire sample of normal oysters from various producing localities in the U. S. The solid content of northern oysters is higher than that of southern oysters. The moisture content of unwashed oyster meats varies from 73 to 85%. Tests for heavy metals in samples of oysters from different Atlantic Coast states showed traces of Pb and appreciable quantities of As, Cu and Zn. Adulteration of oysters with excessive quantities of water may be detected by phys. examn., by a detn. of free liquor, and by the NaCl content of meats and liquor. The results indicate that oysters showing free liquor in excess of 10% by vol. are adulterated by water. Multiplication of *B. coli*, or other lactose-fermenting bacteria, does not occur when shucked oysters are stored below 50° F. Pasteurization of shucked oysters is impractical if the product is to be marketed raw, and ordinary cooking processes cannot be relied upon to sterilize oysters that may contain pathogenic bacteria. A study of the change in compn. of the meats and liquor of shucked oysters when subjected to different washing processes showed that the most efficient and safest method of washing is by use of a blower with salt water. A bibliography of 106 references is appended. **W. H. ROSS**

Some fundamental principles in food packing. **GLASS CONTAINER ASSOCIATION RESEARCH LABORATORY STAFF.** **S. HENRY AYERS, et al.** *Glass Container* **7**, No. 7, 16–34 (1928).—A popular discussion including chem., bacteriol. and engineering phases of the food-preservation industry. **C. R. FELLERS**

Chemical engineering in the meat packing industry. **C. ROBERT MOULTON.** *Chem. Met. Eng.* **35**, 296–8 (1928). **E. H.**

Report on (the detection of) stock feed adulteration. **H. E. GENSLER.** *J. Assoc. Official Agr. Chem.* **11**, 155–6 (1928).—The following method is suggested for the microscopical detection of dried buttermilk in stock feeds: on a clean glass slide mount in H₂O about 5 mg. of the portion of the feed passing through a 40-mesh sieve, dry in a warm place, immerse 1 min. in gasoline or xylene, dry, immerse at least 1 min. in 90% alc. and then in fresh aq. methylene blue soln. for 5–60 sec., rinse in H₂O, decolorize in alc. for several sec. (watching so that decolorization does not proceed too far), dry, exam.

under the microscope, using a 1.9 mm. oil-immersion objective without a cover-glass. If areas contg. many blue-stained bacilli are found, dried buttermilk is present. Collaborative results on samples of known compn. showed the method to be practical and reliable.

A. PAPINEAU-COUTURE

Report on (the determination of) moisture in feeding stuffs. G. E. GRATTAN. *J. Assoc. Official Agr. Chem.* 11, 160-2(1928).—The method outlined by Coleman (*C. A.* 21, 3092), consisting essentially in placing a 2-g. sample in a flat metal dish with tightly fitting cover, heating 1 hr. at 130°, covering and weighing when cold, gives results comparable with the vacuum-drying method for flour; but for feeds (bran, shorts, middlings and feed flour) 2-3 hrs. at 135° are required.

A. PAPINEAU-COUTURE

Report on (the determination of lime and iodine in) mineral mixed feeds. H. A. HALVORSON. *J. Assoc. Official Agr. Chem.* 11, 157-60(1928); cf. *C. A.* 21, 2341.—Collaborative results on the previously suggested method for CaO gave fairly satisfactory results, which would probably be improved by greater familiarity of the collaborators with the method. Collaborative results on the previously proposed method for I gave low results, but is considered worthy of further study. Substitution of FeCl₃ for H₂O₂ and CCl₄ for CS₂ was found unsatisfactory.

A. PAPINEAU-COUTURE

Fish meal as a food for animals and poultry, and improved continuous process. R. A. BELLWOOD. *Chemistry and Industry* 47, 433-5(1928).—A discussion of expts. carried out as to the value of fish meal as a feeding stuff, and of the results published. For many years there was a great controversy as to whether fish meal did or did not taint the meat obtained from animals. Had the fish meals been as pure as they are to-day these controversies would probably never have arisen. White fish meal is made from non-oily fish, and is in the greatest demand. For herring meal it is necessary that the oil be extd. A description in detail is given of the manuf. of fish meal in a modern plant using the latest process.

J. C. JURRJENS

The decomposition of *p*-phenetylcarbamide (dulcin) on heating in aqueous solution (TAUFEL) 2. Incinerating oven (for flour) (FORNET) 1. Mixing mill for foods (Brit. pat. 276,196) 1.

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Softening water in small quantities. *A. BATTIGE*. *Apparatebau* 40, 89–90 (1928).—Description of a small soda-lime plant. *J. H. MOORE*

Sodium aluminate as an aid to water softening. *COMMITTEE REPORT AM. RY. ENG. ASSOCN. Railway Age* 84, 560–5 (1928).—In the soda-lime treating process using 1 to 3 gr. per gal. of $\text{Al}_2(\text{SO}_4)_3$ or FeSO_4 the hydrates formed in the reaction causes the light $\text{Mg}(\text{OH})_2$ particles to settle more quickly and aids in freeing the softened water from CaCO_3 . The latter come out of soln. only slowly and cause after-pptn. and scale in pipe lines. If $\text{Al}(\text{ONa})_2$ instead of FeSO_4 or $\text{Al}_2(\text{SO}_4)_3$ is used, more rapid and complete pptn. occurs. The optimum dosage is $1\frac{1}{2}$ gr. per gal. *C. R. FELLERS*

Electroosmotic water purification. *A. H. W. ATEN*. *Chem. Weekblad* 25, 211–9 (1928).—The app. (Siemens Elektro Osmose G. m. b. H) for water purification consisting of cells divided by special diaphragms in 3 parts depends on unequal ion mobility in the porous division walls not on electroosmotic effects. The technical cells are constructed as a filter press (10 cells in series) with prepd. filter cloth; the cathode and anode spaces are washed with water to prevent excessive salt concn.; 120 v. are used, c. d. 0.2 amps. per cell, rate of flow of the water to be purified 60 cc. per min. of the washing water 8 cc. per min. for the first 8 cells, 2 cc. per min. (of purified water) for the last 2 cells. The net yield is 72 l. purified water (cond. 9×10^{-6} , p_H 4.5) per 24 hrs., 190 l. washing water required, 2.4 kw. hr. The c. d. tends to rise after a few days; it can be lowered by more wash fluid. The action of the successive cells was rather irregular as regards the decrease of salt concn. The resulting water was within the limits of the requirements for distd. water (Dutch Pharm.) for dissolved salts, the org. matter was 0.8 to 1.0 cc. 0.01 N KMnO_4 per 100 cc. solid matter 1.0 to 1.4 mg. per 100 cc.; after 24 hrs. standing (CO_2 escaped) p_H decreased to 5.5, sp. cond. dropped to 6.5×10^{-6} . The bacterial count decreased from 500 to 2 in the process (river water being used). The anodic diaphragms are strongly attacked by Cl_2 after a short time; the energy and water cost of the process compares favorably with ordinary distn. Theoretical considerations are given on the action of the cells; it is found that only a small difference in mobility of the ions through the diaphragms will suffice to give satisfactory purification; the action of the H^+ and OH^- diffusion back into the middle space of the cells will also contribute to the purification. The corrosion of the diaphragm is the most serious drawback. *B. J. C. VAN DER HOEVEN*

The chlorination of water. *L. W. HAASE*. *Gas u. Wasserfach* 71, 385–90 (1928).—The effect of chlorination on the p_H and temporary and permanent hardness of natural water and pure water to which org. matter, CaCO_3 , etc., had been added was studied experimentally. The p_H of the water was detd. by the quinhydrone electrode, with

special precautions such as igniting the Pt wire at frequent intervals and the use of sufficiently large vols. of soln. Total hardness was detd. by adding an amt. of $\text{Na}_2\text{S}_2\text{O}_8$ equiv to the Cl_2 or, by electrotitration, which was also used for temporary hardness. In water contg carbonate or bicarbonate, Cl_2 reacts in the usual way to give $(\text{CaOCl})_2$ and $\text{Ca}(\text{HCO}_3)_2$. The presence of org. matter may act as a "catalytic accelerator" by reacting with the Cl_2 , hydrolyzing and the resulting HCl reacting with CaCO_3 to give $\text{Ca}(\text{HCO}_3)_2$. A portion of the Cl_2 will also react to form chlorides. The above reactions result in the p_{H} of the water changing toward the acid side (p_{H} 8-9 to 6-7), and may result in the increase of the permanent and temporary hardness, depending on the amt. and nature of the org. matter and the amt of carbonate present. The addn. of small quantities of $\text{Ca}(\text{OH})_2$ is suggested as a means of avoiding corrosion where the quantity of carbonate is small. R. W. RYAN

Recent developments in water treatment. J. R. BAYLIS. *Water Works* 67, 37-9 (1928).—See C. A. 22, 1640. C. C. RUCHHOFF

Water treatment plant at the Philips Glow Lamp Works, Eindhoven, Holland. WILLEM RUDOLFS. *Water Works* 67, 7-8 (1928).—An unusual treatment plant the supply for which is obtained from 42 driven wells with a capacity of 2.1 million gallons per day is described. The water is aerated, filtered through lava to remove CO_2 , treated with KMnO_4 to remove Fe and Mn and filtered through sand. C. C. RUCHHOFF

Electrolysis and methods of mitigation. W. B. BUCHANAN. *Can Eng* 54, 121-2, 176 (1928).—A discussion of stray ground currents in water mains and methods for their measurement. C. C. RUCHHOFF

The p_{H} value of the water of the Black Sea as compared with that of the salt lake of Tékir-Ghiol. N. I. COSMOVICI. *Ann. sci. univ. Jassy* 15, 131-2 (1928).—The detns. were carried out colorimetrically by means of thymolsulfonephthalein during the month of July. The p_{H} of Black Sea water was 8.3-8.5, was apparently unaffected by temp. or by wind, but increased by the agitation caused by waves and by increase in the algae and plankton content; the nature of the bottom (sandy or rocky) had no apparent effect on the p_{H} . The p_{H} of the water of Lake Tékir-Ghiol was const. (8.6) and slightly higher than that of the Black Sea. As it contains considerable H_2S , Legendre's hypothesis that the lower p_{H} of Black Sea water at a depth of 180 m. (7.26) is due to the presence of H_2S is considered to be erroneous. A. PAPINEAU-COUTURE

Boiler feed water purification, the "Neckar" system. G. J. FLUX. *Hel Gas* 48, 115-22 (1928).—The "Neckar" system here described consists of a treatment with soda in the heat; the alk. used was between 5 and 10 cc. 0.1 N HCl per 50 cc. water (0.3° Bé). Deposits found in a waste heat boiler after prolonged use consisted mainly of SiO_2 (from colloidal Na_2SiO_3). It is calcd. that by a 7.2% blowdown this danger can be avoided. B. J. C. VAN DER HOEVEN

The de-oiling of condensate from steam engines. RUZANDA RĂSCANU. *Ann. sci. univ. Jassy* 15, 71-80 (1928).—A study of the optimum conditions for the elec. de-oiling of condensed steam. Lab. tests carried out on a mixt. of condensate and raw water in beakers with Fe electrodes 210 mm. long (immersed to a depth of 180 mm. by 110 mm. wide showed that: the elec. current causes formation of Fe hydroxide which holds nearly the whole of the oil; the optimum temp. is 40-50°, because the Fe is more rapidly oxidized and the time required to obtain sufficiently clear water is reduced; agitation reduces the polarizing potential and the resistance of the water; the optimum time was found to be 25 min. (for treating 800 cc.), the amt. of residual oil decreases according to the c. d., but no proportionality was observed between the two, 20-30 millamp giving satisfactory results, too high a c. d. causes the formation of an excessive amt. of Fe hydroxide, which overloads the filter. Tests on a somewhat larger scale showed that the voltage should be varied within certain limits in order to obtain max. de-oiling. Similar expts. with Al electrodes showed that even with twice the c. d. de-oiling was no better, and the use of Al electrodes would therefore not be economical. The results of the tests were applied in designing an installation which is successfully used for treating 5 cu. m. per hr. by means of 640 Fe electrodes, 20 mm. in diam. and immersed to a depth of 920 mm., with a current of 7.2 amp. and an Fe consumption of 2.6 kg. (0.15% on the wt. of the electrodes) per month. A. P.-C.

Utilizing sewage gas. F. C. VOKES AND C. B. TOWNEND. *Public Works*, 59, 47 (1928); cf. C. A. 22, 655.—It was estd. that 160,000,000 cu. ft. of gas (500 B. t. u.) per annum could be recovered from 100,000 cu. yds. of sludge at the Saltley works (primary digestion tanks) of the Birmingham, England, sep. sludge digestion plant. So far a 150 h. p. vertical gas engine, a 100 kw. 4000 v. alternator and 144 floating concrete gas collectors, each 10 ft. by 20 ft. have been installed. The above collection

system yields about 16,000,000 cu. ft. of gas per annum, and the plant has been running on full load since it was installed in 1927. C. C. RUCHHOFF

Effect of lime on sludge digestion. W. RUDOLFS, H. HEUKELERKIAN, P. J. A. ZELLER, D. PETERSON and J. R. DOWNES. N. J. Agr. Expt. Sta., *Ann. Rept.* 1926, 412-43.—The effect of lime on sludge digestion is pronounced, influencing the flora and fauna and consequently the chem. intermediate and end products. Lime also changes the physico-chem. relation in sewage solids so that the solids are differently distributed in the liquid phase with different amts. of lime or, better, with different reactions. In general, lime addns. up to a certain point stimulate the numbers of bacteria, but max. numbers do not necessarily mean max. digestion. With higher reactions (above p_H 7.6) great fluctuations in bacterial numbers occur, indicating a condition of instability. At these higher reactions (p_H 8.2 and 8.8) odors emanating from the digesting material are stronger and more offensive. The numbers of protozoa decrease markedly when the reaction of the digesting material is changed from p_H 7.2 to 7.6 and higher reactions cause rapidly alternating increases and decreases but the variations of p_H values between 7.2 and 8.8 have no limiting effect on the variety of species. If the reaction of incoming fresh solids is kept at p_H 7.3 to 7.6 odors are practically absent. Daily addns. of fresh solids kept at p_H values of 7.3 to 7.6 can be increased from 2 to 3.5% dry solids (on the basis of ripe sludge) and with careful manipulation possibly to 5%, reducing the relation of ripe sludge necessary for efficient digestion from 50 to 1 of fresh solids daily, to 30 to 1. J. J. SKINNER

Water supply, sewage treatment and refuse disposal in 1927. H. BURDETT CLEVELAND. *Public Works* 59, 14-8(1928).—A brief review of progress in the science and art of each, illustrated by notable installations during the year. C. C. R.

Cementation of strata below reservoir embankment. A. A. BARNES. *Munic. Eng. Sanit. Record* 79, 628(1927).—A method is given to stop the egress of water under the embankment of reservoirs. A series of holes was bored into which a dil. mixt. of 1 part of slow setting cement and 20 parts of water were poured. This method was twice repeated, the leakage of over a million gal. per day being finally stopped. Another method for a reservoir holding 500 million gals. was to force grout under special conditions into cleaned bore holes. Estd. savings were £68,645. C. H. BADGER

Municipal works and statistics of Spenborough (England). A. ROTHERA. *Munic. Eng. Sanit. Record* 79, 517-8(1927).—A brief description of the sewage disposal works and water supply is given. C. H. BADGER

Up-to-date sewage works. Hoscar and Pemberton installation (Wigan, England). R. B. DONALD. *Munic. Eng. Sanit. Record* 79, 544(1927).—The plants and the sewage treatment are described. The area of the Hoscar works is $27\frac{3}{4}$ acres and the area of the Pemberton works which treats storm water only is 118 acres. All sewage passes through $\frac{1}{2}$ in. bar screens and raking app. electrically driven. Sludge in the different tanks is removed automatically or by gravitation to sludge drying beds. Storm water is pumped into 4 reinforced tanks. The sewage received at Hoscar is treated with 3 to 5 grains of aluminic ferric after the removal of the rough solids. It then passes through a preliminary settling tank to 3 settling tanks, thence to a receiving chamber and on to 2 batteries of 11 bacteria beds each. The sludge beds are made of graded coke and cinders. The bacteria beds are made of specially graded slag resting on aeration tile. The effluent and the effluent from the humus tanks pass into the river Douglas. Provision is made for a D. W. F. of 3,300,000 and a W. W. F. 3 to 6 times this amt. C. H. BADGER

New sewage works at Coseley, Staffs (England). I. E. W. BERRINGTON. *Munic. Eng. Sanit. Record* 79, 574(1927).—Coseley is divided into 2 equally populated areas as regards the treatment of sewage. As all of the sewage of the north area would have to be pumped it was found to be more economical to drain in the adjoining district of Bilston. The outfall works and sewers, the purification works and the method of purification of the south area are described. Use is made of screening and detritus chambers, liquefying tanks, storm water tanks, sepg. tanks, followed by filtration through circular percolating filters, the effluent from the filters being passed through humus tanks and thence into a brook. C. H. BADGER

Dunfermline (Scotland) waterworks. J. D. CAPB. *Munic. Eng. Sanit. Record* 79, 611(1927).—The works were opened in 1924, the total cost being £400,000. The whole of the district supply is by gravitation. There are 130 miles of mains from 36 in. diam. downward. An attachment to the Venturi meters gives information when consumption rises above a certain figure. Serious bursts are therefore immediately noticed. To get rid of objectionable taste and smell from a weed "Nitella Flexilis" which grew abundantly in the reservoir in summer an application of 1 part CuSO_4

to 10,000,000 parts water was tried. The water was reported free from smell in 4 days. This treatment is repeated annually. The application of $\frac{3}{4}$ grain lime per gal. was unsuccessful. C. H. BADGER

Tenement refuse. Storage and collection. D. KENNEDY. *Munic. Eng. Sanit. Record* 79, 670(1927).—K. recommends that dust bins should be substituted for sacks and bags. They should be of a suitable size to be easily handled and be placed in accessible places for daily collection. "Dust holes" and shoots should be abolished. C. H. B.

Engineering science applied to refuse disposal. H. ARDERN. *Munic. Eng. Sanit. Record* 79, 670(1927).—A discussion on screening and sepn. of house refuse. C. H. BADGER

The law relating to smoke abatement (England). J. L. BIGH TURNER. *Munic. Eng. Sanit. Record* 79, 529(1927) Interpretation and discussion. C. H. BADGER

Medicinal muds of Crimean salt lakes (SAGAIACHNUIT) 11A. Sewage and sulfate of ammonia effluents (PLANT) 21. Apparatus for aerating water (Brit. pat. 276,495) 1.

Base-exchanging materials. A. ROSENHEIM. Brit. 276,967, Sept. 1, 1926. In producing base-exchanging substances from minerals such as leucite, feldspar, nepheline, orthoclase, plagioclase, adularia, microcline, sodalite, noscan, haüyne, lapis lazuli or similar minerals or from industrial glass the initial material is vitrified or revitrified, e. g., by heating in an elec. furnace with or without addn. of fluxes such as Na_2CO_3 , Na_2SO_4 , lime or waterglass, prior to treatment (with or without sepn. of unvitrified constituents) by the process described in Brit. 266,313 (*C. A.* 22, 377). Fused Na K feldspar may be converted into granules and treated with waterglass soln. at 200° under 16 atm. pressure for 2–3 hrs.

Base-exchanging silicates. P. N. ENGEL. Brit. 277,082, June 7, 1926. Base-exchanging silicates are produced by reaction between an alkali metal silicate, a non-alk. soln. of an amphoteric metal salt such as $\text{Al}_2(\text{SO}_4)_3$ and an acid such as H_2SO_4 in such proportions that a product is produced contg. 1 mol. of alkali metal oxide, 1 mol. of amphoteric metal oxide and 10 or more mols. of SiO_2 .

J. J. SKINNER

Physical characteristics and silvicultural importance of podsol soil. P. W. STICKEL. *Ecology* 9, 176–87(1928).—In regions of humid climate, where rainfall is abundant, and winters are severe, there exists a tendency toward the podsolization of forest soils. This soil formation is characterized by a leached layer, gray in color, immediately beneath the org. horizon, and an enriched horizon, burnt sienna in color, below the zone of outwashing. A phys. and chem. examn. of a typical northern podsol profile shows that more org. matter, clay particles and chem. elements are present in the enriched zone than in the leached zone. Cool temps. and acid conditions further the podsolization process because of incomplete oxidation and decompn. A tendency toward podsolization can be combated by opening up the stand and by encouraging the admixture of hardwoods such as ash, birch, maple and beech. E. F. SNYDER

Role of silicic acid as a protective colloid in the formation of Mediterranean red earths. A. REIFENBERG. *Z. Pflanzenernähr. Düngung Bodenk.* 10A, 159–86(1927).—From a comprehensive discussion of the various influences which may play a role in the formation of the red earths, and from cataphoretic and pptn. expts. on the influence of silicic acid gel on the state of the sols of $\text{Fe}(\text{OH})_3$ and $\text{Al}(\text{OH})_3$, it is concluded that the formation of red earths in the subtropical zone is due to the protective action of the silicic acid on the gels of Al and Fe hydroxide. The reciprocal pptn. of the sols of silicic acid and $\text{Al}(\text{OH})_3$ and $\text{Fe}(\text{OH})_3$ cannot explain the formation of the red earths,

but the action of silicic acid as a protective colloid can explain the formation of red earths and the accumulation of $\text{Fe}(\text{OH})_3$ and $\text{Al}(\text{OH})_3$ in these soils even when they are formed from a limestone.

R. M. BARNETTE

A critical view of the question of "fossil" soils and tropical weathering. P. W. E. VAGELER. *Z. Pflanzenernähr. Düngung Bodenkd.* 10A, 193-205(1928).—A critical review of the literature of the formation of red earths and laterites. R. M. BARNETTE

The role of microorganisms in the transformation of organic matter in forest soils. S. A. WAKSMAN, FLORENCE G. TENNEY and K. R. STEVENS. *Ecology* 9, 126-44(1928).—The org. matter of forest soils or forest "humus" should be considered in the light of the compn. of the natural plant products which contributed to its formation and accumulation, the environmental conditions under which the decompn. of natural org. matter has taken place, and the nature of the microorganisms which have been active in the decompn. processes. Forest "humus" is made up (1) of a no. of the residual constituents such as the celluloses, hemicelluloses, fats, waxes, etc., of the various plant products (leaves, twigs, roots, mosses, etc.) which are undergoing decompn.; (2) of the constituents of the plant products which are more or less resistant to decompn., such as the lignins, cutins, tannins, resins, etc.; (3) of the microbial cells (fungus mycelium, spores, bacterial cells, protozoa, worms, etc.) synthesized in the process of decompn. of the natural org. materials continuously added to the soil, and (4) of the products of decompn. of the natural materials and cell products, such as org. and inorg. acids, NH_3 , etc. A series of methods has been developed for comparing the compn. of the org. matter of forest soils with that of fresh undecompn. plant products. The use of alkalies and other reagents in detg. the various "humic acids" and numerous other acids and so-called acids in the org. matter of forest soils is altogether unjustified. R. F. S.

Dynamic relations between plant and soil, with special reference to the supply of water and oxygen. B. E. LIVINGSTONE. *Proc. Nat. Acad. Sci.* 14, 293-5(1928).—For the climatic conditions of a Baltimore summer, white clover and Kentucky bluegrass continue to appear healthy as long as the soil supplies water at the rate of 80 g. per hr. per sq. m. of absorbing surface. When the water supply is reduced to $1/2$ of these figures the plants become vegetatively dead within 2 or 3 days. O necessary for germination varies with different seeds and with the temp. The O requirement for roots of ordinary plants is 3 mg. per sq. m. per hr. This is equiv. to 2 ml. of O or 10 ml. of air.

L. W. RIGGS

The effect of dehydration of soils upon their colloid constituents. III. J. L. STENKAMP. *Soil Science* 25, 327-32(1928); cf. *C. A.* 22, 2227.—When soil material is dried distinct cementation of colloidal material increases the silt fraction for all methods of analysis. The exchangeable bases in unweathered soils and in cultivated soils contg. humus increase with drying with a corresponding increase in acid-salt-forming bases. The highest value for acid-salt-forming bases going into soln. with 0.1 N acid and the lowest figures for neutral-salt-forming bases were obtained with soil dried in CO_2 as compared with those dried in O, N and air. The absorption of salts, except PO_4 , decreases with dryness. Only air-dried soil of high humus content showed reversibility of the colloidal condition after being treated 21 days with 0.1 N NH_4Cl soln. Soil contg. very little humus showed slight recovery except when previously dried in an atm. of CO_2 when a significant recovery was obtained. A. L. MEHRING

Analyses of soils of Morgan and Oconee counties. L. M. CARTER, M. W. LOWRY, W. O. COLLINS, M. E. BRAND and G. L. FULLER. *Ga. Agr. Coll., Bull.* 327, 36 pp. (1926).—The contents of N, P, K and Ca of many of the soils of the 2 counties are given. A table of the plant food requirements of these soils and a table of the percentage compn. of the fine material are included. J. J. SKINNER

Remarks on the mechanical analysis of soils. III. A new pipet apparatus. M. KOHN. *Z. Pflanzenernähr. Düngung Bodenkd.* 11A, 50-54(1928); cf. *C. A.* 22, 2226. —A rapid method of detg. the finer fractions in the mechanical analysis of soils by a simple pipet arrangement is described. R. M. BARNETTE

The determination of the nutrient content of the soil by pot experiments. H. WIESSMANN. *Z. Pflanzenernähr. Düngung Bodenkd.* 10A, 206-8(1928).—In testing the response of a soil to fertilization, W. used a mixt. of 1500 g. soil to 5700 g. of pure sand to which a complete fertilizer was added with the exception of the particular ingredient to be tested (*i. e.*, P or K). To overcome the phys. effects of the soil on the sand, a parallel series was set up which contained only the sand and the fertilizing materials. The yields were then corrected by comparison for the phys. influence of the soil.

R. M. BARNETTE

Comparative investigations on the estimation of phosphoric acid requirements of field soil. G. HAHN. *Bot. Archiv.* 20, 223-42(1927).—The plant physiol. soil analysis of

Mitscherlich is compared with the method of Neubauer and Lemmermann for the H_2PO_4 limit factor. H. describes an improved analytical method for H_2PO_4 . G. R. G.

The rapid determination of the phosphoric ion in soils and fertilizers, by the cerulean molybdate colorimetric method. G. DENIGÈS. *Compt. rend.* 186, 1052-4 (1928).—The procedure for soils when the P is sol. in water and in mineral or org. acids is described. For fertilizers the same technic is employed, with the sole exception that where phosphatic fertilizers are concerned, the dilns. in view of the large content of this ion should be greater with soils. E. F. SNYDER

The micro-Kjeldahl method for the determination of total nitrogen in soils. IGNAZ POLLAK AND RUDOLF DIETZ. *Oesterr. Chem. Ztg.* 31, 57-8(1928).—The micro-Kjeldahl method with a slight modification is well suited for soil investigations. It gives good results in comparison with the customary method. The convenient and quick procedure, distinguished by saving of material and time, as well as the simple control in one and the same sample, makes it possible to employ, instead of the macro-method, the micro-Kjeldahl method for the detn. of total N in soils. E. F. SNYDER

Contribution to the formulation of the microbiological analyses of the soil. W. BENCKE AND H. SODING. *Z. Pflanzenernähr. Düngung Bodenk.* 10A, 129-59(1927).—Algae (*Stichococcus variabilis*) and a fungus (*Aspergillus niger*) were used in cultures to which definite quantities of soil and fertilizer constituents had been added as a means of obtaining an idea of the fertility of the soil from the growth of the organisms. From the examn. of a no. of soils which had been studied extensively by other workers, it is concluded that the biol. methods may give results which agree closely to those obtained by pot expts. and from chem. analyses. R. M. BARNETTE

The influence of physical properties and food content of different soils through tilling and plant value. S. V. BUTIAKOV. *J. Exptl. Landwirtschaftliche in Südosten E. Russland* 3, 60(1927); *Deut. Landwirtschaft. Rundschau* 1, 704(1928).—B. finds that the nitrate formation in soil is at its greatest intensity at a water capacity of 23 to 26%, air vol. 60 to 66% and a temp. of 17° to 22°. A relation exists between H_2PO_4 and nitrate formation. GEORGE R. GREENBANK

Production of nodules on different parts of the root systems of alfalfa plants growing in soils of different reaction. P. E. KARRAKER. *Soil Science* 24, 103-7(1927).—Alfalfa plants were grown in soils from limed and unlimed exptl. plots. The plants were grown in pots contg. all acid and all limed soils and in pots with acid soil in one part and limed soil in the other part. The most useful division was a horizontal one with no actual partition between the two parts. Differences in nodule development could thus be told when the acid and limed soils were (a) acting on entire root systems of plants and (b) acting on different parts of the root system of the same plant. Differences in nodule development were found to be as great in the case of (b) as (a), indicating that the effect of soil reaction is independent of any antecedent general effect of soil reaction on the host plant. The possibility was noted that the poor development of nodules in the acid soil might have been due to the effect of the acid soil on the bacteria during the interval when they were existing non-symbiotically in the soil. However, if the effect of soil reactions on the bacteria is through some first general effect on the host plant, nodule development on the roots in the limed part of the divided pots should be less than on the corresponding part of the root systems of plants grown entirely in limed soils. Such was not found to be the case. Apparently the soil reaction directly affects the bacteria in the nodule; or the antecedent effect of the soil reaction on the host plant which in turn influences no development is so localized as to affect only that part of the roots directly in the soil of the reaction in question. J. J. SKINNER

The relationship between plant growth and soil reaction under the influence of different fertilizing materials and applications of lime. K. NEHRING. *Z. Pflanzenernähr. Düngung Bodenk.* 10A, 348-66(1928).—The soil reaction especially the pH and the exchange acidity is dependent upon the time of sampling and the weather. In the soils which show exchange acidity with strongly acid subsoils, the acidity appears to be lowest in spring as a result of the leaching. In the course of the summer when evapn. is high, the acidity increases. The addition of the amt. of lime calcd. from the buffer capacity of the soil, which amts. are significantly higher than those calcd. from the exchange acidity method of Daikuhara, failed to bring the soil reaction to a pH of 7, and to neutralize completely the exchange acidity. The yields of barley seemed to depend upon the exchange acidity; the highest yields were obtained when the exchange acidity was completely neutralized. An exchange acidity of 2.5-6.0 cc. appeared to be the optimum for oats. In the presence of exchange acidity, the physiol. alk. fertilizer materials are superior for barley. If the exchange acidity is neutralized,

there is no difference in the action of the physiol. acid and alk. fertilizer materials. For oats the physiol. acid fertilizers were superior to the alk. R. M. BARNETTE

The absorption of aluminum and iron by the soil. N. D. PRYANISHNIKOV AND E. K. LUKOVNIKOV. *Z. Pflanzenernähr. Düngung Boden.* 10A, 232-7(1928).—Expts. with a podsol loam from which the absorbed cations had been removed with 0.05 N HCl and which had been satd. with Ca by treatment with CaCl₂ soln showed that solns. of AlCl₃ had a greater replacing ability for Ca than had solns. of HCl and FeCl₃ at the same H-ion concn. The absorption of Al and Fe by the soil complex did not take place at a p_H value greater than 5.00. The total absorption capacity of the soil seems to be a function of the H-ion concn. R. M. BARNETTE

Report on (the determination of the) reaction value of acid soils. H. T. WHERRY. *J. Assocn. Official Agr. Chem.* 11, 150-2(1928).—A brief summary of the present status of the various methods available. At present measurements by means of the H electrode cannot give results closer than $\pm 0.5 p_H$ units. There is no evidence that the quinhydrone electrode gives less precise results than the H electrode and its simplicity recommends it for routine work. The minor errors inherent to the indicator method seem insufficient to offset its advantages, and it can be depended on for measurements of soil reaction under all ordinary circumstances to 0.5 p_H unit. In order to make the results widely intelligible and to enable conclusions as to the relationships between plant growth and soil reaction to be drawn correctly, it is recommended that in general soil reactions be stated not in exponential p_H values but in some sort of terms expressing the H-ion concn and OH-ion concn. A. PAPINEAU-COUTURE

The determination of the phosphoric acid requirement of soils according to the soluble silica. ANTONIN NÉMEC. *Compt. rend.* 186, 1060-2(1928); cf. *C. A.* 22, 1643.—The content of P₂O₅ of the aq. exts. of the soils appears to depend on the content of SiO₂ of the same exts.; the first increases at the same time as the second, except for very calcareous soils. E. F. SNYDER

The determination of the reaction of moor soils. T. ARND AND W. HOFFMANN. *Z. Pflanzenernähr. Düngung Boden.* 10A, 219-32(1928).—Five min. is sufficient time to wait before reading in the detn. of the p_H values of either a water suspension of moor soils or a suspension of these soils in a KCl soln with the quinhydrone electrode. The p_H of N KCl filtrates of very acid soils is the same as that of the suspensions in N KCl. The p_H of suspensions of feebly acid soils is, on the other hand, smaller than that of the filtrates. Water suspensions of both very acid and feebly acid soils have a lower p_H value than the corresponding filtrates. The p_H of suspensions of acid soils is lowered and that of alk. soils increased with increasing amts. of soil in a given quantity of water. A proportion of soil to water of 1 to 10 is recommended as the widest ratio that it is safe to use. Drying moor soils at room temp. and at 105° had no appreciable influence on the p_H value of water suspensions of these soils. R. M. BARNETTE

The effect of growing plants on solubility of soil nutrients. W. H. METZGER. *Soil Science* 25, 273-80(1928).—A study was made of the effect of plants in rendering sol. the mineral nutrients of the soil. This was done by removing soil samples from close proximity to the roots and other samples at a distance of from 2 to 4 in. from the roots and measuring the relative concn. of H₂O exts. of the 2 samples. Detns. of bicarbonates proved the most satisfactory method of measurement of such solvent action. Consistent differences were secured in concn. of bicarbonates, the samples from around the roots showing the higher concn.; this was true with both greenhouse and field samples. It was shown with corn, wheat and kafir that the max. difference in concn. of bicarbonates occurred at the fruiting period of the plants. Of 66 detns. with various plants, 53 showed higher concn. of bicarbonates in samples from around roots, 4 showed equal concn. and 9 lower concn. than in samples taken at a short distance from the plant roots. It appears that plants through the CO₂ excretions from their roots are able to exert a measurable solvent action on the soil minerals. J. J. SKINNER

Reaction and lime requirements of the soils of the Somme. E. ROUX. *Compt. rend. acad. agr. France* 14, 498-501(1928).—The clays of the Somme, especially in the Vimeu and Ponthieu, are in the process of acidification; ground chalk, easily sol. in CO₂-satd. H₂O, constitutes an ideal amendment for this region. E. F. SNYDER

The influence of the structure of the soil on its fertility. A. ACHROMEIKO. *Z. Pflanzenernähr. Düngung Boden.* 11A, 36-50(1928). R. M. BARNETTE

Nitrate assimilation by soil microorganisms in relation to available energy supply. F. E. ALLISON. *Soil Science* 24, 79-93(1927).—The addn. to soils of readily decomposable materials of wide C-N ratio results in a marked increase in biological activities and a decrease in soil NO₃ due to their assimilation by the soil microorganisms. This utilization of the NO₃ causes an injury to most growing crops, almost wholly because of NO₃

starvation. The injury caused by fresh stable manure is not due to any particular toxic compd. present or to the microorganisms added, but is due to the stimulation of biological activities with the resulting NO_3 stimulation. There is no appreciable difference in the nature of the injury produced by such materials as fresh stable manure, timothy hay, straw and corn stover. The injury caused by the addn. of the materials mentioned is not permanent but continues until there is a slowing up of biological activities and until there is sufficient time for the protein in the dead bacterial cells to be made available for plants through ammonification and nitrofication. E. F. S.

The part played by British workers in the application of nitrogen to the soil. JOHN RUSSELL. *Chemistry and Industry* 47, 528-31 (1928). E. H.

Soil reaction and nitrogen fixation. P. G. KRISHNA. *J. Am. Soc. Agron.* 20, 515-8 (1928).—A good correlation between reaction of soils and their N fixation was observed. There was a progressive increase in the amts. of N fixed with decreasing acidity of the soils. About 3.0 mg. of N were fixed by soils between p_{H} 5.2 and 5.9, while between 3.6 and 4.7 mg. of N were fixed in soils between p_{H} 5.9 and 7.65. There was no correlation between nos. of bacteria and N fixation, between bacterial nos. and soil reaction or between soil reaction and the disappearance of dextrose. Soil reaction is the dominant factor influencing N fixation. I. F. SNYDER

Transformation of nitrogen in rice soil. GEORGE JANSSEN AND W. H. METZGER. *J. Am. Soc. Agron.* 20, 459-76 (1928).— NO_3 , NO_2 and NH_3 changes were studied in flooded and unflooded soils under greenhouse conditions. These soils were treated as follows: green manure, NaNO_3 , $(\text{NH}_4)_2\text{SO}_4$ and no treatment. One-half of each series was cropped to rice and the other $\frac{1}{2}$ left uncropped. Results indicate that the NO_2 content of the soil was never significant at any time. For the unflooded series to which $(\text{NH}_4)_2\text{SO}_4$ was applied NH_3 decreased from about 27.5 p. p. m. to a trace over 2 months. The NO_3 increased from 4 p. p. m. to about 27.5 p. p. m. and 1 month later decreased to 13 p. p. m. In the flooded series NH_3 decreased from about 20.5 p. p. m. to 11 p. p. m. in 2 months. NO_3 was not readable after the first analysis. For submerged soils to which NaNO_3 was added NO_3 decreased from 19 p. p. m. to a trace 2 months after cropping. For similar unflooded soils NO_3 was reduced from about 41 p. p. m. to 18 p. p. m. over 2 months. The submerged soils with green manure showed a steady increase over 2 months from 4.1 p. p. m. of NH_3 to 34 p. p. m. In the dry soils the NH_3 increased from a trace to 9 p. p. m. in 2 weeks and then decreased again to a trace after a period of 6 weeks. The NO_3 increased from 3 p. p. m. to 56.5 p. p. m. Soil reaction was changed decidedly toward alk. in flooded soils treated with green manure, with NaNO_3 and those receiving no treatment. No such change occurred where $(\text{NH}_4)_2\text{SO}_4$ was applied. I. F. SNYDER

The influence of heavy applications of dry organic matter on crop yields and on the nitrate content of the soil. A. W. BLAIR AND A. L. PRINCE. *Soil Science* 25, 281-6 (1928).—Cylinder expts. were conducted on Sassafra loam soil for a period of 3 years to study the cause of the depressing effect on germination and growth, which is often noted when dry org. matter such as straw is applied to the soil preceding the planting of crops. Rye straw was used in amts. from 2000 to 16,000 lbs. per acre, and both legume and non-legume crops were grown. In addn. to the rye straw, mineral fertilizers were used and sufficient lime was applied to bring the reaction to a p_{H} varying from about 6.4 to a little above 7.0. With non-legume crops, receiving a moderate application of available N fertilizer, the heavy application of org. matter greatly depressed germination and yield the first year. With the legume crop, both with and without N fertilizer, the yields were not appreciably less with the heavy applications of straw than the yields on the check cylinders. NO_3 detns. made on samples of soil during the summer indicate that the straw did not greatly influence the NO_3 content of the soil. The work was repeated the second year without further addn. of org. matter. This time the non-legume crops in the cylinders which had received the heaviest application of rye straw the year before gave larger yields than the check cylinders, and again the nitrate content of the soil was not influenced by the org. matter. The depressing effect which is sometimes produced by the application of dry org. matter is apparently due to the locking up of available N by organisms which use the org. matter as a source of energy. J. J. SKINNER

The acidity of rice field soils. N. NOVELLI. *Giorn. risicoltura* 18, 1-5 (1928).—Vercellese soils contain only traces of CaCO_3 . Their acidity, expressed in cc. N KOH, under dry cultivation is ordinarily less than 0.1% but after 3-4 yrs. rice cultivation this rises to 0.5-0.6% and, in established rice fields, to 1-1.2%. Bolognese soils, contg. 12.6-14.0% CaCO_3 , increase in acidity to 0.2-0.3% only. The acidity is due to deposits of org. matter from irrigation waters and to crop residues, soils contg. 2-3% org. matter

under dry cultivation increasing to 4 and even to above 10% when cultivated to rice.

ALBERT R. MERZ

Some effects of limestone and hydrated lime on bio-chemical activities in acid soils. HENRY DORSEY. Connecticut Storrs Sta., *Bull.* 141, 113-63(1926).—Hydrated lime is more effective in neutralizing soil acidity than limestone. As the time after application increases, the difference between the effect of the 2 materials decreases. Ground limestone gradually reduces the acidity of an acid soil for a period of 6 to 8 weeks and in some cases shows a tendency to give a rise in acidity at the end of 6 or 7 weeks. Hydrated lime rapidly reduces soil acidity to a minimum. After 2 or 3 weeks the acidity then gradually rises for 8 weeks. Untreated soil shows fluctuations in soil acidity during an 8-week period and these same fluctuations on lower planes are exhibited by the soil treated with limestone and hydrated lime. Of the tests used the Jones is most valuable because it can show the smaller quantity of limestone required due to acidity changes. The Truog and Iowa tests lack in sharp color changes for small variations in soil acidity. The Soiltest test is more suited to qual. field work than to lab. work. The H-ion test correlated rather well with the Jones test. The ammonifying and nitrifying power of acid soils is increased by limestone and hydrated lime. Changes brought about in field soils by lime, limestone and hydrated lime can be measured by all the tests used, but more accurately by the Jones test and the H-ion detn. There are unexplained fluctuations of soil acidity characteristic of each type of soil exhibited by the treated and untreated samples alike. With the Jones test the lime requirement indicated is influenced by the temp. of the water used.

E. F. SNYDER

The action of alkali and soil moisture studies. M. D. THOMAS AND D. S. JENNINGS. Utah Agr. Expt. Sta., *Bull.* 198, 65-8(1926).—By the addn. of Na salts to soil in cylinder expts. the concn. of the soil soln. was increased, producing toxicity to plants. The Na enters the silicate complex, replacing Ca, Mg and K and yields a soil partly impermeable to water and alk. in reaction. A no. of heavy clay soils were treated repeatedly with strong solns. of the salts of uni- and bi-valent bases and subsequently washed free of sol. salts. In wet soils satd. with Na considerable deflocculation was induced.

J. J. SKINNER

Forms and properties of water-soluble phosphorus in soils. F. W. PARKER. *Science* 67, 402-3(1928).—Previously reported results are confirmed, showing that salts solns. and exts. contain considerable quantities of org. phosphate as well as inorg. phosphate. They further indicate that there are at least 2 forms of org. phosphate.

E. F. SNYDER

Action of sulfuric acid on cultivated land. E. RABATÉ. *J. Agr. Prat.* [N. S.] 47, 215-7(1927).—A brief review of the effect of H_2SO_4 on soil fertility, reaction, etc.

E. F. SNYDER

The behavior of cultivated plants in land rich in salts. ANTONIN ROLET. *Rev. gén. sci.* 39, 175-81(1928).—This is a discussion of the subject matter and a method of removing the salt from land by lixiviation.

E. F. SNYDER

A laboratory apparatus for the measurement of carbon dioxide evolved from soils. F. W. MARSH. *Soil Science* 25, 253-61(1928).—A complete app. and method of operation for the measurement of CO_2 evolved from soils under lab. conditions are described. For details the original should be consulted. The CO_2 evolved from 500 g. of various soils as detd. with this method ranged from 23.7 to 162.4 mg. in 72 hrs.

A. L. M.

Use of sulfuric acid in agriculture. P. WAGUET. *Rev. prod. chim.* 31, 161-6, 203-7(1928).—A discussion of the action of H_2SO_4 on vegetation, particularly from the standpoint of its possible use for the destruction of weeds and for the elimination of plant diseases.

A. PAPINEAU-COUTURE

Action of lime and other chemical fertilizers. R. CHIAPPELLI. *Giorn. risicoltura* 2, 18(1928).—One hundred kg. of rice plants exts. 0.83 kg. of CaO, of which 0.78 kg. is in the straw and 0.05 in the rice. If the straw is returned to the earth less CaO is extd. KCl and K_2SO_4 also cause a strong dispersion of Ca through the formation of sol. substances: $2KCl + CaCO_3 = K_2CO_3 + CaCl_2$; $K_2SO_4 + CaCO_3 = K_2CO_3 + CaSO_4$. Every 149 kg. of KCl withdraws 56 kg. of CaO from the ground. With 300 kg. of K fertilizer per hectare 140 kg. of Ca is dispersed in the ground. This, with the absorption of 8000 kg. of rice plants, brings a loss of 163 kg. of CaO.

R. SANSONE

The delayed effect of liming. P. E. KARRAKER. *Soil Science* 24, 147-8(1928).—A delayed effect of limestone in bringing about increased growth of alfalfa on acid soils in pot expts. was noted. The interval ranged from a few weeks to about 2 months, depending on the soil. Knowledge of this delayed effect is important in indicating the desirability of liming some time ahead of seeding legume crops.

E. F. SNYDER

Calcium as a factor in soy-bean inoculation. R. W. SCANLAN. *Soil Science* 25,

313-24(1928).—Results indicate that the common soil amendments, such as crop residues, manure and K, do not significantly influence the degree of modulation of soy beans on 3 acid soils used. Acid phosphate, sodium acid phosphate and bone meal on Putnam Silt Loam, and rock phosphate and sodium acid phosphate on Gray Silt Loam did not affect, in any great measure, the modulation of soy beans. Both $\text{CaH}_4(\text{PO}_4)_2$ and sodium acid phosphate, however, gave fair increases in nodule formation on Bates Fine Sandy Loam soil. Limestone was found to increase nodulation greatly in all instances where used. That soil reaction was not the controlling factor on nodulation is shown by the fact that $\text{Ca}(\text{OAc})_2$, when used on acid plots of each soil, although not greatly altering the soil reaction, increased nodulation 1089% on the Gray Silt Loam, 1010% on the Bates Fine Sandy Loam and 433% on the Putnam Silt Loam. The nodulation of soy beans grown in distd. water and in tap water contg. CaCl_2 increased with increased concn. of the salt up to that of 1 to 1500 in the former and of 1 to 5000 in the latter. CaCO_3 , $\text{Ca}(\text{OH})_2$ and acid phosphate used separately in the field, both on the soy-bean seed and in the row, did not increase nodulation on Putnam Silt Loam. CaCO_3 supplemented with acid phosphate, however, gave indications of some benefit to nodule formation. $\text{Ca}(\text{NO}_3)_2$ and CaCl_2 , when used on soy-bean seed on Putnam Silt Loam soil, not only increased nodulation but also increased the percentage of plants having nodules on their roots. J. J. SKINNER

The action of sodium with potassium as nutrient material for plants. H. HEINRICH. *Z. Pflanzenernähr. Düngung Bodenk.* 10A, 299-323(1928).—In soil expts. with peas, the addn. of increasing quantities of Na as Na_2SO_4 to a const. application of K as K_2SO_4 gave a not insignificant increase in the total dry wt. and yield of seed. With a partial replacement of the K by Na, the total dry wt. remained the same but there was a slight increase in the yield of seed with increased replacement of the K by the Na. With small applications of Na and K salts, the Na appears to have the capacity to replace K to a large extent. A detrimental influence of high applications of Na could not be detected. By a complete replacement of K by Na in pure sand cultures, the Na increased the total wt. of plants about 65%, and the yield of seed about 100% over the culture receiving no K or Na. The favorable action of Na may be explained on 3 different bases. (a) Na works indirectly in that it makes the soil K more available and at the same time favorably influences the utilization of salts applied and the native soil K. (b) Na appears to have a second indirect action, in that it takes over a part of the function of K in the assimilation and conducting organs and thus permits a greater proportion of the K to function in the seed. (c) Na appears to be used directly by the plant in the formation of org. materials, when the available supply of K is not sufficient for the requirements of the plant. R. M. BARNETTE

Significance of the reaction for the effect of ammonium salts on the growth of Zea mays. W. MEVIUS. *Z. Pflanzenernähr. Düngung Bodenk.* 10A, 208-18(1928).—M. attributes the depressive action of NH_4 salts on the growth of corn in neutral and alk. solns. to the extraordinary rapidity of the entrance of the NH_4 ion into the plant cell and the poisonous action of the NH_4 ion within the cell, where it brings about an extraordinarily rapid change in the reaction of the cell to the alk. side. This depressive effect was not noticed in acid solns. Unfavorable conditions for growth brought by the physiol. acidity due to the absorption of the NH_4 ion by the plant are not effective until the p_H value of the soln. reaches about 3.5 or 3.6. Thus between neutrality and a p_H value of about 3.5 is the most favorable reaction range for the use of NH_4 salts. R. M. BARNETTE

The availability of nitrogen in nitrate of soda, ammonium sulfate and dried blood with varying ratios of phosphoric acid and potash. J. G. LIPMAN AND A. W. BLAIR. New Jersey Agr. Expt. Sta., *Ann. Rept.* 1926, 521-8; cf. C. A. 21, 1862.—The fourth year of the work on the availability of N with varying ratios of P_2O_5 and K is reported. The plan provides for a const. amt. of N from 3 different sources and also a combination of these 3, in connection with the use of single, double and triple portions of P_2O_5 and single and double portions of K. With the exception of 1923, when corn only was grown, 2 crops have been grown each year. The fertilizer is applied for the first crop and the second crop is grown to utilize any N not taken by the first crop. In 1925 rape was grown as the first crop and sorghum as the second. For the first crop the yields of dry matter and the percentages of N recovered with NaNO_3 , $(\text{NH}_4)_2\text{SO}_4$ and dried blood were, with slight exception, in the order named. With the double portion of K the larger amts. of P_2O_5 caused a slight decrease in percentage of N recovered. With the single portion of K the highest N recovery was with the triple portion of P_2O_5 and the next highest with the single portion. Generally the mixt. contg. the N from 3 sources gave higher recoveries than those obtained with dried blood alone, but lower

than those with NaNO_3 and $(\text{NH}_4)_2\text{SO}_4$. In most cases the first crop recovered less than 50% of the applied N. For the second crop there does not appear to be any direct relation between the N recoveries and the amts. of P_2O_5 and K used. The dried blood gave relatively higher recoveries with this crop than with the first crop. For the combined crops the double portion of K gave lower av. yields and lower av. recoveries than the single. Here also there does not appear to be any direct relation between the N recovered and the amt. of P_2O_5 used. For the combined crops the av. recoveries vary from about 36 to 61%. The summary of the 4 years' work shows that the highest av. recoveries were obtained with NaNO_3 . J. J. SKINNER

Effects of nitrates on the composition of the potato. WM P. HEADDEN. Colo. Agr. Expt. Sta., *Bull.* 325, 1-96(1928).—Nitrates may develop in Colo. soils so abundantly that potatoes as well as other plants are killed. The amt. necessary to produce toxic effect was uncertain and varied widely under different conditions. The potato grew well for a time in soil contg. 400 p. p. m. of NaNO_3 in the top 6 in. Excessive nitrates decreased the yield and cooking quality of the tubers. The nitrate plot potatoes were soggy, had a yellowish color, a strong odor and a pronounced unpleasant taste. Nitrates depressed the P_2O_5 and increased the K_2O content of the ash of potato tubers. Colo. potatoes were lower in starch and P_2O_5 content, and higher in ash, N and K_2O than potatoes grown in other producing sections. C. R. FELLERS

The effect of the constituents of alkali fertilizers, and soil amendments on the permeability of certain fine-textured soils under irrigation. C. W. BORKIN. New Mexico Agr. Expt. Sta., *Bull.* 160, 61 pp.(1927).—In working with a clay and a clay-loam soil it was found that the penetration of water was retarded by Na and K compds. Na compds. caused a greater depression of permeability than other substances, the influence decreasing in the following order: carbonate, acetate, chloride, nitrate, silicate and sulfate. With varying proportions of carbonate, chloride or nitrate of Na the depressing effect appeared to increase more rapidly than the concn. The following substances in 0.5% concn. increased the rate of water penetration into the air-dried soils, the accelerating effect decreasing in the order named $\text{Al}_2(\text{SO}_4)_3$, FeSO_4 , AlCl_3 , $\text{CaH}_2(\text{PO}_4)_2$, $\text{Fe}_2(\text{SO}_4)_3$, KHSO_4 , tannin, manure and $(\text{NH}_4)_2\text{SO}_4$. Permeability increased with the valence of the basic constituents of the compds. added to the soils. The chlorides were in general more depressing than the sulfates. Soils treated with depressing substances were more alk. after percolation and were highly deflocculated. Substances improving permeability increased the acidity of the percolates and caused flocculation both before and after percolation. The greatest lowering of the p_H value of the percolates per 0.1% of $\text{Al}_2(\text{SO}_4)_3$ occurred at the lower concns. which also produced the greatest increase in acceleration. Al was not present in percolates from soils to which as much as 1.5% $\text{Al}_2(\text{SO}_4)_3$ has been added, but Ca and other bases were displaced in combination with the sulfates; CO_2 was liberated. Fertilizers which tend to decrease soil alk., as $(\text{NH}_4)_2\text{SO}_4$, manure and acid phosphate, improve permeability and tilth. NaNO_3 had an opposite effect. $\text{Al}_2(\text{SO}_4)_3 + \text{FeSO}_4$ caused an immediate, large and permanent increase in permeability. These amendments should be useful in the reclamation of impermeable areas and in the prevention of impermeability in soils which tend to become alk. J. J. SKINNER

The examination of the Mitscherlich procedure for the determination of the fertilizer requirements of soils. M. GERLACH, E. GÜNTHER AND C. SEIDEL. *Z. Pflanzenernähr. Dungung Bodenk.* 11A, 1-29(1928); cf. C. A. 22, 1008.—The expts. carried out by the authors show that Mitscherlich cannot satisfactorily use the value of the growth factor const. and consequently the law founded on it. In the Mitscherlich equation, the total quantities of the nutrient materials used in the test must not be used, but only the part of the nutrients absorbed by the plant. The value of the growth factor const. is not const. The percent increase in yield in two expts. is only equal when, besides the material tested, other growth factors such as the basic fertilization and the water are applied in the same amts. Therefore, the use of the Mitscherlich yield tables is not generally applicable. The Mitscherlich procedure for the detn. of the fertilizer requirements of the soil gives no more than a well-conducted vegetation expt. would give. R. M. BARNETTE

Means of determining the requirements of soils for the principal fertilizers. UGO PRATOLONGO. *Giorn. chim. ind. applicata* 10, 61-6(1928).—A crit. review and discussion of the principles of fertilization and of various means of detg. the optimum doses of P and K fertilizers for various soils. A crit. examn. of biol. tests proposed for detg. soil requirements shows that even the Neubauer test is unsatisfactory, and the development of chem. methods such as those of Lemmermann is of great importance. Expts. indicate that the best solvent for detg. K is NH_4Cl , which has already

been proposed by Kellner. The soil should be extd. with 0.1 *N* NH_4Cl . Analysis of many Italian soils by this method showed a K_2O content of 2–80 mg. per 100 g. of soil. A comparison with field tests indicated that when this sol. K is below 5 mg. of K_2O per 100 g. of soil, K fertilization is usually beneficial. With 5 mg. per 100 g. fertilization is of doubtful value in some cases, and with 10 mg. or more per 100 g. the K content is in general sufficient for ordinary culture. Continued investigation on the application of chem. tests to the detn. of soil requirements gives great promise that such tests will eventually be sufficient in themselves as criteria of the need of fertilization.

C. C. DAVIS

Artificial manure from straw. R. C. COLLISON AND H. J. CONN. *N. Y. Agr. Expt. Sta., Circ.* 95, 1–3 (1928).—The method of decomp. fibrous materials such as straw depends upon the fact that certain kinds of microorganisms will use the straw as a part of their food supply if they are plentifully supplied with water and mineral nutrients. A mixt. composed of $(\text{NH}_4)_2\text{SO}_4$ 60 lbs., superphosphate 30 lbs., KCl 25 lbs. and ground limestone 50 lbs., when added to 1 ton of dry straw or similar material, will make 2–3 tons of artificial manure. The CaCO_3 (limestone) prevents the mass from becoming too acid, which condition retards microbial growth.

C. R. FELLERS

Phosphoric acid fertilizer investigation on grass. ERNST TRUNINGER. *Landwirtschaftliche Jahrb. der Schweiz* 41, 861–912 (1927).—A study of various forms of H_3PO_4 fertilizer. Data are given on yields and after-effects of chemicals and chemical analyses of the dried grasses and soils are given.

GEORGE R. GREENBANK

The value of dicalcium phosphate as phosphoric acid fertilizer. E. RITTER. *Landwirtschaftliche Jahrb. der Schweiz* 41, 787–95 (1927).—R. finds that CaHPO_4 is of the same value as the superphosphates.

GEORGE R. GREENBANK

The influence of manures and organic residues on plant growth. G. A. NEWTON AND K. D. DANILOFF. *Soil Science* 24, 95–101 (1927).—Sawdusts, pine needles and straw were used for soil treatment to det. their influence on growth and yield of oats in pot expts. Fresh and rotted manure were also used. Sawdust, pine needles and straw depress growth and lower yields below that of the control. This depressing effect was partially overcome by adding sufficient quantities of NaNO_3 . Although the residues of low N content retarded growth and yield, their depressing effect on N accumulation was sufficiently overcome during the later stages of the plants development to permit the extra N to become available. The available N in the later period of maturity was used to increase the percentage of N in the grain.

J. J. SKINNER

Burnt limestone in relation to quality of Bordeaux mixtures. R. H. CARR AND L. N. BEMILLER. *Ind. Eng. Chem.* 20, 514–6 (1928).—The quality of Bordeaux mixt. depends on the amts. of CaO and MgO in the lime. These amts. have a marked and consistent effect upon the alky. of the liquid above the ppt., the color and rate of fall of the ppt., and the length of time the Bordeaux mixt. will maintain its colloidal nature and be suitable for spraying purposes. The color changes and phys. properties of the different ppts indicate that Bordeaux mixt. is a colloid when properly made; this is evident by the change in color from dark blue to light green as the CaO content, which causes greater alky., becomes less and the MgO portion increases. As the colloidal particles become larger they cause the reflected light to appear yellow at first, then orange, red, violet, blue and green; hence the deep blue of the high-Ca lime indicates smaller particles than the light green of the MgO lime.

J. J. SKINNER

The effect of green manures and crop residues on the soil reaction. W. G. SACKETT, ALVIN KEZER, IDA W. FERGUSON AND J. C. WARD. *Colo. Agr. Expt. Sta., Bull.* 324, 1–31 (1928).—Barley used as a green manure increased slightly the p_H of a silt loam contg. 3.184% CaCO_3 , although the reaction was always well within the optimum range for N fixation and growth of *Azotobacter* (p_H 7–8). Green manures, crop residues and com. fertilizers had no value as a source of acid for increasing the p_H of a soil rich in CaCO_3 where it was necessary to increase that concn. from p_H 7.7 to 6.0 in order to retard the growth of *Azotobacter* and thus limit N fixation.

C. R. F.

Plant growth as a function of the nitrogen application and of the growth period in oats. R. MEYER. *Z. Pflanzenernähr. Düngung Bodenk.* 10A, 329–47 (1928).—A criticism of the procedure used by Mitscherlich for the calcn. of the fertilizer requirements of soils. Expts. were carried out with applications of N and P salts to oats to det. the N-P curve. The tangent of the N-yield curve decreased with increasing applications of P_2O_5 . The max. of the N-yield curve attained to values of the higher N application with increasing P_2O_5 applications. With increasing applications of N, the roots reached the max. growth first, then the straw and finally the grain. The N-time yield curve was obtained by measuring the plants at different growth intervals. During the growth period the max. of the N curves was progressive with increasing amts. of

N. The roots reached their max. earlier than the top. From the N-time rule or curves, with increasing applications of N, a curve of max. growths at different intervals is obtained and from this curve it is believed that an idea of the final yield curve and the nutrient requirements of the soil may be obtained. The errors attending the results obtained from pot expts. are discussed.

R. M. BARNETTE

Gray speck (manganese deficiency) disease of oats. GOFFREY SAMUEL AND C. S. PIPER. *J. Dept. Agr. S. Australia* 31, 696-705(1928).—Gray speck is a disease of oats in the seedling stage. It does not appear in acid soils but makes its appearance in soils of p_H 7.0 to 8.0 and increases in severity in more alk. soils. N fertilization increases the growth and yield of oats but does not check the characteristic dying of leaves. Mn treatments are very effective in reducing the disease. Applications of from 10 to 40 lbs. $MnSO_4$ per A. progressively reduce leaf-flecking, whereas 75 lbs. $KMnO_4$ almost completely prevents the appearance of the disease.

M. S. ANDERSON

Report on (the determination of) nitrogen (in fertilizers). A. L. PRINCE. *J. Assoc. Official Agr. Chem.* 11, 186-91(1928); cf. *C. A.* 21, 2350.—The Busch nitron method for nitrate N (Treadwell and Hall, *Analytical Chemistry* 2, 391, *C. A.* 18, 1963) is accurate and comparatively simple even in the presence of compds. like cyanamide and urea, but the high cost of nitron renders it unsuitable for routine work. The Arnd method (*C. A.* 12, 662) is simple and accurate when used on nitrate salts alone, but possesses no distinct advantage over the Devarda method which has already been adopted as tentative. Comparison of the official method and the Jones method (*C. A.* 21, 1324) for NH_3 and nitrate N in fertilizers contg. smaller proportions of cyanamide and urea than the ones previously used showed that both gave practically theoretical results for NH_3 N, while for nitrate N the same sources of error were apparent as previously, but to a smaller extent because of the smaller cyanamide and urea contents. It is recommended that the Zn-Fe method for nitrates be discarded, and that the reduced Fe method be marked "applicable only in the absence of cyanamide and urea."

A. PAPINEAU-COUTURE

Report on the determination of chlorine in commercial fertilizers. A. P. KERR. *J. Assoc. Official Agr. Chem.* 11, 201-2(1928).—Two methods were studied collaborately: (1) The sample was made alk. by adding $CaCO_3$ to drive off NH_3 , which might be present before washing on the filter. (2) The sample was washed on the filter with distd. H_2O and titrated direct. Method (2) seems to be more practical.

A. PAPINEAU-COUTURE

Report on the gravimetric determination of phosphoric acid (in fertilizers). W. H. ROSS. *J. Assoc. Official Agr. Chem.* 11, 180-6(1928); cf. *C. A.* 21, 2350.—A collaborative study of the relative accuracy of the present official A. O. A. C., Lundell and Hoffmann's single pptn. and double pptn. (*C. A.* 19, 800) and Jørgensen's (*C. A.* 20, 1773) method showed that: (1) Lundell and Hoffmann's single pptn. method gives slightly high results, and the other 3 give satisfactory results; (2) the slightly higher accuracy of L.'s and H.'s double pptn. method is not sufficient to justify its adoption for routine analysis in place of the present official method; (3) presence of SiO_2 causes slightly high results with the official and Jørgensen methods, and its elimination should be provided for; (4) recent controversies over methods of P_2O_5 detn. are largely due to the use of standards of variable compn. or of materials that have been standardized by chem. analysis only, and KH_2PO_4 , either alone or in admixt. with K_2SO_4 , is recommended as standard; (5) the disadvantage of an alk. MgO mixt. (action of the alkali on the glass of the container) can be eliminated by prepg. a neutral soln. and adding NH_3 just before use; (6) previous conclusions regarding ignition to produce snow-white $Mg_3P_2O_7$ are confirmed.

A. PAPINEAU-COUTURE

Report on nitrogen activity methods in fertilizers. JOHN B. SMITH. *J. Assoc. Official Agr. Chem.* 11, 191-200(1928).—Discrepancies in the results obtained by different labs. using the official A. O. A. C. method are attributed to insufficient exactness in the wording of the directions. An investigation into the various steps of the technic is described in detail, and as a result certain modifications in the wording are recommended providing for: use of 1 drop of lubricating oil of medium viscosity instead of 0.2 g. paraffin, digesting at exactly 110° instead of $100-10^\circ$, distg. in exactly 60 min. instead of 45-90 min., keeping the rate of distn. as uniform as possible throughout the whole 60-min. period, efficiently trapping the NH_3 fumes from the distn., use of freshly prepd. (not over 1 month) alk. $KMnO_4$ soln. having the proper oxidizing power (25 g. $KMnO_4$ per l.) and showing no signs of decompn.

A. PAPINEAU-COUTURE

Insecticides. Their action and constitution. H. H. CROUCHER. *Trop. Agr. (Trinidad)* 4, 183-4(1927).—A brief review.

A. L. MEHRING

Insecticidal pyrethrum. J. CHEVALIER. *Recherches et inventions* 9, 143-52 (1928).—A review of its cultivation, properties and use.

A. PAPINEAU-COUTURE

The insecticidal properties of calcium arsenate. A. PAILLOT. *Compt. rend. acad. agr. France* 14, 502-5(1928).—The insecticidal value of the products in commerce sold under the name of arsenate of lime is variable; it cannot be detd. by the chem. compn. E. F. SNYDER

Insecticidal action of some esters of halogenated fatty acids in the vapor phase. R. C. ROARK AND R. T. COTTON. *Ind. Eng. Chem.* 20, 513-4(1928).—From the standpoints of toxicity to insects, availability, cost, and freedom from fire hazard, methyl, isopropyl and ethyl monochloroacetates appear to be the most promising of the lower alkyl esters of chloroformic (chlorocarbonic), monochloro-, dichloro- and trichloroacetic, monobromoacetic, α -bromo- and β -bromopropionic and β -chloropropionic acids tested. Dosages of 1 lb. $\text{CH}_2\text{ClCO}_2\text{Me}$, 1.5 lbs. $\text{CH}_2\text{ClCO}_2\text{CHMe}_2$, and 2 lbs. $\text{CH}_2\text{ClCO}_2\text{-Et}$ per 1000 cu. ft. are effective against stored-product insects in fumigation vaults of the commercial type. The monochloroacetates injure the germination of wheat, and are not promising for the fumigation of grain intended for seed. J. J. SKINNER

Electrolytic apparatus for the determination of copper in insecticides and fungicides. E. B. HOLLAND AND G. M. GILLIGAN. *Ind. Eng. Chem.* 20, 533(1928).—The app. described as easily maintained, ready for use at a nominal cost is described. E. F. S.

Report on (the determination of unsulfonated residue in mineral oils used as) insecticides and fungicides. J. J. T. GRAHAM. *J. Assocn. Official Agr. Chem.* 11, 141-7(1928); cf. *C. A.* 21, 1345.—A collaborative study of the use of 37 N and 38 N H_2SO_4 , warming 10 and 60 min. at 60-5° and warming at 100° for 1 hr. showed that on the whole use of 38 N acid and warming 10 min. at 60-5° gave somewhat lower results (*i. e.*, resulted in more complete sulfonation) and caused less trouble from the formation of a dense, black column necessitating addn. of water for the reading. Adoption of the method as previously published is recommended, with the addn. that, if greater accuracy is required, the measured sample may be weighed and its exact vol. calcd. from the wt. and the d. of the oil. A. PAPINEAU-COUTURE

Lubricating oil emulsions for the control of pear psylla. F. Z. HARTZELL AND F. L. GAMBRELL. N. Y. Agr. Expt. Sta., *Circ.* 98, 1-4(1928).—A 3% lubricating oil emulsion applied at the late dormant period effectively controlled psylla without foliage injury. An air temp. of 18° was satisfactory. Oil was most effective when applied before psylla egg deposition occurred on the trees. C. R. FELLERS

Effect of fertilizers on vitamin content of wheat (ANON) 11E. The problem of Cu as a normal component of plants (QUARTAROLI) 11D.

HASELHOFF, EMIL, and BLANCK, EDWIN: *Lehrbuch der Agrikulturchemie. II. Düngemittellehre.* Berlin: Gebrüder Borntraeger. 216 pp. M. 13 50, subscription price, M. 12.

MASON, A. FREEMAN: *Spraying, Dusting and Fumigating of Plants.* A popular handbook on crop protection. New York: The Macmillan Co. 539 pp. \$5.

Fertilizer. F. G. LILJENROTH. *Brit.* 275,843, Aug. 13, 1926. Mineral phosphate is treated with H_2SO_4 to form $\text{H}_3\text{P}_2\text{O}_7$ and a ppt. of CaSO_4 ; the $\text{H}_3\text{P}_2\text{O}_7$ is sepd. and the CaSO_4 , as a silt in water, is treated with NH_3 and CO_2 to produce a ppt. of CaCO_3 and a soln. of $(\text{NH}_4)_2\text{SO}_4$. The $\text{H}_3\text{P}_2\text{O}_7$ is neutralized with NH_3 and mixed with the soln. of $(\text{NH}_4)_2\text{SO}_4$ and the soln. thus formed is evapd. to obtain a fertilizer.

Phosphatic fertilizer. L. ADELANTADO. *Brit.* 276,297, Aug. 19, 1926. Finely divided natural phosphate is treated with sol. sulfates in the presence of inorg. acid, preferably H_2SO_4 , in the proportion of 3 mols. of H_2SO_4 and 3 mols. of sulfates such as those of K and NH_4 to 2 mols. of tri-Ca phosphate. The product is treated with hot water and the acid soln. obtained is neutralized, concd. and crystd. The material may be used with peat or other materials in making composite fertilizers.

Device for spraying and granulating fused materials such as urea or other fertilizer materials. T. B. TURLEY, W. H. ROSS and A. R. MERZ. U. S. 1,670,831, May 22.

Ammonium and calcium nitrate and sulfates or phosphates. AZOGENO SOC. ANON. PER LA FABBRICAZIONE DELL'AMMONICA SINTETICA E PRODOTTI DERIVATI, C. TONIOLO and B. TANZI. *Brit.* 276,350, Aug. 19, 1926. A double salt less hygroscopic than $\text{Ca}(\text{NO}_3)_2$ is prepd. by mixing $(\text{NH}_4)_2\text{SO}_4$ and anhyd. $\text{Ca}(\text{NO}_3)_2$ in the presence of 2 mols. H_2O for each mol. of nitrate. In some cases more water may be used. Phosphates may be used instead of the sulfate and various other substances may also be added to form composite fertilizers.

Disinfecting seeds. G. OSVALD. U. S. 1,670,980, May 22. A finely divided

dry compn. for treating seeds comprises an inert material such as talc admixed with about 2–10% of polymerized CH_2O .

Fungicides for treating seeds. I. G. FARBERIND. A.-G. Brit. 276,033, Aug. 16, 1926. A Cu salt is mixed with a solid caustic alkali and with a tartrate, *e. g.*, a mixt. may be formed of anhyd. CuSO_4 , anhyd. Rochelle salt, NaOH and NaCl. Cf. C. A. 22, 1648, 2232.

Apparatus for carbonizing seaweed and recovering a condensate which may be used as an insecticide. G. J. B. CHAMAGNE. Brit. 275,998, Aug. 11, 1926.

16—THE FERMENTATION INDUSTRIES

C. N. FREY

Origin of aldehydes in fermentation products. III. MASAKAZU YAMADA. *Bull. Agr. Chem. Soc. (Japan)* 4, 18–21(1928); cf. C. A. 22, 841.—From the steam-distn. product of evapd saké and shoyu, an aldehyde resembling in its reaction methylfurfurole was obtained. The ethereal ext. of saké and shoyu, on the other hand, gives no Jorissen's furfurole reaction. The furfurole may then be supposed to be produced during distn. IV. *Ibid* 22–4.—The gradual increase of AcH contents of saké during storage is caused for the most part by the action on EtOH of an oxidizing agent in the material of the container, *i. e.*, *Cryptomeria* timber. The aldehyde formation according to the kind of timber is as follows: pine 0.00949%, American pine 0.00210, camphor tree 0.01961, *Quercus glandulifera* 0.00210, cherry 0.00443, *Chamaecyparis pisifera* 0.01222, American *Cryptomeria* 0.00132, *Cryptomeria japonica* 0.02860. This oxidizing power is retarded by alk. reaction. Timber boiled for thirty min. loses its oxidizing power. K. Goro

Products of fermentation by filamentous fungus. III. YUSUKE SUMIKI. *Bull. Agr. Chem. Soc. (Japan)* 4, 13–4(1928).—From the fermentation fluid produced by *Cytospora damnosus* were isolated ethyl alc., fusel oil, acetaldehyde, pyruvic acid and acetic acid. K. Goro

Influence of various concentrations of phenol on the rate of alcoholic fermentation. EMIL ABDERHALDEN. *Fermentforschung* 9, 389–91(1928).—PhOH in concns. of 0.000, 0.001, 1–0.000,000, 2 g. per 25 cc. phosphate buffer of p_H 6 accelerates alc. fermentation. Higher concns. are inhibitory. A. W. Dorr

Production of alcohol from sisal (waste). ANON. *Ann. office nat. comb. liquides* 3, 63–8(1928).—Lab. and semi-com. expts. showed that sisal waste can easily be pressed to recover 85% of the juice which, fermented by special yeasts and suitably treated, gives a wort contg. 3.7% alc. by vol. A. PAPINEAU-COUTURE

Wines of the coöperative cellars of the Hérault from the 1927 vintage. HUGUES AND PAU. *Ann. fals.* 21, 142–6(1928).—Analyses of 19 wines of known purity are tabulated and discussed. A. PAPINEAU-COUTURE

Rapid micro-determination of the phosphoric ion in wines and other fermented beverages. GEORGE DINIGES. *Ann. fals.* 21, 136–42(1928); cf. C. A. 22, 1296.—A detailed description of the technic, particularly as applied to wines. Because of the very small quantities of material used, the detn. of total P_2O_5 (including destruction of org. matter with HNO_3) can be carried out in not over 10 min. A. P.-C.

Contribution to the study of the use of sulfurous acid in wine making. II. Use of sulfurous acid as a preservative in grape musts and in sweet white wines. L. MOREAU AND E. VINET. *Ann. fals.* 21, 130–36(1928); cf. C. A. 21, 4013.—Most yeasts will not grow in must in the presence of 60 mg. free SO_2 per l. some will in the presence of 90–110 mg., but none in the presence of 150 mg. The presence of 700 mg. free SO_2 per l. kills all the yeasts in 1.5 hrs.; 300 mg., in 5 hrs.; 200 mg., in 24 hrs. Because of combination of added SO_2 with the constituents of the must, 380–500 mg. free SO_2 should be added, to ensure a min. of 150 mg. free SO_2 per l. after combination is complete. The min. quantity of free SO_2 required to prevent growth of yeasts in wine depends on the alc. content; it was found to be 45 mg. per l. with 9% alc., 30 mg. with 11% and 20 mg. with 13%. Because of slow loss of SO_2 through oxidation, sweet white on bottling should contain 60–70 mg. free SO_2 if it contains 11% alc. and 40–50 with 13%. The expts. were carried out with the yeasts generally present in white wines. A. PAPINEAU-COUTURE

Samsu from rice. R. O. BISHOP AND G. L. TEIK. *Malayan Agr. J.* 16, 14–9(1928).—The methods of fermenting and distg. rice are very crude and large losses result. The alc. content of the fermented mash is 8.5% by wt. on the 8th day and 8.9 on the 25th day. The fluidity reaches a max. on the 19th. Twenty% of unfermented

starch is left. 123.5 lbs. of pure starch yield only 4.75 gals. alc. The theoretical yield is 8.85 gals. In good practice 6.8 to 7.4 gals. can be obtained. To increase the yield, yeast should be added. The compn. of samsu is alc. 37.96, volatile acidity as acetic acid 0.097, fixed acidity —, esters as Et acetate 0.43, higher alcs. 0.043. C. N. F.

Distilling and rectifying column for alcoholic liquids. J. SCHNEIBLER. U. S. 1,670,743, May 22.

Dehydrating alcohol with addition of benzene. J. A. STEFFENS. U. S. 1,670,053, May 15. Dehydration is effected in a column still so operated as to produce a mixt. of vapors of alc., H_2O and C_6H_6 at the head of the still having a compn. such that 2 liquid layers would be formed on condensation of the mixt. The mixt. is condensed at substantially still head temp. and there is sepd. and withdrawn a minor fraction of the layer of liquid contg. the greater proportion of water, and the rest of the condensate is returned to the still. Concd. alc. is obtained at the base of the still, and the fraction of the head condensate which is sepd. is redistd. An app. is described.

Apparatus for feeding vinegar stock to generators. E. G. PFAHL. U. S. 1,670,164, May 15.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

Detection of lead and copper in citric and tartaric acids, and extracts. G. FRERICHS. *Apoth. Ztg.* 43, 513-4(1928).—A critical discussion of the Ger. Pharm. tests.

W. O. E.

Distribution of saponins. L. ROSENTHALER. *Apoth. Ztg.* 43, 528-30(1928).—A list of saponin-bearing plants is presented based upon L. Kofler's monograph "Die Saponine."

W. O. E.

Rice and wheat starches of the D. A. B. 6. G. FRERICHS. *Apoth. Ztg.* 43, 543(1928).—An exptl. study of these two products based on the Ger. Pharm. requirements.

W. O. E.

Defatting preparations for the hair. A. THIEME. *Pharm. Ztg.* 73, 554-5(1928).—A discussion of the various cosmetics (powders, hair waters and soaps) designed for the removal of excess fat from the hair.

W. O. E.

An active disinfectant. H. HIERMANN. *Pharm. Zentralhalle* 69, 273-5(1928).—Of all the many disinfectants at present available, the author considers that the chloramine preps. of Heyden deserve particular attention in point of chem. and phys. properties.

W. O. E.

Chemical examination of paraffin-oil emulsions prepared with tragacanth. E. SCHULEK AND G. VASTAGE. *Pharm. Zentralhalle* 69, 275-8(1928).—In a tared 200-cc. beaker heat 20 g. of the sample 10 min. on the water bath with 50 cc. 96% alc., stirring constantly the while to promote sepn. of the emulsion, whereby the paraffin should collect at the bottom of the beaker. Add 50 cc. petroleum ether to the cooled mixt., stir with a glass rod and transfer the liquids to a separatory funnel, leaving the tragacanth in the beaker. Wash the gum by kneading with a rod with four 10-cc. portions of petr. ether, which are finally added to the liquids in the separator. Pass the paraffin-contg. petr. ether through a pledget of cotton into a 200-cc. Erlenmeyer flask, then ext. the aq.-alc. soln. with three 10-cc. portions of petr. ether. Distil the united petr.-ether exts., dry the residual paraffin at 120° and weigh. Transfer the alc. soln. to the original beaker, evap. on steam bath, dry at 105° and weigh.

W. O. E.

Testing of balsam of copaiba and Peru. H. WIEBELITZ. *Pharm. Ztg.* 73, 567(1928).—A critique of the Ger. Pharm. specifications, notably with respect to their behavior in $CHCl_3$, abs. EtOH or AcOH soln.

W. O. E.

Determination of high-boiling phenols in a coal-tar creosote-castor oil soap disinfectant. J. N. TAYLOR. *J. Assocn. Official Agr. Chem.* 11, 222-5(1928).—Using the methods described by Chapin (C. A. 3, 690) high-boiling phenols in an emulsion-producing type of disinfectant contg. a castor-oil soap were found to be more satisfactorily and accurately detd. by distg. directly than by steam distn. A. PAPINEAU-COUTURE

Farnesol from oil of palmarosa. F. ELZE. *Reichstoffindustrie* 1928, 41; *Parfums de France* 6, 112(1928).—Fractionation of the product of sapon. of the tail fractions obtained from 5200 kg. of oil gave 31.5 kg. geraniol and 34.5 kg. crude farnesol, which, on purification via the acid phthalate, gave 18 kg. farnesol, b_p 145-7°, d_4^{20} 0.897, n_D^{20} 1.461, semicarbazone of the corresponding aldehyde m. 133-134.5°. A. PAPINEAU-COUTURE

Contribution to the knowledge of the composition of oil of rosemary. B. N.

RUTOVSKII AND I. V. VINOGRADOVA. *Trav. inst. chim. pharm. Moscou* 17, 86-97(1927); *Parfums de France* 6, 112(1928).—Oil of rosemary of Crimean or Caucasian origin was found to contain *l*- and *dl*- α -pinene, camphene, cineole, borneol, *l*-camphor and probably camphylene.

A. PAPINEAU-COUTURE

Recent progress in the chemistry of perfumes. HENRI TATU. *Technique moderne* 20, 263-8(1928).—A brief review of the synthetic prepn. of borneol, terpineol, thymol, menthol, vanillin and hydroxycitronellal.

A. PAPINEAU-COUTURE

Crimean oil of anise. B. N. RUTOVSKII AND P. LEONOV. *Trav. sci. inst. chim. pharm. Moscou* 10, 64-8(1924); *Parfums de France* 6, 112-3(1928).—The oil, obtained in 0.61% yield, had f. p. $+4^{\circ}$, d_4^{20} 0.9705, $n_D^{20} +12.15^{\circ}$, $n_D^{25} +1.5405$, acid no. 0, sol. in 6.3 vol. 80% alc. The anethole sepd. by freezing, m. 17.5° , and had n_D^{20} 1.5271. Phellandrene was identified by its nitrite (m. 113.5°) and methylchavicol by $KMnO_4$ oxidation to homoanisic acid (m. 86°). No fenchone was detected.

A. P.-C.

Procedure for the extraction of amygdalin and emulsin from the press cake of bitter almonds. M. BRIDEL AND (MLLE.) M. DESMARET. *Bull. soc. chim. biol.* 10, 373-80(1928); cf. C. A. 22, 971.—Sugars and glucosides are readily extd. from bitter almond press cake by means of a rapid percolation with 70% alc., the sucrose being totally extd. in 9 hrs. and the amygdalin in 12.5 hrs. By this rapid method these constituents are extd. before the enzymes exercise their hydrolyzing action, and before these same enzymes are altered by alc. From the residue of press cake after the rapid percolation by alc. an emulsin can be extd. which has practically the same properties as the emulsin extd. from sweet almonds, the same quantity per kg. and at $1/8$ to $1/7$ of the cost. The yield of amygdalin was 30 g. per kg.

L. W. RIGGS

Results of elementary analysis of a preparation of insulin with an activity of forty units per milligram. A. BOIVIN AND R. GUILLEMET. *Bull. soc. chim. biol.* 10, 415-20(1928); cf. Abel, C. A. 21, 2912.—The procedure for prepg. the samples of insulin analyzed is described. The results were C 51.8, H 5.8, O 25.4, N 14.0, S 2.96, ash 0.

L. W. RIGGS

A new method of estimating crystalline digitalin. EM. PERROT AND P. BOURCET. *Compt. rend.* 186, 1021-4; *Bull. sci. pharmacol.* 35, 233-5(1928).—Details are given for the detn. of cryst. digitalin, m. $240-47^{\circ}$, in the dried leaves of the plant. The procedure is long and such as would be used by the manufg. chemist.

L. W. RIGGS

Fishing vessels medicines. ANON. *Chemist and Druggist*, 107, 275, 374(1927).—An official list is given of 10 formulas of medicinal mixts. for emergency use on fishing vessels. The formula for eye drops to act as a local anesthetic is cocaine 0.5%, HCl 0.033% in castor oil; concise directions are given for its application. S. warns that with the oily medium, surface anesthesia is not produced within the time stated; he recommends a soln. of 0.5-1% cocaine in 2.5% PhOH, or an aq. soln. of ethocaine borate.

S. WALDBOTT

Detection of refined olive oil in virgin olive oil. BAUD AND COURTOIS. *J. pharm. chim.* 7, 215-8(1928); cf. C. A. 22, 1051.—Prehse's observation (C. A. 19, 2278) is confirmed: Pure refined olive oils exposed in a small quartz tube to ultra-violet light filteree through a Wood's screen exhibit a characteristic tint and fluorescence which differentiatd them from virgin olive oils. Addn. of 10% of pulp oils is easily detected; the addn. of 10% of 2nd pressure oil is not so easily detected. Soy-bean oil and grape-seed oil also show strong blue fluorescence. Virgin olive oil becomes fluorescent in Wood's light after prolonged heat; the intensity varies with the length of heating and the temp.

S. WALDBOTT

Ammoresinol from ammoniacum gum-resin. P. CASPARIS AND IDA MICHEL. *Pharm. Acta Helv.* 3, 25-31, 41-52(1928); cf. C. A. 19, 2261.—The gum-resin consists largely of ammoresinol (A). To avoid resinification and obtain good yields, select a light colored drug, use excess of Et_2O in extg. A (e. g., 500 cc. for 20 g. drug), shake out A with weak NaOH soln. (1%), remove A at once from NaOH soln. with weak acid in the presence of Et_2O , evap. Et_2O in vacuo to avoid heat, then convert A into the Ac compd., from which A is recovered almost quant. by mild sapon. A is insol. in H_2O , sol. in 5% Na_2CO_3 , pptd. from this soln. by CO_2 ; sol. in alkali, difficultly in C_6H_6 , C_6H_5Me , sol. in $EtOH$, $MeOH$, Et_2O , $CHCl_3$, Me_2CO , $AcOH$, $AcOEt$, and C_6H_5N . A and its solns. in org. solvents rapidly turn yellow when exposed to light. A 10% soln. in abs. $EtOH$ is optically inactive; the alc. soln. is faintly acid to litmus. In $CaOCl_2$ soln., A is sol. with orange-red color (Plugge's test for ammoniacum). The formula $C_{15}H_{24}O_4$ for A is expanded to $C_{16}H_{17}(OH)(OMe)_2$, since 2 MeO groups are shown to be present. Degradation by oxidation with H_2O_2 in glacial AcOH yielded γ -resorcylic acid, indicating an aromatic nucleus in which 2 O atoms are in *m* position. Br is not

absorbed, but by catalytic hydrogenation H_4 is added indicating 2 double bonds in a partly hydrogenated nucleus. The following tentative formula for *A* is given: $C_6H_2(OH)(OMe).CH_2CH_2.C_6H_2(H_2)Me_2(OMe)$. It suggests a relation of *A* to polyterpenes which also tend to resinify. S. WALDBOTT

The hydrocyanic acid question. XXII. Hydrocyanic acid in the genus *Vicia*. L. ROSENTHALER. *Pharm. Acta Helv.* 3, 31-2(1928); cf. *C. A.* 22, 1995.—HCN is known to exist in *Vicia sativa*, L. (0.0008% in seeds, Bruynning and van Haarst) and var. *briannica* (0.00016%, B. and v. H.), var. *flore albo* and var. *Bernayer*; *V. hirsuta* Gray, *V. angustifolia* (Clos) Roth (0.075% in seeds, Bertrand); *V. macrocarpa* Bertol., *V. villosa* Roth (in unripe seeds). Free from HCN are *V. narbonneensis* (except in the germ, R.), *V. Cracca* L., *V. agrigenina* (?), *V. fulgens* Batt., *V. dumetorum* L., *V. villosa* Roth (in ripe seeds). By macerating the crushed seeds for 12-24 hrs. with H_2O , distg and testing for HCN in the distillate by the NH_4SCN reaction, R. finds HCN present in the seeds of *V. ambigua* Guss., *V. atropurpurea* Steud. (traces), *V. biennis* L. (traces), *V. calcarata* Desf., *V. carnigera*, *V. cassubica* L. (0.008%), *V. disperma* DC (traces), *V. Gerardii* Vill. (traces; more HCN in the germ), *V. grandiflora* Scop. (traces), *V. globosa* Retz (traces), *V. lutea* var. *pallidiflora* (traces), *V. Michauxii* Schrank, *V. multiflora*, *V. pannonica* Crantz (traces; more HCN in the germ), *V. peregrina* L., *V. pica* Fisch. et Mey., *V. polyphylla* Waldst et Kit. (traces), *V. pseudocracca* Bertol (traces), *V. striata* Bieb. (0.028%), *V. sepium* L. (traces; also in the flowering green parts, cf. R., *C. A.* 17, 1269), *V. tricolor*. No HCN was found by R. in the seeds of *V. bithynica* L., *V. cuspidata* Boiss., *V. ferruginea*, *V. hybrida*, *V. onobrychioides* L., but HCN was present in their germs. No HCN was present in the seeds or germs of *V. sylvatica* L. and *V. faba* L. XXIII. Hydrocyanic acid in grasses of Bechuanaland.

MARGUERITE HENRICI. *Ibid* 33, from Reports of the Director of Veterinary Education and Research, Pretoria, 1926.—By applying Guignard's test (*C. A.* 11, 675), HCN was found in the following grasses at the time of their withering or beginning to dry: *Antherophora pubescens*, *Aristida unipennis*, *A. congesta*, *Chrysopogon serrulatus*, *Digitaria erantha*, *Pogonarthria fulcata*, *Sporobolus fimbriatus*, *Themeda triandra*. No HCN was found in *Chloris virgata*, *Cymbopogon plurinodis*, *Eragrostis superba*, *E. lehmanniana* and *Fingerhuthia africana*. Unlike the grasses contg. HCN, those devoid of it turn red during the dry period in summer, indicating a relation between formation of HCN and that of anthocyanins. XXIV. The hydrocyanic glucoside from the seeds of the myrobalan plum. I. ROSENTHALER. *Ibid* 33-4.—In the seeds of *Prunus myrobalana* Loisel (L.), R. found 0.125% HCN, present as *l-amygdalin*. S. WALDBOTT

The centenary of the birth of Marcelin Berthelot. ANON. *Neue Zürcher Zeitung; Schweiz. Apoth. Ztg.* 65, 573-4, *Chemist and Druggist* 107, 416(1927)—Biography. S. WALDBOTT

A phase of the relationship of chemical structure to pharmacological action. C. W. BAUER. *J. Am. Pharm. Assocn* 16, 1059-61(1927)—This is a discussion of the influence on the degree of toxicity produced by an acid radical which is used to render the drug H_2O -sol. Many drugs which are useful in therapy are insol. and many attempts have been made to render them sol. by the addn of groups. SO_3H and $COOH$ and their alkali salts render many compds sol but destroy their activity. In many instances the activity may be restored by esterification. On the other hand the HCl of the NH_4 group renders a drug sol. and does not destroy its activity. L. E. WARREN

The causes of precipitation in tinctures and fluidextracts. W. L. SCOVELLE. *J. Am. Pharm. Assocn* 16, 1136-46(1927).—Four classes of drugs were selected for study (A) alkaloidal, (B) astringent, (C) cathartic and (D) miscellaneous. Of each of 31 drugs 1000 cc. of tincture were prepared. The prepn. was divided into 8 portions of 125 cc. each. They were variously subjected to different (1) intensities of light, (2) acidity, (3) alkalinity, (4) oxidation, (5) reduction, (6) strongly ionizing agents, (7) saline buffers and (8) dehydrating agents. Light is not a serious factor; acidity is important as is also the manner of its addition, i. e., whether added before or after percolation; HCl or $NaCl$ prevented pptn. in but one instance, increased it in 12 and was neutral in 18; NH_4OH caused pptn. in every case; H_2O increased pptn. in 5, decreased it in 5 and showed no effect in 21; CO_2 showed slight beneficial effect on 3 and increased pptn. in 24; H_2PO_4 showed a beneficial effect on 3, increased pptn. in 20 and was neutral in 8; $Na_2C_2H_3O_2$ benefited in 18; the use of $C_2H_5(OH)$, and of $EtOH$ in greater concns. tends to reduce pptn. by reducing the hydrolytic action. L. E. WARREN

Pharmaceutical products from mucic acid. F. F. BLICKE AND J. L. POWERS. *J. Am. Pharm. Assocn.* 16, 1146-9(1927).—Granular effervescent salts may be made with mucic acid instead of tartaric acid at some saving in cost. Other possible pharmaceutical uses are mentioned. L. E. WARREN

The effect of changes of hydrogen-ion concentration upon compound tincture of gentian. J. C. KRANTZ, JR. AND F. J. SLAMA. *J. Am. Pharm. Assoc.* 16, 1158-7 (1927).—Several tinctures were prepd. from the same specimen of ground drug. To the official menstrum varying amts. of acid or alkali were added and the effects noted on standing. The acids used were HCl, H₂SO₄, and HC₂H₃O₂. The alkali was NaOH. In each case the H-ion concn. was detd. electrometrically. The results indicated that the min. deposit is formed when the p_H of the menstrum is near the neutral point.

L. E. WARREN

Apparatus for the determination of volatile oil. J. F. CLEVINGER. *J. Am. Pharm. Assoc.* 17, 346 (1928).—The app. consists essentially of a distg. flask, a condenser and a separator for sepg. the volatile oil from the H₂O in the distillate. The separator exists in two forms, A and B. A, for oil lighter than H₂O, consists of a condenser having its lower ends drawn out to a graduated tube and provided with a glass tap at its distal end. The tube carrying the vapors enters the condenser from the side at a point above the graduated tube. A siphon leaves the condenser at a point below the graduations. This rises to a point above the graduations. It returns the se d H₂O to the distg. flask, leaving the volatile oil in the graduated tube above. B, for oils heavier than H₂O, is similar to A except that the return siphon for the H₂O leaves the separator at a point above the graduations, leaving the oil in the graduated tube below. The material contg. the volatile oil is placed in the distg. flask with H₂O. The flask is heated in an oil bath. The oil found in several drugs by the new method closely paralleled that found by the U. S. P. X method for volatile Et₂O ext.

L. E. WARREN

The assay of Ephedra vulgaris. J. B. WILLIAMS. *J. Am. Pharm. Assoc.* 17, 430-1 (1928).—*Ephedra* has been reported to contain 0.2-1% of total alkaloids. By the U. S. P. X assay method for belladonna, slightly modified samples of *Ephedra* were assayed. Gravimetrically the yields were 0.73-1.42%; volumetrically 0.48-1.25%. The factor used in the volumetric assay with Mc-red indicator is 1 cc. 0.1 N acid = 0.01659 g. of alkaloid. If a CHCl₃ soln. of the alkaloids be allowed to stand and then evap., Cl will be found in the residue. At 100° the alkaloid is almost completely volatile. Good results can be obtained by using Et₂O as final solvent and adding the 0.1 N acid before evapn. The Et₂O soln. should be filtered through wet cotton with Et₂O and not washed with H₂O.

Emetine. E. BURCKHARDT and M. STÄRKLE. U. S. 1,670,059, May 15. Cephaeline is methylated with phenyltrimethylammonium hydroxide.

Aldehyde compounds of diaminoacridines. G. W. RAIZISS and B. C. FISHER. U. S. 1,670,740, May 22. An addn. product is formed by 2 aromatic aldehyde mols. such as salicylaldehyde joined to the amino groups of 3,6-diamino-10-alkylacridinium compds such as acriflavine. These products are *therapeutic bactericides*.

1-Amino-3-tertiaryamino-2-propanols. I. G. FARBENIND. A.-G. Brit. 276,012, Aug. 13, 1926. 1-Amino-3-diethylamino-2-propanol is made by heating 3-chloro-2-hydroxypropylphthalimide with a soln. of diethylamine in alc. and sapon. the product or by heating the hydrochloride of 3-chloro-2-hydroxypropylamine with diethylamine and alc. Similar methods are given for the production of 1-amino-3-piperidino-2-propanol and 1-amino-3-phenylmethylamino-2-propanol. These compds. may be used as medicines or as intermediates for making other therapeutic compds.

Gold nucleic acid compounds. SOC. ANON. POUR L'IND. CHIM. À BÂLE. Brit. 276,677, Aug. 25, 1926. Therapeutic Au compds. are made by reacting upon nucleic acid or a water-sol. nucleate with a Au compd. such as AuCl₃. In neutral or alk. soln. a water-sol. Au-alkali nucleate is obtained; in acid soln. an insol. Au nucleate is produced which is converted by alkali into the sol. Au-alkali compd.

Scarlet fever antitoxins. I. G. FARBENIND. A.-G. Brit. 276,024, Aug. 14, 1926. Anti-serums are prepd. from rod-like bacilli found in cases of scarlet fever but differ from the usual scarlet fever hemolytic streptococci. Various details and modifications of procedure are given.

Hormones. CHEMISCHE FABRIK. AUF AKTIEN, FORM. E. SCHERING. Brit.

276,994, Sept. 4, 1926. Hormones such as may be obtained from germ glands by the process described in Brit. 261,356 (C. A. 21, 3425) are obtained in water-sol. form by treatment with an alk. earth and subsequently pptg. the latter as carbonate. Cf. C. A. 22, 251.

Vegetable medicinal products similar to hormones from glands. CHEMISCHE FABRIK AUF AKTIEN VORM. E. SCHERING. Brit. 277,302, Sept. 11, 1926. Processes are described closely similar to those of Brit. 271,492 (C. A. 22, 1654).

Solvents for medicines. SOC. ANON. POUR L'IND. CHIM. A. BALE. Brit. 277,003, Sept. 1, 1926. The product for dissolving medicines insol. or difficultly sol. in water obtained as described in Brit. 218,982 (C. A. 19, 560) is modified by substituting for the carbamic acid-ester a water-sol. aliphatic acid amide or N-substituted deriv. such as acetamide or diethylacetamide.

Medicinal tablets formed of yeast and chocolate. C. DOCTOR. Brit. 276,926, May 10, 1927.

Coatings for wrapped medicines, etc. F. BLANK. Brit. 276,501, Aug. 26, 1926. Wrapped medicines, bandages, etc., are coated with a celluloid varnish or similar compn. contg. a cellulose deriv.

Cosmetic. T. HASHIMOTO. U. S. 1,670,449, May 22. A slightly acid soln. of Bengal isinglass agar is heated under about 2 atm. pressure to prevent coagulation, and there are added a soln. of *gloiopeltis furcata*, $(\text{CH}_3)_4\text{N}_4$, Li benzoate and an alc. soln. of lanolin. Cf. C. A. 21, 476.

Mixture for treating the hair. O. S. FOLTMAR. Brit. 276,500, Aug. 25, 1926. A compn. for removing grease from and curling the hair is formed of PrOH or C_6H_6 , camphor, resorcinol and water, with or without perfume and coloring.

Varnish for finger nails. L. STUDER and B. G. BAINBRIDGE. Brit. 276,834, Sept. 9, 1926. Pyroxylin and camphor are dissolved with AmOH, acetone, AmOAc and MeOH and the mixt. is colored with "carmine oil" (a cochineal prepn.).

Paper sheets treated with gums or antiseptics for "trapping" or destroying bacilli in sputum, etc. F. KOESTER and J. RHODE. Brit. 275,935, Aug. 11, 1926.

E. M. SYMMES

Modified circulation system improves operation of chamber plant. E. L. LARISON. *Chem. Met. Eng.* 35, 229 (1928).—In a chamber H_2SO_4 plant as ordinarily operated, the vol. of acid distributed over each Gay Lussac tower is the same as that of the nitrous vitriol fed to the Glover tower. This is often less than the amt. desirable for most efficient absorption in the Gay Lussac towers. A simple change in operating detail is described which permits continuous optimum liquid flow through the Gay Lussac towers even when the Glover tower feed is considerably less. The new circulation system results in an increase in percentage recovery in the Gay Lussac tower from 85 to 90, and a decrease in daily consumption of fresh NaNO_2 from 2500 to 1700 lbs. The plan is covered by U. S. patents Nos. 1,613,139 and 1,638,042. R. L. DODGE

Treatment of leucite with nitric acid. G. A. BLANC. *Atti II congresso naz. chim. pura applicata* 1926, 1398–405.—When HCl is replaced by HNO_3 in the treatment of leucite, pure Al_2O_3 and pure KNO_3 are obtained (cf. C. A. 19, 1616). Subsequent expts. show that the HNO_3 process is utilizable on a com. scale, in which case the leucite is treated under the same conditions as with HCl and the general phenomena are similar, solns. free of SiO_2 being obtained, even without filtration. The best method found for the sepn. of $\text{Al}(\text{NO}_3)_3$ and KNO_3 depends upon the fact that $\text{Al}(\text{NO}_3)_3$ is practically insol. in cold 65–70% HNO_3 , while the soly. of KNO_3 increases with increase in the concn. of HNO_3 . The soly. of $\text{Al}(\text{NO}_3)_3$ and of KNO_3 in HNO_3 of all concns. at 15° is shown graphically. Just sufficient HNO_3 of suitable concn. is added to the hot reaction mixt., satd. with both $\text{Al}(\text{NO}_3)_3$ and KNO_3 , to cause on cooling the sepn. of all $\text{Al}(\text{NO}_3)_3$ but no KNO_3 . Under these conditions the $\text{Fe}(\text{NO}_3)_3$ also remains in soln. with the KNO_3 and the crystd. $\text{Al}(\text{NO}_3)_3$ contains only a trace of $\text{Fe}(\text{NO}_3)_3$. The mother liquor contg. KNO_3 and $\text{Fe}(\text{NO}_3)_3$ is evapd., the nitrous-nitric vapors are condensed, and the KNO_3 and $\text{Fe}(\text{NO}_3)_3$ crystd. Al_2O_3 is obtained from $\text{Al}(\text{NO}_3)_3$ in much the same way as from AlCl_3 and its properties are the same. The H_2O in the Al_2O_3 is not H_2O of hydration but is adsorbed and can be eliminated at low temps., and the reaction is not exothermic, as with the evolution of H_2O of hydration from Bayer Al_2O_3 . The removal of H_2O is, therefore, far more economical in the Blanc process. Nitrous-nitric vapors are condensed both in the evapn. of the KNO_3 soln. and in the decompn.

of $\text{Al}(\text{NO}_3)_3$, and when granular leucite is moistened with water it has the power of fixing all these nitrous-nitric vapors, whatever their diln. in the H_2O -air distillate. Therefore, the HNO_3 is completely recovered and used for the attack of more leucite. It is best to use the vapors from the evapn. of the KNO_3 to acidify the soln. for attack of the leucite, while the vapors from the decompn. of $\text{Al}(\text{NO}_3)_3$ pass through towers filled with leucite with a counter-current of water. This great ability of leucite to fix the last traces of nitrous-nitric vapors suggests the use of leucite in the HNO_3 industry. C. C. D.

Ammonia synthesis with catalysts derived from complex cyanides of iron. A. MITTASCH AND E. KUSS. *Z. Elektrochem.* **34**, 159-70(1928); cf. following abstract.—Complex cyanides of Fe or carbides derived from these cyanides are not themselves effective catalysts for the synthesis of NH_3 . The active agent is elementary Fe resulting from the decompn. and reduction of the complex cyanide. The activity of the Fe may be enhanced by the presence of other materials that arise during the decompn. of the complex cyanides. The effective catalyst is then only a promoted Fe catalyst. This conclusion is supported by extensive chem., x-ray and magnetic studies of the complex cyanides and their decompn. products. The bearing of this research on the NH_3 catalyst patent situation in Germany is indicated. R. L. DODGE

The thermal decomposition of complex iron cyanides in connection with the ammonia synthesis. A. MITTASCH, E. KUSS AND O. LEMERT. * *Z. anorg. allgem. Chem.* **170**, 193-212(1928); cf. preceding abstract.—The complex Fe cyanides as such are not NH_3 catalysts, but the products of their decompn. and reduction are. $(\text{NH}_4)_4\text{Fe}(\text{CN})_6$ and $\text{KAlFe}(\text{CN})_6$ are decomposed at high temp. in a $\text{N}_2\text{-H}_2$ mixt. with intermediate formation of a substance corresponding in compn. to $\text{Fe}(\text{CN})_2$. The purely thermal decompn. of $\text{Fe}(\text{CN})_2$ gives Fe, C, Fe_3C , Fe nitride and N_2 , probably with the intermediate formation of FeC_2 . In $\text{N}_2 + \text{H}_2$, $\text{Fe}(\text{CN})_2$ reacts as follows: at 230° , the C and the N in the CN groups are reduced at the same rate, and the completed reaction yields Fe. At 400° the rates of reduction differ and there is obtained, probably through the intermediate formation of FeC_2 , a mixt. of Fe, Fe_3C , C and probably the 2 latter in varieties easily reduced by the $\text{N}_2\text{-H}_2$ mixt. These varieties are changed by prolonged heating above 400° , although the Fe_3C can still be reduced. Fe must always be formed first; Fe_3C could not be prepd. under any conditions without the formation of Fe, while it is possible to control the conditions so as to obtain only Fe. The NH_3 contact catalysts prepd. from complex Fe cyanides must always contain Fe, and are composed chiefly or exclusively of products of reduction. These are activated by the $\text{N}_2\text{-H}_2$ mixt. and constitute then a catalyst. Fe_3C in finely divided form is readily reduced by H_2 to a compact form, at least superficially, so that the catalytic action of Fe_3C as such has never been observed. G. CALINGAERT

The equilibrium relations in the ammonia-soda process under pressure. BERNHARD NEUMANN AND RICHARD DOMKE. *Z. Elektrochem. angew. physik. Chem.* **34**, 136-53(1928).—The app. described, for detg. the solubilities of solids in aq. solns., is capable of holding pressures up to 3 atm. for several hrs. at equil. temp. and allowing samples to be pipetted. The solubilities of combinations, such as $\text{NaCl} + \text{NH}_4\text{HCO}_3 = \text{NH}_4\text{Cl} + \text{NaHCO}_3$, are detd. at 20° , 30° and 40° (not at 40° for those contg. NH_4HCO_3) at 1.2 atm. of CO_2 , accurate to 1%, including: NaCl (I) and NH_4Cl (II), I and NaHCO_3 (III), III and NH_4HCO_3 (IV), II and IV; solns. satd. in II, III, IV and III, II, I; and solns. satd. in II and III, and, III and IV, contg. I in each. To det. the influence of pressure the expts. are repeated at 2.5 atm. of CO_2 on solns. of II, III, IV and I, II, III. From these, 9 diagrams are plotted by Löwenherz's method (*Z. physik. Chem.* **13**, 459; **28**, 453). The congruency or incongruency of the solns. is detd. by given methods and the results are discussed. The Na and NH_4 yields are calcd., from the solubilities for 1.2 and 2.5 atm. of CO_2 at 20° and 30° . The NH_4 yield is increased by lowering the temp. and increasing the pressure, while the Na yield decreases in both cases. Based on the data obtained, a technical process is outlined, the optimum temp. being 30° and the molar ratio of NaCl to NH_3 in soln. 1:1.07. The diagrams and yields are discussed. J. BALOZIAN

Attempts to obtain ammonium phosphates from secondary and tertiary calcium phosphates. CURT MÜCKENBERGER. *Z. anorg. allgem. Chem.* **169**, 81-95(1928).—M. has investigated the transformation of $\text{Ca}_3(\text{PO}_4)_2$ (pure and technical varieties) and CaHPO_4 into sol. phosphates by the action of H_3PO_4 , $(\text{NH}_4)_2\text{SO}_4\text{-H}_3\text{PO}_4$, $\text{NH}_4\text{H}_2\text{PO}_4$, $(\text{NH}_4)_2\text{HPO}_4$ and $(\text{NH}_4)_2\text{CO}_3$ at various temps. and pressures in a glass bomb app. of Askenasy and Elöd. Upon heating mixts. of 3.1 g. $\text{Ca}_3(\text{PO}_4)_2$ with 20 cc. H_3PO_4 (3.1895 g. $\text{P}_2\text{O}_5/20$ cc.) for 5 hrs. at $178\text{--}253^\circ$ under pressures of 14-17 atm. N. 75-61.8% of the P_2O_5 of the reactants was water-sol. The insol. residue was mainly CaHPO_4 . By using the same amt. of $\text{Ca}_3(\text{PO}_4)_2$ and adding 4-5 g. $(\text{NH}_4)_2\text{SO}_4$ and 20 cc.

of H_3PO_4 (0.2709–6.3790 g. P_2O_5 /20 cc.) at 180–290° and pressures of 16–14 atm. N or CO_2 it was found that at the higher temps. and the highest concn. of H_3PO_4 (40% excess) 92% of the P_2O_5 content became sol. according to the reaction $\text{Ca}_3(\text{PO}_4)_2 + 3(\text{NH}_4)_2\text{SO}_4 + 4\text{H}_3\text{PO}_4 \rightarrow 6\text{NH}_4\text{H}_2\text{PO}_4 + 3\text{CaSO}_4$. $\text{NH}_4\text{H}_2\text{PO}_4$ and $(\text{NH}_4)_2\text{HPO}_4$ effect only slight transformations of $\text{Ca}_3(\text{PO}_4)_2$ into sol. phosphates (3–4%). The solid phase remaining when $\text{NH}_4\text{H}_2\text{PO}_4$ is used is a mixt. of CaHPO_4 and $\text{Ca}_3(\text{PO}_4)_2$ at 61–215°. When $(\text{NH}_4)_2\text{CO}_3$ at about 55° is allowed to react with varying amts. of CaHPO_4 under various conditions of pressure (10–12 atm. N or CO_2) in the presence of varying amts. of NH_4Cl , NH_4NO_3 , $(\text{NH}_4)_2\text{SO}_4$, $\text{NH}_4\text{H}_2\text{PO}_4$, $(\text{NH}_4)_2\text{HPO}_4$, NH_4OH and NH_4HCO_3 , an equil. is established between the solids $\text{Ca}_3(\text{PO}_4)_2$, CaHPO_4 , CaCO_3 and traces of CaO and the soln. contg. 30–47% of the P_2O_5 of the original reactants in water-sol. form. Data giving the specific temp., pressures, concns., yields, etc., are tabulated. E. R. S.

Studies on bleaching powder. VIII. The decomposition of calcium hypochlorite by carbon dioxide. SABURO URANO. *J. Soc. Chem. Ind. Japan* 31, 53–60 (1928); cf. *C. A.* 22, 1443.— CO_2 decomposes $\text{Ca}(\text{OCl})_2$ in the presence of H_2O : $3\text{Ca}(\text{OCl})_2 = \text{Ca}(\text{ClO}_3)_2 + 2\text{CaCl}_2$. CO_2 decomposes a mixt. of $\text{Ca}(\text{OCl})_2$ and CaCl_2 in the presence of H_2O : $\text{Ca}(\text{OCl})_2 + \text{CaCl}_2 + 2\text{CO}_2 = 2\text{CaCO}_3 + 2\text{Cl}_2$. Though the formation of $\text{Ca}(\text{ClO}_3)_2$ from $\text{Ca}(\text{OCl})_2$ or the evolution of Cl_2 from a mixt. of $\text{Ca}(\text{OCl})_2$ and CaCl_2 is caused by heat only, CO_2 accelerates these reactions because HOCl is produced from $\text{Ca}(\text{OCl})_2$ by CO_2 and the HOCl oxidizes in turn $\text{Ca}(\text{OCl})_2$ to $\text{Ca}(\text{ClO}_3)_2$ or CaCl_2 to $\text{Ca}(\text{OH})_2$ and Cl_2 . As CO_2 expelled almost all Cl_2 from bleaching powder, Lunge assumed that the chem. constitution of bleaching powder had to be CaCl_2O or $\text{Ca}(\text{OCl})\text{Cl}$. But the mixt. of $\text{Ca}(\text{OCl})_2$ and CaCl_2 also sets free all Cl_2 by CO_2 similarly to bleaching powder. Even CaCl_2 itself expels Cl_2 by CO_2 in the presence of an oxidizing agent like KMnO_4 . The reaction of CO_2 expelling Cl_2 from bleaching powder is therefore no proof of the peculiar combination of $\text{Ca}(\text{OCl})_2$ and CaCl_2 , but can be explained as the common reaction between $\text{Ca}(\text{OCl})_2$, CaCl_2 and CO_2 , or simply as the inverse reaction of the formation of bleaching powder. The chem. constitution of bleaching powder cannot be deduced from the action of CO_2 . K. K.

A study of some calcium and magnesium salts of commerce. G. S. CALIN. *J. Am. Pharm. Assoc.* 16, 1053–6 (1927).—Several specimens of Mg citrate imported into Mexico from Europe were found to be adulterated with Mg tartrate. One was composed entirely of Mg tartrate. Later other substances, such as MgO , MgCO_3 and CaCO_3 were found to contain impurities. L. E. WARREN

Preparation of cyanides from calcium cyanamide. A. A. YAKOVIN and N. A. FLEISHER. *Trans. State Inst. Applied Chem. (Moscow)* 1927, No. 5, 3–7.—In his 3 expts. on the prepn. of cyanides by calcining CaCN_2 with Na_2CO_3 A. Kretov (cf. *C. A.* 20, 3334) obtained a yield of 70–80% of the group CN based on the amt. of N contained in the cyanamide, but as he did not state the operating temp. and used com. cyanamide of low N content Y. and F. investigated this process. The expts. were made in a tubular elec. furnace. The materials were placed in a porcelain dish and the temp. was maintained mostly between 900° and 1000° and the operations were in a current of N. At the conclusion of each calcination the contents of not only the dish but also of the tube were washed with water and the soln. obtained was analyzed. Preliminary expts. with com. CaCN_2 contg. 12.7% N and 1.4% gypsum and free from CaCl_2 , showed that most of the N formed NH_3 and volatilized, the yield in cyanide being very small. Other expts. made with cyanamides contg. from 20.6 to 22.2% N, freshly prepd. by heating mixts. of finely pulverized com. CaC_2 with 2% CaF_2 at 1000°, showed that the yield of cyanides is noticeably increased when insignificant amts. of nitrides of either Ce, Mg or Al are used as catalyzers and that the most favorable temp. is about 950°. The duration of the operation is about 2 hrs.; if the heating is prolonged to about 6 hrs. part of the cyanide formed is destroyed and the yield is lowered. The best yield (89%) was obtained with 1.62 g. KCl for every 0.5 g. cyanamide and with 0.05 g. Mg_3N_2 as catalyzer. BERNARD NELSON

Chemical utilization of gypsum. G. GALLO. *Giorn. chim. ind. applicata* 9, 405–10 (1927); *Brit. Chem. Abstracts* 1928B, 12.—The only 2 successful processes for the chem. utilization of gypsum comprise the manuf. of (1) H_2SO_4 by the contact process from SO_2 obtained by heating a mixt. of gypsum, SiO_2 , Al_2O_3 and coal in a rotary cement furnace, the residual clinker being used for making cement, and (2) $(\text{NH}_4)_2\text{SO}_4$ and CaCO_3 , by passing NH_3 and CO_2 into an aq. suspension of powd. gypsum. Expts. show that, in the presence of water, equimol. proportions of $(\text{CaSO}_4)_2\cdot\text{H}_2\text{O}$ and MgCO_3 react at ordinary temps., a soln. contg. about 50 g. per l. of MgSO_4 being obtained after 45 days. With $\text{CaSO}_4\cdot 2\text{H}_2\text{O}$ the reaction is slower, and the resulting MgSO_4 soln. contains only 30–35 g. per l. Other uses for MgSO_4 are being sought. C. C. DAVIS

Survey of the opening, the distribution, the organization, and the content of the German potassium-salt deposits. E. FULDA. *Z. physik. chem. Unterricht.* 41, 81-6 (1928). M. BEBER

Survey of the origin, the structure, and the extraction of German potassium-salt deposits, including data on the occurrence of potassium salts abroad. E. FULDA. *Z. physik. chem. Unterricht* 41, 125-32(1928). M. BEBER

The salt series in the Vienenburger potash works. FRANKÉ AND BÜCHNER. *Kali* 22, 103-5(1928).—An exhaustive mining, microscopical and chem. study proves that the potash layer of Vienenburger represents the horizon of the Ronnenberger stratum A. L. HENNE

The reduction of sodium sulfate to sodium sulfide, particularly by hydrogen and carbon monoxide in the presence of catalysts. PETER P. BUDNIKOV AND EUGEN SHILOV. *J. Soc. Chem. Ind.* 47, 111-3T(1928); cf. *C. A.* 21, 803 and following abstract.—Both Ni and C accelerate the reduction of Na_2SO_4 by CO, but C has much greater effect because the primary reaction is reduction of Na_2SO_4 by CO, with CO_2 formation; the C then reduces the CO_2 to CO. When C is present the reduction goes as well with CO_2 as with CO. Reduction of Na_2SO_4 with H begins at 700° , and proceeds with the formation of Na_2S and H_2O ; H_2S and other decompn. products are formed by secondary reactions. Ni catalyzes the reduction, and also the decompn. At temps. of 900° and over Na_2SO_4 reacts with Na_2S to give SO_2 . T. S. CARSWELL

The reduction of sodium sulfate with carbon. P. P. BUDNIKOV AND A. N. SISOEYEV. *Z. anorg. allgem. Chem.* 170, 225-32(1928); cf. preceding abstract.—The reduction of Na_2SO_4 to Na_2S by means of C depends on 3 basic reactions: $\text{Na}_2\text{SO}_4 + 2\text{C} = \text{Na}_2\text{S} + 2\text{CO}_2$; $\text{CO}_2 + \text{C} \rightleftharpoons 2\text{CO}$; $\text{Na}_2\text{SO}_4 + 4\text{CO} = \text{Na}_2\text{S} + 4\text{CO}_2$. The temp. of incipient reaction between C and Na_2SO_4 is a function of the purity and coarseness of the coal, and also of the degree of contact between the 2 substances. The reaction starts at first between the 2 solid phases. The rate of reaction of C with Na_2SO_4 is great. Since gas phases are involved in the process, the theoretical study of the reaction must take the vol. into consideration, and not only the coexistent solid phases. G. C.

Manufacture, properties and use of iron carbonyl. ANDRAULT DE LANGERON. *Rev. univ. mines* 16, 145-61(1927). C. W. OWNINGS

Feldspar in 1926. JEFFERSON MIDDLETON. *Bur. Mines, Mineral Resources of the U. S.* 1926, Part II, 109-17 (preprint No. 10, published Oct. 20, 1927). E. H.

Fuller's earth in 1925. JEFFERSON MIDDLETON. *Bur. Mines, Mineral Resources of the U. S.* 1925, Part II, 25-8 (preprint No. 3, published Feb. 19, 1927). E. H.

Mica in 1926. B. H. STODDARD. *Bur. Mines, Mineral Resources of the U. S.* 1926, Part II, 255-71 (preprint No. 23, published Dec. 30, 1927). E. H.

Potassium and magnesium from Lake Sacki in Crimea. A. F. SAGAIACHNUII. *Trans. State Inst. Applied Chem. (Moscow)* No. 5, 18-24.—The water of Lake Sacki is unusually rich in K and Mg salts. An analysis gave NaCl 12, KCl 0.74, MgCl_2 2.43 and MgSO_4 2.43% and the sp. gr. 1.13. Expts. are being made on the most suitable method of concn. of the water to obtain comparatively pure K and Mg salts. B. N.

Silica in 1926. ESTELLE R. PHILLIPS AND J. A. DORSEY. *Bur. Mines, Mineral Resources of the U. S.* 1926, Part II, 169-73 (preprint No. 16, published Nov., 1927). E. H.

Commercial casein. A. C. WEIMAR AND J. J. TAYLOR. *Michigan Agr. Expt. Sta., Tech. Bull.* 82, 16 pp.(1927).—Commercial methods of mfg. casein were studied to det. which gave the best products. The methods studied were HCl , H_2SO_4 , rennet and sour curd. The natural sour curd method gave the most uniform low-ash casein and good yield. The time and space required for this method do not favor it for economic production. Rennet casein gives an extremely high-ash product. The H_2SO_4 and HCl caseins have the greatest uniformity. The H_2SO_4 is more economical when milk sugar is not made; the whey cannot be used for sugar manuf. J. J. SKINNER

DE JUSSIEU: Evolution de la fabrication de l'acide sulfurique par le procédé des chambres de plomb dans les dernières années. Paris: L'Industrie Chimique. 460 pp. F. 60. Reviewed in *Rev. prod. chim.* 31, 287(1928).

WIESNER, JULIUS VON: Die Rohstoffe des Pflanzenreichs. * Vol. II. Hölzer bis Zucker. 4th ed., revised. Edited by Paul Kraus and Wilhelm von Brehmer. Leipzig: Wilhelm Engelmann. pp. 1123-2253. M. 46; cloth, M. 49; half-leather M. 52.

Sulfuric acid. H. PETERSEN. *Brit.* 276,659, Aug. 28, 1926. In a tower process such as the Opl process, almost all of the nitrous oxides are set free in the first produc-

tion tower, which is of large dimensions and is intensively irrigated with nitrated acid. The tower may be fitted with atomizers, washers, rotary mixers or like devices or may be packed with acid-resisting material.

Denitration of waste acids. W. BÜSCHING. Brit. 276,972, Sept. 3, 1926. H_2SO_4 vapors from a H_2SO_4 concn. boiler are led into a denitration column in counter-current to a flow of waste acid from a preliminary heater. HNO_3 vapors escaping are washed and dried in another column with H_2SO_4 and recovered in concd. form in a cooler. Remaining nitrous fumes pass to absorption towers. An app. and various details are described.

Carbon dioxide. E. W. GREER. Brit. 276,146, Nov. 4, 1926. Solid acid substances and carbonates are mixed with wax, hydrogenated oil or fat or like substances to retard and control their reaction.

Ammonia condenser. S. O. LOKEY. U. S. 1,669,943, May 15.

Catalytic oxidation of ammonia. F. G. LILJENROTH. Brit. 276,295, Aug. 19, 1926. See U. S. 1,663,914 (C. A. 22, 1657).

Ammonia synthesis and other catalytic reactions. H. HARTER. Brit. 275,983, Aug. 10, 1926. The catalyst-holding tube is divided into sep. compartments, each supplied with reacting materials, and the reaction products from each compartment pass into a single conduit. Several alternative details of construction are specified.

Alkali hydrides. DEUTSCHE GOLD- UND SILBER-SCHNEIDANSTALT VORM. ROESSLER. Brit. 276,313, Aug. 23, 1926. H, at a temp. above 200° , is passed over alkali metal, e. g., Na, distributed on a solid diluent such as NaCl, Fe powder, Na_2CO_3 or wood charcoal. The reaction may be carried out counter-currentwise in a rotary inclined tube, and after the process is under way the hydride formed may serve as the diluent for continuing the process.

Ammonium chloride. CHEMISCHE FABRIK GROSS-WEISSANDT GES. and P. SEIDLER. Brit. 275,991, Aug. 10, 1926. Large crystals of NH_4Cl are obtained by effecting crystn. in the presence of aq. exts. obtained by the action of hot H_2O (which may contain HCl) on grasses, weeds, leaves, stalks, barks, roots, fruits, seeds, hay, dry sugar beet shreds, dried malt germs or like substances.

Calcium hypochlorite. I. G. FARBENIND. A.-G. Brit. 276,307, Aug. 18, 1926. Dibasic Ca hypochlorite of the formula $2\text{Ca}(\text{OH})_2\text{Ca}(\text{OCl})_2$, prep'd. as described in Brit. 188,662 (C. A. 17, 1694), is stored with a final moisture content of 5-15% after sepn. from the mother liquor by centrifuging.

Chromium chloride. MATHIESON ALKALI WORKS. Brit. 276,120, July 20, 1926. Cl is passed through ferro-Cr at a high temp. and under non-oxidizing conditions so that Fe is removed as FeCl_3 . An app. is described for producing and treating the ferro-Cr.

Di-ammonium phosphate. R. GRIESSBACH, O. BALZ and A. RÖSSLER. U. S. 1,670,504, May 22. See Can. 265,190 (C. A. 21, 994).

Producing finely divided lead oxide, etc. L. SCHERTEL and W. LÜTY. U. S. 1,670,049, May 15. Metalliferous material such as Pb in subdivided condition is passed through a shaft and over an extended surface of refractory material, highly heated and inert to the material under treatment, and hot gases such as O-contg. gas are passed over the material to effect volatilization and form a fume suspended in the gases; this fume is withdrawn and pptd. An app. is described.

Metallic chlorides. I. G. FARBENIND. A.-G. Brit. 275,945, Aug. 13, 1926. The process for the production of anhyd. MgCl_2 , described in Brit. 259,498 (C. A. 21, 3429) is applied to the production of other chlorides such as those of Be, Al, Ca, Cr, Fe and Ti from their oxides by treatment with Cl in the presence of substances such as coked sawdust which form a porous mass.

Metal phosphides. W. KORHLER. Brit. 276,112, June 25, 1926. See Can. 275,581 (C. A. 22, 1219).

Molybdates. A. KISSOCK. Brit. 276,155, Sept. 4, 1926. MoO_3 is mixed with $\text{Ca}(\text{OH})_2$ or other basic oxide or hydroxide (other than an alkali metal compd.) water is added to the mixt. to form a paste and the molybdate is heated to obtain a dry product.

Stable percarbonates and other persalts. F. NOLL. U. S. 1,669,997, May 15. A stable percarbonate free from non-alkali-metal silicates and free from Fe compds. is obtained by treating Na_2CO_3 or other carbonate with Na silicate, filtering and treating with H_2O_2 . Perborate is similarly made from borax.

Potassium salts from marine algae. G. J. B. CHAMAGNE. Brit. 275,999, Aug. 11, 1926. Material obtained by burning or carbonizing marine algae is finely ground, burned in pulverulent fuel burners with or without added fuel, and elec. pptn. may be employed for the recovery of volatilized salts such as KBr, KCl, KI and K_2SO_4 which may then be dissolved and sepd. An app. is described.

Zinc oxide. J. A. SINGMASTER, F. G. BREYER and E. H. BUNCE. U. S. 1,670,169, May 15. See Brit. 268,301 (C. A. 22, 1219).

Carbon black. W. K. LEWIS. U. S. 1,669,618, May 15. Air is preheated to 500–1800° and passed through a body of coke to form CO having a temp. above the decompn. point of CH₄ and the gas thus prepd. is passed through a thermally insulated passage into which CH₄ is fed without preheating, to effect decompn. of the CH₄. An app. is described. Cf. C. A. 22, 1220.

Carbon black from mixtures of acetylene and other hydrocarbons. C. S. VENABLE. U. S. 1,669,636, May 15. A mixt. of C₂H₂, another hydrocarbon such as CH₄ or gasoline in gaseous phase and air is introduced into a chamber under pressure and detonated while cooling the walls of the chamber. An app. is described.

Carbon granules. F. O. BARRALET. Brit. 277,129, June 17, 1926. C granules for telephone transmitters are prepd. by treating furfural, sugar "or other pure hydrocarbon deriv." with a carbonizing agent such as strong H₂SO₄ and subjecting the C obtained to a suitable heat treatment to give it the required density and other properties desired. Various details of the treatment are given.

Apparatus for producing carbon and generating steam from gas. I. J. McNUTT. U. S. 1,670,686, May 22.

Polishing chromium. J. C. PATTEN (TO METALS PROTECTION CORPORATION). Brit. 277,296, Sept. 9, 1926. Surfaces such as electrodeposits of Cr are polished with a compn. comprising fine-grained calcined hydrated alumina or bauxite and which may also contain various other polishing substances, stearic acid, wax, soap, petroleum jelly, etc.

Hydrogen. GEWERKSCHAFT DER STEINKOHLENZECHÉ MONT-CENIS. Brit. 276,687, Aug. 30, 1926. H or a mixt. of gases contg. H, which may be intended for use in catalytic reaction, is freed from org. compds. of S, P and As by passing it at a temp. of 200–500° and under a pressure of 100 atm. over a catalyst comprising metals other than Cu having an at. wt. between 51 and 65 or oxides of metals such as Ni and Al₂O₃. Impurities are converted into CH₄ and its homologs and inorg. S compds., which can then be removed from the gas with alkali.

Hydrogen. GEWERKSCHAFT DER STEINKOHLENZECHÉ MONT-CENIS. Brit. 276,668, Aug. 26, 1926. H or gases contg. H are first treated with alk. substances (in dissolved, solid or fused condition) for removing CO₂, H₂S, SO₂, etc., and then treated under pressure and while heated with a catalytic mass contg. finely divided metals of the Fe group such as Ni, or contg. Cr, Mn, Zn or V or their oxides, and these steps of treatment are repeated in the same sequence. The H after this purification may be used for NH₃ synthesis.

Krypton and xenon from air. A. J. A. BLARINGHEM. U. S. 1,670,014, May 15. Liquefied O contg. Kr and Xe is evapd. and the vapors are passed into contact with gas-absorbing material such as C. An app. is described.

Precipitation of nickel from solutions. A. B. BAGHDASARIAN. U. S. 1,671,004, May 22. After removal of impurities from a Ni-bearing soln., Zn is added to ppt. most of the Ni, the pptd. Ni is sep'd., the soln. is maintained at approx. the b. p. and sufficient addnl. Zn is added to complete the pptn. of the Ni.

Separating tin and arsenic compounds. W. T. LITTLE. U. S. 1,670,307, May 22. In order to sep. Na stannate from Na arsenate, a mixt. contg. them is leached with NaOH soln. or other suitable liquid at a temp. (suitably about 85.5° or higher) sufficiently high to melt the Na arsenate.

Molding phenolic condensation products. PRODUCTS PROTECTION CORPORATION. Brit. 276,440, May 28, 1926. In molding products such as mixts. contg. wood meal and phenolaldehyde condensation product, the "A" product is heated to a temp. slightly below the transition temp. to the "B" form before it is introduced into the mold. The material may be preliminarily dried over CaCl₂, then heated to slightly below 80°, introduced into molds heated to about 100° and then heated in the molds to 130° and cooled slowly in an insulated container after molding. Brit. 276,441 specifies an app. in which molding may be effected in a liquid dielectric of greater viscosity than water such as "cumar" or "halowax" (which may impregnate the surface of the molded article) under heat and pressure. The app. may include an elec. heating coil.

Molding phenol-formaldehyde condensation products. H. BURMEISTER. Brit. 275,678, Feb. 10, 1926. Products such as are obtained by mixing resorcinol and polymerized CH₂O in the proportion of about 2:1 by wt. and which may also contain a filler and a reaction-retarder such as glycerol are molded by a single hot-pressing, e. g., under pressure at 120–5° for 2–5 min. according to the thickness of the article.

Condensation products of formaldehyde with urea and thiourea. SOC. ANON.

POUR L'IND. CHIM. A BALE. Brit. 275,995, Aug. 11, 1926. CH_2O or a polymer is condensed with thiourea or with a mixt. of urea and thiourea in such proportions that 1 mol. of the urea component is present to less than 2 mols. of the CH_2O in the final product. The condensation may be effected in a single stage or in successive stages, and a condensing agent such as $(\text{NH}_4)_2\text{SO}_4$ or NH_4CNS may be used. Cf. C. A. 21, 805.

Ornamenting materials with deposits of urea-formaldehyde condensation products, etc. BRITISH BEAD PRINTERS, LTD., J. C. VREDENBURG and F. A. H. HEYNERT. Brit. 277,091, June 8, 1926. In ornamenting as described in Brit. 247,001 (C. A. 21, 503) various inert auxiliary ornamenting materials are added such as glass particles, metal or pearl dust, mica flakes, paper, wool or cotton, which may be applied so as to form a pattern.

Hardening casein. SOC. INDUSTRIELLE DES MATIÈRES PLASTIQUES. Brit. 276,542, Dec. 1, 1926. Casein is mixed and pressed with CH_2O , without heating and in the presence of EtOH or other alc. Polymerized CH_2O or a CH_2O -bisulfite compd. also may be used, and swelling agents, dyes, etc., may be added.

Articles of molded pulp. J. J. H. STURMEY. Brit. 276,395, April 19, 1926. Hollow articles of molded pulp are waterproofed and made rigid by use of a material such as Al resinate which may be fused in the mold and allowed to set.

Hard molded bodies from asbestos. H. GERDIEN. U. S. 1,670,659, May 22 In forming insulation or other articles, asbestos is heated to a high temp. (suitably about $1000-1200^\circ$) and subjected to high pressure while heated.

Bituminous and resinous compositions for road making, insulation, molded articles, etc. L. BOLGAR. Brit. 277,291, Sept. 13, 1926. Tar, pitch, asphalt, resin or their mixts. or derivs. are mixed hot with acids such as HCl , HNO_3 , H_2SO_4 , H_3PO_4 or H_3BO_3 or with acid salts such as K, Na or Ca bisulfates or AlCl_3 and may also be mixed with various fillers, tar oil, fats, wax, etc.

Stiffening material for boots and shoes. FILKO CHEMISCHE FABRIK GES. Brit. 276,929, Oct. 14, 1927. A mixt. of resin, paraffin and talc is used as an impregnating compn. for stiffening caps of boots or shoes.

Cork composition for metal bottle caps, etc. H. F. BUSCH. Brit. 276,318, Aug. 18, 1926. A compn. may be formed of granulated cork 100 lbs., glycerol 10 lbs., gelatin 5 lbs. and CH_2O 20 oz. Various structural details of caps are given.

Porous material for storing acetylene. T. G. ALLEN and ALLEN-LIVERSIDGE, LTD. Brit. 277,100, June 9, 1926. Storage receptacles are filled with a mixt. of kapok with other fibrous material such as asbestos, cotton, silk, flax or akund floss, which may be used with or without a solvent for the C_2H_2 .

Printers' inking rollers, etc. D. GESTETNER. Brit. 277,058, June 3, 1926. Rollers or impression surfaces made with a resilient body of vulcanized oil compn. are thinly coated with a flexible gelatin compn. which is rendered insol. so that it is not sensitive to temp. variations.

Material for spinning rollers, etc. D. M. PROCTOR and CARBORUNDUM CO., LTD. Brit. 275,762, June 29, 1926. Rollers are formed of or coated with hard abrasive material such as SiC or fused Al_2O_3 and a binder such as Na silicate, shellac, vulcanite or ceramic material.

Cleaning flues of bakers' ovens, etc., by combustion. G. WIED. Brit. 275,947, Aug. 14, 1926. Materials such as cartridges of S, KNO_3 and C are burned to expel deposited matter from flues.

Rail filler. A. C. FISCHER. U. S. 1,671,021, May 22. Strips are formed of bituminous material such as blown material in which are incorporated cellular flakes, e. g., mica, slate or papier maché, arranged in substantially parallel strata and spaced apart. U. S. 1,671,022 specifies strips for similar uses or for insulation, sound deadening or expansion joints, formed of waterproof material such as blown asphalt together with granular and fibrous material, e. g., cork and fiber.

Stencil sheets. S. HORII. Brit. 275,747, May 25, 1926. Esters such as cellulose nitrate or mannan acetate are used with other substances such as chlorinated $\text{C}_1 \text{H}_n$, oils, fats, waxes and solvents. Cf. C. A. 22, 1832.

Plastic composition for use in dentistry. R. M. WITCOMBE. Brit. 277,107, June 10, 1926. Molding compns. suitable for use instead of plaster of Paris are made by heating red or black Cu oxides with 1-6 times as much as S, preferably at a temp. past that of max. fluidity. The material is stated to impart germicidal properties to dentures in contact with which it is used as a molding material.

Material for artificial dentures. H. J. GRAINGE and S. W. WILDING. U. S. 1,669,557, May 15. A gum facing of material such as a condensation product of PhOH and CH_2O which is adversely affected by moisture evolved from investing material

is protected during investing by a layer of impervious material such as a rubber sheet or Sn foil which may be subsequently removed. Cf. *C. A.* 21, 3109.

Filling for roots of teeth. E. G. HEDSTRÖM. *Brit.* 276,526, Sept. 27, 1926. Syrian or other natural asphalt is dissolved in a solvent such as C_6H_6 and a Bi salt or other substance which is opaque to Röntgen rays is added.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

Glasses of antiquity. BERNHARD NEUMANN. *Z. angew. Chem.* 40, 963-7(1927); cf. *C. A.* 20, 975 —Glasses representing several periods and peoples between 1500 B. C. and 500 A. D. are described. The softening points range from 880° in the earliest period to 742° for the 1st-5th century B. C. The compn. of these glasses approaches that of the 750° eutectic of the ternary system $Na_2O-CaO-SiO_2$. The low softening points observed are attributed to the presence of several minor oxide constituents. The ancients found empirically the easiest melting mixts. H. F. KRIEGE

Study of the behavior of fluoride additions to glasses and enamels. II. Röntgen ray determination of the opacifiers in fluorine-containing enamels. G. AGDE, H. F. KRAUSE AND W. M. LEHMANN. *Z. angew. Chem.* 40, 804-8(1927).—With the use of NaF as opacifying agent NaF seps from the cooling solvent and produces turbidity. When AlF_3 is used NaF is formed which seps. during cooling. Glasses contg. CaF_2 owe their opacity to both CaF_2 and NaF, the proportion of each depending upon the compn. of the glass. H. F. KRIEGE

Electric heating helps to make better glass bottles. S. D. KIRKPATRICK. *Chem. Met. Eng.* 35, 279-80(1928).

American chemical industries. General Ceramics Company. P. C. KINGSBURY. *Ind. Eng. Chem.* 20, 550-2(1928).—The history and organization chart are given. C. H. K.

The influence of the flue-dust on the deterioration of firebricks in the Siemens-Martin furnace. FRANZ SCHMITZ. *Ber. Ver. deut. Eisenhüttenleute: Werkstoffausschuss* 1926, 1-4; *J. Inst. Metals* 38, 674.—Chem. examn of worn-out siliceous bricks and samples of flue-dust show that the deterioration is principally caused by the flue-dust from the producer gases. Reduction of silicic acid by hydrocarbons is the chem. process chiefly concerned. The life of the bricks is increased by the presence of long gas conduits, as the flue-dust is then deposited. This can also be attained, if necessary, by artificial means, by introducing a collecting conduit of large cross-section, or by inserting obstacles. H. G.

Manufacture and properties of a new light fireproof brick of crystalite. E. STEINHOFF. *Ber. Ver. deut. Eisenhüttenleute: Werkstoffausschuss* 95, 1-10(1926); *J. Inst. Metals* 38, 674.—By means of a new process light useful bricks can be made from silica. The mfg. process and the properties of the bricks are described. The bricks are loose in structure, and are therefore suitable for use in the case of dry heat and slow heating, e. g., in coke-oven and gas-furnace work. H. G.

A new refractory. BERNARD KLEINSCHMIDT. *Zentr. Hütt. Wulzwerke* 30, 79-80(1926); *J. Inst. Metals* 38, 670.—The prepn. of carborundum and of carborundum-clay refractory shapes is described briefly, together with some of their properties. "Refrax" is nearly pure SiC; it has a sp. heat of 0.162, a heat cond. of 0.0275, and a tensile strength of 12.5 lb. per sq. in. "Carbofrax" contains up to 10% of clay, and the values of the corresponding properties are 0.180, 0.0243 and 14.7, resp., while its porosity is 15-20% greater than that of "Refrax." The sp. gr. of SiC is 3.7, and of carborundum bricks 2.1-2.5 (apparent). H. G.

Classifying refractory clays. E. WEBER. *Feuerfest* 1, 5, 27(1925); *J. Inst. Metals* 36, 669.—The old and newer methods of testing fireclay are discussed. Chem. analysis alone is not sufficient, but the methn. of the m. p., softening point under load, and coeff. of expansion are of importance. H. G.

The refractory nature of common high-temperature oxides. J. BRONN. *Feuerfest* 1, 25(1925); *J. Inst. Metals* 36, 668.—Nearly all high refractory materials used are in the form of oxides, i. e., Al_2O_3 , CaO , MgO , SiO_2 , and Cr_2O_3 , FeO , Fe_2O_3 , TiO_2 , ZrO_2 . The need for closer investigation of the properties under high temps. of this latter group is brought out and now made possible by the development of the elec. furnace. H. G.

Refractory nature of common oxides. J. BRONN. *Feuerfest* 1, [7], 67(1925);

J. Inst. Metals 36, 668—Curves are given plotting the m. p. of the following binary compds. in various proportions: lime-alumina, lime-magnesia, magnesia-alumina, lime-iron oxide, kaolin-magnesite, kaolin-chrome. H. G.

The importance of the silica transformations in the behavior of refractories during burning and use. K. STEINHOFF. *Keram. Rundschau* 35, 368-70(1927); cf. *C. A.* 21, 1528.—The literature on the temps. of the various SiO_2 transformations and the vol. changes accompanying the transformations is reviewed. Silica bricks for coke ovens should be burned to complete transformation of the quartz to cristobalite or tridymite. In heating furnaces up to 600° adequate room for expansion must be provided where highly siliceous refractories are used. Cracks produced by rapidly heating or cooling SiO_2 refractories afford places for the entrance of slags with consequent disruption of the brick work. Bricks of diatomaceous earth heated to 1100° or more are transformed to cristobalite and produce a refractory of light wt. very resistant to deformation under load at temps. up to 1600° . Because of the marked vol. change at 200° they are not resistant to rapid temp. change. H. INSLEY

The calculation of the melting points of silicates. W. FISCHER. *Keram. Rundschau* 35, 381-2(1927).—Van't Hoff's law for m.-p. lowering is inapplicable quantitatively to most silicate systems because of the occurrence of compds., eutectics and solid solns. with accompanying thermal and vol. changes. Quant. predictions can only be based on the experimentally detd. temp.-concn. equil diagram. H. INSLEY

A new type of kiln. M. HEINE. *Keram. Rundschau* 35, 87-9(1927).—To avoid cold spots and too rapid heating during the early stages of firing, a semi-recuperative kiln is recommended. H. INSLEY

Our knowledge of the changes taking place in kaolin during burning. K. SPANGENBERG. *Keram. Rundschau* 35, 331-6, 352-4, 370-2(1927).—After a review of the literature K. concludes: (1) that the H_2O is removed from kaolinite at or above $430 \pm 10^\circ$, the major part of the H_2O of constitution being more completely and quickly removed with lower vapor tension and less completely and more slowly with normal vapor tension; (2) that the dehydrated kaolinite cannot be considered as an ordinary mech. mixt. of Al_2O_3 and SiO_2 but that there is some systematic bond between the 2 oxides, perhaps a lamellar variation of the original structure skeleton although x-rays fail to show a true crystal lattice; (3) that the cause of the exothermic reaction near 900° during the heating of the kaolin is still not fully explained; (4) that mullite is probably only stable at high temps. and that further work is needed to det. the nature of the products of decompn. of mullite on cooling. H. INSLEY

DONATH, EDUARD: *Die Chemie des Ziegelmauerwerkes*. Vol. 30 of the "Sammlung chem. und chem.-techn. Vorträge." Stuttgart: F. Enke 74 pp. M. 6 50.

Glass. B. LONG. U. S. 1,669,908, May 15. A $\frac{1}{2}$ Na lime glass which is not colored by sunlight is formed of SiO_2 , Na_2O and CaO , together with 2-3% of Pb oxide.

Laminated glass. W. F. BROWN. U. S. 1,670,435, May 22. Glass sheets which are to be united with intervening non-brittle material are coated with a film of cellulosic material which is treated with a non-solvent animal oil. U. S. 1,670,436 specifies the similar use of a film of non-solvent mineral oil such as liquid petrolatum. Cf. *C. A.* 22, 1023.

Laminated glass sheets. P. H. HEAD and SAFETY GLASS & METAL PRODUCTS, LTD. Brit. 277,044, March 15, 1926. In order to prevent discoloration of the celluloid or like sheet used for reinforcing glass sheets, a bleaching agent such as $\text{C}_2\text{H}_5\text{Cl}$ or other suitable Cl deriv. is incorporated in the celluloid solvent used (which may comprise alc. and AmOAc) or otherwise applied to the celluloid. The glass sheets are coated with gelatin. Cf. *C. A.* 22, 2252.

Glass furnace and leer. J. H. O. BUNGE. U. S. 1,669,968, May 15.

Glass-melting furnace and associated apparatus for sheet glass production. P. F. GUTMANN. U. S. 1,671,073, May 22.

Continuous tank furnace for glass. W. K. BROWNLER. U. S. 1,670,098, May 15.

Tank furnace, etc., for melting and refining glass. E. J. SCHNEIDER. U. S. 1,669,676, May 15.

Apparatus for feeding "gobs" of molten glass. EUROPÄISCHER VERBAND DER FLASCHENFABRIKEN GBS. Brit. 276,558, Jan. 14, 1927.

Rotary device for feeding molten glass for manufacture of glassware. L. J. BROCHS. U. S. 1,670,058, May 15.

Apparatus for delivering charges of molten glass. R. LA FRANCE. U. S. 1,669,475, May 15.

Apparatus for delivering mold charges of molten glass. H. W. INGLE. U. S. 1,670,770, May 22.

Apparatus for drawing glass sheets or cylinders. A. E. SPINASSE. U. S. 1,670,909-10, May 22.

Forming blown glass articles. CORNING GLASS WORKS. Brit. 276,606, June 7, 1927. Mech. features of blowing portions of a glass ribbon into molds.

Mold for pressed sheet glass. F. FRASER. U. S. 1,670,110, May 15. Molds are formed of a "non-corrosive" metal alloy such as nichrome, Monel metal or stellite. Various structural features are specified.

Apparatus for forming sheet glass. E. T. FERNGREN. U. S. 1,670,246-7-8, May 15.

Apparatus for forming glass sheets. J. A. REECE. U. S. 1,670,167, May 15.

Apparatus for molding plates or sheets of glass. H. J. HAYS. Brit. 276,517, Oct. 4, 1926.

Apparatus for forming and flattening sheets of glass. A. F. FOWLE. U. S. 1,670,146, May 15.

Rolling-apparatus for plate-glass manufacture. M. BICHROUX. Brit. 276,662-3, Aug. 28, 1926.

Bending rolls or other glass-shaping apparatus formed of metal covered with fused silica. EMPIRE MACHINE CO. Brit. 277,070, June 4, 1926. Various details of structure of glass-working app. are specified.

Apparatus for annealing glassware. E. O. HILLER. U. S. 1,670,769, May 22.

Tunnel kiln adapted for burning ceramic ware. J. B. OWENS. U. S. 1,669,777, May 15.

Kiln suitable for burning ceramic ware. B. M. JOHNSON. U. S. 1,669,563, May 15.

Refractory articles. A. MARKS. Brit. 276,016, June 8, 1926. In forming molded articles from a mixt. comprising dead-burned magnesite and linseed oil or other siccativ oil, the oil is allowed to become oxidized by heating or standing to improve its binding properties. The molded articles are preferably dried slowly as described in Brit. 271,847 (C. A. 22, 1663). Driers and thinners also may be added.

Refractory and abrasive materials. FIRM OF C. POLYSIUS. Brit. 276,185, Oct. 19, 1926. Furnace linings, grindstones, etc., are made by baking a mixt. of aluminous cement and corundum.

Firing refractory blocks at softening temperatures while preventing distortion from unequal shrinkage. P. G. WILLETS. Brit. 276,903, Sept. 23, 1926. During the firing the blocks are supported on material which will shrink during the firing at least as much as the blocks themselves. Powd. or granular refractory material may be placed between the blocks and their supports to prevent sticking.

Valve-grinding abrasive paste. A. L. BROWNE. U. S. 1,669,596, May 15. SiC or other finely divided abrasive material is mixed with the reaction products of an alkali metal silicate, and a fatty acid, soap, water and glycerol.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Setting and hardening processes of cements. R. NACKEN. *Zement* 16, 1017-23, 1047-51 (1927); *Pit and Quarry* 15, 79-83 (1928).—The assumption is made that the mixing H₂O in reacting with the CaO present forms enclosing envelopes of liberated SiO₂ gel, approaching the sol. condition. The hydration processes are discussed in the light of observed colloidal behavior. H. F. KRIEGER

Soundness of cements in corrosive waters. G. HABGERMANN. *Zement* 16, 1190-2 (1927); cf. C. A. 22, 1663.—Mortar tests bore out earlier observations that cements with high SiO₂ or Fe₂O₃ content but low Al₂O₃ resist the action of sulfate solns. Cements with av. content of SiO₂, Fe₂O₃ and Al₂O₃ should have the hydraulic modulus values below 2.0. The CaO content alone is no criterion of the durability of cement.

H. F. KRIEGER

Use of shale ashes in cement manufacture. F. KILLIG. *Zement* 16, 735-7 (1927).—The compn of a series of ashes from carbonaceous shale showed close resemblance to that of a glacial clay. As a substitute for clay in cement manuf. the dryness and the ease of grinding the ashes were offset by the variations in the acid-sol. constituents and presence of CaO in the inner poorly burned portions. Burning the fresh shale with limestone did not result satisfactorily. H. F. KRIEGE

Testing of cement with plastic mortars. M. Roš. *Zement* 16, 1119-23, 1141-7, 1173-6 (1927).—The development of the tests for cement in plastic mortars is traced historically. The values obtained with plastic and earth moist mortars are compared. In general greater irregularities are found in the values of the tests on plastic materials in a series of detns. in labs. of several nations. Many data are presented in graphic form. H. F. KRIEGE

Properties of portland cement. G. HAEGERMANN. *Zement* 16, 1043-7 (1927).—During the past 80 years the compns. of cements have increased in CaO % and SO₃ and decreased in alk. and insol. residue. Other constituents have varied irregularly. Improved mixing, more complete burning, and finer grinding have aided greatly in producing cements of steadily increasing tensile and compression strengths. H. F. KRIEGE

Determination of small quantities of magnesium in the presence of large quantities of ammonium salts with special reference to the determination of magnesium in portland cements. O. KALLAUNER. *Zement* 16, 1093-5 (1927).—The pptn. as NH₄ phosphate is best accomplished in the cold. With very small quantities of Mg present the addn. of known quantities of Mg is advised to cause complete pptn. Only with excessive amts. of NH₄ salts should these be volatilized. The Mg ppt. should stand 48 hrs. before filtration if the quantities present are very small. H. F. KRIEGE

Digest of literature on nature of setting and hardening processes in portland cement. R. H. BOGUE. *Rock Products* 31, No. 10, 69-71, et seq. (1928). RAYMOND WILSON

Iron oxide vs. alumina as a fluxing agent in the manufacture of portland cement. A. J. BLANK. *Rock Products* 31, No. 11, 48-9 (1928).—Plant-scale production of normal clinker (I), high-alumina clinker (II), and high-iron clinker (III) showed that III gave the best quality of cement at a saving in fuel. Compn. of the clinkers was closely similar except for Fe₂O₃ and Al₂O₃, which averaged: I, 2.98%, 7.62%; II, 2.67%, 8.30%; III, 2.98%, 6.66%. Fuel oil consumptions per barrel of clinker were 9.8, 11.1 and 8.8 gals. Tensile strengths of 1-3 mortar at 3 days were 230, 200 and 250 lb.; at 28 days, 400, 380 and 420 lb. RAYMOND WILSON

Concrete in sea water. RICHARD GRUN. *Zement* 16, 1180-90 (1927).—The effect of sea water on concrete is due in part to the formation of CaSO₄·2H₂O and 3CaO·Al₂O₃·3CaSO₄·3OH₂O in the cement. The resistance to this attack may be increased through substitution of Fe₂O₃ for Al₂O₃, decreasing the CaO present by use of aluminous cements, or strengthening the hold on the CaO present by adding puzzolan. Dense aggregates and good placing of the concrete are essential factors. The surface of the concrete mass may be made more resistant by thorough air curing, by impregnation with some material which fixes the CaO present such as a fluoride, and by bituminous coats. H. F. KRIEGE

Gypsum mortar materials. O. F. HONUS. *Zement* 16, 1201-4, 1227-30, 1249-52 (1927).—The properties of gypsum during heating, hydration and setting as mortar are discussed. Structural formulas are given to portray the chem. changes involved in these processes. H. F. KRIEGE

Eliminating one theory as to the cause of hair checking in concrete road slabs. B. H. PETTY AND H. E. FILLINGER. *Roads and Streets* 68, 233-5 (1928).—Lack of moisture is not the primary cause of checking. L. B. MILLER

Recent developments in highway research. V. L. GLOVER. *Roads and Streets* 68, 105-9 (1928).—G. describes tests upon the following subjects: field control of quality of concrete, multiple loads, methods of proportioning concrete, tests of 6 wheel truck loads, comparison of 6 and 4 wheel trucks, truck impact tests, impact test of bars embedded in concrete, bend-pull test, special impact test on bent bars. L. B. MILLER

Recent road construction and surfacing work in a district of Birmingham (England). J. STUART KING. *Munic. Eng. Sanit. Record* 79, 546-8 (1927).—A discussion on repairing and constructing highways dealing with the use of such material as creosoted deal blocks, hard wood blocks, hot bitumen and granite chippings, cold-spray bitumen emulsions, mexphalite grouted slag and mexphalte grouted Enderby granite, tar macadam, tarred slag, rapid or semi-rapid hardening cement, granited rock asphalt, bituminous concrete, asphaltic concrete, and asphalt macadam. C. H. BADGER

Modern methods of testing road materials in France, Germany and America.

EDMOND MARCOTTE. *Technique moderne* 20, 254-9, 293-6(1928).—A description of the methods with a brief discussion of the interpretation of the results. A. P.-C.

Application of the bituminous emulsion "Colas" to municipal use. M. G. MATHIEU. *Tech. sanit. munic.* 23, 59-65(1928).—Colas emulsion proved very valuable in the treatment and resurfacing of wood-block or stone pavement. C. R. FELLERS

The production of high-alumina slags in the blast furnace for the manufacture of alumina cement (JOSEPH) 9. Paints, etc. [plasters, cements] (Brit. pat. 275,772) 26. Bituminous emulsions [for use in road-making or in cements] (Brit. pat. 276,543) 22. Shaft kiln for manufacture of lime, "gypsum," cement, etc. (Brit. 276,066) 1.

GATEHOUSE, FRANK B.: *A Handbook for Cement Works Chemists*. 3rd ed., revised. London: Charles Griffin & Co., Ltd. 180 pp. 7s. 6d., net.

KYRIACOU, V.-C.: *Aperçu de la fabrication de superciment*. Paris: Ch. Béranger. 50 pp. F. 10.

Cement. CHEMISCHE FABRIK GRÜNAU LANDSHOFF & MEYER A.-G. AND W. KIRCHNER. Brit. 275,897, April 5, 1927. Setting of cement is accelerated by adding chloride and nitrates of Ca and Al.

Cement. H. O. MORBIUS. U. S. 1,670,269, May 15. Cement-forming raw materials are burnt to form a clinker and the latter is crushed and agitated in a blast of cooling air. An app. is described.

Forming and waterproofing cement pipe. G. C. MARTIN. U. S. 1,669,768, May 15. Mech. features.

Portland cement. BRITISH PORTLAND CEMENT MANUFACTURERS, LTD., J. G. BAXTER, M. K. BAMBER AND W. J. DICKINSON. Brit. 276,438, May 28, 1926. In making fused cement in a rotary kiln, the material is discharged from the kiln through holes situated at its hottest point. The end of the kiln may be tapered to facilitate the discharge.

Building sheets of asbestos-cement composition faced with cement and stone chips, etc. A. F. E. CUCKOW. Brit. 276,815, Aug. 6, 1926.

Forming pipes from asbestos cement and similar materials. C. HERZOG. U. S. 1,670,855, May 22. Mech. features.

Concrete blocks. F. A. ROBINS and F. M. TAYLOR. Brit. 275,680, Feb. 12, 1926. Building blocks are formed of wood chips 9, port. cement 1 and ashes or similar "grit" to act as a "binder" 3 parts.

Concrete and mortar. J. HOWARD and W. J. HOWARD. Brit. 276,836, Sept. 15, 1926. Debris or spoil from iron mines is mixed with cement and a small proportion of paraffin oil and naphtha to form a facing or glazing material, for building purposes.

Device for measuring stresses such as those in concrete structures. W. A. PERKINS and W. W. GAYMAN. U. S. 1,670,981, May 22

Fibrous material for use with concrete, plaster, etc. E. M. LUNDGREN. Brit. 276,709, May 1, 1926. Cork, peat or other fibrous material may be treated with $\text{Ca}(\text{HCO}_3)_2$, and then with lime water or may be treated with a CaCl_2 soln. followed by treatment with waterglass with or without lime water or followed by alum or $\text{Al}_2(\text{SO}_4)_3$ soln.

Self-setting and self-hardening plastic material produced by wet-grinding of calcium sulfate "of any origin." R. SCHOENHOEFFER. Brit. 275,788, Aug. 5, 1926.

Material for covering floors, roofs and walls. M. H. TATE. Brit. 275,685, May 31, 1926. A sheet of rubber is attached by adhesive to a sheet of felt impregnated with bituminous material. Various details are specified.

Lime-sand bricks. C. H. THOMPSON. Brit. 276,597, May 11, 1927. Waste lime-kiln gases are used for hardening lime-sand bricks and like articles, either before, during or after treatment with steam under pressure.

High plastic "finishing lime." E. O. SCHNELL. U. S. 1,670,425, May 22. Burnt powd. limestone is hydrated with an aq. emulsion of colloidal clay and earth and there is added to the fresh hydrated lime, when cooled, a dry mixt. of colloidal clay and earth.

Heat-resistant steel columns, etc. E. R. POWELL. U. S. 1,670,378, May 22. A support such as a steel beam or column having an exposed surface is covered with a layer of cement and a hydrated cryst salt or other material of relatively high heat-absorbing capacity, and a heat-insulating and flame-resisting coating also is placed around the material.

Paving. A. F. SCHUTTE. U. S. 1,670,826, May 22. Paving material is prepd. by satg. burlap waste or other vegetable fiber with a bituminous cement, cutting the fiber into small particles and mixing with addnl. bituminous and mineral materials.

Paving. A. JANIN. *Brit.* 276,538, Feb. 27, 1926. A broken stone, gravel, slag or macadamized road is surfaced with irregular aggregate, the surface voids of which are filled with finely divided aggregate, the particles of which are coated with a thin film of bituminous material having a consistency between 30 and 125 points of penetration on the Dow testing app. Lime may be used as a filler and light hydrocarbons may be used as fluxes. *Brit.* 276,539 specifies treating mineral aggregate with a primary coat of light volatile mineral oil and a second coat of bituminous cement, with or without lime or other materials. *Brit.* 276,866 relates to similar pavements formed with "non-slip" surfaces. Cf. C. A. 22, 2254.

Asphaltic road material. J. D. FORRESTER. U. S. 1,671,070, May 22. Crushed stone aggregate is heated to drive off moisture and while it is still hot there is added to it a light oil having a flash point above the temp. of the drying heat; an asphaltic binder is subsequently added. Cf. C. A. 21, 1532.

"Non-slip" road surface. LA TRINIDAD. *Brit.* 277,216, Oct. 29, 1926. Road surfaces are separately coated with tar or bitumen and sprinkled with a comparatively thin "carpet layer" of asphalt, bitumen, tar or like material.

Bituminous emulsions for road construction. RUTGERSWERKE A.-G. AND L. KAHL. *Brit.* 275,928, Aug. 13, 1926. Liquefied bituminous material is added with stirring to paste-like substances which are naturally alk. or are rendered alk. such as waste Fe hydroxide from gas manuf. or from Al_2O_3 production, pptd. $Al(OH)_3$ or ZnO , basic Mg salts or starch paste contg. about 5% of alkali.

Preserving wood. H. W. WALKER. U. S. 1,670,086, May 15. Wood is impregnated with a combination product of a water-sol. dye such as crystal violet or malachite green and an org. constituent of the wood such as tannin, lignin or cellulose.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

The fuel industries and the work of the chemical engineer. ARTHUR DUCKHAM. *Chemistry and Industry* 47, 519-21(1928). E. H.

The fuel problem. C. H. LANDER. *Chemistry and Industry* 47, 356-60(1928).—Various types of low-temp.-carbonization plants are described, and mention is made of the Bergius hydrogenation process. T. S. CARSWELL

Low-temperature carbonization. R. P. WILSON and C. H. PARKER. *Gas J.* 182, 245(1928).—A discussion of various com. processes. F. S. GRANGER

Low-temperature carbonization (of coal). SAINTE-CLAIRE DEVILLE. *Ann. office nat. comb. liquides* 3, 43-61(1928); cf. C. A. 22, 153.—An address dealing with the utilization of the products of low-temp. carbonization. A. PAPINEAU-COUTURE

Unsaturated hydrocarbons in the gases from the carbonization of coal. Fuel Research Board's method of determination. C. H. LANDER. *Dept. of Scientific and Industrial Research, Fuel Research Technical Paper No. 19*; *Gas World* 88, 422-4(1928).—The new method involves the sepn. of the unsatd. gases as bromides and the regeneration of C_2H_4 , C_4H_6 and C_6H_6 by the Zn-Cu couple. The resulting gas is then analyzed by absorption of C_2H_4 and C_4H_6 with 87% H_2SO_4 and by combustion of a further quantity of the gas over CuO at 700°, and detn. of the vol. of CO_2 produced. Results are given illustrating the application of the method, showing, in general, an increase in total olefine content with rising temp. of carbonization from 400 to 700°. More C_2H_4 and less C_4H_6 and C_6H_6 are produced by high-temp. carbonization than by low. F. S. G.

Coals as colloid systems. L. L. FERMOR. *Nature* 121, 705-6(1928).—There is a relationship between the sp. gr. and the ash content of Indian coals. The coals from the Bokaro field can be divided into 2 series according to their macroscopical aspect in hand specimens; the series so made yields different types of density-ash curves. The vitrain-durain series, ranging from bright to dull coal, has a linear density-ash relationship. If g be the sp. gr. of the coal, k the sp. gr. of ash-free vitrain (1.26 for Bokaro) and a the ash content, the following relationship holds: $a = 100(g - K)$. The second series ranges from shaly coals to carbonaceous shales; the relationship density-ash is given by an empirical curve. The empirical data are explicable if one regards the vitrain-durain series as a series of suspensoid colloid solns., and the shaly coals, coaly shales and carbonaceous shales as a series of coarse suspensions, often with layers of vitrain. A. L. HENNE

Test on the Crozier retort. ANON. *Gas J.* 182, 236(1928).—At each of 5 levels, of the externally heated vertical retort, were 3 inclined cross flues with hooded off-take

pipes to the center between. A 34%-volatile, Scottish non-coking splint-coal was fed intermittently at the top and extd. continuously into a water-sealed chamber at the bottom. The temp. varied from 820° at the base to 280° at the top. Of the 129,000 cu. ft. of gas made during the test, 123,000 was burned in the furnace with the addn. of 15.2 cwt. of coke, or 30.6 therms per ton of coal carbonized. The av. throughput was about 4 tons per day. Considerable poking was necessitated by bridging of the charge. There were obtained 15.4 cwt. of coke, 14.6% volatile and satisfactory for domestic grates, 23.9 gas therms, 16.4 gals. of tar and 9.1 lbs. $(\text{NH}_4)_2\text{SO}_4$ per ton of coal.

F. S. GRANGER

Stack draft. M. GRELLERT. *Apparatebau* 40, 103-5(1928).—Calcns. on capacity are given.

J. H. MOORE

Recovery methods and the ammonia problem. L. H. SENSIBLE. *Gas J.* 182, 384-91(1928).—The NH_3 problem arises from competition of synthetic NH_3 and effluent restrictions. An argument is presented in favor of direct recovery processes. In these, the hot foul gas passes into the saturator, where the NH_3 is absorbed in dil. H_2SO_4 , before any aq. condensation has taken place, that is while still above its dew point, 60-80°. The NH_3 recovery is more complete, but the principal advantages are much lower costs of installation and operation, because of elimination of stills, etc. The effluent is $1/3$ that from indirect recovery, and practically the only objectionable (O_2 absorbing) substances to be removed are phenols, which can be recovered economically.

F. S. GRANGER

Sewage and sulfate of ammonia effluents. W. PLANT. *Gas J.* 182, 445-6(1928).—The system adopted at Stafford is described.

F. S. GRANGER

Definition of the concepts brown coal and peat. ED. DONATH AND A. LISNER. *Braunkohle* 27, 257-64(1928).—Investigation of several difficultly characterizable specimens showed that the two classes could be distinguished with a fair degree of certainty by the C content of the water- and ash-free material, which, for peat, normally does not exceed 60%, the cellulose and pentosan contents, and the reducing behavior of aq. peat exts. Detn. of the peat substance by means of CH_3COBr , and of adsorptive power by means of FeCl_3 failed as means of distinction.

F. S. GRANGER

Causes and prevention of auto-combustibility of brown-coal semi-coke. P. ROSIN. *Braunkohle* 27, 241-56, 282-92(1928).—Auto-combustibility is defined as the capability of heating up spontaneously to the ignition temp. This heat is produced by adsorption, oxidation and taking up of moisture. The initial temp. is important. Com. semi-coke, transported directly from the oven in sealed containers, was allowed to stand in a sealed, insulated vessel with thermometers inserted at various points and O_2 passing through it. The temp. rose gradually in spots with absorption of 20% of the gas-flow. When 80° was reached at any point, gas outflow stopped entirely with a sharp temp. rise, soon becoming general, indicating spontaneous combustion. Eventually CO_2 , which was evidently adsorbed at first, was evolved. The adsorptions of N_2 , O_2 and CO_2 , by coke, gave typical curves, as with active C, and increased in the order named. CO_2 greatly exceeded the others. N_2 developed little heat, but CO_2 heated the coke to 70°. H_2O accelerates adsorption. For air, a max. effect was obtained with 10% H_2O . Absorption of H_2O liberates heat, due to adsorption of the H_2O and of gasses in increased quantity, accelerated oxidation, and chem. combination of the H_2O with ash constituents, etc., indicated by the retention of part of it on drying. This heat reaches a max. for a certain % H_2O . The temp. rises rapidly to equil. with the heat of evapn. of the H_2O . Unless sufficient H_2O is present so that this effect lasts until the O_2 requirement of the coke is satisfied, spontaneous combustion is merely postponed until the H_2O is evapd. This usually requires too much water for practical application. This explains why spontaneous combustion occurs usually in damp weather. Chem. reaction of H_2O with the coke substance was indicated by moistening a coke previously degassed at 1000°. On reheating, a fresh quantity of gas was evolved, largely H_2 and CH_4 . The ignition temp. of coke was found to rise with the carbonization temp. but the adsorptive capacity was increased also, if air was excluded during cooling. Active C or high-temp. coke, though more adsorptive, is not spontaneously combustible, on account of lack of easily combustible substances, mainly hydrocarbons. The more

finely the coke was ground, the lower its adsorptive capacity and auto-combustibility were found to be. This was attributed to more complete oxidative satn. or aging of the smaller particles during grinding. That finer coke generally heats up more is attributed to less chance for the heat to escape because of closer packing. Adsorbed gases are displaced by other gases in higher concn. When, as in present practice, coke is first satd. with CO_2 , before exposure to air, the heat effect of the air adsorption is neutralized by the reversal of the adsorption of the CO_2 , so that practically no rise in temp. occurs. Also, the air adsorption is hindered by the escaping CO_2 . But if the coke is moistened after the CO_2 pretreatment, the protective effect disappears entirely. It is not affected by moistening the coke before CO_2 treatment. The temp., on moistening coke, rose to 140° after previous exposures to O_2 , as compared to 80° after air and 40° after N_2 , indicating the association of H_2O with oxidation. Three methods were found practical for preventing spontaneous combustion, namely, (1) artificial aging or allowing the unavoidable but irreversible oxidation, stimulated by previous moistening, to take place in an app. providing temp. control, by cooling, and agitation, to prevent nest formation, (2) pretreatment with CO_2 , and (3) addn. of MgCl_2 or NH_4Cl . F. S. G.

Illuminating gas from brown coal. F. SEIDENSCHNUR. *Braunkohle* 27, 273-80, 354-9 (1928); cf. C. A. 21, 3263.—If the primary carbonization is stopped at a low enough temp., say 400° , so that a tar residue of about 1% of the original coal is left in the semi-coke, the subsequent degasification of which is stopped at 900° , the gas obtained exceeds the established norm in calorific value. The gas obtained above 900° is small in quantity and, being mainly H_2 , lowers the volatile calorific value of the total gas. The small residuum of tar, which must be left in the semi-coke to bring the calorific value of the gas up to the norm, is of little or no value as tar. In fact, the yield of paraffin from a brown coal, whose primary carbonization was stopped at 400° , was actually greater than from the same coal carbonized free of tar to 470° . The final coke has nearly as high a calorific value as metallurgical coke and more than twice its volatile content. It is more reactive than the semi-coke and, in spite of its higher ash content, has a much higher calorific value. The process seems, on the whole, economically promising. F. S. GRANGER

The ignition temperatures of acetylene-oxygen and acetylene-air mixtures as well as the decomposition temperatures of pure acetylene. W. RIMARSKI AND M. KONSCHAK. *Acetylen in Wissenschaft u. Ind.* 31, 24-9 (1928).—A general literature survey and description of detns. by the authors. Mixts. contg. 20-70% O_2 and 50 to 90% air all gave values between 350° and 390° . On slow passage through a heated iron tube, at atm. pressure, pure C_2H_2 decomposed to the extent of 87% at 600° , 97% at 750° and 99% at 900° . No explosions occurred at 900° with over-pressures up to 1 atm., the limit of the investigation. F. S. GRANGER

A possible source of error in calculation of gas yield from calcium carbide. ADOLF FRANKEL. *Acetylen in Wissenschaft u. Ind.* 31, 1-2 (1928).—When the C_2H_2 is measured over a satd. salt soln., the error, from using the vapor tension of pure water instead of that of the salt soln., in reducing to standard conditions, is of the order of about 0.5% in the examples given. A vapor tension table for satd. NaCl and water is given. F. S. GRANGER

Determination of the raw [as extracted] and pure free sulfur in exhausted gas-purification masses. R. KATTWINKEL. *Teer u. Bitumen* 26, 189-93 (1928).—Methods in present use are reviewed. The extn. method using active C, as carried out in Holland, was exptly. tested and its applicability demonstrated. In conclusion, a new method was described. The sample is washed free of sol. sulfate with hot water, dried and the % loss in wt. noted. One-tenth g. of the product is fused in a porcelain crucible with 3 g. Na_2O_2 for $\frac{1}{4}$ hr., boiled with H_2O to decompose excess Na_2O_2 , acidified with HCl and freed from SiO_2 in the usual manner. Fe, etc., is removed with NH_4OH and the sulfate is detd. with BaCl_2 . The results check closely those obtained by the active-C extn. and HNO_3 -oxidation methods. The new method has the advantage of greater simplicity. F. S. GRANGER

The 1927 military competition for producer-gas-driven automobile trucks. ANON. *Ann. office nat. comb. liquides* 2, 809-13 (1927).—The tests, in which took part 12 3.5-ton trucks and 5 5-ton trucks, comprised bench tests lasting from April 11 to June 4 and a 2570-km. road test lasting from June 7 to July 5. Wood dried to 18% H_2O was not found satisfactory, even in a specially designed producer, because of clogging of parts of the equipment (pipes and gas purifiers) with tar and production of heavy smoke on starting the motor. Wood dried to 10-2% water content gave satisfactory results, but would require rather frequent cleaning of the motor and pipes. Charcoal and carbonite were satisfactory from the standpoint of regularity of operation and power

development and require only a weekly or semi-weekly cleaning of the gas filters and coolers.

F. S. GRANGER

Tar fog. A new method for its precipitation. ANON. *Gas World* 88, 424-5 (1928).—The cascade separator, operating on the shock principle, ppts. both gravity and colloid fog and can be cleaned without interruption of the flow of gas. A removable cover permits removal of the working parts from the tank without breaking pipe joints. The gas, entering laterally, strikes the surface of the outermost of 3 fixed concentric inverted truncated cones, passing downward to an opening into the cone, where its direction is reversed, throwing out most of the gravity fog, which settles to the bottom. The gas then passes upward along the 2nd cone to its base at the top where 2 concentric annular nozzles are formed by the 2nd and innermost cones with the concentric skirts of a bell member which automatically regulates the annular orifices to suit the gas flow. The gas passes down through the 1st nozzle, up along the 3rd cone and down through the 2nd nozzle, impinging, as it emerges from each nozzle, upon a bed of fine steel bristles upon which the colloid tar, etc., is deposited and runs off to the bottom. The gas finally passes upward through the central skirt and a steel wool filter, in the top of the bell, and out. Normally, about 90% of the total fog is removed.

Distilling solid fuel. F. F. HOBSON. Brit. 277,214, Jan. 10, 1927. Solid fuel is fed continuously in an annular stream around a vertically reciprocating louvered gas collector in an externally heated retort, and the residue is continuously removed. Various structural features are described. Brit. 277,215 relates to similar app.

Carbonized fuels. F. SRIDENSCHNUR. Brit. 276,455, June 8, 1926. Coal, lignite or like material is heated at about 500° with a large vol. of hot gases free from O to obtain a product contg. 21-30% volatile matter and the product is rather coarsely ground.

Fuel briquets. W. T. MILLER. U. S. 1,670,865, May 22. Coal or other finely divided carbonaceous material is treated with an adhesive formed of a glutinous substance such as dextrin dissolved in water and partially thrown out of soln. by a precipitant e. g., alc. Na silicate also is used.

Liquid fuel for internal-combustion engines. AVENARIUS, GEB. Brit. 277,326, Sept. 7, 1926. Gasoline or similar fuels are treated with "anti-knocking" agents comprising higher fatty acids or corresponding esters, aldehydes, ketones, lactones, anhydrides or other derivs. which may be treated with halogens, N, O or ozone or their mixts., e. g., there may be added 0.5% of olive or castor oil, triolein or Et or Me oleate.

Coking coal. R. TORMIN. Brit. 277,290, Sept. 8, 1926. Closed receptacles contg. the coal are rolled through a heating chamber and thence into a cooling chamber where the heat of the material is recovered. An app. is described.

Distilling coal. F. BERGIUS. U. S. 1,669,439, May 15. Coal is distd. to produce NH₃, coke, tar, a gaseous fraction relatively poor in H but of high heating value and a gaseous fraction relatively rich in H; the tar is mixed with coal and the mixt. is subjected to liquefaction and hydrogenation treatment with the gaseous fraction relatively rich in H at elevated temp. and pressure to produce NH₃, oil and a gas of high heating value and this gas is combined with the gaseous fraction relatively poor in H.

Distilling coal or like material. H. NIELSEN and B. LAING. Brit. 276,407, March 6, 1926. In a continuous process, the material is first subjected to "low-temp." distn. (at 185-580°) and then to a high-temp. distn. (at 580-1200°) and an inert gas may be passed in counter-current to the material undergoing distn. A single retort or 2 retorts communicating with each other may be used.

Extracting and carbonizing coal. A. PISTORIUS. Brit. 277,293, Sept. 8, 1926. Powd. or lump coal is extd. with a solvent such as pyridine which may be used under pressure, and is then carbonized. A voluminous residue is obtained suitable for coal-dust firing, use as an *explosive* or as a *reducing agent in metallurgical operations* as in obtaining carbides or silicides, or for *making electrodes*. It can be rendered still more porous by treatment with acids and may be treated by activating methods. The coal may be distd. without previous removal of the solvent with which it is preliminarily treated.

Gravity separation of coal from impurities. R. LESSING. Brit. 276,723, May 27, 1926. A CaCl_2 soln. may be used for gravity sepn. in an app. which is described.

Destructive hydrogenation. I. G. FARBERIND. A.-G. Brit. 277,273, March 131, 1926. In producing liquid hydrocarbons by destructive hydrogenation of coal, tars, mineral oils and like materials, both the hot and cold parts of the app. are made of meta, not reacting with CO as described in Brit. 247,217 (C. A. 21, 515) and Brit. 249,155 (C. A. 21, 1002). For the cooler portions of the app. metals of relatively low m. p. may be used such as Sn, Zn, Cd, Pb or their alloys; for the hotter portions, Cu, Ag, Al alloys, Cr, Mn, V, U or steel or alloys of Ni or Co may be used contg. about 20% or more of Mn, Ti, Cr, V, W or Mo. Reducing gases other than those contg. H and CO may be used in the process.

Destructive hydrogenation of carbonaceous materials. I. G. FARBERIND. A.-G. Brit. 276,001, Aug. 11, 1926. Catalysts are used preferably contg. not more than 10% of Ag, Cu, Zn or Cd and a larger quantity of B, Al, Si, Ti, V, Ta, Cr, Mo, W or Co; *e. g.*, a catalyst of tantalic acid with about 10% Ag may be used for treating crude cresylic acid from lignite tar in a current of H at 450° under 200 atm. pressure to form a product consisting largely of toluene, C_6H_6 and hydroaromatic hydrocarbons.

Low-temperature carbonization of carbonaceous materials. SYNTHETIC AMMONIA & NITRATES, LTD., R. E. SLADE and C. F. R. HARRISON. Brit. 276,522, Oct. 13, 1926. Carbonaceous material is treated with superheated steam, org. compds. are sepd. from the steam at a relatively high steam, and the steam is recirculated through the material. Permanent gases produced are periodically removed from the circuit. Catalysts such as Fe oxide with or without alkali may be added to the charge.

Pressing and drying peat for fuel. B. JIROTKA. Brit. 276,471, March 30, 1926. Mech. features.

Furnace for drying fuel, etc. E. W. BOWEN. U. S. 1,670,606, May 22.

Use of catalysts for promoting combustion in furnaces, etc. T. W. GRUETTER. Brit. 276,300, Aug. 23, 1926. Catalysts such as base metal oxides, *e. g.*, oxides of Cu, Ni, Co or Fe, may be applied to porous supports such as bricks or may be injected into fuels.

Operating vapor engines on aircraft with toluene or similar materials. SIEMENS-SCHUCKERTWERKE AKT.-GHS. Brit. 275,625, Aug. 6, 1926.

Valve system for gas producers, etc. R. THOMAS & CO., LTD. AND E. A. JONES. Brit. 275,697. April 13, 1926.

Apparatus for producing carburetted air gas. H. FOERSTERLING. Brit. 277,206, March 5, 1926.

Gas filter for use in connection with gas pipe lines. C. B. GAMBLE. U. S. 1,669,461, May 15.

Outlet pipe system for withdrawing coal gas from retorts. LOW TEMPERATURE CARBONISATION, LTD. AND C. H. PARKER. Brit. 277,079, June 7, 1926.

Retort door construction. LOW TEMPERATURE CARBONISATION, LTD. AND J. F. PARKER. Brit. 277,078, June 7, 1926.

Treating ammoniacal gas liquor. S. M. SHADBOLT and CHEMICAL ENGINEERING & WILTON'S PATENT FURNACE CO., LTD. Brit. 276,393, Dec. 1, 1926. Distn. is effected

in the presence of solvent oils such as gasoline, C_6H_6 , paraffin, naphtha or creosote, to facilitate recovery of by-products such as pyridine, phenols and oils.

Purifying gas mixtures. F. SIEMENS A.-G. Brit. 276,347, Aug. 19, 1926. Gas such as producer or coke-oven gas, contg. H_2S , is passed over a catalyst at a temp. which will form S oxides. If CN compds. are present, the temp. and catalyst are chosen to form NH_3 , and unsatd. hydrocarbons may be similarly converted into satd. hydrocarbons and washed out with the C_6H_6 . C oxides produced by cracking of the CN compds. may be converted into MeOH which may be removed in the C_6H_6 washer. The catalyst contains at least one S-binding metal such as Fe, Ni, Co, Mn, Cu, Zn, Pb, Ag, Bi, Sb or its oxide or salt or mixts. with each or with other metals or salts or metalloids such as C, B, Si or Ti. Numerous details are given.

Producer gas. H. L. DOHERTY. U. S. 1,670,102, May 15. A column of fuel is passed downwardly through a shaft and air under induced draft is introduced into the major portion of the upright sides of the column; the air supply is maintained so as to give the highest gas-making temp. in the upper portion of the column, producer gas formed is removed adjacent the top of the column and flue gases for controlling combustion are introduced into the lower part of the column, and the movement of the flue gases upwardly is controlled to cause a lowering in temp. of the fuel as it advances below the mid-portion of the column. An app. is described.

Water-gas generator. HUMPHREYS & GLASGOW, LTD. AND J. C. STELFOX. Brit. 276,753, June 4, 1926. A core is suspended centrally within the distn. chamber to increase the wall surface in contact with the fuel, promote more even carbonization and maintain the fuel in an unbroken annular mass.

Apparatus for making carburetted water gas. J. W. GIBSON. Brit. 276,065, May 17, 1926

Apparatus for producing carbureted water gas. O. MISCH. Brit. 276,630, Nov. 8, 1926.

Plant for making carburetted water gas. T. W. STONE. U. S. 1,671,093, May 22.

Valve-control devices for water-gas plants. T. W. STONE and W. BARR. U. S. 1,670,911, May 22.

Combined water-gas producer and steam generator. J. BELLAY. Brit. 275,978, Aug. 11, 1926.

Purifying tar oils. S. CAPLAN. Brit. 276,216, Sept. 22, 1926. Tar acid-bearing oils such as low-temp. and blast-furnace tars and shale oils are freed from certain impurities and thereby rendered suitable for use as disinfectants by agitating with an aq. soln. of borax or with H_2BO_3 and alkali. The treatment may be repeated and the purifying soln. may be revived by treatment with a sol. ferric salt such as $FeCl_3$ and alkali which form a black flocculent ppt. which is removed. "Oxidized copperas soln." also may be used for the revivification and the alkali may be added simultaneously or separately.

Coke. P. DVORKOVITZ. Brit. 276,181, Oct. 15, 1926. In a process of making hard coke as described in Brit. 249,901 (C. A. 21, 1002), an alkali such as lime or soda is added to the charge before or during the preliminary heating.

Horizontal coke-oven construction. FIRM OF C. STILL. Brit. 275,914, May 12, 1927. Distn. gases are withdrawn from the bottom of the oven and the supply of heat to the oven walls can be controled in a vertical direction; preferably, a slightly lower temp. may be maintained at the bottom than at the top of the flues, and by this manner of operation the plastic zone is prevented from reaching and passing the outlet duct at the bottom through which the distn. products are withdrawn before the upper part of the charge has been coked.

Rectangular sole-fired coke-oven construction. TAR & PETROLEUM PROCESS CO. Brit. 277,256, May 11, 1927.

F. M. ROGERS

Apparatus used for the distillation of coal, shale and petroleum products. F. BORDAS. *Ann. fals.* 21, 146-54(1928).—A comparison of the methods and app. which are official in France, Germany, England and the U. S., from which B. concludes that, at the present time, France is the only country where standardization of app. and unification of methods have been practically accomplished. Bibliography of 10 references.

A. PAPINEAU-COUTURE

Investigation of Sakhalin crude oils. Okha oil field. S. S. NAMETKIN AND V. G. PUZILLO. *Neftyanoye Khozyaistvo* 14, 519-20(1928).—Crude oil from 4 wells was tested. "Kadzusa No. 3" had d. 0.9304, E_{40} 2.85, flash point (Abel-Penskii) 37.5°, resin 36%; "Cable No. 1" 0.9309, 2.89, 31°, 36.8%; "Cable No. 5" 0.9302, 2.88, 68° (Martin-Penskii), 40.0%; "Rotary No. 1" 0.9300, 2.85, 28.5° (Abel-Penskii), 36%. The freezing points for all samples were below -20°. Crude oil from "Cable No. 1" was further tested. Engler distn. gave: I. b. p. 175°, up to 200° 1.5%, 225° 6%, 250° 12.9%. The oil was cracked at higher temps. as a result of high contents of tar. The sample was distd. with steam, and 4 fractions were sepd.: (1) 40-213°, 14% by wt., d. 0.8403; (2) 213-240°, 14%, d. 0.8830, E_{40} 1.12; (3) 240-275° 14%, d. 0.9123, E_{40} 1.46; (4) 275-302° 22.9%, d. 0.9451, E_{40} 3.41; residue 31.6%. The first 2 fractions redistd. yielded up to 270° 20.1%. The color was slightly yellow and after treatment with H_2SO_4 a kerosene distillate was obtained: d. 0.847, flash point (Abel-Penskii) 38.5°, viscosity (Ostwald 20) 0.02137, Doctor test negative, color (Stammer) 2.6, sulfur 0.08%. This kerosene distillate is high in S but within the limit for American standards; the high sp. gr. is due to naphthenes with condensed chains present in this crude. After distn. of the kerosene fraction the remaining fuel oil had d. 0.971, flash point (Brenken) 150°, E_{40} 7.3-7.4, freezing point below -20°. By mixing the fractions 2 and 3 with the residue left in the still, in the proportion 1:1 a very high-grade fuel oil is obtained with freezing point still below -20°. The lubricating-oil fractions amount to 14-16%. Cylinder stock could not be obtained.

A. A. BOEHTLINGK

Comparison of Diesel fuel oils from Baku, Groznuii and Emba. N. CHERNOZHUKOV. *Neftyanoye Khozyaistvo* 13, 323-7(1927).—The following properties are characteristics of various oils tested on Diesel engines in the Institute for Fuel Research in Moscow.

Name of oil	I Up to 250°	II 250° 350°	III Above 350°	II I+III	% of C. Conrad- son	% of C in the C de- posit in the engine
Emba solar	4.2	69.5	26.3	2.28	0.59	31
Neftesindikar	14.8	45.5	39.4	0.85	0.85	41
Emba crude oil	22.8	42.4	34.8	0.74	0.41	41
Baku No. 1	7.4	37.6	55.0	0.60	1.66	42
Baku No. 2	18.6	36.0	45.4	0.56	1.01	40
Groznuii	26.6	41.6	31.8	0.77	2.34	60

A good Diesel oil should comply with the following specification: Distil up to 250° not more than 10%, 250-350° not less than 50%, bottoms not more than 10%. The oils tested showed more or less satisfactory results except the Groznuii oil, which forms too much carbon.

A. A. BOEHTLINGK

Present status of specifications for transformer oils. H. WEISS AND T. SALOMON. *Ann. office nat. comb. liquides* 2, 801-7(1927).—A brief general discussion showing the necessity for international action and outlining what has been accomplished in this direction.

A. PAPINEAU-COUTURE

Determination of the oxidizability of transformer oils. N. BUTKOV. *Neftyanoye Khozyaistvo* 13, 332-3(1927); cf. C. A. 21, 4058.—Testing methods for transformer oils are reviewed. B. used an autoclave with some Wood's metal on the bottom in which were immersed glass test tubes with oils under test. The autoclave was heated to 150° and O_2 led in at a rate of 4-5 l. per hr. The oils were treated afterward with H_2SO_4 , the layers sepd. and detns. made of acidity, formation of sludge and saponification.

A. A. BOEHTLINGK

Autoxidation during slow combustion. E. W. J. MARDLES. *J. Chem. Soc.* 1928, 872-85.—Exptl. evidence, using the tube and bulb methods, is obtained for answering objections to the autoxidation theory. The slow combustion of fuel-air mixts. gives

short-lived "active" O_2 , presumably as org. peroxides, which are decompd. into aldehydes and acids with no effect on the detonation. The less the time of heating these mixts., the greater the amt. of "active" O_2 formed, only a minute quantity being present after 1 min. heating. If alc., C_6H_6 , etc. are added to hexane-air and phenol or aniline to Et_2O -air mixts. the "active" O_2 decreases. Autoxidation occurs when C_6H_6 (at 500°) or aniline (at 350°) is heated with hexane-air mixts. H_2O_2 does not autoxidize the combustion, its presence being due to the hydrolysis of primary peroxides. Detonation-inducers (N_2O_5 , iso-Am nitrite, benzoyl peroxide) are efficient in lowering the spontaneous ignition temps. of fuels contg. small quantities of various org. compds., while detonation-preventers (Fe carbonyl, $Pb(C_2H_5)_4$) produce the opposite effect. Temp.-pressure curves, detd. by the bulb method, are analyzed and completely confirm the conclusions of the tube method.

J. BALOZIAN

The Dubbs cracking process in Roumania. GEOFFROY. *Am. office nat. comb. liquides* 3, 149-58(1928).—A brief description of the installation of the refinery of the Société Columbia, which was the first European Dubbs cracking plant, and of its operation.

A. PAPINEAU-COUTURE

Use of the Carius method for the determination of sulfur in the less volatile petroleum oils. J. M. DEVINE AND F. W. LANE. *J. Am. Chem. Soc.* 50, 1707-10(1928); cf. *C. A.* 22, 2261.—Sp. directions are given for the use of the Carius method to det. S in the less volatile petroleum oils. Especial care is necessary to effect complete oxidation. HNO_3 is completely removed before the $BaSO_4$ is pptd. C. J. WEST

Determination of sulfur in volatile fuels. H. T. KENNEDY. *Ind. Eng. Chem.* 20, 201-2(1928).—The fuel oil to be tested is measured in a reservoir, then admitted through an unbored stopcock with tapering channel to the vaporizing chamber where it is absorbed by a plug of glass wool. By means of a current of air heated by a nichrome coil which surrounds the chamber the oil is completely volatilized and made ready to burn at the tip provided. The gases are absorbed in standard Na_2CO_3 soln. which is then titrated with methyl orange indicator. The method is especially good for oils contg. CS_2 .

H. L. OLIN

Thermal decomposition of organic sulfur compounds. W. F. FARAGHER, J. C. MORRELL AND S. COMAY. *Ind. Eng. Chem.* 20, 527-32(1928).—Solns. of mercaptans, alkyl sulfides and disulfides, thiophene and sulfur in naphtha from Pennsylvania crude oil were subjected to heating at cracking temp. ($925^\circ F.$). Thiophene is not decomposed even at $1600^\circ F$ but H_2S , mercaptans, thiophene and elementary S were found among the decompn. products of the other S compd. Gas oil from Grosneft crude contg. org. disulfides in soln., when cracked at $819^\circ F$. and 250-lbs. pressure gave the same S products as by cracking at atm. pressure.

E. E. CRANDALL

Basis for a sound construction of dephlegmators. S. VOLOKH. *Neftyanoye Khozyaistvo* 13, 317-22(1927).—Polemical with Kostrin. Principles of dephlegmation are reviewed.

A. A. BOERTLINGK

Comparison of Soviet and American kerosenes. S. NAMETKIN. *Neftyanoye Khozyaistvo* 13, 328-31(1927).—American kerosenes are characterized by their narrow boiling range. The final b. p. is much lower than that for Russian kerosenes. Some of American kerosenes have a comparatively high content of S and unsatd. compds.; they are not very stable in color. Soviet kerosene has a wider boiling range; 70-75% is distd. off at $100-110^\circ$. This kerosene has more heavy gasoline and light solar oil fractions. The Soviet kerosenes have a high content of unsatd. compds. (5-10%). The S content is negligible. The Russian kerosene is better adapted for fuel, having more evenly distributed low, medium and heavy fractions.

A. A. BOERTLINGK

Determination of the boiling-point limits of benzine. A. W. SENSFENSIEDER-ZIG. 55, 135(1928).—The principal, and possibly single, cause of disagreeing results in testing benzine by fractional distn. lies in the lag of thermometers, which usually are not sensitive enough for the purpose.

P. ESCHER

Natural-gas gasoline in 1926. G. R. HOPKINS. *Bur. Mines, Mineral Resources of the U. S.* 1926, Part II, 159-68 (preprint No. 15, published Nov. 11, 1927). E. H.

Some autoxidation reactions of gasolines. ANDRÉ GRAETZ. *Ann. office nat. comb. liquides* 3, 69-76(1928).—From a brief crit. review of work on the subject G. concludes: (1) before any thermal disocn. reaction takes place there is autoxidation of the gasoline, which takes place mainly in the liquid phase at an optimum temp. of $120-60^\circ$; (2) the most readily autoxidizable hydrocarbons are the C_7H_8 hydrocarbons, the autoxidation of which can take place in 2 different manners to give either unstable and detonating compds. or stable compds. The presence of a fairly large proportion of C_7H_8 hydrocarbons in gasoline thus causes a more regular autoxidation of the paraffine hydrocarbons and leads to more stable or more easily hydrolyzed products. Similarly,

the anti-knock properties of terpenes are attributable to their regulation of autoxidation to produce more stable products; (3) the anti-knock properties of aromatic hydrocarbons are due to the stability of the peroxides which they form, but this stability renders them less suitable as catalyzers of the autoxidation of the paraffins. They can combine directly with compds. contg. double bonds, and act as reagents, rather than catalyzers, and the oxides which they form are very easily hydrolyzed. In order to produce a beneficial effect they must therefore be present in large proportions in gasoline (50% and over); (4) ketones and aldehydes (particularly cyclohexanone and menthone) behave like C_2H_4 hydrocarbons; (5) the 2 chief factors which destroy the peroxides formed by autoxidation are H_2O which hydrolyzes them and high temp. which decomps. them.

A. PAPINEAU-COUTURE

Lead tetraethyl in internal-combustion engines. H. S. ROWELL. *Nature* 121, 570-1(1928); cf. Mardles, *C. A.* 22, 2050.—R. criticizes M.'s statements regarding the effect of using $PbEt_4$ in gasoline. *Ibid* 571. E. MARDLES. M. replies that its use is not injurious to the engine and is beneficial to the performance. G. CALINGAERT

Detrimental properties of lubricants in use. FR. FRANK AND HANS SELBERG. *Erdöl u. Teer* 4, 215-7(1928).—It is contended that the method advanced by Hackford (*Engineering and Boiler House Review*, Sept. 1926, 152), for evaluation of lubricating oil with reference to deterioration in use, is based on a principle long well-known and is specifically nothing but the method of Haslam and Fröhlich (*C. A.* 21, 1345) according to which O_2 is passed through a large sample of the oil at 130-140° and the increasing acidity is detd. at intervals. Hackford's results, however, are considered new and unique since they indicate that paraffin base oils are more stable toward O_2 than naphthenes, which is directly contrary to scientific experience. Since the method is important because of its shortness, and Hackford bases his conclusions on insufficient data, it was checked as follows. A no. of oils of American and Russian origin were tested by the method of Haslam, but at 150°, the increased acidities and sapon. nos. being detd. after 9 hrs. Three out of the 5 Russian (naphthenic) oils showed less acid increase than any of the 7 American (paraffinic) oils. Of the other 2, one showed a much lower sapon. no. increase than any of the American oils and deteriorated less in use.

F. S. G.

Use of "Voltols" in the textile industry. W. KACZKOWSKI AND H. BORTNOWSKA. *Przemysł Chem.* 12, 99-102(1928).—Vegetable and animal fats electrically treated and then mixed with mineral oils have been recommended under the name of "Voltols" as greases suitable for lubricating textile machinery because of their relatively heavy consistency at elevated temps. They are as safe as mineral greases in regard to likelihood of their spontaneous ignition on the fabrics, but of a somewhat questionable value as regards the ease of washing out of the materials which they may happen to stain.

A. C. ZACHLIN

Use of lubricating greases for preservation of metals. M. V. BORODULIN. *Trans. State Inst. Applied Chem. (Moscow)* 1927, No. 5, 53-8.—Walker and Steele's method (Cf. *C. A.* 15, 766) of testing the preservative qualities of lubricating oils by means of steel plates has been used by B. The plates covered with oils were exposed to moist air and vapors of HNO_3 or Cl_2 . The most desired characteristic of preservative oil is a good adhesiveness, *i. e.*, adsorbability of the oil by the surface of the metal; this is a more important factor than viscosity. As, however, there is no adequate method of detg. adhesiveness, viscosity is used as a standard. The higher the viscosity, the better the oil acts in forming a protective layer on the surface of the metal. Unfortunately viscosity detns. of thick oils cannot be made below 50° (with Engler's viscometer), as the oils do not run at lower temps. As to detns. of sp. gr. and flame point, they have no other importance than that of usually giving values increasing with the viscosity of oils and thus confirming the data obtained by viscosity tests. The presence of free naphthenic acids in the preservative oils is harmful to metals, as can be seen by Cu becoming green and steel darkening. Soap which is usually introduced in these oils in order to neutralize the effect of free acids does not prevent the action of atmospheric O on the metals and even has a tendency of facilitating it.

BERNARD MELSON

Oil-asphalts and tars. A. N. SAKHANOV AND N. A. VASIL'EV. *Neftyanoye Khozyaistvo* 13, 334-9(1927).—Neutral tars were extd. from fuller's earth after asphaltenes and acid sludge had been removed. The neutral sludge (tar) contains O_2 and S and is completely sol. in gasoline, etc., without forming any salts. This sludge is very unstable and is easily condensed by contact with fuller's earth. Mean mol. wt. and sp. gr. (sometimes above 1) are much higher than the corresponding oil fractions. This sludge is liquid, semi-liquid or solid; it has the formula $C_nH_{2n-m}O_p$, in which n is 19-55, m

9-33, p 2-3. These compds. are found in all fractions except gasoline; they have a highly developed polycyclic structure with not more than one double bond. They form true solns. and are not colloids. They color the solvent intensely. They are sol. in H_2SO_4 , under certain conditions forming compds. A. A. BOEHTLINGK

Problems in the manufacture of asphalt. A. N. SAKHANOV AND L. G. SHERDEVA. *Neftyanoye Khozyaistvo* 14, 513-8(1928).—American, Mexican and Russian asphalt cements are compared. The possibilities are discussed of using acid sludges obtained after treatment of the lubricating-oil fraction and heavy bottoms left after distg. off the lubricating oil. Expts. were made on non-paraffin acid sludge from Groznuii crude oil; part of the heavy fractions of lubricating oils was left; the temp. was kept as low as 220° and the amount of steam was greatly increased. The results obtained were quite satisfactory but the price was prohibitive. Expts. with Groznuii paraffin and Balakhanui products were less satisfactory. The crude oils most suitable for this purpose are from Kaluga, Kirmaki, Binagadui and Voznesenskii (heavy). The disadvantage of using heavy crude oils is the distn. of light fractions. The Kaluga crude gives an excellent product after distn. of 20% and a succeeding oxidation of the bottoms left. The next is the heavy crude from Kirmaki. About 25% must be distd. off; the bottoms have to be oxidized. The Binagadui and Voznesenskii crude oils are less satisfactory; they contain a large amount of light fractions. A. A. BOEHTLINGK

Acidic asphalts. S. GASIOROWSKI. *Przemysl Chem.* 12, 90-9(1928).—Asphaltization takes place during the refining of oils (from Boryslaw) over H_2SO_4 , and gives a product closer related to the natural rather than the artificial asphalts. This classification is based on the S content, presence of free acids and high sapon. value; low content of asphaltines, and high content of oily substances may be caused by insignificant degree of asphaltization. In asphalts of this kind there appear products of oxidation, action of S, sulfonation of hydrocarbons, sulfonic and asphaltogenic acids, etc. High % of N is striking. Longer asphaltization under the action of air proceeds like that of S-free asphalts, and polymerization predominates. The addn. of free S causes a more rapid reaction, increases S and O content of the product as well as that of acid and the saponifiable matter. A. C. ZACHIN

Statistics on petroleum mining for 1925 (HOFMANN) 13. Purifying tar oils (Brit. pat. 276,216) 21. Heat treatment of mineral oils (U. S. pat. 16,971) 13.

SCHNEIDERS, GOTTFRIED: Die Gewinnung von Erdöl, mit besonderer Berücksichtigung der bergmännischen Gewinnung. Berlin: J. Springer. 363 pp.

WESTCOTT, JAMES H.: Oil, Its Conservation and Waste. New York: Beacon Pub. Co. 213 pp.

Cracking hydrocarbon oils. W. L. GOMORY. U. S. 1,670,804, May 22. A mixt. of hydrocarbon material such as petroleum oil and H is forced through a conduit in which it is heated to about 540° under a maintained pressure of about 150 lbs. per sq. in.; about 80-85% of the mixt. is vaporized and the resulting gases, vapors and liquid are drawn off and recovered. An app. is described.

Cracking hydrocarbon oils. O. KAY. Brit. 276,947, Sept. 4, 1926. Hydrocarbon oils are atomized in a stream of air and the atomized particles are permitted to settle in accord with their d., into different collecting receptacles.

Cracking hydrocarbon oils. E. SCHULTZ. Brit. 277,042. March 9, 1926. In distg. crude petroleum or other materials as described in Brit. 254,011 (C. A. 21, 2556) the materials in the still or retort as well as the vapors are treated with purifying or converting materials such as lime mixed with ZnO or $ZnCl_2$, $MgCl_2$ or $CaCl_2$, $NaCl$, Na , montmorillonite, bentonite, bauxite or $AlCl_3$; the heavy fractions are also treated to effect conversion. An app. is described.

Cracking hydrocarbons. J. F. P. DE LA RIBOISIÈRE. Brit. 276,532, Nov. 12, 1926. Vapors from a still in which oils or mixts. of oil with coal, tar, lignite, pitch, etc., are cracked are passed through a filled tower or condensing column or like device in which an approx. const. temp. is maintained by use of liquids such as water or C_6H_6 or a mixt. of liquids of const. b. p. The condensate formed may be refluxed to the still.

Cracking petroleum oil. G. EGLOFF. U. S. 1,670,108, May 15. Oil is passed through a heating coil in which it is heated to a cracking temp. and thence passes to an expansion chamber from which vapors are removed; the vapors are subjected to a refluxing condensation and residuum is withdrawn from the expansion chamber and is recirculated back through the expansion chamber into the vapor space of the latter,

and the reflux condensate is also returned to the expansion chamber for retreatment. Cf. C. A. 21, 3267.

Cracking petroleum oil. C. P. DUBBS. U. S. 1,670,103, May 15. Oil is passed through a heating coil and thence to a plurality of enlarged chambers connected in series and vaporization is permitted in the chambers and the vapors are withdrawn; liquid residue is withdrawn from each of the chambers independently and portions of the residue are diverted back to the charging stock and mingled with it for retreatment. Cracking is effected under pressure. An app. is described.

Apparatus for cracking oil. C. P. DUBBS. U. S. 1,670,104, May 15. A system is specified comprising a battery of stills, connected with headers, aerial pipes, condensers, pressure-regulating valves, etc. Connections are provided for drawing off reflux condensate from one of the headers and returning it to any of the stills.

Apparatus for cracking petroleum oil. G. EGLOFF and H. P. BENNER. U. S. 1,670,105, May 15. A first pair of horizontal stills is mounted in the lower part of a furnace which may be heated to cracking temp. and a second pair of horizontal stills is mounted above the first pair; another single horizontal still is mounted above and between the second pair. Oil is delivered to the first pair of stills substantially to fill them without filling the other stills and connections are provided so that vapors from the first pair of stills are superheated in the other stills, which are connected with a dephlegmator and condenser. Reflux condensate is returned from the dephlegmator to one of the first pair of stills.

Apparatus for cracking oil. G. EGLOFF. U. S. 1,670,106, May 15. An annular conduit serving as a reflux app. is placed in the upper portion of a still and through this conduit raw oil may be fed and discharged into the still near the bottom of the latter.

Deemulsifying hydrocarbon oils. G. EGLOFF. U. S. 1,670,107, May 15. Oil is distd. under pressure and NaOH is simultaneously injected into the vapor space of the still. An app. is described.

Purifying cracked oils. I. G. FARBERIND. A.-G. Brit. 276,427, May 26, 1926. The more unsatd. constituents are removed from cracked oils by heating with FeCl₃ contg. water; *e. g.*, crude gasoline may be boiled under a reflux with 2% of cryst. FeCl₃ hydrate, then distd. and washed with water or dil. alkali.

Heat conversion of hydrocarbon oils. F. A. HOWARD and N. E. LOOMIS. U. S. 1,670,037, May 15. Oil such as crude petroleum is forced through a highly heated confined passage with a velocity sufficient to prevent substantial deposition of coke, to heat the oil to a cracking temp., discharged into an enlarged chamber while the heat is confined in it to maintain it at cracking temp., and the products from this enlarged chamber are passed into a second enlarged chamber into which the oil enters at a temp. of about 360-365°; an O-contg. gas such as air is supplied to the second enlarged chamber to maintain the temp. and effect combustion of parts of the material. An app. is described. Cf. C. A. 21, 3454.

Apparatus for preheating crude mineral oil preparatory to fractionation. W. L. GOMORY. U. S. 1,670,805, May 22.

Apparatus for distilling petroleum oils. M. SINGER. Brit. 276,302, Aug. 19, 1926. An app. is specified "of the sep. heater and evaporator type" adapted for producing lubricating oils.

Tube still and furnace for distilling hydrocarbon oils. R. T. POLLÖCK. U. S. 1,670,122, May 15.

Refluxing "bubble tower" for petroleum distillation, etc. R. CROSS. U. S. 1,670,762, May 22.

Refining petroleum oils and distillates. P. MCMICHAEL. U. S. 1,669,944, May 15. Oil is treated with Na hyposulfite and with a heavy metal compd. such as Na chromate in alk. aq. soln., and the oil is then further treated with a dil. aq. soln. contg. a free acidic constituent such as HCl.

Dephlegmator for petroleum oil vapors. H. S. MABEY. U. S. 1,670,118, May 15.

Manhole cover for petroleum stills. A. E. FEW, JR. U. S. 1,669,839, May 15.

Apparatus for separating oil and gas. D. G. LORRAINE. U. S. 1,670,728, May 22.

Centrifugal apparatus for degassing transformer oils, etc. SOCIETÀ ITALIANA PIRELLI. Brit. 276,987, Aug. 31, 1926.

Separating wax from lubricating oils. AKTIEBOLAGET SEPARATOR-NOBEL. Brit. 276,658, Aug. 24, 1926. Trichloroethylene or other liquid making the oil heavier than the wax is added before centrifugal sepn. An app. is described.

Magazine filter for lubricating oils, etc. F. W. MANNING. U. S. 1,669,718, May 15.

Filter for use with gasoline pumps, etc. SHELLMEX, LTD., and J. LAWSON. Brit. 275,695, April 9, 1926.

Refining hydrocarbons with sulfur dioxide. ALLGEMEINE GES. FÜR CHEMISCHE INDUSTRIE. Brit. 275,884, March 2, 1927. In the continuous treatment with liquid SO_2 of hydrocarbons obtained from the distn. of coal tars, tars from brown coal, kerosene, transformer oil, light lubricating oil or similar materials, the resulting fractions are subjected to a continuous evapn. process carried out in several stages in the last of which a high vacuum is employed. An app. is described. Cf. C. A. 22, 1470.

Bituminous emulsions. MINERAL AKT.-GES. BRIG. Brit. 276,543, Dec. 3, 1926. Material such as tar, asphalt or petroleum asphalt, preferably molten, is added to an emulsion in Na_2CO_3 or K_2CO_3 soln., of a neutral glyceride such as that of an animal or vegetable oil. The emulsions may be used in road-making or in cements or paints.

Emulsions of hydrocarbons, oils, waxes, etc. I. G. FARBENIND. A.-G. Brit. 277,277, March 10, 1926. Emulsions such as those for the treatment of fibers or fibrous materials are prepd. by the use of a sulfonic acid of a polynuclear aromatic hydrocarbon, or a salt of such an acid, which is substituted in the nucleus by an amyl, hexyl, or higher alkyl group, *e. g.*, amylated naphthalenesulfonic acid or hexylated naphthalenesulfonic acid.

Destructive hydrogenation. I. G. FARBENIND. A.-G. Brit. 275,670, Aug. 9, 1926. In hydrogenating a middle oil from petroleum, a current of H in excess may be used at 450° and 20 atm. pressure, in the presence of a catalyst of Au, Ru, Pb or Sn on Mg, to obtain a high yield of hydrocarbons of low b. p. Magnesite or Cr oxide may also be used as carriers for the catalyst which may include Pt, Pd or Sn in various combinations. The gas may be forced through porous plates supporting the carbonaceous material.

Destructive hydrogenation of carbonaceous materials. I. G. FARBENIND. A.-G. Brit. 275,662, Aug. 7, 1926. Deposition of C on the walls of the app. is avoided, as described in Brit. 268,796 (C. A. 22, 1468) and Brit. 271,451 (C. A. 22, 1676), by lining the app. with alloys contg. Mo, W, V, Mn or Ni which also contain B, As, Sb, Si, Bi, P or Se; Cu may be used also if the reacting materials are freed from S. The alloys serve also as catalysts. Brit. 275,663 specifies destructive hydrogenations by use of catalysts which consist of elements of groups 4-8 of the periodic system or their compds. together with other elements of groups 2-7 or with Cu or Au or their compds. Molybdic acid may be used with MgO , Cu or $\text{Al}(\text{OH})_3$ and various mixts. of V oxide, Cr oxide, U oxide, etc. are also specified.

Destructive hydrogenation of carbonaceous materials. I. G. FARBENIND. A.-G. Brit. 275,664, Aug. 7, 1926. A stream of hydrogenizing gas is supplied in large excess and under a pressure of at least 50 atm. in the presence of catalysts which contain carbides, active C, or metalloids such as B, Si, P, As, Se, Te or halogens, or their compds., *e. g.*, H_3PO_4 , As_2O_3 , HF, HCl, SiO_2 , H_3BO_3 , selenious acid or its salts, SiC, alderwood charcoal soaked with H_3PO_4 and glowed at 800° , Ca phosphate, Mo phosphate, W phosphate, Fe phosphate, As_2O_3 alone or mixed with Mo or W, Fe silicide contg. 15% Si, active SiO_2 , hydrosilicates, borides of Ti or Fe, CaF_2 , Mo with 10% of AlCl_3 or CdCl_2 and molybdic acid with Na selenite. In treating crude mineral oil with Al phosphate as a catalyst a temp. of 420° and pressure of 200 atm. are suitable. Vapors of the middle oil obtained may be further hydrogenized at 460° in contact with alderwood charcoal impregnated with H_3PO_4 .

"Base powder for use in waterproofing, bonding, cementing, painting, etc. R. R. Cone. U. S. 1,670,844, May 22. A bituminous material is cooled sufficiently to render it brittle, ground to a powder and mixed with colloidal material.

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Preliminary investigations on the constitution of the hemicellulose of timber. M. H. O'DWYER. *Biochem. J.* 22, 381-90(1928); cf. C. A. 21, 174.—Eighty % of hemicellulose A (obtained from beech wood 80 years old by treating in the cold with 4% NaOH, after the removal of the water-soluble constituents, the pectic substances and the protein) could be acetylated, but only 20% of the same substance from an older beech and from oak heartwood yielded to acetylation. The hemicelluloses contain a certain percentage of methoxyl of which about half exists in the form of an ester. Methylation the residue obtained after acetylating the oak revealed a rise in the methoxyl content.

BENJAMIN HARROW

Fractional precipitation and ultra-filtration of nitro-cellulose. WILHELM KUMMEL. *Kolloidchem. Beihefte* 26, 161-98(1928).—The nitrocelluloses are not simple substances because their solns. in acetone can be fractionally pptd., yielding 2 components, *A* and *B*, that differ markedly in chem. and phys. properties. They can be recognized by the difference in the functions connecting viscosity and concn. Component *B* is made up of degradation products of nitrocellulose by hydrolysis and oxidation; component *A* exhibits the reactions of very pure nitrocellulose. The N content of *A* and *B* is the same, the ash content higher in *B* than in *A* and the viscosity enormously greater in solns. of *A* than of *B*. The relation between viscosity and concn. does not follow Arrhenius' formula and the viscosity cannot be computed from the law of mixts. The soly. of *A* and *B* in ether-alc. remains the same after fractionation as that of the original mixt. For all tech. applications *A* is better than the original mixt.; *B* is unsuitable for explosive manuf. Nitrocellulose can also be sepd. fractionally by ultrafiltration through ultrafilters of graded pore size. Very fine filters remove all of the nitrocellulose, permitting only pure solvent to pass, showing that nitrocellulose is colloiddally dispersed. F. L. BROWNE

Investigations on viscose. MASAHARU NUMA. *Kunstseide* 9, 457-9(1927).—See *C. A.* 22, 2055. FREDERICK C. HAHN

Organization of rayon factories. M. DURÉ. *Kunstseide* 9, 505-8(1927).—The manuf. of rayon is discussed from an operating standpoint. Systematic superintendence and uniform working methods on all working shifts are stressed. F. C. H.

Stretching process for rayon. DURÉ. *Kunstseide* 9, 459-60(1927).—Wet rayon, before purifying, can be stretched 1.4 times in length at a rate of 40 m./min. without any unfavorable effect on the quality. Greater prolongation and higher rates are possible but are not desirable. The improvement in the quality and the appearance of the stretched rayon speak in favor of the industrial application of this so-called stretching spinning process for rayon. FREDERICK C. HAHN

Improvement of the quality of rayon fabrics. F. HENK. *Kunstseide* 9, 427-8(1927).—The increasing importance and use of rayon fabrics are not only due to sales propaganda but primarily to improvement in quality. H. discusses how careful handling of the material influences the quality of rayon fabrics and what special devices are necessary for this handling. FREDERICK C. HAHN

Cost of rayon. HEINRICH GÖLKEL. *Kunstseide* 9, 417-8(1927).—Various factors in the cost of rayon are discussed. FREDERICK C. HAHN

Review of the pulp and paper industry in 1927-1928. A. PAPINEAU-COUTURE. *Can. Chem. Met.* 12, 129-30(1928). E. H.

Modern engineering answers the call for lower costs in newsprint. A. E. BUCHANAN, JR. *Chem. Met. Eng.* 35, 285-9(1928). E. H.

Electric apparatus for determining moisture content of paper or cellulose (Brit. pat. 275,741) 4.

HAGGLUND, ERIK: *Holzchemie*. Leipzig: Akadem. Verlagsgesellschaft. 275 pp. M. 18; bound, M. 20.

Treating wood or other cellulose materials. J. G. FARBENIND. A.-G. Brit. 276,025, Aug. 13, 1926. A modification of the process described in Brit. 274,892 (*C. A.* 22, 2273) for opening up cellulose-contg. materials such as wood and straw involves treating the material with cold or warm dil. HNO_3 and then treating it with air in a tube or tower. The material may be subjected to a preliminary steaming to remove resin and facilitate diffusion of the HNO_3 .

Cellulose esters and ethers. I. G. FARBENIND. A.-G. Brit. 275,660, Aug. 6, 1926. Alkali cellulose which may be in the form of pulp or paper as obtained from a half-stuff draining-machine is esterified or etherified by gaseous reagents, e. g., treated with EtCl at 100° under 5 atm. pressure, or with MeCl at 70° under 5 atm. pressure, or with CS_2 vapor at $20-25^\circ$, or with the vapor of lauric acid chloride at 100° together with circulating N by which the temp. is maintained.

Cellulose ethers. I. G. FARBENIND. A.-G. Brit. 277,111, June 10, 1926. Insol. ethyl cellulose or similar relatively insol. ethers of cellulose or of other carbohydrates are rendered more sol. by treating them with a depolymerizing or degrading agent such as HCl , H_2SO_4 , H_3PO_4 or oxalic acid or a mixt. of ZnCl_2 and HCl . Swelling agents and solvents also may be added.

1,4-Dioxane as a solvent for cellulose esters and ethers. I. G. FARBENIND. A.-G. Brit. 275,653, Dec. 23, 1924. Cellulose acetate or other cellulose esters or ethers are

dissolved with 1,4-dioxane, with which other solvents also may be used, together with resins and dyes, for forming artificial silk, coating compns., etc.

Cellulose from sugar cane. E. C. H. VALET. Brit. 277,163, Aug. 25, 1926. Cellulose for paper-making is obtained from sugar cane bagasse by agitating it with a heated soln. contg. 3–5% lime and subsequently boiling it under pressure in a soln. contg. NaOH 6% and Na_2SO_3 or Na hyposulfite 2–3%. An app. and various details of the procedure are described.

Sugars from cellulose. R. A. KOCHER. U. S. 1,670,727, May 22. Cellulosic material such as sawdust is mixed with HCl and digested in a container closed to the atm. while maintaining the strength of the HCl at about 30% or higher; the digested product is transferred successively to 2 other containers without exposure to the air and the HCl is sepd. from the product for use with a fresh batch of material. An app. is described.

Water-soluble sulfonated cellulose derivatives. I. G. FARBENIND. A.-G. Brit. 277,317, Sept. 10, 1926. Cellulose in the form of an alk. compd. is caused to react with an alkyl-halide-sulfonic acid, e. g., mercerized cellulose is treated with an alc. NaOH soln., Na benzylchloride-*p*-sulfonate is added in alc. soln. and the mass is kneaded at 50–60°. Other examples also are given. The products can be sepd. by conversion into their Ca or Ba salts which are insol. in water. They are suitable for *impregnating textile materials as fireproofing agents*.

Bottle capsules or other decorative cellulose or cellulose derivative products. WOLFF & Co., E. CZAPEK AND E. BAUER. Brit. 276,206, Nov. 27, 1926. Molds are immersed successively in material of different character or color, before coagulation is effected.

Decorating celluloid, etc. H. MANOVILL. U. S. reissue 16,963, May 15. See original pat. 1,636,523 (C. A. 21, 2985). Fish-scale may be used in the coating.

Extruded viscose product. S. A. NEIDICH. U. S. 1,670,162, May 15. A solid core filament with an outer continuous imperforated sheath of shriveled crinkled surface is formed by coagulation of filaments in a 16.5% H_2SO_4 soln. contg. PO_4 ions.

Artificial silk. SILVER SPRINGS BLEACHING & DYING Co., LTD., AND A. J. HALL. Brit. 277,089, June 8, 1926. Resistance of "cellulose acetate silk" to hot or boiling aq. liquids is increased by stretching the fully set and finished filaments beyond their elastic limit; the material may be pre-treated with swelling agents such as acetone, alc., CH_3O or glycerol and a stretch of 15–25% is suitable.

Artificial silk from viscose. I. G. FARBENIND. A.-G. Brit. 276,679, Aug. 25, 1926. In order to improve the wetting properties of "viscose silk," there is added to the viscose soln., or to the spinning bath or other treating soln. a wetting agent such as an alkylated or aralkylated naphthalenesulfonic acid, an aminobenzenesulfonic acid, an aminonaphthalenesulfonic acid alkylated or aralkylated in the amino group, or sulfonation products such as are described in Brit. 269,942 (C. A. 22, 1419) and Brit. 271,474 (C. A. 22, 1694).

Casing, etc., for preventing dissemination of fumes from artificial silk spinning machines. J. L. RUSHTON. Brit. 276,748, June 3, 1926.

Flotation separation of fibers from backwaters of cellulose pulp mills, etc. A. M. R. KARLSTROM. Brit. 277,310, Sept. 7, 1926. An app. is described.

Beater for paper-making apparatus. J. S. BECK. U. S. 1,670,181, May 15.

Paper-making apparatus. J. S. BECK. U. S. 1,670,182, May 15.

Beater for paper pulp. J. S. BECK. U. S. 1,670,183, May 15.

Paper-making apparatus. P. ERKENS. U. S. 1,670,884, May 22.

Paper-making apparatus. J. K. HORSBURGH. Brit. 276,884, Feb. 4, 1927.

Paper-making apparatus. S. A. MACIVOR. Brit. 276,103, June 8, 1926.

Apparatus for making paper, pasteboard and cardboard. O. LEONHARDT. Brit. 276,549, Jan. 7, 1927.

Drier section for paper-making apparatus. L. M. AVENSON. U. S. 1,670,873, May 22.

Apparatus for screening paper pulp, etc. S. MILNE. U. S. 1,670,473, May 22.

Apparatus for reclaiming suspended solids from "white water" of paper manufacture. A. BANKUS and G. S. BACKUS. U. S. 1,670,874, May 22.

Apparatus for drying and calendering paper. S. MILNE. Brit. 277,181, Oct. 9, 1926.

Chromium-plated steel rolls for calendering paper or textiles. C. G. HAUBOLD AKT.-GES. Brit. 276,599, March 31, 1927.

Stock-consistency regulator for paper machines. M. DE ZURIK. U. S. 1,669,412, May 15.

Finishing paper by pressing it between fabric layers. S. W. WEBB and A. ALLEN. U. S. 1,669,885, May 15

Chemical paper stock from wood. W. H. HOWELL, JR. U. S. 1,670,156, May 15. After cooking wood in a digester with steam and a chem. liquor such as NaOH or sulfate, the spent liquor is withdrawn and immediately while still at a high temp. it is subjected to a vacuum to evap. and conc. it and is heated by indirect contact with steam withdrawn from the digester. An app. is described.

Heat-sensitive paper for recording telegraph and like apparatus. R. H. RANGFR. Brit. 276,020, Aug. 14, 1926. A heat-sensitive material for marking by a hot gas jet, elec. spark or other heating means preferably comprises a short-fiber paper impregnated with a substance which changes its appearance when heated, e. g., (a) a soln. formed of water 100, gelatin 10, salt 5 and phenolphthalein 0.5 parts, or, (b) aniline-HCl 9.8 g., water 99 cc. and KNO₃ 8 g. or other oxidizing agent, or, (c) water 100 cc., Ni nitrate 5 g., Na₂S₂O₃ 3.9 g. and NaNO₃, 1% gelatin soln., 5 cc.

Liquid air, a new safety explosive, or the problem of safe blasting solved. ANON. *Z. ges. Schiess-Sprengstoffw.* 23, 117-8(1928) - Controversial Statistics are presented which show comparison of liquid air and ordinary blasting explosives as regards fatalities and accidents in use. C. G. STORM

Accident statistics and liquid-air explosives. H. MACURA. *Z. ges. Schiess-Sprengstoffw.* 23, 118-9(1928) C. G. S.

The burning of carbon disulfide. II. The velocity of the uniform movement of flame in carbon-disulfide-second combustible-air mixtures. A. G. WHITE. *J. Chem. Soc.* 1928, 751-63; cf. *C. A.* 21, 2385.—The exptl. methods are similar to those previously used, excepting that a new photographic app., to be described in a later paper, is devised for measuring flame speeds. Detns. are made of the flame speeds in CS₂-air and CS₂-sec. combustible (either *n*-C₄H₁₂, Et₂O, C₂H₂ or CH₄)-air mixts., contg. either a deficit or an excess of O₂. By varying the conditions of ignition, CS₂-air mixts. may be made to propagate flame at one of two widely differing speeds. In CS₂-air mixts., the low-speed flame does not propagate when the CS₂ content is below 2.20% and changes to the high-speed form above 2.35%. CS₂-air mixts. are abnormally sensitive to their O₂ content. The complex mixts. have lower flame speeds than do the simpler CS₂-air, the effect being more pronounced in those contg. insufficient O₂. The effectiveness of the sec. combustible in hindering the burning of CS₂ is in the order given above, agreeing with W.'s list. Payman and Wheeler's "law of flame speeds" (*C. A.* 20, 2750) does not hold for CS₂-air mixts. It is quite certain that the burning of CS₂ is catalyzed by a product of the combustion, this action being inhibited by other combustibles. J. BALOZIAN

Inflammability of hydrogen. VI. Influence of ethyl ether, ethyl alcohol, acetone and hydrocarbons on the limits of inflammability of hydrogen-air mixtures. YOSHIO TANAKA and YUZABURO NAGAI. *Proc. Imp. Acad. (Japan)* 4, 154-7(1928); cf. *C. A.* 22, 1854. —The addn. of a small quantity of each of Et₂O, EtOH, Me₂CO, C₆H₆ and other hydrocarbons existing in gasoline to H-air mixts. lowers markedly the upper limit of inflammability of H. The upper limit is reduced from 71 mol. % H to the values given by the % of addn. agent stated: 6.7% Et₂O, 0; 3.51% EtOH, 44; 5% Me₂CO, 27; 5.45% C₆H₆, 0; 4.6% C₃H₁₂, 0; 4.5% cyclohexane, 0, 3% of methylcyclohexane, 13; 4% of a mixt. of about 43% dimethylcyclopentane and 57% of isohexane, 0. C. J. WEST

Why not a standard initial impulse? M. WOLFF. *Z. ges. Schiess-Sprengstoffw.* 23, 120-1(1928).—W. presents arguments for the use of a single strength of *blasting cap* or *detonator*, equal to the present No. 8 (equivalent to 2 g. Hg(ONC)₂). Blasting caps of grades from No. 1 to No. 10 are still manufactured in Germany. A comparison of the results of Trauzl Pb block tests using No. 3 and No. 8 caps is shown:

Explosive	Trauzl test No. 3 caps	(c.c. expansion) No. 8 caps
Gelatin dynamite.....	345	415
NH ₄ NO ₃ explosive.....	350	407
Picric acid.....	257	305

Most explosives require a No. 8 detonator to produce max. efficiency. Weaker detonators may cause failure or partial explosion with increased formation of toxic gases. Stronger detonators (No. 9 or 10) do not show greater efficiency, probably because such increase cannot be obtained by a greater length of the primary and secondary charges of the detonator. It is suggested that greater strength may be obtained by increasing the diam. and providing for concentric arrangement of the primary and secondary charges. (Note: An editorial comment suggests 3 grades—Nos. 3, 6 and 8, and remarks that No. 1 dynamite develops its max. rate of detonation with a No. 3 cap.)

C. G. S.

The use of time fuses in war. RUDOLF KRUG. *Z. ges. Schiess-Sprengstoffw.* 23, 113-5(1928).—Describes, with illustrations, various devices used by the Allies during the World War for exploding buried charges of explosives. Some of these devices provided for electric ignition and functioned by contact, others depended entirely on chemical action and were arranged to operate in any desired time from 1 to 30 hrs. C. G. S.

The explosion of an autoclave in the preparation of anhydrous alcohol. v. KEUSLER. *Apparatebau* 40, 88-9(1928).—The explosion occurred while discharging the lime residue in the Merck process and is thought to have been due to catalytic action of the fine lime on the alc.-air mixt

RUBY K. WORNER

The abnormal fugacity to light of some vat colors. L. RINOLDI. *Bol. assoc. ital*

tes. coloristi 9, 1-4(1928).—An abnormal fugacity to light of shades dyed on wool with indigo and certain vat colors is not caused by hyposulfite, but by colloidal S, and its decompn. when the dyeing vat becomes acid. The S is produced by some of the bath coming in contact with the warming tubes. Its presence is noted after using the vat for some time. The colloidal S deposits inside and outside the fiber, and cannot be eliminated by milling. By the action of air, sun, etc., it is oxidized to H_2SO_4 , that transforms indigo and other vat colors into sulfonates, less fast to light than the original products. A fresh vat of indigo gives faster shades than an old vat. A deficiency of NaOH or Na_2CO_3 in the vat causes lower fastness, NH_3 being insufficient for replacing them. Indophenol also causes lower fastness, that can be sometimes increased by treating with weak Na_2CO_3 .

R. SANSONE

New photographic process for printing cellulose fabrics. MARIO MICHELS. *Bull. soc. ind. Mulhouse* 94, 124-35(1928); cf. C. A. 22, 1477. Report. PIERRE BRAUN. *Ibid* 135-8.—The different stages of the process are essentially as follows: after exposure, wash to remove excess $Ag(OH)_2$, pass through a NaCl soln. (to convert residual $AgNO_3$ into $AgCl$), wash with H_2O , pass through Pb ferriocyanide soln. (to form Ag and Pb ferrocyanide), wash with H_2O , pass through a $CuCl_2$ soln. (to form cupric ferrocyanide), wash with H_2O , pass through $Na_2S_2O_4$ soln. (to remove Ag salts), wash with H_2O , pass through a reducing bath of Na_2SO_3 , Na_2CO_3 and quinone (which acts as catalyzer) to reduce the cupric to cuprous ferrocyanide which is practically colorless, wash with H_2O , dye in strongly AcOH soln., wash in soap soln. The process is in many respects similar to the Uvachrome process, but differs from it in the following respects: the Uvachrome process uses a gelatin substratum, the Febo process a substratum of cellulose fibers; the Uvachrome uses a cupric, the Febo process a cuprous ferrocyanide mordant; in the Uvachrome process dyeing is carried out in the cold, in the Febo process it is done hot; the Ag image is cryst. in the Uvachrome and colloidal in the Febo process. Using normal negatives (reproductions of paintings) with details and half-tones, proper reproduction required 30-60 min. exposure in sunlight, 3-4 hrs. in the shade, or 45-90 min. with a 1000 c. p. Hg arc, and the details do not come out very well in the lighter portions of the print; with over-exposure to bring out these details, the darker portions are not sufficiently clear. In nearly all cases the whites are slightly colored, which is evidently due to some extent to the nature of the dye selected. Exposure of the printed fabric to daylight (sky mostly overcast) for 45 days caused no appreciable fading. Fastness to alkalis was very satisfactory. The shades obtained by the Febo process with certain dyes are exceptionally bright and quite comparable to those obtained with tannin mordant.

Dyestuff Rept.* 17, 286-92.—The points emphasized with reference to a satisfactory soap for textile use are soly., degree of hydrolysis, degree of preferential absorption, stability of fatty acid emulsion in presence of acids, rinsibility and stability toward oxidation and reactivity.

L. W. RIGGS

Degumming silk. III. Action of hydrochloric acid upon sericin and the effect of formalin upon the action. TAKAO TAKAHASHI. *J. Soc. Chem. Ind. (Japan)* 31, 34-9, Suppl. binding 11-2B (In English) (1928); cf. C. A. 22, 873.—Raw silk was boiled 30 min. with HCl of various concns. in the range of $5.0-95.0 \times 10^{-3} N$, and the amount of HCl consumed in the treatment and the degree of degumming (i. e., the wt. loss of the fiber mass), were detd. The acidity of the bath, $2.0-3.0 \times 10^{-3} N$ HCl, was supposed to be the isoelec. point of sericin, and with regard to the above-mentioned tests, remarkable changes were observed at this acidity. The degree of degumming decreased as the acidity of the bath was increased to the above-mentioned acidity, reached a min. at this point and then increased; the amount of HCl consumed by the treatment increased as the acidity of the bath increased to the above point and the further increase of the acidity did not cause any increase of the consumption of acid. The degree of degumming did not show a min. in the presence of formalin, as the acidity of the bath increased. The two curves of degree of degumming, one in the presence and the other in the absence of

formalin, coincided at the min. point of the latter and further on. The amount of HCl consumed by the treatment in the presence of formalin increased as the acidity of the bath increased, reached a max. at the above-mentioned acidity and then decreased. From the above results, the author concluded as follows. When the acidity of the bath was less than $2.0-3.0 \times 10^{-4} N$ HCl, the sericin adsorbs H ion and is gelatinized; and when it is larger than this acidity, the sericin does not gelatinize but reacts with the HCl and forms the sol. hydrochloride. IV. Gelatinization of sericin. *Ibid* 39-45, Suppl. binding 12-3B (In English).—The viscosities of the silk boiling-off liquor produced from the degumming baths of various H-ion concn. either in presence or in absence of formalin were examd. As the H-ion concn. of the degumming bath increased, the viscosity of the boiling-off liquor increased and reached a max. at the H-ion concn. corresponding to about $3.0 \times 10^{-4} N$ of NaOH, and then decreased. This max. point corresponded to the max. point of gelatinization. The boiling-off liquor obtained from degumming liquor contg. formalin showed very small viscosities, which meant the destruction of the gelatinizing properties of sericin by the action of formalin. The degumming is mainly due to the gelatinization of sericin in the alk. liquor, but mainly due to the swelling in the acidic liquor. The author expressed his view upon the nature of gelatinization and swelling. S. O.

Silk and the iron bath. FRED GROVE-PALMER. *Dyer, Calico Printer* 59, 162-3 (1928).—Practical suggestions are given for the care of the iron bath used in the production of tan-logwood-iron black upon silk. The acidity of the bath is kept down by boiling it for an hour or two every day with clean iron shavings enclosed in a perforated wooden box. The formula for a reducing mixt. to check oxidation of the ferrous salts in the bath is given. RUBY K. WORNER

The most recent rayon. KÖLLICKER. *Kunstseide* 9, 415-7(1927).—A general discussion of the development of cellulose acetate rayon, including its dyeing and other properties. FREDERICK C. HAHN

Resistance of rayon and silk to sunlight and weather. P. M. GREMPPE. *Kunstseide* 9, 462-3(1927).—Rayon and silk fabrics are evaluated on the basis of their loss of strength when exposed to the weather. A fabric is considered practically unusable after it loses about half of its original strength. In all cases where the textile is exposed to the weather destruction takes place on the surface exposed to the light. The destruction of the fabric is caused by a combined action of water and the short-wave ultra-violet light rays from the sun. Silk and rayon fabrics exposed to the weather lasted for a half year. FREDERICK C. HAHN

Effect of starch sizing and calendering upon the physical properties of a cotton fabric. ANITA KUEHN AND RACHES EDGAR. *Am. Dyestuff Rept.* 17, 279(1928).—Samples of glazed and unglazed chintz otherwise identical were analyzed as to wt., thickness, shrinkage, percentage of gloss, yarns per inch, yarn count, yarn diam. and twist, length and diam. of fiber, petr.-ether ext., ash, wet and dry breaking and bursting strength, resistance to abrasion and fastness to light and laundering. L. W. R.

Flax, and some of its products, especially canvas hose. JAMES TRIMBLE. *Munic. Eng. Sanit Record* 79, 584(1927).—Hose should be subjected to a chem. treatment known as Burnettizing which tends to prevent rot and mildew and adds to its softness and flexibility. C. H. BADGER

A microchemical study of the structure and development of flax fibers. D. B. ANDERSON. *Am. J. Botany* 14, 187-211(1927).—Fibers originate in the meristematic region of the stem tip. The middle lamella is of pectose, and the secondary wall of cellulose somewhat modified by pectose in the region of the middle lamella. Fiber elongation is the result of both a slipping action of the cells past each other and an elongation of the fiber in harmony with the adjoining tissues. Tertiary deposition occurs through the periodic deposition of complete layers within the secondary wall. The amt. of tertiary deposition varies, often amounting to 90% of the area of the cell in cross section. The stratification visible in cross section is probably not due to alternate layers of "water-rich" and "water-poor" cellulose but represents the boundary lines between successive lamellae of cellulose. Alternate layers of spiral fibrils run in opposite directions. The fibrils are cryst. in nature and probably orthorhombic. Flax fibers are partially lignified when seen in the stem. Lignification is a change of pectic compds., and there is evidence that some change of cellulose to pectose occurs previous to lignification. Retting is accomplished not by dissolution of the middle lamella but by the destruction of the entire secondary wall. Lignification interferes with retting, and the degree of lignification is one of the detg. factors in the success of the retting process. E. F. SNYDER

Use of "Voltols" in the textile industry (KACZKOWSKI, BORTNOWSKA) 22. Cr-plated steel rolls for calendaring textiles (Brit. pat. 276,599) 23. Water-soluble sulfonated cellulose derivatives (Brit. pat. 277,317) 23.

GUENEAU, L.: *La soie artificielle*. Paris: Dunod. 232 pp. F.30.

LABRIFFE, M.: *Manuel du tissage. Matières textiles. Tissue simples*. Paris: Dunod. 288 pp. Bound, F 22.

Dyes. I. G. FARBERIND. A-G. Brit. 276,353, Aug. 19, 1926. Monoazo dyes giving fast yellow dyeings are made by coupling diazotized 2,5,6-trichloro-3-amino-toluene-4-sulfonic acid with a 1-sulfohenyl-5-pyrazolone substituted in the 3-position by a methyl, carboxyl or carboxylic ester group.

Dyes. I. G. FARBERIND. A-G. Brit. 277,275, April 12, 1926. Azo dyes or lakes from them are obtained in finely divided form by adding an aromatic sulfonic acid substituted by a hydrocarbon side chain such as propylated or butylated naphthalenesulfonic acids, or salts of such acids, alone or together with turkey red oil or a similar sulfonated oil.

Dyes. L. B. HOLLIDAY & Co., LTD., AND C. SHAW. Brit. 277,125, June 15, 1926. Dibenzanthrone or its low oxidation product obtained by treatment with HNO_3 or MnO_2 and H_2SO_4 is oxidized with a dichromate and H_2SO_4 . The products dye cotton from the vat fast gray to black shades.

Dyes. I. G. FARBERIND. A-G. Brit. 276,372, Aug. 21, 1926. Arylazodiarylamines are made by reaction of a monoaminoazo dye with an aromatic nitro compd. contg. at least one exchangeable halogen atom and at least one sulfo or carboxyl group. The products are sol. in water and dye animal fibers; those contg. not more than one sulfo group are also suitable for dyeing cellulose esters and ethers. Condensation may be effected by boiling in the presence of an acid-binding substance such as NaOAc or CaCO_3 , or under pressure of 6-12 atm. in cases where the halogen is exchanged with difficulty as in the case of mononitrohalogenaryl sulfonic or carboxylic acids. Several examples are given.

Dyes and intermediates. I. G. FARBERIND. A-G. Brit. 275,724, May 12, 1926. 1,3-Di(4'-alkyloxyphenylamino)-naphthalene and its derivs. are made by heating a naphthylaminesulfonic acid having a sulfo group in the *m*-position to the amino group with a *p*-alkoxyaniline or a deriv. The production of 1,3-di(4'-methoxyphenylamino)-naphthalene-8-sulfonic acid and the corresponding 6,8-disulfonic acid are described. These products may be used as dye intermediates and for this purpose may be condensed with an aromatic nitroso compd. or oxidized with 1,4-phenylenediamine or a deriv. which contains at least one free amino group. Dyes may be thus obtained which dye wool clear even greenish blue shades.

Hydroxyarylaminoanthraquinones. I. G. FARBERIND. A-G. Brit. 276,408, May 13, 1926. Hydroaromatic amine residues are introduced into anthraquinones by customary methods. The sulfonic acids of the products dye wool clear blue shades which are faster to light than those given by alkylaminanthraquinonesulfonic acids. Several examples are given.

2-Amino-4-nitrophenoxyethanol. O. KNECHT. U. S. 1,669,764, May 15. 2,4-Dinitrophenoxyethanol is treated with an alk. sulfide such as Na tetrasulfide to obtain the corresponding amino compd. which may be used as a *dye intermediate*. It forms yellow crystals, sol. in alc. and very difficultly sol. in C_6H_6 and easily sol. in dil. inorg. acid, forming quantitatively diazotizable solns.

2-Amino-4-nitrophenoxypropanediol. O. KNECHT. U. S. 1,670,969, May 22. 2,4-Dinitrophenoxypropanediol is treated with alkali sulfide; the product is a *dye intermediate*, forms yellow crystals, and is easily sol. in alc. and very difficultly in C_6H_6 and dissolves easily with dil. inorg. acids to quantitatively diazotizable solns.

Benzanthrone derivatives. BRITISH DYESTUFFS CORPORATION, LTD., J. BADDILEY, A. SHEPHERDSON AND S. THORNLEY. Brit. 276,766, June 19, 1926. Benzanthrone is treated with sulfonating agents such as concd. H_2SO_4 , H_2SO_4 monohydrate, or oleum, with or without the use of catalysts such as Hg or H_3BO_3 ; sulfonic acids are produced which by caustic-alkali fusion yield dyes which dye cotton from the vat reddish blue shades.

Fiben^zanthrone dyes. BRITISH DYESTUFFS CORPORATION, LTD., AND S. THORNLEY. Brit. 276,767, June 19, 1926. The dyes obtained as described in Brit. 276,766 (preceding abstr.) are treated with hydroxylamine or its salts, with or without use of FeSO_4 . Dyes are thus formed which dye cotton gray to black shades from the hyposulfite vat. Examples are given in which the reaction is effected in H_2SO_4 soln.

Dibenzanthrone dyes. BRITISH DYESTUFFS CORPORATION, LTD., J. BADDILEY, A. SHEPHERDSON AND S. THORNLEY. Brit. 276,768, June 21, 1926. Dyes obtained as described in Brit. 276,766 (cf. second preceding abstr.) are treated with alkylating agents, with or without preceding treatment with oxidizing agents and reducing agents; dyes are thus formed which dye cotton greenish blue.

Lakes. I. G. FARBERNIND. A.-G. Brit. 275,943, Aug. 12, 1926. Primary, secondary or tertiary aromatic amines which are not basic dyes and which are free from acid groups are treated with complex acids or their salts or with substances capable of forming such compds. as phosphotungstic, phosphomolybdic and silicomolybdic acids, and the products may be subjected to an after-treatment under pressure, with heating, and preferably with addn. of salts such as those forming other complex compds. than those first used. Substrata or dispersing agents may be used and among the starting materials specified as suitable for use are 4,4'-tetramethyldiaminodiphenylmethane, 4,4'-tetramethyldiaminobenzhydrol, and *p*-aminobenzaldehyde. Lakes of various colors are obtained.

Stable preparations of leuco compounds of vat dyes. J. R. GEIGY A.-G. Brit. 276,023, Aug. 16, 1926. Vat dyes such as Tinon scarlet G extra, indigo, thioindigo or anthraquinone dyes are mixed with a dihydric alc. such as ethylene glycol, propylene glycol, ethylene thiodiglycol or with CH_2O and converted into a leuco compd. by the action of a reducing agent such as a hyposulfite or sulfide in the presence of alkali, to form a stable product which may be dried and is readily sol. in water and suitable for use directly in dyeing or printing. Na_2SO_4 or Na ricinoleate may also be added, before drying the products.

Dyeing apparatus. J. H. GILES and D. M. GILES U. S. 1,670,067, May 15.

Dyeing. CHEMISCHE FABRIK VORM SANDOZ. Brit. 276,100, June 7, 1926. The threads obtained by the processes described in Brit. 195,619 (C. A. 17, 3613), Brit. 224,502, Brit. 241,854 (C. A. 20, 3577), and German pat. 346,883 are dyed, printed or stencilled by means of insol. or difficultly sol. dyes, used either in simple aq. suspensions or solubilized by agents other than those specified in Brit. 246,609 (C. A. 21, 501). The dyes used may be azo dyes, Cr mordant dyes, basic di- or tri-arylmethane dyes, quinonimide dyes, reduced or unreduced, azines, oxazines, thiazines, acridine, pyridine, quinoline, xanthene and indigoid dyes, anthraquinone and naphthoquinone dyes, reduced or unreduced, S dyes, nitro-aryl- or di-arylamines or -phenols, aminoanthraquinones, reduced or unreduced, and benzo- and naphtho-quinoline anilides. Among the solubilizing agents which may be used, singly or in mixt., are, aliphatic alics., aldehydes, ketones, amines, sulfonic and carboxylic acids and their derivs., and various emulsifying agents. Detailed examples are given.

Dyeing cellulose esters. BRITISH ALIZARINE CO., LTD., W. H. DAWSON, C. W. SOUTAR AND R. J. WOOD. Brit. 275,752, May 27, 1926. Yellow or orange shades are produced on material such as cellulose acetate by nitroacridine compds. such as α - or β -nitroacridine or dinitroacridine or tetranitroacridine, with or without addn. of an acid or salt.

Dyeing "viscose silk" and similar products. BRITISH DYESTUFFS CORPORATION, LTD., J. BADDILEY, P. CHORLEY AND C. BUTLER. Brit. 276,450, June 4, 1926. Level blue, green or black shades are produced by use of secondary disazo dyes made by coupling diazotized aminosalicylic acids or their homologs with the usual middle components, further diazotizing and coupling with 1,8-dihydroxynaphthalenesulfonic acids or 1,8-aminonaphtholsulfonic acids or N-substituted derivs. of the latter. Numerous examples of suitable dyes are given.

Dyeing "viscose silk," etc. BRITISH DYESTUFFS CORPORATION, LTD., J. BADDILEY, P. CHORLEY AND C. BUTLER. Brit. 276,757, June 7, 1926. Regenerated cellulose artificial silks such as those from viscose are dyed in level shades by using secondary disazo dyes with the same first and second components as those specified in Brit. 276,450 (preceding abstr.) but with any naphthol- or naphthylamine-sulfonic acid or N-substitution deriv. of the latter as end component; e. g., "viscose silk" is dyed a deep black in a dye bath made up with Solochrome black F, Na_2SO_4 and soap; the fastness to washing may be increased by after-treatment with Cr fluoride. Several other examples are given.

Perforated grooved former for dyeing hat bodies in marbled effects. G. CHARLES. Brit. 276,893, March 4, 1927.

Bleaching and weighting textile fabrics. J. F. KING. Brit. 275,891, March 14, 1927. Wool, silk, cotton, linen, rayon or other materials are boiled under pressure with a soln. formed from Na perborate 300 lbs., cornstarch 50 lbs., Na_3PO_4 30 lbs., Al sulfate 25 lbs., MgSO_4 75 lbs. and denatured alc. 20 lbs. for each 500 lbs. of the ma-

terial treated. The cornstarch and alc. may be omitted and the proportions varied.

Washing textile materials. HENKEL ET CIE GSS. Brit. 276,337, Aug. 17, 1926. In order to prevent running of colors, urea is added to washing liquors which may also contain soap, tryptic enzymes, O-evolving detergents, soda, waterglass and other substances. Brit. 276,338 specifies a "low-temp." process of washing, in which urea is decompd. in the washing liquid by an enzyme such as urease. Temps. of 30–70° are suitable. Brit. 276,339 specifies compns. for use in processes of this kind, *e. g.*, a compn. formed from soap 70, urea 56, NaH_2PO_4 28, Na_2HPO_4 14, "urease 42" and pancreatin 2 lb. may be used in water at a temp. of about 40°.

Purifying textile materials. H. KOHNSTAMM & Co. Brit. 276,121, July 22, 1926. About 10% of Mg oleate is added, preferably together with other soap or sol. oils, to alk. solns. which are used for boiling out waxes, fats, etc., from textile materials prior to bleaching, mercerizing or dyeing.

Apparatus for singeing fabrics. E. TURNER. Brit. 275,696, April 10, 1926.

Conditioning yarn. F. KERSHAW. U. S. 1,670,262, May 15. Hanks of yarn are conveyed through a drying compartment, then through a conditioning compartment and in the latter compartment the movement of the hanks is retarded one after the other and they are sprayed to moisten them. An app. is described.

Treating cellulosic fibers to give them the appearance of linen. ARNOLD PRINT WORKS. Brit. 276,877, Jan. 21, 1927. Fibers, yarns or fabrics of artificial silk, jute, linen, ramie, wood, cotton or other cellulosic material are treated with caustic alkali and then subjected to the superficial action of cuprammonium soln. The materials may be preliminarily mercerized and the treatment improves their smoothness, stiffness and luster and gives other fibers an appearance more nearly like that of linen. Light fabrics are rendered more transparent, and by the use of resists or other local treatment, pattern effects may be produced.

Wool-like effects on vegetable fabrics. HEBERLEIN & Co., A-G. Brit. 276,352, Aug. 19, 1926. Raw vegetable fabrics which have not been freed from their natural incrustations are treated with a swelling agent such as an alkali, a concd. inorg. acid, ZnCl_2 , $\text{Ca}(\text{CNS})_2$ or ammoniacal Cu oxide, while leaving the fabric free to contract and without placing it under tension. Soft crepon. effects may be produced by local application of the treating agents. An app. and various mech. details are described.

Artificial silk from viscose. C. M. WHITTAKER. U. S. 1,670,919, May 22. In order to produce batches of artificial silk from viscose which will have substantially the same dyeing properties, portions of the material are treated with a dyeing agent such as "direct blue 2B" which may produce uneven shades on batches which are not uniform but which can be readily modified, *e. g.*, by a hypochlorite, so as to render it colorless, and the batches are sorted into groups of like dyeing properties according to the effect of the test dyeing agent, the latter is then rendered colorless.

Films from viscose, etc. WOLFF & Co., E. CZAPEK and R. WEINGAND. Brit. 277,309, Sept. 13, 1926. The film is stripped from the base before the coagulating liquid has had time to pass through the coagulated film and wet the base.

Felt for hats. H. HAAKII. Brit. 275,939, Aug. 14, 1926. Material such as that of velour hats, after scratching, is treated with Cl or Br or with reagents such as hypochlorites or chloramines, to render it soft, glossy and inodorous.

Metallizing fur and feathers. J. VON BOSSE, K. RICHTER, K. LAUCH, H. SIEGELBERG and W. KOCI. Brit. 276,291, May 20, 1926. The material is exposed to cathode rays in a vacuum, a cathode of Au-plated Cu or other metal to be deposited being employed. High tension d. c. or a. c. may be used.

26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

Uses of luminous colors. L. VANNINO. *Frabe u. Lack* 1927, 639–40.—Pigments must be calcined at high temperature. Clear dammar preferably should be selected as the vehicle. Molten paraffin or wax may be used. If oils are used the pigment should only be stirred in, not ground. Many household, theatrical and scientific uses are given. G. G. SWARD

Some notes on heat-resisting paints. F. T. WALKER. *Ind. Chemist* 4, 138–40 (1928).—Paints able to withstand a temp. of 250–300° were sought. The vehicles tested were: linseed oil; fish oil; bitumens, asphaltum, coal-tar and petroleum pitches; Na silicate soln., portland cement wash; shellac soln.; coal tar, rosin, etc.; cellulose

ester lacquer. Pigments tested were: graphite; pure metals and alloys; ordinary paint pigments. The tests applied were: (1) Heat test.—A 6-in. by 6-in. steel plate is painted and allowed to dry for 18 hrs. Half of the plate is given a second coat and dried. It is then heated to 260° for 23 hrs and 300° for 1 hr. (2) Hot water test.—A painted plate half immersed is boiled in water for 30 min. (3) Brushing properties.—This test is made by actual trial of the paint. (4) Weathering test.—The paint is given a trial on the heated surface to be protected. The best all around results were obtained with "Aluminum Bronze Powder" in 1 part of Japanners gold size and 2 parts of naphtha, white spirits, etc.

L. B. MILLER

Preparation of chrome green. R. HALLER. *Farbe u. Lack* 1928, 7-10.—Several formulas and working directions are given together with photomicrographs of the pigment under various conditions of illumination.

G. G. SWARD

Linseed oil foots. FELIX FRITZ. *Farbe u. Lack* 1928, 59-60, 70-1, 82-5.—A review of the sources of and methods for removal of foots.

G. G. SWARD

White lead and zinc oxide in the production of varnishes. A. MACCHI. *La med. italiana* 9, 8(1927).—An increase was noted in the intoxications caused by varnishes with white lead. The substitution with zinc white required its reduction into very small granules before use, bringing up the cost of the varnishes, where different oils were required. Besides this the varnishes with zinc white resisted less than those with white lead. Recent research seems, however, to overcome the difficulty.

R. SANSONE

Colophony varnishes. M. OPPENHEIMER. *Farbe u. Lack* 1928, 4, 18.—Rosin should be limed or esterified for use in varnish.

G. G. SWARD

Nitrocellulose and combination lacquers. JOHS. SCHEIBER. *Farbe u. Lack* 1928, 17, 26-7.—A review.

G. G. SWARD

Cellulose acetate and its solution. I. Composition of cellulose acetate lacquer for airplane dope. KATSUMOTO ATSUKI AND RYO SHINODA. *Rept. Aeronautical Research Inst. Tokyo Imp. Univ.* 3, 49-68(1928).—Various mixed solvents for cellulose acetate (A) in the prepn. of airplane dopes have been studied from the standpoints of solvent power, the viscosity of the resulting solns., and the tensile strength and elongation of the films prepd from these solns. The mixed solvent which has the highest solvent power and which gives A solns. of the lowest viscosity also gives films of the highest tensile strength and elongation. Of the common org. solvents, the optimum compn. of the mixed solvent is acetone 60%, EtOH 15-17%, benzene 19-21%, benzyl alc. 1-2%, and triphenylphosphate 1-2%; and the optimum concn. of A is 7-9%. II. Stability of cellulose acetate. KATSUMOTO ATSUKI. *Ibid* 71-88.—A prepd. with H₂SO₄ as a catalyst contains more or less AcOH and H₂SO₄ in a loosely combined form from which the acids are easily liberated spontaneously. The free AcOH does not affect the stability, but the H₂SO₄ attacks the A, lowering its stability. The H₂SO₄ may either be adsorbed by A or combined with it chemically in the form of esters. The H₂SO₄ liberated attacks A by sapon. the ester, hydrolyzing the cellulose, lowering its colloidal properties, and destroying the gel structure. If these changes occur in A in the form of film or rayon, the mechanical properties of these forms are destroyed. The H₂SO₄ retained by A decreases as the ripening proceeds, due to sapon. of the H₂SO₄ ester, and also because the coagulating power of A diminishes, allowing easier diffusion of the acid. The hydrolytic degradation products of cellulose formed during the acetylation or ripening have lower decompn. temps. than A, but they do not affect the stability of A as long as they do not contain H₂SO₄. Details are given of a no. of stability tests on A that were used in the foregoing work. These tests depend on the development of acid or charring when A is heated under specified conditions. III. Stabilizer for cellulose acetate. YOSHIO TANAKA AND KATSUMOTO ATSUKI. *Ibid* 91-100.—In the manuf. of A with H₂SO₄ as a catalyst, it is difficult to remove the H₂SO₄ entirely from A, and it is necessary, therefore, to add some stabilizer. Ca naphthenate (B) was found to be an effective stabilizer both for A and for nitrocellulose. B exerts no injurious effect on A, and it combines with the H₂SO₄. The naphthenic acid produced exerts no sapon. action on A, but improves the mechanical properties of A films by acting as a plasticizer. The amount of B to be added is calcd. from the amount of H₂SO₄ present in A, but in general 1-2% of the wt. of A will be sufficient. IV. Acetylation of cellulose. KATSUMOTO ATSUKI AND RYO SHINODA. *Ibid* 103-11.—A study is made of various factors in the acetylation of cellulose. When cellulose is acetylated extensively there occur the successive reaction stages peptization → acetylation → acetolysis → equilibrium. Cellobiose and glucose, the end products of the acetolysis, are not found in the early stages of the acetylation. When cellulose is acetylated, the sol. portion is the triacetate and the insol. portion is cellulose, the mono- and diac-

tate not being produced. In excessive acetylation, cellulose is slightly saponified, after which acetylation occurs with simultaneous acetolysis. The most homogeneous triacetate of cellulose is obtained by stopping the acetylation at a point where the soly. in acetone is a min. after the triacetate is produced. Excessive amounts of Ac_2O lower the degree of acetylation. The velocity of acetylation is doubled for a rise of 10° between 30° and 50° , but it is scarcely doubled by a rise of 20° when the temps. are higher than 50° . At these higher temps., the decompn. of cellulose is very active, thus disturbing the relation between velocity increase and temp. V. Relation of temperature and time of ripening to the viscosity of cellulose acetate. KATSUMOTO ATSUKI AND RYO SHINODA. *Ibid* 115-23.—A study is made of the ripening step in the manuf. of A, using the viscosity detns. of acetone solns as the criteria of the degree of ripening. The viscosity is governed by many factors, but when the cellulose used, as well as the compns. of the acetylation and ripening baths, are kept const., it is detd. by the temp. and time of ripening. The relation between temp. and time of ripening to produce a ripened A of a given viscosity is represented by $T = ae^{kt}$, in which T is the temp., t the time of ripening, and a and k are consts. FREDERICK C. HAHN

Glyptal and coumarone resins. J. H. FRYDLENDER. *Rev. prod. chim* 31, 241-6, 281-6 (1928); cf. *C. A.* 16, 1874.—A review of the prepn., properties and uses of artificial resins produced by condensation of polyhydric alcs. with polybasic acids, and of the present status of coumarone resins. A. PAPINEAU-COUTURE

Bituminous emulsions [for use in paints] (Brit. pat. 276,543) 22. Mixing mill for paints (Brit. pat. 276,196) 1. Starch compositions [as painters size] (Brit. pat. 276,340) 28.

ANDRÉS, LOUIS EDGAR: **Die Fabrikation der Kopal-, Terpentinöl und Spirituslacke.** 4th ed., revised and enlarged. Edited by Erich Stock Vienna: A Hartleben 428 pp. M. 9, bound, M. 10.

MARGIVAL, F.: **Laquers et vernis.** Paris: Desforges, Girardot et Cie. 165 pp. F. 16.50.

MARGIVAL, F.: **Peintures.** Paris: Dunod 230 pp. F. 22.50.

Paints, etc. A. M. SARGENT and G. W. CROWE. Brit. 275,772, July 9, 1926. Paints, plasters, cements or putty comprise ZnO or MgO or both, a sol. silicate, and a powd. metal such as Al, Zn, brass, Cu, Ni or Sn.

Metallic paints. ZÄHNHÄR & SCHIESS & Co. Brit. 276,613, Aug. 30, 1926. Finely divided Pb is used with linseed oil or other suitable vehicle and a material such as Sb, Bi, Cd, Mn, Al, Sn, Zn or Mg (which may be alloyed with the Pb) to prevent premature oxidation of the Pb powder.

Titanium pigments, etc. J. BLUMENFELD. Brit. 275,672, Aug. 9, 1926. Oxides of Ti, Th, Zr, Sn, Ce and other fourth-group metals are prepd. by hydrolysis of a soln. of a salt of the metal in the presence of colloidal particles of a compd. of the metal found in or added to the soln. before or during hydrolysis; e. g., a hot concd. crystalloidal soln. of Ti sulfate is slowly poured, while stirring, into $\frac{1}{4}$ its vol. of hot water or dil. soln. by which colloidal particles are formed and later pptd.

Lithopone. J. H. CALBECK. U. S. 1,669,857, May 15. Reactive proportions of aq. solns. of ZnSO_4 and BaS are run into a pptg. and mixing tank, the contents of which are energetically stirred, and the contents of the tank are continuously drawn off so as to maintain an approx. const. level, and lithopone is allowed to settle from the mixt. withdrawn.

Lithopone. W. H. LANDERS. U. S. 1,669,476, May 15. Undried lithopone is fed into one end of an elongated slightly inclined furnace which is rotated to cause the lithopone to move toward the other end of the furnace and a combustible gas is supplied countercurrentwise and burned with a lesser quantity of air than would be necessary for complete combustion, to effect drying, preheating and calcining of the lithopone. An app. is described.

Decorative finishes. H. E. B. GREENE and J. H. GREENE. Brit. 276,864, Nov. 8, 1926. Articles are dipped repeatedly and in reverse directions in a paint which may comprise a soln. of a cellulose ester and a pigment. Various modifications of the process may be employed to produce marbled effects, etc.

Paints, varnishes, etc. R. M. GERLACH. Brit. 277,083, June 7, 1926. Heavy, metal salts of "weak acids" such as acetates, formates, ferrocyanides, ferricyanides or fluosilicates of Pb, Cu or Hg are treated with the acid components or derivs. of resins, mineral oils or fats, such as abietic acid, naphthenic acid or the higher fatty acids,

to obtain a soln. of a complex compd. which may be used alone or with oils, varnishes, japans or pigments for painting or impregnating and preserving various materials.

Varnishes. H. BECKER and SIEMENS & HALSKE A.-G. Brit. 275,813, Sept. 29, 1926. Drying varnishes are made by the action of elec. discharges on liquid or vaporized hydronaphthalenes, *e. g.*, tetra- or deca-hydronaphthalenes, with addn. of a frothing agent such as a viscous oil. An app. is described.

Varnishes, leather polishes, etc. I. G. FARBERND. A.-G. Brit. 275,852, Dec. 23, 1924. 1,4-Dioxane is used as a solvent for fats, waxes, solid hydrocarbons, natural or artificial resins, to form compns. which may also contain dyes or other solvents such as fatty oils, mineral oils, turpentine, benzine or solvent naphtha.

Ornamenting and varnishing various surfaces. M. A. V. C. G. VILLE. U. S. 1,669,816, May 15. Ornaments cut from sheet material are applied to a surface and coated with gelatin and then with varnish.

Coloring lacquers. I. G. FARBERND. A. G. Brit. 275,969, Aug. 13, 1926. Cellulose ester or ether, oil or "spirit" lacquers are incorporated with "methyl violet B extra," "alkali blue B extra" or other basic dyes, which may also contain acid groups, and with complex acids or salts which form color lakes with the dyes, such as phosphotungstic, phosphomolybdic, silicotungstic and phosphotungstomolybdic acids or their salts.

Aqueous japan emulsions. W. P. DAVEY. Brit. 275,955, Aug. 16, 1926. To improve the quality of japan coatings, deposited electrically from an aq. emulsion of japan compn. as described in Brit. 121,533, the emulsion is prepd. by use of a metallic alkali soap such as described in Brit. 212,248 (*C. A.* 18, 2258), and NH_3 1-10% is added, *e. g.*, there may be used gilsonite 300, rosin 75, boiled china wood oil 150, boiled linseed oil 150, emulsified with water and Na_2CO_3 7.5 parts and sufficient NH_3 to bring the NH_3 content to 3.4%.

Coating with water japans. H. CHISLET. Brit. 275,960, Aug. 16, 1926. In coating metals or other articles with compns. such as the water japan described in Brit. 121,533 coagulation on the surface is effected by an electrolyte. A soln. of alkali such as NaOH or KOH or of NaCl or other salts may be allowed to dry on the surface and the latter then dipped in the japan emulsion.

Coating metal surfaces of electric condensers. R. BOSCH, A.-G. Brit. 276,635, Aug. 28, 1926. Successive layers of shellac and bakelite are applied.

Waterproofing compositions. A. ASHBY. Brit. 277,051, Feb. 5, 1927. A compn. for waterproofing brickwork, stone, tiles, paper, "fabrics" or other materials comprises turpentine or a "turpentine substitute," a drying oil such as linseed oil and paraffin wax or similar wax. A small quantity of gold size may be added.

Artificial resins. I. G. FARBERND. A.-G. Brit. 276,518, Oct. 4, 1926. Condensation is effected of mixts. such as those of cyclohexanone with *m*- or *p*-methylcyclohexanone or mixts. of several methylcyclohexanones such as are obtainable by hydrogenation of purified industrial cresylic acid and subsequent dehydrogenation and distn. or mixts. such as are obtained by passing vapors of cyclohexanol over Cu. Resins are obtained suitable for use in lacquers or cements, for making films and for other purposes. Numerous details and examples are given.

Artificial resin. C. KULAS. U. S. 1,669,831, May 15. In producing resin of the phenol- CH_2O type, the constituents are subjected to reaction while heated, then cooled and the resulting product is settled to form a liquid stratum and a partially dehydrated resin stratum; the latter is centrifuged cold and successive thin layers of the resin are subjected to rotation while supported on a heated surface and then while on a cool surface, in order continuously to produce sheet or leaf material. An app. is described.

Synthetic resins. I. LIGHT. Brit. 275,725, May 12, 1926. CH_2O is condensed with an equimol. proportion of a primary amine such as PhNH_2 in the presence of HOAc or HCl , to produce products the character of which may be varied by heating to different temps.

Plastic compositions containing artificial resins and fibrous materials. H. FRIEDLANDER. Brit. 275,795, Aug. 18, 1926.

Drying resinous condensation products, etc. M. G. SHEPARD. Brit. 276,627, Aug. 25, 1926. Products such as produced by condensation of AcH with aniline may be freed from water by melting with about 10% of a fatty acid such as stearic acid, and heating to evap. the water.

Phenol resin. C. J. ROMBEUX. U. S. 1,669,674, May 15. A mixt. of a phenol such as "crude cresylic acid" boiling above 202° and CH_2O is treated with an alkali such as NaOH in a quantity less than 0.1% the quantity of the phenol, and reaction is effected. The product may be obtained either in a fusible and sol. or an infusible and insol. state.

Coating compositions containing phenolic resin. BAKELITE CORPORATION. Brit. 276,417, May 20, 1926. Coating compns. which can be hardened by heating comprise a phenolic resin, an aq. alk. solvent and an aldehydic hardening agent which is either a liquid capable of acting as a diluent or a substance of higher mol. wt. than CH_2O and less reactive than CH_2O or $(\text{CH}_2)_3\text{N}_4$, e. g., furfural with or without other hardening agents.

Acid-proof receptacles, pipes, etc. I. G. FARBENIND. A.-G. Brit. 276,697, Aug. 30, 1926. A reinforcing support of wide-meshed fabric is impregnated with a synthetic resin compn. and the latter is then hardened. Numerous details of temp. treatment, mech. manipulations, etc., are given.

Purifying rosins. HERCULES POWDER CO. Brit. 275,862, Jan. 22, 1927. The process of converting low-grade rosins into high grade as described in Brit. 253,082 (C. A. 21, 2568 where the number is erroneously given as 253,081) is modified by removing the coloring matters by a phenol, a chlorohydrin, furfuryl alc., SO_2 or aniline.

Floor-covering compositions. A. JONES. Brit. 275,949, Aug. 13, 1926. Material such as linoleum may be printed with colored nitrocellulose lacquers for which various formulas are given including such ingredients as EtOAc, castor oil, pigments, BuOAc, toluene, Et lactate, triphenyl phosphate, ester gum, diacetone alc., manila gum, and Bu phthalate, in various admixtures. An app. for printing with the lacquers is also described.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

Solidification temperature of fat mixtures. G. G. POVARNIN AND G. ARBUSOV. *Vestnik* (Organ of the All-Russian Leather Synd.) 1925, No. 1, 143-5; *Collegium* 1927, 549.—Solidification temps. of mixtures of tallow with seal oil, mineral oil and birch tar are tabulated.

H. B. MERRILL

Saponification of fats in a heterogeneous system. L. LASCARAY. *Rev. gén. colloïdes* 6, 32-44 (1928).—Sec. C. A. 22, 175.

E. H.

The use of catalysts in the saponification of fats by alkalies. D. ROSHDESTVENSKI. *Seifensieder-Ztg.* 55, 127-8, 166-7 (1928).—The speed of sapon. of the various fats is inversely proportional to their content of unsatd. glycerides. The speed is greatly increased by the addn. of 1% of certain aromatic hydrocarbons. Of 10 reagents tested hydroquinone, naphthalene and Na naphthalenesulfonate exert no influence upon the reaction; phenol, eugenol and "constant reagent Petroff" accelerate emulsification but cause no temp. increase; cresols, naphthols and thymol increase the temp. from 34° to a max. of 50°; 600 g. cottonseed oil with 1% β -naphthol finished sapon. in from 25 min. to 2 hrs. at 70° to 23°. At 100° no reaction occurred because at that temp. no permanent emulsion could be obtained. Activation is probably due to the formation of absorption compds. at the double C bond of unsatd. fatty acids, causing surface orientation of the hydrocarbon chains and weakening of the mol., thereby allowing easier attack by NaOH.

P. ESCHER

Determination of oleic and linoleic acids contained in an oil; new method of determining the bromine number. Y. VOLMAR AND BJ. SAMDAHL. *J. pharm. chim.* 7, 106-9 (1928).—The I no. of a mixt. of oleic (A) and linoleic acids (B), e. g., in the oil of kirondro (cf. C. A. 21, 1666, 2134; 22, 2394) does not permit calcn. of the quantities of A and B. The results compared with those of the direct Br method of Eibner and Muggenthaler (cf. C. A. 7, 903) are too high for B and too low for A. A new method of detg. the Br no. and calcg. the constituent quantities of A and B is given. Dissolve about 0.5 g. of the mixt. of unsatd. fatty acids in 15 cc. dry Et_2O cooled to -10°, then add Br drop by drop while stirring, until the brown color persists. Allow to stand for 2 hrs. at -10°, then remove excess of Br by washing with 5% $\text{Na}_2\text{S}_2\text{O}_3$, then with H_2O . Decant, then distil off the Et_2O , dissolve the residue in 95% EtOH and complete the vol. to 100 cc. Remove 20 cc., add 5 cc. aq. 60% KOH and heat for 5 hrs. under reflux on a water bath. Cool, add 30 cc. H_2O , 1 cc. HNO_3 , then det. Br by the AgNO_3 method. This gave a Br no. $I_{\text{Br}} = 70.68$. If x and y are % of A and B, resp., and i_1 and i_2 are the calcd. Br nos. of A and B, then x and y may be calcd. from the equations: $x + y = 100$, and $(x \cdot i_1 + y \cdot i_2)/100 = I_{\text{Br}}$. This method applied to the oil of kirondro gave for A 75.54, for B 24.46%. The result agrees closely with that obtained by the E. and M. method.

S. WALDBOTT

Composition of normal oleins. A critical consideration of the applicability of the thiocyanate method in olein analysis. M. DITTMER. *Seifensieder-Ztg.* 55, 141-3,

150-2(1928).—Kaufmann's thiocyanate method for the direct detn. of linolic acid is not applicable in the evaluation of oleins because a no. of unknown factors make the results unreliable, such as the behavior of thiocyanate toward linolenic acid, anhydrides and unsapon. matter. A normal olein of the candle industry (furnished by J. G. Siegert, Neuwed) was sepd. into solid and liquid acids by the lead salt alc. method: the presence of much iso-oleic acid permitted the use of only $4\frac{1}{2}$ g. olein instead of 10 g. per 100 cc. alc. and together with sep. isolation of the unsapon. plus neutral fat yielded the following data: 1 nos. (Hanus) olein 88.02, solid acids 80.20, liquid acids 91.44; unsapon. + neutral fat 85.58. These results calc. the following compn: satd. fatty acids 3, iso-oleic acid 27, oleic acid 61, linolic acid 1.5, unsapon. + neutral fat 0.7%. The low percentages of both satd. and unsatd. fatty acids are in direct contrast to Kaufmann's results, obtained with his thiocyanate method and thus throw doubt upon the general applicability of his method. The speed of oxidation of oleins can at present be measured only approx. by Mackey's test and resinification test, until accurate detns. of the oxidizability of the individual fatty acids are available. P. ESCHER

Lime stability of hexalin soaps. K. LÖFFL. *Seifensieder-Ztg.* 55, 133-4(1928).—Soaps made with sulfonated oils form sol. Ca compds. and can be used with hard water. Hexalin and methylhexalin, which dissolve Ca compds. when used alone, cannot prevent Ca pptn. in soap solns. of the laundry, which are too dil. and contain insufficient solvent for the amt. of Ca in the water. P. ESCHER

Fishoil and its adulteration. S. SALM. *Ledertech. Rundschau* 20, 76-7(1928).—The kinds of fish oils are briefly discussed. Fish-oil preps. often contain 80 to 90% of mineral oil. I. D. CLARKE

Head and blubber oils of the sperm whale. I. Quantitative determinations of the mixed fatty acids present. T. P. HILDITCH AND J. A. LOVERN. *J. Soc. Chem. Ind.* 47, 105-11T(1928).—Each oil appears to consist of a mixt. of higher alc. esters (waxes) and glycerides; the wax constituents are 65-75% of the whole oil. The head oil is less unsatd. than the blubber oil, but neither contains any great amt. of acid less satd. than monoethylenic; the alcs. present are parallel with the acids in their respective contents of unsatd. compds. and in their relative mean mol. wts., cetyl alc. being the main component of the head oil alcs., while C_{18} alcs. predominate in those from the blubber. The fatty acids in the two oils differ markedly between themselves and with other marine animal oils. Those from the blubber contain a high % of palmitoleic acid, and considerable amts. of mildly unsatd. acids of the C_{20} series; but highly unsatd. derivs. of this series characteristic of ordinary whale oil are absent. The acids from the head oil are distinctly abnormal for a marine animal oil, over 50% being of lower mol. wt. than palmitic acid. Capric acid occurs to the extent of 3 to 4%, and in addition to lauric (16%) and myristic (14%) acids, there are present the corresponding monoethylenic lauroleic (4%) and myristoleic (14%) acids. There is reason to believe that the monoethylenic acids present in these oils are not in all cases identical with the forms found most commonly in other animal and vegetable fats. E. SCHERUBEL

Absorption and fluorescence of grapeseed oils. ANDANT. *Ann. office nat. comb. liquides* 2, 821-4(1927).—As regards absorption of light from the Hg arc, grapeseed oil behaves similarly to oxidized castor oil. Fluorescence obtained either with the total light radiations of a Hg arc or with light filtered through a Wood screen (which passes only light of $\lambda = 3560$ Å. U.) has a characteristic reddish violet shade. Photographs of the fluorescence spectra of different oils varied considerably in intensity and showed that there are differences in constitution. A. PAPINEAU-COUTURE

Contribution to the study of grapeseed oil. L. MARGAILLAN AND (MRS.) A. RABELLE. *Ann. office nat. comb. liquides* 2, 825-34(1927); cf. C. A. 21, 3278; 22, 176.—Analysis of 31 samples of grape seed gave: H_2O 9.5-20.0, oil 8.5-14.8, crude protein 8.8-11.3, fiber 28.0-41.7, ash 1.9-5.3, N-free ext. 25.1-35.0%. The oil content is considerably lower than that of previous years, where 14-5% oil contents were quite frequent. Analysis of the oil gave: d_{40} 0.912-0.945 viscosity at 61.5° in c. g. s. units 0.116-0.156, n_D^{15} 1.4717-1.4775, sapon. no. 181-198, acid no. 0.3-70, I no. (Hanus) 125-138, Ac no. (Lewkowitsch) 4.0-49.2, resinous matter 3.1-5.9%, unsaponifiable 0.5-2.7%. The oil is not naturally oxidized but readily becomes so if the seeds have not been kept with sufficient care or if the oil is not extd. immediately after crushing of the seed, and on oxidation the acidity, Ac no. and I no. can exceed the above-mentioned max. values. In no case was an Ac no. found even approaching that of castor oil. There is no systematic difference between oils extd. with petroleic ether and oils extd. with C_2H_5Cl . Distn. of the skins before sepn. of the seed has only a slight effect on the const. of the oil. Seed which has been allowed to stand in heaps for some time gives

a more highly oxidized oil, while seed which has been dried at 100° gives a less acid and less oxidized oil than air- and sun-dried seed
A. PAPINEAU-COUTURE

Physico-chemical study of the unctuousness (oiliness) of grapeseed oil. A. AUBERT AND A. PIGNOT. *Ann. office nat. comb. liquides* 2, 815-21 (1927).—A study of the orientation, dissymetry and mol. dimensions of grapeseed oils from different varieties of grapes showed that some of the oils having high Ac nos. more or less approach castor oil in these respects, and some of the oils could be used for lubrication, at least in admixt.

A. PAPINEAU-COUTURE

Properties of "yamagobo" oil. MIYO OGURA. *J. Soc. Chem. Ind. (Japan)* 31, 60(1928). The oil, obtained from the seed of "yamagobo," *Phytolacca acinosa* Roxb., has light orange color and the following properties. d_4^{15} 0.9148, n_D^{20} 1.4713, sapon. value 186.2, I value 104.6 and unsapon. matter 1.73%. The fatty acids sepd. from the oil are orange-colored liquids, with neutralization value 198.5, I value 105.7, contain 92.3% liquid acids and 7.7% solid acids. The acids give 35.9% solid bromide, m. at 113-4°, which corresponds to that of tetrabromostearic acid.
K. K.

Soy-bean oil. I. The component acids. KORO HASHI. *J. Soc. Chem. Ind. (Japan)* 30, 849-55, Suppl. binding: 221-2B (In English) (1927); cf. C. A. 22, 1864.—The acids of the soy-bean oil were sepd. into two parts, one a solid (10.6%) and the other a liquid (85.4%) by means of the lead-salt-alcohol method of Twitchell. The solid acids were esterified with MeOH and were sepd. into fractions by vacuum distn. They consist of much palmitic acid, an appreciable quantity of stearic acid and a little arachidic acid. The liquid acids were brominated and were further sepd. into fractions by the difference of soly. of their brominated products. From the results, the following compn. was computed for the acids of soy-bean oil: linolenic acid 2.9%, linolic acid 51.5%, oleic acids 35.6% and solid fatty acids 11.1%. **II. Isolation of the oleodipalmitin.** *Ibid* 856-8, Suppl. binding: 222-3B (In English).—The oleodipalmitin was extd. with acetone from soy-bean oil, was purified by means of recrystn. (10 times) from acetone and was identified.
SHUMPEI OKA

The components of unsaturated acids of chrysalis oil. WASABURO KIMURA. *J. Soc. Chem. Ind. (Japan)* 30, 856-65, Suppl. binding: 223-6B (In English) (1927).—The unsatd. acids were sepd. from the satd. acids by means of the Ph-salts-alc. method and they were brominated. The hexabromide, the tetrabromide and the dibromide were sepd. by the difference of their solubilities, and identified by means of their Br contents, their Br- or H-absorbing power, their mol. wt. and the oxidation products of the debrominated acids. The unsatd. acids are oleic, linolic and linolenic acids as formerly reported by other investigators, but the content of linolic acid is not so small as formerly reported. The same conclusions were reached from the identification of the products of the oxidation, by means of $KMnO_4$, of the mixed acids. The oxidation products were dihydroxystearic acid, α - and β -sativic acid and linisic acid.

SHUMPEI OKA

Spectroscopic determination of the constitution of the fatty acids of tung oil. W. MANECKE AND F. VOLBERT. *Farben-Ztg.* 32, 2829-31, 2887-9 (1927).—M. and F. give a review of the various methods for detg. the constitution of the eleostearic acid in tung oil. They det. the spectroscopic absorption of this acid with the method of V. Henri (cf. C. A. 7, 3071) and find an absorption figure which is higher than that of linolic acid. Considering the fact that an increase in the absorption goes parallel with an increase in double bonds, they conclude that the eleostearic acid contains more than 2 double bonds.
J. SCHALCH

Gelatins of different origin as emulsifying agents. J. C. KERNOT AND J. KNAGGS. *J. Soc. Chem. Ind.* 47, 96-100T (1928).—Gelatins from which org. and inorg. impurities have been removed are more efficient emulsifying agents than the same gelatins with the impurities. The source from which the gelatin is obtained and the treatment to which it is subjected before the gelatin is extd. has a marked effect on the emulsifying power of the gelatin. Gelatins which have been previously treated with alkali are more efficient as emulsifiers. Oils contg. double or triple linkings are more easily emulsified than satd. hydrocarbon oils.
T. S. CARSWELL

Behavior of beeswax with trichloroethylene at ordinary temperatures. GEORG BUCHNER. *Chem.-Ztg.* 52, 319 (1928).—At ordinary temp., beeswax is 30% sol. in CH_2Cl_2 , small quantities of the free acids and esters and most of the hydrocarbons being dissolved. Sol. part: m. 54.5°; acid no. 3.45; ester no. 24.36; sapon. no. 27.8. Insol. part: m. 67.5°; acid no. 15.6; ester no. 54.0; sapon. no. 69.6. Calcd. to cerotic acid and ester, the ratio in the original wax is 1.65, in the sol. portion 1:12, and in the insol. 1:6.3. *Java (Ghedda) wax* is also partially sol. in CH_2Cl_2 ; stearic acid, paraffin, tallow

and *pitch* are completely sol.; *carnauba wax*, *ozocerite* and *cerasin* are difficultly sol. Mixts. of these compds. with beeswax give insol. fractions having characteristic phys. properties.

Soap films. W. BASTINÉ. *Z. physik. chem. Unterrichts.* 40, 1-3(1927).—Surface forces in soap films are demonstrated by the use of differently shaped models made from wire.

The how and why of silicate of soda. J. C. VAILL. *Soap* 3, 25-7, 77-81(1928).—This article discusses the position of $\text{Na}_2\text{Si}_2\text{O}_5$ in soap manuf., in the washing operation and in incidental plant operations

Separating animal and vegetable oils from aqueous solutions of proteins and glues by centrifuging. AKTIEBOLAGET SEPARATOR. *Brit.* 277,311, Sept. 8, 1926. The "glue" or "fruit" water is centrifuged before the glues or proteins coagulate and sep. as solids and while the temp. is about 80° or above.

Destructive hydrogenations. J.-M. F. D. FLORENTIN, A. J. KLING and C. MATIGNON. *Brit.* 276,007, Dec. 17, 1925. Animal and vegetable oils are heated in liquid phase under a min. pressure of 45 kg. per sq. cm. and temp. of $350-480^\circ$ in the presence of H and dehydrating catalysts such as thoria, Al_2O_3 , clay or SiO_2 , to form hydrocarbons of low b. p.

Detergent. E. McNAIR. *Brit.* 276,645, Aug. 26, 1926. Soap is mixed with sawdust, wood powder or wood pulp.

28—SUGAR, STARCH AND GUMS

F. W. ZERBAN

Some application of physico-chemical determinations to the control of sugar manufacture. R. H. HURST. *Trop. Agr. (Trinidad)* 4, Sugar supplement. 32-3 (1927).—Surface tension and cond. measurements of sugar solns. are discussed. The coagulation of suspended colloids is largely due to changes in the surface tension at the colloid-liquid interface.

A. L. MEHRING

The real acidity in sugar manufacture, its determination with indicators, and its effect on the product. P. HONIG. *Arch. Suikerind.* 36, 212-22(1928).—The advantages of p_{H} detn. over the titrimetric method are pointed out and it is explained why the drop method is preferable. During the crop of 1927 several difficulties appeared. The indicators used were bromothymol blue (BTB) and *p*- α -naphthol (PAN). It happened sometimes that in turbid juices the p_{H} with one indicator was higher than with the other. In juices clarified by the sulfitation process the p_{H} with PAN was higher than with BTB. After filtration of these juices with kieselguhr or norit the BTB p_{H} showed only a very small change, but the PAN p_{H} gave too high results. Different explanations of this fact are discussed. The influence of the temp. on the p_{H} will have to be studied. Juices entering the evaporators neutral in several instances yielded return waters decidedly alk., while juices which were certainly not oversulfitated gave return water contg. SO_2 . This shows that the juices contain substances which at high temp. have a tendency to lower the p_{H} . The influence of the concn. of the juices is another point to be studied. The p_{H} of sirups and molasses was detd. at different concns., but definite conclusions are not possible so far. There are indications that the unknown losses are greatly reduced by working throughout the process at p_{H} 7, measured at low temp. and without dilm. The colloids are affected not only by the H ions but by other ions also. Several non-sugars go again into true soln. with a slightly acid or slightly alk. reaction, and even if they are not entirely pptd. during clarification, their bad effect on crystn. is lessened. The influence of the Ca ion on clarification and crystn. is of great importance and will have to be studied, also the influence of the anions on colloids. The coagulating effect of the anion is of quite as great importance as that of H-ion effect.

P. R. P.

Report on polariscopic methods of (sugar determination). F. W. ZERBAN. *J. Assoc. Official Agr. Chem.* 11, 167-75(1928); cf. *C. A.* 21, 2393.—The sucrose of the

blackstrap molasses sirup was inverted with invertase. Results obtained on mixts. of this sirup and sucrose by different inversion methods lead to the following conclusions: (1) In the plain acid method, the influence of the free acid on the rotation of levulose tends to give high results, hydrolysis of the reversion products tends to give high results, and changes in rotation caused by the effect of the acid on the amid-amino-acid mixt tends to give low results. (2) In Jackson and Gillis' method No. II (C. A. 14, 2561) the influence of free acid on the rotation of levulose has no effect on the results, hydrolysis of reversion products tends to give high results, and hydrolysis of any asparagine present tends to give low results. (3) In Jackson and Gillis' method No. IV (C. A. 14, 2561) the influence of free acid on the rotation of levulose has no effect, hydrolysis of reversion products tends to give high results, and change in rotation of the amides and amino acids caused by the free acid tends to give low results, which effect is greater than that caused by hydrolysis of asparagine followed by neutralization, so that method No. IV gives lower results than method No. II. With high sucrose and low invert sugar, reversion products, amides and amino acids the disturbing influence of the latter may fall within the limits of error of saccharimetric analysis. With complex mixts. (like many sugar-cane products) the only safe procedure for detn. of sucrose is the invertase method; but in special cases the 2 Jackson and Gillis methods, or even the plain acid method, may, by a compensation of errors or by a negligible magnitude of the errors, give correct results.

A. PAPINEAU-COUTURE

The experimental and instructional cane sugar factory crop 1927. W. SCOTT. *Trop. Agr. (Trinidad)* 4, Sugar Supplement 27-31(1927); cf. C. A. 22, 1247.—The sucrose extn. from whole cane, and from pieces cut into 3 in. and $\frac{3}{4}$ in. lengths was 86.41, 84.18 and 75.06%, resp. Four hrs. after being cut cane had lost 2.91% in wt. The sucrose content of different varieties ranged from 9.45 to 11.70%. The mill was run in various ways to obtain the best possible clarification. Pectin, phosphate, silicate and colloidal matter were most completely eliminated by overliming. Liming had no apparent effect upon removal of pentosans. Const. heating at 215° F. removed pentosans effectively. Nitrogenous substances were removed more completely both by under- and overliming than by normal defecation. Additions of H_3PO_4 produced a clarified juice of great brilliance. From an economic standpoint, centrifuging seemed to be the most promising method of clarification.

A. L. MEHRING

Chemical research problems in cane sugar production. F. HARDY. *Trop. Agr. (Trinidad)* 4, Sugar Supplement 41-6(1927).—Sugar production in the cane and its recovery by manufg. processes are reviewed step by step with numerous references to the literature.

A. L. MEHRING

Report on meetings of technical advisers in the Java sugar industry, Feb. 22 to 24, 1927. ANON. *Arch. Suikerind.* 35, IV (1927); cf. C. A. 21, 1892.—Joint meeting of the three sections. 3-27.—A round table discussion on weighing of cane; estn. of sugar yield for different cane varieties, particularly by the Djombang method; analyses to det. ripeness of cane, milling qualities of cane varieties; effect of P_2O_5 in soil and cane on settling of defecated juices; new POJ varieties and their effect on factory capacity. Joint meeting of chemical and technical sections. 29-144.—Similar discussion on crushers and shredders; mills and milling; bagasse sampling and analysis; weighing and measuring devices; hot maceration; relation between Djombang method and mill control; fuel economy and control; returning of press mud to mills; Vallez and Sweetland presses; cleaning of evaporators; corrosion; centrifugals; washing sugar with sirup or steam; diln. of run-offs; drying of sugar; crystal breakage; effect of microorganisms in the mill, in the factory, in the sugar. Meeting of chemical section, 145-66.—Discussion on juice clarification; effect of pH ; evapn. and boiling; Lafeuille crystallizer; molasses purity; factory control. Meeting of technical section, 167-246.—Discussion on Bruyn mill; turn plates; electrification of sugar factories; central condensation; boilers, economizers and steam accumulators; steam turbines; Meeting of agricultural section, 247-308.—Discussion on distance between plants; time of planting; optimum length of growth; fertilizers; green manuring; molasses as fertilizer; liming; new varieties; seed cane supply; value of practical plot tests; vascular bundle disease; root rot; white louse; borers; mosaic. Index, 309-16. F. W. Z.

The determination of the true polarization sugar in the beet by aqueous digestion and the errors caused by the marc. VL. STANEK AND J. VONDRAK. *Z. Zuckerind. Cechoslov. Rep.* 52, 165-74(1927); cf. C. A. 21, 3481.—The present beet-digestion methods, adopted 1890-1895, are based on a vol. for marc and Pb ppt. of 0.6 cc. and of 23 cc. of juice in 26 g. of pulp. Recent investigations have shown that the marc vol. is several times that of 0.6 cc., resulting therefore in a less juice vol., which in addn. is still more reduced because of the much higher sugar content of the beets of today

compared with that 35 years ago. These factors unite to produce a higher polarization than corresponds to the facts. The authors attacked the problem of detg. the true vol. of marc and juice by producing absolute extn. of the pulp with the centrifugal method. This resulted in a very dil. ext. necessitating concn. by boiling under high vacuum, which, however, caused no destruction of sucrose. App. used and method of procedure are illustrated and described. The results proved that the present method of analysis gives too high values. Av. vol. of marc was found to be 1.3 cc. and that of the juice in 26 g. of beet pulp 21.78 cc. Av. marc content of ripe beets was 4.79, of unripe beets 3.7%. Av. errors in polarization by the normal wt. pipet digestion method was 0.19%; that of the $\frac{1}{2}$ normal wt. pipet method was 0.17%. For the normal wt. flask digestion method 0.197, for the $\frac{1}{2}$ normal wt. flask digestion method 0.065%. The authors suggest the following procedure: *Flask digestion method:* 52 g. of pulp are transferred with boiling water to a 403 cc. flask. Add 8 cc. of lead acetate. Destroy foam with alc. or Et_2O . Make up to mark with hot H_2O and place for 30 min. in a bath of 80–85°. From time to time stir with a bent wire. Cool to 20°, rinse the wire, make up to the mark, filter and polarize in a 400-mm. tube. *Pipet digestion method:* Transfer 52 g. of beet pulp with 356.4 cc. of dil. basic lead acetate into a 500-cc. digestion can with cover and place for 30 min. in a bath at 80–85° (Note: In California, on account of very high polarizing beets the marc and juice volumes were found to be even further from the proportions which S. and V. have detd. Instead of using 177 cc. of lead water which the original Sachs-Le Docte method requires, or the 178.2 cc. which S. and V. propose, the writer has been using for the evaluation of beets 178.4 cc. for the last eleven years.)

F. R. BACHLER

Microorganisms which cause inversion of raw beet sugar. VOJTECH MAREŠ. *Z. Zuckerind. Cechoslov. Rep.* 52, 177–92(1927).—Raw beet, like raw cane sugar, will show signs of decompn. during storage, made manifest by absorption of H_2O , inversion and loss of alkyl. M. shows that inversion is caused by invertase excreted by vegetative micellae. This has the purpose of prepg. the otherwise difficultly digestible substrate for assimilation. The hygroscopicity of invert sugar causes gradual additional diln. of the inverted substrate, which facilitates additional and more energetic bacterial growth; this in turn causes rapid increase of the quantity of invert sugar. The alkyl. of a sample is no criterion of the resistance of a raw beet sugar against microbial decompn. nor can a conclusion be drawn from the no. of mold spores present. Only the no. of spores of *Aspergillus glaucus* and of *Penicillium crustaceum*, which M. has found to possess greatest inverting power, can be taken as an indication of the degree of harmful infestation that can be expected. Drawings and photomicrographs of these and similar molds are given and mode of procedure is described in great detail. F. R. BACHLER

Study of the speed of solution of sugar. K. ŠANDERA. *Z. Zuckerind. Cechoslov. Rep.* 52, 154–60(1927).—The factors which influence soly. conditions of sucrose are of the greatest importance for the entire sugar industry. Š. detd. first the speed of soln. of single crystals and of pellets of amorphous sugar. He placed a weighed crystal, or pellet, on a fine copper screen which was then submerged below the surface of quiet H_2O of 20°. The time necessary for complete soln. was measured. On crystals, probably on account of their anisotropy, speed of soln. varied somewhat because of different speeds of soln. in their diverse directions. Pellets, however, being isotropic, gave closely agreeing results. The speed of soln., expressed in g. per sec. per sq. cm., is a const., $K = 1.6 \times 10^{-4}$, and is for sugars of different shape and kind approx. the same. It is a function of structure and surface. In another series of expts. Š. detd. the speed of soln. of white sugar crystals of different size during washing. He placed on a screen with glass bottom 10 g. of crystals, over which 100 cc. of H_2O of 20° was permitted to flow; within 1 min. the wash liquid was polarized. The crystals of diff. size showed the following % of soly.: coarse 11.8, medium 27.6, fine 59.0, flour 86.0. This shows, in conformance with previous detns. and the experience of practice, that a given quantity of H_2O will dissolve, in the same time, the more sucrose the finer and more uneven is the grain, or the larger the surface of the grain. Similar expts. were made with raw sugars, in which, besides degree of soly., it is also of interest to know what amount of impurities a given quantity of H_2O will remove in a given time. Great differences in soly. and removal of non-sugars were found to exist in raw sugars of different grain size and quality.

F. R. BACHLER

The relation between alkalinity and electric conductivity of carbonation juices. V. STANĚK AND K. ŠANDERA. *Z. Zuckerind. Cechoslov. Rep.* 52, 209–13(1927).—The alkyl. of a carbonation juice is principally due to dissolved CaO and it falls as CaO is removed. With the decrease of CaO there is a decreased elec. cond. However, there is

also the influence to be considered due to variations in sol. salt content of the diffusion juice and the diffusion battery supply water. The authors made elec. cond. measurements in first carbonation juices, diffusion juice and battery supply water and deduct from their results that a direct proportion exists between alk. and cond.; that the influence of varying amt. of salts in diffusion juice and battery supply water during widely differing parts of campaigns is within the limit of exptl. error (0.01–0.02% CaO) and therefore negligible; and that elec. cond. measurements give the promise of making possible the detn. of the end point of first carbonation. F. R. BACHLER

Defecation by adding raw juice to milk of lime to the desired final reaction. G. H. DE VRIES. *Arch. Suikerind.* **36**, 263–7 (1928).—To get a better clarification, it is proposed to add raw juice to milk of lime instead of the ordinary practice where milk of lime is added to raw juice. By starting with a strongly alk. medium a part of the non-sugars is pptd. which remains in soln. when alky. is not reached. Several lab. tests were made by defecating raw juice in both ways. With the same amt. of lime used in both cases and with a neutral final reaction, the vol. of the mud was larger with the new method, and the color and brilliancy of the clarified juice were better. W. APPEL. *Ibid* 355–6.—Besides the improvements mentioned by de Vries, the new method also has the following advantages (1) a large range of p_H ; (2) the final reaction can, with varying quality of raw juice, be accurately adjusted within less than 0.1 p_H , (3) the final reaction can be selected with regard to min. mud vol. and low Ca salts content; (4) there is no difference between the p_H of limed raw juice and that of clarified juice; (5) simplicity of controlling the p_H which can be adjusted in accordance with the quality of the raw juice. P. R. P.

Supplementary note on the Peck strainer. L. BAISSAC. *Rev. agr. Maurice* **5**, 16–7 (1928); cf. *C. A.* **21**, 1203.—The strainer with a 60-mesh screen, made of Monel metal, has continued to give satisfactory service, with the method of cleaning described previously. The method recommended by Peck is not satisfactory in Mauritius. The gum-producing organism is not *Leuconostoc mesenteroides*, but is a staphylococcus. In another factory an organism similar to *Bacterium gelatinosum* has been found, which also produces a gum. F. W. ZERBAN

Cellulose from sugar cane (Brit. pat. 277,163) **23**.

A Comprehensive Survey of Starch Chemistry. Compiled and edited by Robert P. Walton. New York: Book Dept. of "Sugar." \$10, post paid.

Sugar. RAFFINERIE TIRLEMontoise Soc ANON. Brit. 276,527, Sept. 20, 1926. The fine grain is removed from sugar sirups or molasses by the surface action of articles of material such as kieselguhr, paper or sugar crystals and by use of high centrifugal force. Cf. *C. A.* **22**, 2288.

Sugar. RAFFINERIE TIRLEMontoise Soc ANON. Brit. 276,611, Aug. 26, 1926. Raw sugar, after-product sugar and like products, before further treatment such as by centrifuging, are stored for a time under condition of temp. and humidity which cause the sirup surrounding the crystals to attain as low a purity as possible, e. g., 60% or less of sugar in the total dry content of the sirup.

Centrifugal apparatus for washing sugar, etc. C. L. CARLSON. U. S. 1,669,927, May 15.

Apparatus for filtering sugar sirups, etc. R. J. SWEETLAND. U. S. 1,670,319, May 22.

Anhydrous powdered glucose. W. H. DICKERSON. U. S. 1,670,101, May 15. A glucose sirup is sprayed or atomized and brought into contact with a current of gas which is initially highly heated but which falls in temp. as the dehydration proceeds so as to avoid melting of the glucose. An app. is described.

Starch compositions. HENKEL ET Cie GRS. Brit. 276,340, Aug. 17, 1926. Halogen-Ca starch preps. such as are described in German pats. 308,616 and 406,820 are treated with an alc.-water mixt. contg. 50–80% alc. by which the halogen Ca component is largely eliminated. The product may be used as an adhesive or size and may be mixed with resin or resin size to form a dry painters size. Cf. *C. A.* **21**, 339.

29—LEATHER AND GLUE

ALLEN ROGERS

Prof. Dr. Roberto Lepetit. LEOPOLD POLLAK. *Gerber* 54, 55-6(1928).—An obituary.

Report of work of the German research laboratory for the leather industry at Freiberg for the year 1927. ANON. *Ledertech. Rundschau* 20, 45-9, 57-62(1928).—Report of analyses of tanning materials and defective leathers. I. D. CLARKE

Recent work on the mechanism of vegetable tanning and the influence of p_H value. A. DEFORGE. *Halle aux Cuirs* 1928, 100-5.—A review of the work of Parker and Gilman (C. A. 21, 3140) and Schiaparelli and Bussino (cf. following abstract).

H. B. MERRILL

The chemical nature of vegetable tannin. CESARE SCHIAPARELLI AND GIOVANNI BUSSINO. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 5, 343-61(1927); *Conceria* 35, No. 1018, Pt. Tec., 28-35(1928).—Small samples of beef hide were tanned with a tannic acid soln. (about 2%) contg. varying amts. of lactic acid. From observations of the process of tanning at different H-ion concns., S. and B. conclude that it is necessary in practice to survey the p_H of the soln. because below p_H 2.6 the leather obtained in their expts. was of poor quality. The more acid the bath is, the larger is the quantity of washable substances and the smaller is the resistance toward warm water. In a 2% tannic acid soln. at a p_H higher than 2.50 and at ordinary temp., 100 parts dry protein combine irreversibly with 60 parts tannin.

GUENTHER SCHWOCH

An extractor for vegetable tanning materials. B. SCHWARZBERG. *Collegium* 1928, 151-4.—The Proctor extractor has been modified by adding a second vessel similar to that contg. the tanning material and from which H_2O at the temp. of the extrn. is automatically siphoned on to the material. The H_2O level in this vessel is kept const. by an inverted flask contg. H_2O .

I. D. CLARKE

Specific gravity of vegetable tannins and of the skin. D. SHURAVLIEV AND D. ARBUSOV. *Vestnik* (Organ of the All-Russian Leather Synd.) 1926, No. 12, 41; *Collegium* 1928, 44-5.—Dry, ashless tannins from different sources do not have the same densities. The sp. gr. of pyrogallol tannins is (generally) higher than that of catechol tannins. The sp. gr. of dry, ashless collagen was detd. as 1.42, which agrees well with previous detns.

H. B. MERRILL

Absorption of vegetable tannins by hide powder under different conditions. G. W. SCHILLER AND B. SCHWARZBERG. *Vestnik* (Organ of the All-Russian Leather Synd.) 1926, No. 1, 45-7. *Collegium* 1928, 112-3.—Hide powder was tanned with solns. of different tanning exts., with and without sulfitation or addn. of acid. Total material absorbed and "tannin irreversibly fixed" are calcd. as % of original hide powder wt. Acid addn. increases both total and "irreversible" fixation. Sulfitation decreases total, but has no effect on irreversible, fixation. Fixation increases with increase of ratio tannin:hide powder (vol. const.), and is independent of this ratio when the concn. of the soln. is const.

H. B. MERRILL

Tanning materials of Bahia (Brazil). ANON. *Ledertech. Rundschau* 20, 49-53 (1928).—The most important tanning materials of Bahia are barks of angico (*Piptadenia*) which contains 17-22% of tannin, and red and white mangrove. Muricy bark, which contains about 25% tannin, babatenom (15-25% tannin) and a few less important materials are briefly described.

I. D. CLARKE

The utilization of poplar bark as a tanning material. G. A. BRAVO. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 5, 387-402(1927).—Three samples of fresh bark of *Populus nigra*, *P. alba* and *P. canadensis*, resp., were kept in a dry room for 2 months thus losing 32-34% H_2O , but still contg. an av. of 10.65% H_2O . Then the bark was ground and estd. according to Proctor's method; the extrn. is complete when a temp. of 95° is employed. The liquid obtained is of reddish color and gives the typical reactions of tannins. The quantity of the tannins in the soln. was 4.3-5.3%; besides this, the analysis yielded 3.1-4.2% sol. non-tannin substances and 78.4-81.3% insol. material. The tannin content of poplar wood was found to be 1.08% in 1 sample analyzed. An aq. ext. of poplar bark was concd. under reduced pressure to a density of 20° Bé. The quantity of tannin was 20.50% at this stage. By evap. to dryness a residue of 85 g. was obtained from 1 kg. bark. The compn. of this product was 42.00% tannin, 36.09% sol. non-tannin substances and 9.83% insol. substances. The most satisfactory way to bring the insol. material into soln. was by adding sulfite cellulose or the synthetic tannin, "Coritan." These combinations have excellent tanning properties. Numerous references are given in the paper.

G. S.

Value as tanning material of two barks from Indo-China. F. HEIM DE BALSAC. *Halle aux Cuirs* 1928, 117-24.—"Gie'-Mit" (*Actinodaphne* sp.) showed on analysis of bark H_2O 11.6%, tannin 6.4%, sol. non-tannin 3.6%, insol. matter 78.4%. The tannin is of the catechol type. "Re'Bau" (*Machilus* sp.) showed on analysis H_2O 13.0%, tannin 13.0%, sol. non-tannin 7.7%, insol. matter 66.3%. The tannin is of the pyrogallol type. Analyses were made by the I. S. L. T. C. method. Neither material is especially promising commercially. H. B. MERRILL

Outlook for a rational investigation and utilization of pine bark. P. YAKIMOV AND B. ANIKIN. *Vestnik* (Organ of the All-Russian Leather Synd.) 1926, No. 8/9, 68-79; *Collegium* 1927, 546.—Pine bark, a most important material to the Russian tanner, is one of the least investigated tanning materials. Preliminary investigations have led to the following conclusions: Exposure to rain causes little direct tannin loss by leaching, but storage in the damp state causes a notable loss through mold growth. Water transportation of logs does not materially reduce tannin content. Total sol. matter decreases with increasing age of the tree, and with increasing size of tree for a given age. Ratio of tannin: non-tannin is practically independent of these influences. H. B. MERRILL

Formaldehyde as a tanning material. B. A. TARACHOVSKII. *Vestnik* (Organ of the All-Russian Leather Synd.) 1925, No. 2, 102-3; *Collegium* 1927, 542-3.—Skins are placed in a closed drum with 80 lbs. H_2O per 100 lbs. skin, and 10 lbs./100 lbs. of a slightly alk. soln. of $HCHO$ is introduced. The concn. of $HCHO$ during tanning is 0.5-3.5%. It is essential that slight alk. be maintained. Coloring and fat-liquoring are carried out as for Cr-leather. H. B. MERRILL

Status of synthetic tannins. A. A. CLAFLIN. *Shoe and Leather Reporter* 170, No. 4, 49-51, No. 5, 14-8 (1928).—The high cost of raw materials from which true synthetic tannins might conceivably be made inhibits any attempt toward their com. manuf. *Syntans* are condensation products of sulfonated phenols with $HCHO$ which combine with hide substance. Their history and method of prepn. are reviewed. While syntans have not attained wide use as tanning agents *per se*, they are widely used in combination with other tanning materials. H. B. MERRILL

The tanning process. P. I. PAVLOVICH. *Vestnik* (Organ of the All-Russian Leather Synd.) 1926, Nos. 10 / 11, 60-65; *Collegium* 1927, 543.—The hypothesis is advanced that the max. tannin fixation observed by Thomas and Kelley at $p_H = 7-8$ was due to subsequent washing of the hide powder with H_2O at $p_H = 5.8$, the dispersity of the tannin decreasing with increasing p_H value. On the basis of these observations, a procedure for tanning was devised wherein the skins are tanned first in strong exts. at $p_H = 7-8$, the p_H value gradually lowered to 2-3, and tanning completed with strong exts. at this acidity. Tests showed that no hydrolysis occurred in the p_H range 7-9 in 1 week. To prevent oxidation during the alk. pretannage the operation was carried out in vacuum or in an inert gas. Best results were obtained with pretannage at $p_H = 7-8$ and retannage at the natural p_H value of the ext. (about 5.5). H. B. M.

Dry chrome tanning. N. KOTELNIKOV AND I. BASS. *Vestnik* (Organ of the All-Russian Leather Synd.) 1926, Nos. 2 / 3, 45-7; *Collegium* 1927, 542.—Skins soaked and limed as usual but not pickled are completely neutralized by washing with a soln. contg. 1 lb. HCl (d. 1.15) per 100 lbs. skin. The skins are placed in a drum and enough of "Steir's soln." (d. 1.42, basicity = 72, $NaCl = 10\%$) is run in to give 1.8 lbs. Cr per 100 lbs. skin. After tanning is complete (1-1.5 hrs.) the stock is washed with 35 lbs. H_2O per 100 lbs. skin. It is not advisable to horse the stock prior to washing. Utilization of Cr and quality of the leather are said to be good. H. B. MERRILL

One-bath tanning. VITTORIO CASABURI. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 5, 380-2 (1927).—Preliminary report on expts. done for the purpose of observing the chem. and phys. changes in hide and liquor. G. S.

The chemical processes of combined tanning. CESARE SCHIAPARELLI AND LUIGI CAREGGIO. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 5, 362-7 (1927).—I. Turney-Wood (cf. *Collegium* 1908, 261; cf. *C. A.* 2, 2173.) had made the statement that chromated gelatin when immersed in a tannic acid soln. absorbed just as much tannin as gelatin not chromated. S. and C. checked this statement using beef hide as the starting material. The hide was chromated in a 5% chrome alum soln. and then tanned in 1.8% tannic acid soln. From the expts. of Schiaparelli and Bussino (cf. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 5, 343-61 (1927); *C. A.* 22, 1494), the following equation was expected: 100 g. protein + 60 g. tannin + 6.76 g. $Cr_2O_3 = 166.76$ g. leather. The equation found was: 100 g. protein + 61.43 g. tannin + 6.18 g. $Cr_2O_3 = 167.61$ g. leather, which result confirmed Turney-Wood's hypothesis. G. S.

Tanning experiments with naphthalene derivatives. Y. BUNIMOVICH. *Vestnik*

(Organ of the All-Russian Leather Synd.) 1926, No. 4, 12; *Collegium* 1927, 543.—Sheepskins tanned with mixts. of quebracho and naphthalene acids were brighter and softer and required no further bleaching, as compared with skins tanned with quebracho alone.

H. B. MERRILL

The employment of the hydrostatic balance in the study of the tanning process. GIOVANNI BUSSINO. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 5, 421-7(1927).—The employment of the hydrostatic balance for the purpose of detg. the dry wt. of a hide sample when immersed in a soln., is described.

G. S.

The retarding action of the tannins on the atmospheric oxidation of alkaline bisulfites. ANDREA PONTE. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 5, 403-15 (1927).—By aeration of a tannin-SO₂ soln., practically all SO₂ is expelled and little is found retained as SO₃. In a soln. of neutral sulfite, tannin limits the oxidation of sulfite to sulfate to a considerable extent. In alk. bisulfite soln., the retarding action of tannin is still greater; at the same time the tannin holds a large part of the bisulfite firmly in soln., despite violent aeration. P. concludes from his expts. that in alk. soln., the tannin forms an additive compd. with the bisulfite, similar to the type of the additive compds. of aldehydes and ketones with bisulfite. This reaction does not occur in neutral sulfite or SO₃ soln.

G. S.

Analytical control of the sulforicins employed in the tanning industry. II. Sulforicinoles. MARIO GERONAZZO. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 5, 416-20(1927).—Sulforicinoles of good quality should be clear, homogeneous and straw-colored or golden; its reaction may be acid, neutral or alk., according to its prepn. It may contain NH₃ or Na, which is used for neutralizing. The emulsive power is estd. by shaking 2 cc. sulforicinoles with 20 cc. H₂O for 2 min. and examg. the stability and the degree of opalescence of this emulsion. The emulsive capacity is estd. by detg. the stability of an emulsion of a certain amt. of some other substance and sulforicinoles. The quality of the sulforicinoles is directly proportional to the emulsive capacity and the stability of an emulsion of this substance. The sulforicinoles-water emulsion should become perfectly clear after addn. of NII, soln. The titer of the sulforicinoles is detd. by placing 25 cc. of the substance in a graduate and adding 25 cc. of dil. H₂SO₄. The mixt. is shaken for 1 min. and allowed to stand for 12 hrs. The number of cc. of the upper layer times 4 equal commercial titer. The lower layer of the mixt. is tested for the presence of Fe with ferrocyanide.

G. S.

Preparation of pure collagen and its utilization for determination of tannins in tanning materials. V. S. SADIKOV. *Trans. State Inst. Applied Chem. (Moscow)* 1927, No. 6, 64-81.—Standard hide powder presents the defect of not being a definite and uniform chem. substance. It principally consists of collagen, but it also contains elastin, keratin, proteins and mucoids. The use for analytical purposes of pure collagen instead of hide powder has been adopted by the State Institute of Applied Chemistry in Moscow and the results obtained were found very satisfactory. Pure collagen is obtained as follows: Fascia of an ox, after careful removal of the remains of other tissues, and after washing with water, is finely pulverized. The powder is agitated for 6 hrs. with 0.35% soln. of NaOH at room temp. (or else digested with the soln. for 24 hrs.), the soln. is poured off, replaced by a fresh soln. with which the powder is again agitated, then the new soln. is poured off and the powder is agitated for the third time with fresh NaOH soln. These treatments remove albuminoids, mucoids, etc. Then the strongly swelled mass is washed with water by decantation, coagulated either by CH₃COOH or by a current of CO₂ gas, pressed out, suspended in water and pressed out again. The mass is suspended in water again and submitted to agitation with frequent change of water; these treatments are necessary for the complete removal of sol matter. Finally collagen is strongly compressed so as to form thin leaves and the latter, after being dried first by a current of cool air (or by acetone, or by alc.), is thoroughly dried in a thermostat at 40°, after which it is either reduced to a fibrous mass or pulverized. S. gives the results of numerous comparative analytical tests made by the use of this collagen.

BERNARD NELSON

Difference of resistance of treated and untreated collagen to enzymes. V. S. SADIKOV. *Trans. State Inst. Applied Chem. (Moscow)* 1927, No. 3, 82-8.—Untreated collagen and collagen which has been treated physically or chemically behave differently toward collagen-decompn. enzymes. When collagen becomes hydrolyzed either by water, or by rise in temp., or by hydrolase, its trypsin resistance gradually decreases; pulverization of collagen has a similar effect. Thus, hides and fascia are very resistant to enzymes in comparison with the behavior of pure collagen obtained from fascia (cf. preceding abstract); but if hides and fascia are pulverized and subjected to the action of weak NaOH soln., they too become less resistant to enzymes. B. N.

Influence of degree of tannage on water-impermeability of leather. G. G. POVARNIN AND AKULININ. *Vestnik* (Organ of the All-Russian Leather Synd.) 1926, Nos. 5/6, 27-8; *Collegium* 1927, 544-5.—Permeability of skin to H_2O increases with extent of tannage, particularly if the skin is previously swollen with H_2SO_4 . H. B. M.

Swelling, degree of tannage, and mechanical properties of leather. G. O. POVARNIN AND M. I. RUBICH. *Vestnik* (Organ of the All-Russian Leather Synd.) 1925, 10/11, 115-8; *Collegium* 1927, 545.—Strips of skin were swollen with 0.04 N solns. of the following acids: H_2SO_4 , HCl , H_2SO_4 followed by $HCHO$, acetic, oxalic and lactic acids. Testing the strips after tanning gave the following results (1) Swelling decreases strength of leather to a certain min. The greatest diminution of strength occurred with strong acids, the least with acetic acid. It is possible that the % decrease in strength is a function of the degree of swelling, independent of the nature of the acid. (2) With increasing swelling, the "tanning coeff." increases to a max. and thereafter declines. The "filling coeff." increases regularly with swelling. (3) Fixing swollen skins in $HCHO$ increases roughness of leather, is without influence on strength, lowers "tanning coeff." and raises "filling coeff." (4) There is no direct connection between chem. compn. and strength. (5) Strong mineral acids in concns. technically employed have a distinct weakening effect of leather. H. B. MERRILL

Determination of total acid in tan liquor. N. MICHAILENKO-MALENKO. *Vestnik* (Organ of the All-Russian Leather Synd.) 1925, No. 9, 52-4; *Collegium* 1928, 41.—Treat tan liquor with a soln. made by dissolving 50 g. $NaCl$, 8 g. gelatin and 4 g. gum arabic in 250 cc. hot water and neutralizing with $NaOH$. Filter. Titrate an aliquot of filtrate with 0.01 N $NaOH$, using hematin. H. B. MERRILL

Role of non-tannin. P. I. PAVLOVICH. *Vestnik* (Organ of the All-Russian Leather Synd.) 1926, Nos. 5/6, 16-9; *Collegium* 1927, 548.—Addition of non-tans to tan liquor with the aim of producing an acid liquor by their fermentation is uneconomical, since much tannin is simultaneously destroyed. Regulation of acidity by adding acid is preferable. If this is done, non-tans are positively harmful, since they diminish the effect of the added acid by their buffering qualities. Non-tans prevent drawing of the grain, act as filling materials and reduce the astringence of the tanning ext. Leathers tanned with exts. in which the ratio of tannin : non-tannin was varied from 60 : 40 to 80 : 20 were practically identical in properties and compn. H. B. MERRILL

Ways of improving leather manufacture. N. KOTELNIKOV AND I. BASS. *Vestnik* (Organ of the All-Russian Leather Synd.) 1926, Nos. 10/11, 70; *Collegium* 1927, 493-5.—A discussion of tannery control in the light of the colloid chemical concept of tanning. H. B. MERRILL

Properties of leather (testing impermeability of) retan sole leather. AUG. C. ORTHMANN. *J. Am. Leather Chem. Assn.* 23, 184-7 (1928).—Two tests are described: (1) immerse a strip 2 in. \times 4 in. in water and det. the increase in wt. after 0.5 hr. and after 3 hrs. (2) Cut soles from leather and attach to the feet of a man weighing about 145 lbs. Det. the no. of min. required for the subject to obtain wet feet when walking on water-covered floor at 120 strides per min. The 2 tests do not give the same relative results for series of different leathers. The performance test means more than the absorption test. H. B. MERRILL

Resistance of leathers to hydrolysis. G. ARBUJOV. *Vestnik* (Organ of the All-Russian Leather Synd.) 1926, No. 4, 29-31; *Collegium* 1928, 40-1.—Resistance to hydrolysis was measured by Fahrion's method before and after extn. with aq. $MeOH$. Resistance increased with "true tanning coeff." In some leathers resistance was lowered by $MeOH$ extn., showing that in unextd. leather some sol. matter is fixed during the hydrolysis test. In other cases resistance to hydrolysis was increased by $MeOH$ extn., for which no explanation is offered. H. B. MERRILL

Effect of acid concentration in plumping on the mechanical and chemical properties of leather. G. G. POVARNIN AND SHIMANOVICH. *Vestnik* (Organ of the All-Russian Leather Synd.) 1926, No. 7, 7-10; *Collegium* 1927, 543-4.—Calfskin strips were treated with different concns. of H_2SO_4 before tanning or with different concns. of lactic acid during tanning. Tests on the vegetable-tanned strips led to the following conclusions: (1) H_2SO_4 decreases tensile strength and resistance to stretch and increased roughness of leather. Loss of tensile strength is noticeable at acid concns. giving negligible swelling; per cent loss increases to max. at concn. giving max. swelling, and is thereafter const. for higher concns. Roughening is noticeable only at acid concns. giving excessive swelling. (2) Lactic acid in concns. used had no influence on roughness or tensile strength. (3) The "true tanning coeff." and "true filling coeff." increased with increasing swelling. (4) Swelling that is accompanied by hydrolysis decreases tensile strength and increases roughness of leather. H. B. MERRILL

Action of free sulfuric acid on leather. A. KUKARKIN. *Vestnik* (Organ of the All-Russian Leather Synd.) 1925, No. 1, 150-5; *Collegium* 1928, 41.—Small quantities of H_2SO_4 added to sole leather decrease H_2O -sol. matter and increase apparent % tannage; this is due to pptn. of otherwise sol. tannin as phlobaphenes. H. B. M.

Chemical and microscopic investigations on the soaking of leather and hides. VITTORIO CASABURI. *Boll. ufficiale staz. sper. ind. pelli mat. concianti supplemento tecnico* 5, 205-22(1927); *Conceria* 35, No. 1028, Pt. Tec., 27-34(1928).—Dry beef hides were immersed in pure water, neutral and alk. solns., resp., and the chem. and histological changes of the hides and the chem. changes of the liquids were examd. The expts. were carried out at 24° and 15°. About 50 g. of hide was placed in the respective solns. and from time to time a small piece of it was dyed and examd. under the microscope. After the max. swelling had occurred, dry residue, p_H and N content of the liquid were estd. In pure water, the gain in wt. of the hides was about 100% after 96 hrs., the dry residue was less than 0.2%, the loss of hide substance (calcd. from the N content of the liquid) was 1.8%. The p_H stayed around 6. The histological examn. showed 3 stages of swelling; (1) mechanical, (2) chem. absorption of water, (3) hydrolysis. Expts. with artificial hard water (0.06% $CaCl_2$ soln.) yielded similar results, while with 0.02 N NaHS putrefaction began after 96 hrs., the p_H dropped from 9.6 to 6.7 and the loss of hide substance was about 5.8%. The loss of hide substance was less in 0.2 N NaHS than in NaOH and much less in 0.02 N sodium citrate and 0.02 N sodium arsenite. In these two latter solns. losses were the 0.8% and 0.7%, resp. but with 0.02 N KCNS, the loss was practically zero; with 0.02 N NaCl, 2.9% of the hide substance was hydrolyzed. The p_H remained nearly const. in each of the latter expts. and the gain of wt. of the dry hides was around 100% in all expts. Chem. and microscopic tests showed that the KCNS soln. gives results most satisfactory for the process of soaking, while sodium arsenite and sodium citrate were found to be next best. G. S.

Improved methods for soaking and unhairing. N. KOTELNIKOV AND I. BASS. *Vestnik* (Organ of the All-Russian Leather Synd.) 1926, Nos. 10/11, 78; *Collegium* 1927, 492.—Green salted skins are tumbled intermittently in 3 changes of water in a drum for 3.5-4 hrs. Unhairing is carried out in the same drum by adding 2.5 lbs. Na_2S , 3.5 lbs. $CaCl_2$, 1.5 lbs. $Ca(OH)_2$ and 70 lbs. H_2O per 100 lbs. skin. The drum is rotated 15 min. and intermittently thereafter for 2.5-3 hrs. The liquor is drained off, the skins are tumbled in the empty drum for 10 min., and washed in running H_2O 20 min. All hair is said to be removed and the skins are little swollen. The quality of the resulting leather is said to be good. H. B. MERRILL

Contribution to the study of the pickling of hides. ENRICO SIMONCINI. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 5, 383-6(1927).—A preliminary report on a series of expts. concerning the changes in the acid and salt retention of the hide in the pickling process by varying the vol., the acid and salt content of the soln. employed. G. S.

Determination of sulfato groups in chrome leather. HENRY B. MERRILL, J. G. NIEDERCORN AND ROLF QUARCK. *J. Am. Leather Chem. Assocn.* 23, 187-208(1928).—The pyridine digestion method (C. A. 21, 1027), wherein acid sulfate in leather is detd. before and after digestion with 4% aq. C_5H_5N , yields results that are much too low. The content of H_2SO_4 left in leather is (approx.) independent of time of digestion with pyridine, but this is due to the establishment of equil. between sulfate in soln. and sulfate in leather, and not to sepn. of protein-bound from Cr-bound acid. The % H_2SO_4 left in leather depends upon % originally present and upon concn. of SO_4 in soln. The % H_2SO_4 left in leather at $p_H = 4.5$ is no greater than at $p_H = 8.0$, with the same concn. of C_5H_5N , indicating that removal of SO_4 is a specific replacement by C_5H_5N and not by OH. The "diffusion-neutralization" method, wherein H_2SO_4 is detd. after the leather is suspended in H_2O maintained at $p_H = 5$ by titration with NaOH until equil. is attained, gives results for Cr-bound acid that are much nearer the truth. Absolute equil. is never attained, because slow hydrolysis of Cr-bound acid occurs. Results obtained are, therefore, always slightly low. Procedure: Soak 2 g. Cr leather in 100 cc. H_2O for 18 hrs. Agitate and titrate to $p_H = 5.2-5.4$ (methyl red) using 0.02 N NaOH at 15 min. intervals for 2 hrs., at 30 min. intervals for the rest of the day, and 4 times at intervals of 1 hr. the following day. Wash 1 hr. in running distd. water, and det. residual sulfate in the leather by the phosphate displacement method. H. B. MERRILL

Cheapening of chrome extracts. I. BASS AND M. BOYARSKII. *Vestnik* (Organ of the All-Russian Leather Synd.) 1926, Nos. 2/3, 44-5; *Collegium* 1927, 548-9.—The reduction of dichromate may be begun with cheap materials such as wood shavings

and completed with more expensive materials such as $\text{Na}_2\text{S}_2\text{O}_8$ or glucose. The initial reaction is so violent that the wood is completely oxidized to CO_2 and hence no undesirable by-products are left in the liquor, as would be left if the reduction were completed with shavings.

Utilization of waste chrome liquors. I. B. BASS. *Vestnik* (Organ of the All-Russian Leather Synd.) 1926, No. 7, 10-11; *Collegium* 1928, 39.—Part of the spent Cr liquor can be used in making up fresh stock liquor, part added to color baths and part to pickle liquors. The remainder can be evapd., the residue subjected to destructive distn. and a no. of valuable products recovered.

Salt stains in green salted pelts. A. SEREGIN. *Vestnik* (Organ of the All-Russian Leather Synd.) 1925, Nos. 10/11, 140-3; *Collegium* 1927, 541.—Adoption of a uniform procedure for salting calfskins is claimed to have reduced the no. of skins showing salt stains to 3-4% for summer stock and 7-8% for fall stock. Procedure: (1) every salt shipment is examd. in the lab.; (2) salt is screened to remove lumps; (3) salted skins are piled not over 25-30 deep; (4) skins are repiled and excess salt is shaken off after 7-10 days; (5) temp. is maintained at 10-12° C.

Red spots on green salted calfskins. ANON. *Vestnik* (Organ of the All-Russian Leather Synd.) 1925, Nos. 10/11, 143-5; *Collegium* 1927, 541-2.—Red spots noted in raw salted skins, which are coextensive with damaged spots in grain after finishing, are due to a proteolytic organism.

Lime analysis (in the tannery). M. SERGÉE AND S. BRESSLER. *Vestnik* (Organ of the All-Russian Leather Synd.) 1926, Nos. 8-9, 79 *et seq.*; *Collegium* 1928, 39.—The method of Proctor is recommended as the best of several investigated.

The Sicilian "agrocotto" in the leather industry. VITTORIO CASABURI. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 5, 374-6(1928).—The possibility of using "agrocotto," i. e., concd lemon juices as a tanning material is discussed. The agrocotto is a liquid of yellowish brown color, contg. besides citric acid, albuminoid, gummy and pectin substances, sucrose and glucose. A sample analyzed had d_{25} 1.345, dry residue 60.5%, free acid (calcd. as citric acid) 47.25%, true citric acid 45.40%, reducing substances (calcd. as glucose) 11.10%, N content 0.3%. For tanning purposes the liquid must be neutralized with NaOH. The sample described above required 310 g. NaOH for neutralizing 1000 cc.

"Sea leather" and the capture of the sharks. GIOVANNI LUCCO. *Boll. ufficiale staz. sper. ind. pelli mat. concianti, supplemento tecnico* 5, 195-203(1928); *Concneria* 35, No. 1008, Pt. Tec., 29-32(1928).—An account is given of the situation in the industry using the skins of sharks as a source of leather.

The examination of colloidal substances by means of optical methods. GIACINTO BALDRACCO. *Boll. ufficiale staz. sper. ind. pelli mat. concianti* 5, 330-42(1927); *Concneria* 35, No. 1008, Pt. Tec., 24-9(1928).—A brief summary of recent important papers dealing with the examn. of tanning exts. and dermic substances by means of spectroscopic, fluoroscopic and polarimetric methods. The phenomena of double refraction and some phys. and chem. principles of colloidal behavior are discussed.

Gelatins of different origin as emulsifying agents (KERNOT, KNAGGS) 27. Solidification temperatures of fat mixtures (POVARNIN, ARBUSOV) 27. Varnishes, leather polishes (Brit. pat. 275,652) 26.

Tanning compositions. J. R. GEIGY A.-G. Brit. 276,014, Aug. 16, 1926. Salts of hydrofluosilicic acid are added to salts of synthetic tanning agents obtained by the condensation of aromatic sulfo acids and CH_2O .

Leather substitute. RESPRO, INC., AND R. K. ABBOTT. Brit. 276,392, April 7, 1926. A sheet of unwoven fabric of loose texture is impregnated with rubber or like compn. and then coated with a nitrocellulose compn. or the like; varnish, gums, wax, borax, soap and other substances may be used in the coating and solvents are preferably used which will affect the impregnating compn. first applied.

Rubber jar rings for preserving. H. SERGER. *Konservenindustrie* 1928, 129; *Gummi-Ztg.* 42, 1480-1(1928).—Specifications for the quality and behavior of rings are described. C. C. DAVIS

An experiment on heavy tapping on Tjiseroe Estate. Investigation of the rubber and some remarks on the composition of the latex. W. SPOON. *Arch. Rubbercultuur* 12, 207-16(1928). (In English 217-9).—Heavy tapping in the case cited resulted in a latex with low rubber content and rubber which vulcanized rapidly and had a low viscosity compared with rubber obtained under normal conditions on the same estate. C. C. DAVIS

Effect of heat on raw rubber. C. R. PARK, C. M. CARSON AND L. B. SEBRELL. *Ind. Eng. Chem.* 20, 478-84(1928).—Various types of raw rubber were heated in steam at 158° in the absence of air to det. the influence of such treatment on the plasticity and chem. properties before vulcanization and on the quality after vulcanization, with and without an accelerator. Under these conditions the plasticity, the acetone ext., the acid no. and the rate of vulcanization increased, while the total N decreased. An increase in acetone ext. may result from partial depolymerization of the rubber or from hydrolysis of proteins. An increase in acid no. probably results from hydrolysis of fatty acid esters and proteins. The total N decreases because of the evolution of volatile N compds. In comparative vulcanization tests before and after heat treatment, the rate of vulcanization was increased with some accelerators but not with others by preheating the rubber, and the stress-strain curve became more convex toward the strain axis, i. e., a tendency toward softer products, a difference which persisted after aging. Preheating rubber did not impair the aging of its vulcanizates. To det. why heating rubber increases its rate of vulcanization, protein decomp. products were added to different mixts., and also the water ext. of heated rubber was analyzed. The most active products in mixts. contg. ordinary accelerators were the least complex compds., e. g., glycine, whereas in unaccelerated mixts. those with a strongly basic group and no acid group were most active. The aq. ext. of acetone-extd. rubber contained no substance which reduced Fehling soln., no tannin and no free amines, but did contain saponin, proteins, alkaloids and other N bases. Fractionated products from the

alc. extn. of rubber (previously extd. with acetone and water) were also tested. These compds., though not identified exactly, included a compd. of the approx. compn., $C_6H_7O_2N$, monoamino acids, diamino acids and dicarboxylic acids. The alc. ext. activated accelerated mixts. The results show that only the simplest amino acids have any effect in unaccelerated mixts., that amines and N bases activate accelerated mixts. and that alkaloids have certain accelerating and activating effects. All 3 types are probably present in rubber, and the alterations brought about by heating rubber are attributable at least in part to changes in these non-rubber components. C. C. D.

Experiments on stretching raw rubber. P. ROSBAUD AND E. SCHMID. *Z. tech. Physik* 9, 98-106(1928).—The stretching of raw rubber (smoked sheet) was examd. in a Schopper app. between 5 and 100 kg. stress and in a Polanyi wire-stretching app. The sheet thickness was 2.0 to 2.5 mm., the length of the exptl. strips 6 mm. From expts. on the influence of rate of stretching (0.025% per sec. up to 50% per sec.) on the stress-strain curve, it was found that the tensile strength increased from 12 to 317 g. per sq. mm., while max. elongation was influenced less (360 up to 1280%). One expt. in which stretching periods were alternated with rest periods of several hrs. (total duration of expt. 350 hrs.) proved that the rubber flows in the rest periods, and that with continued stretching small stresses of the order of 10 g. per sq. mm. are sufficient to bring about rupture. At temps. from -20° to $+80^\circ$, the tensile strength decreases for rapid or slow stretching rapidly with increasing temp.: for a 14% per sec. rate, it drops from 3100 g. per sq. mm. (5900 at -185°) at -20° to 24 g. per sq. mm. at $+80^\circ$. The max. elongation increases slightly with temp. (1000% to 2000% roughly); at very low temps. (liquid air) it is negligible, and at -80° it is about 50%. At the more elevated temps. especially from 60° on local contractions of the rubber occur, which on continued stretching spread all over the strip. Polanyi's observations of increased strength at -185° after preliminary stretching at a higher temp. were confirmed. The results are represented in a space diagram. tensile strength vs rate of stretching vs. temp.

B. J. C. VAN DER HORVEN

"Normal" aging of compounded rubber. R. H. MCKEE AND H. A. DEFEW. *Ind. Eng. Chem.* 20, 484-91(1928).—Nine widely different types of cured rubber mixts. were aged for 4 yrs. (1) outdoors protected from direct light but subject to normal variation of temp. and humidity (-17.8 to 37.8° and 40-100% humidity), (2) indoors in darkness (10 - 29.4° and 25-100% humidity); (3) in darkness in a continuous current of dried air, and (4) in darkness in a continuous current of humidified air. The mixts. stored in a damp atm. showed "softer" stress-strain curves than the same mixts. kept dry. Judged by tensile strength, overcured mixts. deteriorated more rapidly in a dry atm. than in a wet atm., whereas the reverse was true of undercured mixts. Judged by gain in wt., underground mixts. oxidized at about the same rate whether the atm. was wet or dry, whereas overcured mixts. oxidized more rapidly in a dry atm. than in a wet atm. The change in wt. of mixts. kept dry proved to be a good criterion of their deterioration, each 1% gain (based on the rubber) corresponding to a decrease of about 50% in reinforcing properties. The mixts. were then aged under strains of 50 and 20% outdoors in sunlight and indoors in darkness. In sunlight, overcured mixts. became surface-checked sooner than the corresponding undercured mixts., whereas in darkness the reverse was the case. The effect was, however, confined to the surface. Paraffin and Zn oxide retarded this action of light, and there is probably a close relation between the protection of paint and of rubber from deterioration by light. When the uncured mixts. were stored, their rate of vulcanization became notably slower, perhaps because of oxidation of S to SO_2 and H_2SO_4 . Some of the uncured mixts. became tacky.

C. C. DAVIS

Diffusion experiments with rubber solutions. D. KRÜGER. *Gummi-Ztg.* 42, 1471 4(1928).—Acetone extd. and unextd. samples of various rubbers and balata were swollen in solvents in darkness and with agitation, and were then centrifuged. With the exception of balata, soln. was practically complete. There was no change in viscosity after the solns. were kept for 2 weeks (cf. van Rossem, *Kolloidchem. Beih.* 10, 83(1918)). Diffusion coeffs. of rubber-hexane, rubber- Et_2O and rubber- CaH_2 were detd. by the Oeholm method (*Z. phys. Chem.* 50, 309(1905)) and the Scheffer-Kawalki tables (*Ann. Physik* [3] 52, 185(1894)), 4 superimposed strata being measured. The results are tabulated in detail. The influence of temp. was very slight. Unlike the case of a chem. homogeneous substance with uniform particles, the diffusion const. of rubber increased from the bottom to the uppermost layer. Highly masticated rubber, in spite of its relatively concd. solns., showed smaller differences among the 4 strata than did unmilled rubber. The rubber content of the second layer deviated so much from the Fick law that the Scheffer-Kawalki tables were inapplicable. The variation of the

diffusion coeff. with increasing concn. and with decreasing time of diffusion might have resulted from (1) a mixt. of chem. different substances of different mol. wt., not, however, by the resins, or (2) different degrees of aggregation of the same substance. The data obtained are not adequate for a mathematical analysis of the variations of the diffusion coeffs. There were indications that a readily diffusible component was distributed uniformly throughout the 4 strata, while a difficultly diffusible component remained for the most part in the lowest layer. The diffusion coeff. depends upon the concn., and furthermore different results were obtained depending upon whether the soln. was allowed to diffuse immediately after prepn. or was let stand. Diffusion coeffs. are therefore not characteristic constns. but mean values which depend upon the relative quantities of small and large particles in the individual layers. The nature of the solvent also influenced the coeff., probably because different liquids differ in their ability to disaggregate the rubber to simpler units.

C. C. DAVIS

Tensile properties of soft rubber compounds at temperatures ranging from -70° to $+147^{\circ}$. R. F. TENER, S. S. KINGSBURY AND W. L. HOLT. *Bur. Standards, Tech. Paper No. 364*, 367-77 (1928).—Elongation and tensile strength tests of 6 widely different types of cured rubber mixts. at 147° , 130° , 100° , 70° , 40° , 23° , 10° , -10° , -30° , -50° , -60° and -70° show that these properties vary greatly with variation in the temp. In all cases the elongation was a max. around 100° and diminished both above and below this range. From -50° down, it diminished very rapidly and at -70° the mixts. were rigid and inelastic. The tensile strengths were a max. at -70° and diminished continuously up to 147° , at which point there remained almost no strength. The various rubber mixts. behaved essentially in the same way and differences resulting from compounding ingredients were in degree rather than in kind. The results are shown graphically, including the stress-strain curves of the various mixts. The results are of great importance in connection with the design of products contg. rubber which are to be used under very cold or hot conditions. Cf. van Rossem and van der Weijden, *C. A.* 22, 1059.

C. C. DAVIS

Prevention of scorching of rubber mixtures during the mixing operation. WERNER ESCH. *Kautschuk* 1928, 51-5.— PbO_2 is very effective in preventing the scorching of various types of rubber mixts. accelerated with tetramethylthiuram disulfide. About 0.25% (based on the rubber) gives good results. Pb oleate and golden Sb also have a favorable influence. Such addns. also reduce the tendency to scorch in mixts. accelerated otherwise, e. g., by mercaptobenzothiazole and diphenylguanidine. C. C. D.

The absorption of hydrogen by rubber at elevated pressures and the behavior of the rubber after the pressure is lowered. G. TAMMANN AND K. BOCHOW. *Z. anorg. allgem. Chem.* 168, 322-4 (1928).—When rubber, Zn and dil. H_2SO_4 are subjected to high pressures, e. g., 550 or 1150 kg. per sq. cm., the rubber becomes satd. with H_2 , so much being absorbed that when the pressure is released the rubber is porous, and some time afterwards is still several times its original vol.

C. C. DAVIS

Some features of sulfur in rubber manufacture. D. F. TWISS. *Trans. Inst. Rubber Industry* 3, 386-400 (1928).—A crit. review of the properties of S and its use in rubber, including the different allotropic forms of S and their properties, the soly. of S in rubber, "blooming," the phys. effects on rubber induced by S, and possible explanations of these effects. Influences which favor internal crystn. of S in rubber inhibit blooming and the latter may be minimized by (1) cool conditions during milling to prevent complete dissoln. of S, the undissolved particles acting as nuclei for internal crystn.; (2) not too fine S; (3) a high enough proportion of S to furnish a residue of undissolved S; (4) the addn. of a relatively insol. cryst. substance isomorphous with rhombic S to act as permanent nuclei for crystn., e. g., Se, and (5) the use of S flowers contg. insol. S. Measurements by various investigators of the vapor pressure of S from 125° to 225° do not agree closely. A vapor pressure-temp. curve constructed from calcs. based on the Ramsay and Young law and the vapor pressure of Hg gave results which agree satisfactorily with the best exptl. data and are continuous over the range of temp. From this curve and with the assumption that below 300° S vapor is octatomic, the max. wt. of S which can vaporize into a given vol. of gas at different temps. can be calcd. A crit. review of theories which assume that S_8 or S_6 is the form which induces vulcanization shows that these theories are inadequate to explain the phenomena (cf. T., C. A. 11, 2973; T. and Thomas, C. A. 15, 1421), and new exptl. evidence is given to support this view. The earlier evidence in conjunction with the new expts. leads to certain important conclusions. S_8 is not appreciably more active than S_6 as a vulcanizing agent, and in the expts. described the rates of vulcanization were substantially the same. At ordinary vulcanization temps. S_8 changes very rapidly into S_6 . This tendency is so great that a mixt. of rubber, S_8 , ultra-accelerator and ZnO in a solvent

forms a gel nearly as soon as a similar mixt. contg. S_λ in place of S_μ . The regularity of the increase in the rate of vulcanization with increase of temp. indicates that between 60° and 188° the increasing proportion of S_μ and S_τ relative to S_λ has no marked accelerating action on the rate of vulcanization. This latter fact also controverts the theory of L. E. Weber (*Chemistry of Rubber Manufacture* p. 88) that only S_λ mols. bring about vulcanization. Evidence in general shows that whatever allotropic forms may be present in equil. in S under normal conditions, their activity toward rubber is practically the same. Evidence against the Dannenberg theory of vulcanization (cf. C. A. 21, 3764) is very great and exptl. evidence is given to show that the theories of Dannenberg (C. A. 21, 3764) and of Scholz (C. A. 21, 2399) are extremely improbable. A mixt. of rubber with 10% S_μ shows no tendency to vulcanize. Vulcanization proceeds at substantially the same rate with S_λ and S_μ in a given mixt. S_μ cannot exist under vulcanizing conditions, for it is converted at 120° to S_λ and S_μ is not formed from S_λ to any appreciable degree below 170°. If combined S consisted solely of S_μ , treatment of vulcanized rubber with hot alkalis would remove combined S. The active, unstable form of S in the Peachy process is probably also formed when a rubber-S mixt. is exposed to sunlight or ultra-violet light, and this active form accounts for vulcanization under these conditions. Evidence is offered in support of the rubber sulfide reinforcement theory of T. (cf. C. A. 19, 1964). C black changes the course of the stress-strain curve of a cured rubber-S mixt. in the same direction and in the same way as an increase in the state of cure, but a greater change can be brought about by C black than by longer vulcanization without an extreme overcure. In this connection a comparison of stress-strain curves of a rubber-S mixt. contg. C black and the same mixt. without C black but cured to higher states indicates that an ingredient like C black alters the phys. condition of the rubber in the same way as does further vulcanization but to a greater extent than is possible without undesirable effects. Therefore C black reinforces in the same manner as the curing process within a certain range of cure. Expts by Bierer and Davis (C. A. 20, 2092) which showed that the proper use of Se improves the resistance to abrasion of rubber mixts. contg. C black could not be confirmed. A general discussion follows the paper.

C. C. DAVIS

Specifications for the construction of rubber goods and service requirements. WERNER ESCH. *Kautschuk* 1927, 75-83; cf. Bierer and Davis, C. A. 22, 883.—A discussion of various aspects of the subject. Comparative tests are tabulated of the resistance to abrasion on 2 different abrasion machines (N. J. Zinc Co. and B. F. Goodrich Co.) of mixts. contg. C black with and without Se. The resistance to abrasion depended upon the quantity of accelerator and of S, upon the presence or absence of Se and upon the state of cure. Near the optimum cure the 2 methods gave concordant results, but when mixts. were overcured, or undercured discordant results between the 2 methods were obtained. Se increased notably the resistance to abrasion (cf. Bierer and Davis, C. A. 20, 2092; Twiss, *Trans. Inst. Rubber Industry* 3, 386 (1928)) and this superiority of the mixts. contg. Se was still manifest after aging in air at 70°. The improvement through Se illustrates the importance of non-rubber components in detg. the quality of rubber goods and the fallacy of specifying the chem. compn. of rubber goods as a criterion of quality. In further abrasion tests, mixts. in which rubber was partially replaced by a greater proportion of reclaim resisted abrasion better than the corresponding mixts. contg. no reclaim, and the addn. of Se increased the resistance still more. Other data show the quality of mixts. suitable for soles and the superiority of C black over ZnO in mixts. designed to resist abrasion.

C. C. DAVIS

Aldol- α -naphthylamine. H. KLOPSTOCK. *Kautschuk* 1928, 64.—Polemical (cf. Esch, C. A. 22, 2078).

C. C. DAVIS

Aldol- α -naphthylamine. WERNER ESCH. *Kautschuk* 1928, 64.—A reply (cf. preceding abstr.).

C. C. DAVIS

Recent scientific advances in connection with guayule. DAVID SPENCE. *Rubber Age* (N. Y.) 23, 133-4 (1928); cf. C. A. 20, 3841; 22, 333.—Further biochem. and chem. research on guayule is described. Most important is the discovery that rubber in guayule shrub does not exist in the cells in the form in which it is recovered but is present chiefly as a colloidal suspension in the plant juices. Within the cells the suspended globules are in rapid Brownian movement and their agglomeration and subsequent coagulation by ordinary reagents can be followed microscopically. The shrub contains about 10% water-sol. substances (tannins, carbohydrates, N substances, etc.), 10-15% substances sol. in water after hydrolysis (pectins, proteins, etc.), besides cellulose and resins. By fermentation of the carbohydrates into sugars, org. acids and CO_2 , and by putrefactive decompn. of the protein, the acetone ext. of guayule rubber can be reduced 60-70% and the vulcanizing properties improved. Only a small part of the acetone-sol. sub-

stances is resinous, and by retting the shrub, the acetone ext. can be reduced from 25-30% to 9-10%, with consequent improvement in properties when vulcanized. The com. product is termed *Ampar rubber*.

C. C. DAVIS

X-ray investigations of rubber and related substances. P. ROSBAUD AND E. A. HAUSER. *Z. Elektrochem. angew. physik. Chem.* 33, 511-13(1927).—This is a recapitulation of results obtained by this method. "Frozen" rubber, even unstretched, shows distinct Debye-Sherrer rings, which disappear when the rubber is thawed. When stretched, it gives a point diagram. Balata and gutta percha are very similar to frozen rubber. At higher temps. they can be stretched and then give typical fiber diagrams of identical character. At high tension, a point diagram is produced, giving a characteristic interval of 9.35 Å. U. in agreement with Clark's (*C. A.* 20, 3837) value of c . His values $a = b = 5.40$ Å. U. are not substantiated; but the unit cell is certainly small, contg. between 2 and 8 mols. Racked rubber is analogous to stretched balata and gutta percha, giving a very distinct x-ray diagram and indicating extensive orientation of the particles. Rubber fractionated by Pummerer's method shows clear point diagrams in the sol, gel and total fractions, whether stretched or cold-vulcanized.

A. W. KENNEY

C black from mixtures of C_2H_2 and other hydrocarbons (U. S. pat. 1,669,636) 18.
C black (U. S. pat. 1,669,618) 18.

Treating latex. A. BIDDLE. *Brit.* 277,194, Nov. 10, 1926. See *Can.* 267,166 (*C. A.* 21, 1031).

Concentrating rubber latex and similar latices. A. PETERSON. U. S. 1,670,900, May 22. A thin layer of latex is spread on a moving surface such as that of the inner surface of a rotating drum and moisture is removed from the layer without coagulation, the latex thus treated is returned to the bulk supply and this operation is continued until the bulk of material under treatment has reached the desired concn. An app. is described.

Containers (lined with unvulcanized rubber) for shipping rubber latex. E. HOPKINSON. *Brit.* 277,074, June 7, 1926.

Rubber articles from latex. S. D. SUTTON. U. S. 1,670,598, May 22. In forming gloves, bulbs or other articles, liquid latex is applied to and dried upon a former or mold, thickened or concd. latex is then applied to the surface of the dried latex, and the material is heated so that the outer skin or surface only of the thick or concd. latex is dried; the article is then subjected to the action of C_2H_2 or other suitable rubber solvent or softening agent to produce a superficial effect or design.

Rubber composition. F. C. DYCHER-TEAGUE. U. S. 1,670,599, May 22. A reinforcing agent and filler for rubber consists of C produced by reaction of CO in the presence of Ni and Fe powder or other metal catalyst, together with the catalyst on which it is deposited. Cf. *C. A.* 22, 1498.

Aging rubber. H. W. ELLEY (to E. I. DUPONT DE NEMOURS & Co.). *Brit.* 276,968, Aug. 31, 1926. Aging of rubber is improved by treating it with secondary aromatic amines such as phenyl- α -naphthylamine, ditolylamine, dixylylamine and tolyl- α -naphthylamine in soln. or vapor form, either before or after vulcanizing.

Coating metal surfaces with rubber. DUNLOP RUBBER CO., LTD., A. LAKEMAN AND F. C. MACABE. *Brit.* 276,705, April 29, 1926. Gutters, structural iron work, automobile bodies or other surfaces are covered with a vulcanized compn. about 75% of which may be formed of tire scrap and which, in various mixts. and proportions, may also include uncured rubber scrap, S, mineral oil, "brown substitute," PbO, lime, whitening, stearic acid and $MgCO_3$.

Coloring rubber. I. G. FARBERNIND. A.-G. *Brit.* 277,034, Sept. 4, 1926. Insol. metal salts of triarylmethane dyes having a sulfo group in o -position to the methane C atom, or of a sulfonic acid or carboxylic acid of an anthraquinone deriv. having at least one free or substituted amino group, are mixed with rubber before vulcanizing. Several examples are given.

"Non-skid" patterns on crepe rubber surfaces. ST. HELENS CABLE & RUBBER CO., LTD. AND H. C. HARRISON. *Brit.* 276,763, June 17, 1926. A frame of woven wire or the like may be heated and pressed into the rubber or the rubber itself may be heated and the frame pressed in cold. Various details are given.

Planographic printing surfaces formed of rubber. W. C. HUEBNER. U. S. 1,669,416, May 15.

Condensation system for recovery of volatile solvents from rubber, etc. A. BORCLER. *Brit.* 276,694, Aug. 30, 1926.

Regenerating waste rubber. SYNDICAT FRANCO-NEERLANDAIS. Brit. 276,626, Aug. 25, 1926. Material of tire casings or the like is impregnated with oil obtained by distg. waste rubber, further treated with HCl to polymerize the oil and swell the material, washed with water, slitted and sepd. from the hard core and then further treated to effect regeneration.

Apparatus for making vulcanized fiber sheets. G. W. TEMPLE. U. S. 1,669,429, May 15.

Rubber vulcanization accelerators. C. M. CARSON (TO GOODYEAR TIRE & RUBBER Co.). Brit. 277,338, Sept. 7, 1926. Mercaptobenzothiazyl disulfide or other sulfides of the thiophenols, aminothiophenols, thiazoles, etc. are prepd. by treating the mercaptan or its salts with S chloride. The products may be used as accelerators alone or with amino compds.

Vulcanizing rubber tubes and other articles. L. A. LAURSEN. Brit. 276,430-1, May 27, 1926. Mech. features.

Vulcanizing rubber. C. O. NORTH and C. W. CHRISTENSEN. U. S. 1,670,312, May 22. The reaction product of aniline and crotonaldehyde is used as an accelerator.

Vulcanizing rubber. E. I. DUPONT DE NEMOURS & Co. Brit. 276,435, May 28, 1926. Accelerators are prepd. from an aldehyde, an amine and CS₂ or from an anhydroaldehyde amine and CS₂ or from an aldehyde and the substituted NH₄ salt of a mono-substituted dithiocarbonic acid. The mol. proportions of aldehyde, amine and CS₂ may be 1:1:1, 2:1:1, 2:2:1 or 4:2:1. Aldehydes such as CH₂O, AcH, propionaldehyde, butyraldehyde or benzaldehyde may be used and among the suitable amines are: methylamine, ethylamine, hydroxyethylamine, *n*- or iso-propylamine, *n*- or iso-butylamine, aniline or *o*- or *p*-toluidine. Several detailed examples are given.

Vulcanized pitch. W. SAVAGE. U. S. 1,669,490, May 15. A soft rubber-like compn. adapted for use on roads, tanks or roofs, etc., is formed from fatty acid "still bottoms" residue vulcanized with S and an accelerator such as PhNH₂, thiocarbanilide, ZnO or MgO. U. S. 1,669,491 specifies a vulcanizing agent contg. an active alk. substance such as basic Mg carbonate.

CHEMICAL ABSTRACTS

Vol. 22.

JULY 20, 1928

No. 14

1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

Improved laboratory condenser. E. S. WEST. Washington Univ. *Ind. Eng. Chem.* 20, 737(1928). F. J. CRANE

A new chemical laboratory fume duct system. F. C. VILBRANDT AND J. T. DOBINS. Univ. of North Carolina. *J. Chem. Education* 5, No. 5, 589-94(1928). F. H.

Autoclaves in the chemical industry. A. LINK. *Z. Farben-Ind.* 20, 14-6(1928).—A discussion of materials suitable for the construction of autoclaves for different purposes FREDERICK C. HAHN

A new adiabatic calorimeter for high temperatures. WALTER KANGRO. *Z. Elektrochem.* 34, 253-6(1928).—The calorimeter is built inside an electric oven. A regulating device operated by a Pt resistance thermometer inside the calorimeter enables the oven to follow instantaneously any change in the temp. It is thus possible to carry on measurements at 800-900°. A. L. HENNE

An inexpensive desiccator. J. E. DAY AND J. W. WALKER. Ohio State Univ. *J. Chem. Education* 5, No. 5, 597(1928). E. H.

Universal extraction apparatus. KARL ZIFF. *Biochem. Z.* 193, 207-10(1928)—This app is suitable for the extn. of solid matter with liquids of low or high sp. gr. or for the extn. of fluids with similar extractants (ether or chloroform). S. M.

Ionocolorimeter, an apparatus for measuring the ionic acidity of solutions. M. CAILLE. *Bull. soc. chim. biol.* 10, 590-601(1928).—The ionocolorimeter is an arrangement of cylinders, cells and a mirror designed particularly for estg. color in the Clark and Lubs detns. of p_H . The instrument can also be used as an ordinary colorimeter. L. W. RIGGS

Two new rotating furnaces for the laboratory. V. TAFEL. *Metall Erz* 25, 158-60(1928)—Details are given for constructing two gas-fired, rotating furnaces, the tube of one being 37 cm. long and of the other 2.2 m. J. BALOZIAN

New vacuum stopcock. A. P. H. TRIVELLI. *Chemistry & Industry* 47, 496(1928).—A Hg-sealed vertical stopcock is obtained by making the stopper hollow and open at the top and bottom. For greater security a Hg ring may be put about the middle of the stopcock. Also in *J. Optical Soc. Am.* 16, 367-9(1928). T. S. CARSWELL

Guarantees of capacity for condenser-water coolers. W. OTTE. *Arch. Wärmewirt.* 9, 1-4(1928).—Tests of cooling towers should be confined strictly to the towers. Curves for correcting the test results to the conditions of the guarantee are given (but not explained). ERNEST W. THIELE

Devices for increasing accuracy in weighing. F. C. GUTHRIE. *Nature* 121, 745-6(1928).—The rider should be supported on one point instead of resting on the beam by contact at 2 or more places. The inconsistency noticeable when working to the limit of sensitiveness of the balance is due to the lateral shift of the whole beam to left or right each time the beam is released from its fixed supports. This gives a perceptible shift in the zero when observing swings on the fixed scale at the base of the main pillar. To avoid parallax in reading the position of the rider a paper scale can be pasted off to the glass front or back of the balance case. It is useful to have a simple device by means of which a puff of air can be obtained on the under side of one pan; the amplitude of the swingings is thus easily controlled. A. L. HENNE

Frederking apparatus. A. BUNTROCK. *Z. Farben-Ind.* 20, 16-8(1928).—A critical discussion of this apparatus in which superheated water is used as a source of heat for chem. reactions. FREDERICK C. HAHN

A new apparatus for automatically recording the amount of combustible vapors in the air. V. EIBEL. *Zentr. Gewerbehyg. Unfallverhütung*, 14, 291-3(1927); *Bull. Hyg.* 1, 236(1928).—The app. is based upon the measurement of the difference in the viscosity of the gases in comparison with their sp. wts. It can be arranged to sound a warning. GEORGE R. GREENBANK

Modifications of the apparatus of Desgrez for the total carbon with reference to alkalimetric microestimation. L. LESCOEUR AND T. TUROBINSKI. *Bull. soc. chim. biol.* 10, 606-16(1928); cf. Desgrez and Vivario, *C. A.* 19, 1837.—The principal modifications consist in the use of Pyrex app., the substitution of an air condenser for a water-circulating cooling app. and the addn. of Ag_2CrOH to the $\text{K}_2\text{Cr}_2\text{O}_7 + \text{H}_2\text{SO}_4$ oxidizing mixt. L. W. RIGGS

A photoelectric turbidity meter. L. W. HAASE AND HEINRICH THIELE. *Gas u. Wasserfach* 71, 414-7(1928)—The water, of which the turbidity is to be measured, is placed in a cylinder 300 mm. long and 35 mm. in diam., provided with a Se cell at one end and a flashlight lamp at the other. A storage battery or step-down transformer may be used to supply the lamp, which is maintained at a const. brightness by maintaining a const. current. The change of the resistance of the Se cell is measured by means of a slide-wire bridge. Methods of operation are described which eliminate the usual errors due to the slow recovery of the cell after illumination. The cell is calibrated with definite percentages of SiO_2 in suspension. Typical calibration curves are shown. R. W. RYAN

A new electrically heated apparatus for fat and oil Soxhlet extractions. F. GOGOLEV. *Masloboino-Zhirovoye Delo* 1928, No. 3, 18-9.—The usual extn. app. heated with elec. carbon bulbs has a jacket for water circulation to prevent the overheating of the elec. part of the equipment. A Liebig condenser keeps the water at low temp. The flasks as well as the box contg. the bulbs are shielded by asbestos boards to keep a uniform temp. A. claims economy of elec. current and very uniform temp. A. A. BOEHTLINGK

Photoelectric photometers. C. J. YOUNG (to General Elec. Co.). U. S. 1,672,671-2, June 5.

Psychrometer. E. J. CARROLL and G. W. JOHNSON (to American Laundry Machinery Co.). U. S. 1,671,103, May 29.

Pyrometer of the expansion rod type. R. C. PAIRMAN. U. S. 1,672,229, June 5.

Thermometer and protecting frame. M. E. MOELLER (to A. E. Moeller Co.). U. S. 1,672,851, June 5.

Wet and dry bulb thermometer apparatus for determining humidity. R. LANQUETIN. Brit. 278,380, Oct. 2, 1926.

Thermometer for automobile radiators, etc. W. J. STALLAN and A. W. FREESTONE. Brit. 277,906, May 17, 1927. Structural features.

Torsionometer. SIEMENS BROS. & Co., LTD. AND F. TURNER. Brit. 277,416, June 15, 1926.

Air filter. W. E. SNAMAN. U. S. 1,671,383, May 29.

Filter for gasoline or other liquids. J. ZWICKY. Brit. 278,099, July 6, 1926. A filter is described which is suitable for attachment to a hose.

Filter for oils, etc. L. W. WILLIAMS (to Central Union Trust Co. of N. Y.). U. S. 1,671,958, May 29.

Rotary filter (with radial filtering leaves) for filtering liquids. H. A. VALLEZ. Brit. 277,546, Feb. 1, 1927.

Endless travelling band strainer or filter for liquids. R. A. BLAKEBOROUGH, H. TART and J. LINDSAY. Brit. 278,175, Sept. 29, 1926.

Röntgen-ray apparatus. SIEMENS-REINIGER-VEIFA GES. FÜR MEDIZINISCHE TECHNIK. Brit. 277,945, Sept. 25, 1926.

X-ray anodes. E. G. GILSON (to General Electric Co.). U. S. 1,671,953, May 29. One end of a metal stem which may be formed of Mo or W is surrounded with refractory material such as W powder and the latter is subjected simultaneously to heat and pressure to effect sintering.

* **X-ray tube shield.** A. F. PIEPER. U. S. 1,672,423, June 5. Mech. features.

Mercury condenser filled with sponges. E. K. PETERS. U. S. 1,672,499, June 5.

Acetylene generator. P. DORSEY (to Imperial Brass Mfg. Co.). U. S. 1,672,606, June 5.

Acetylene generator of the drip-feed type. J. DUNGAVEL. Brit. 278,414, July 1, 1926.

Carbide-feed control for acetylene generators. T. J. SULLIVAN. U. S. 1,671,751, May 29.

Apparatus for aerating liquids in bulk. H. SILBERBERG. Brit. 277,638, Sept. 20, 1926.

Mixing and emulsifying apparatus for treating paints, foods or other substances. J. MCGOUGAN and J. HUNTER. U. S. 1,671,868, May 29.

Apparatus for distilling tars and oils. W. RUNGE (to International Combustion Engineering Corp.). Brit. 277,952, Sept. 21, 1926.

Heat-exchange apparatus. W. LONSDALE (to Foster Wheeler Corp.). U. S. 1,672,850, June 5.

Heat-exchange apparatus. G. CAHILL (to Winchester Repeating Arms Co.). U. S. 1,672,708, June 5.

Heat-transfer apparatus adapted for use with water, steam, etc. J. E. ERKANBRACK. U. S. 1,671,631, May 29.

Heat-exchange apparatus for generating steam or for other purposes. W. D. LA MONT and A. F. ERNST (to La Mont Corp.). Brit. 278,704, Oct 7, 1926.

Closed evaporating apparatus with internal heating tube systems. H. HILLIER. Brit. 278,075 and 278,299, June 29, 1926.

Safety gas valve. I. L. SAUVEY and S. DE FRANCE. U. S. 1,672,504, June 5.

Gas cooler and purifier (with fixed and rotating disks arranged in pairs). RICHARDSON, WESTGARTH & CO., LTD. AND F. G. INGLIS. Brit. 278,118, July 21, 1926.

Portable apparatus for testing gases. R. E. TERHUNE. U. S. 1,671,795, May 29.

Apparatus for removing gases from liquids. L. D. MILLS (to Merrill Co.). U. S. 1,671,601, May 29.

Vertical gas washer with baffle disks on an endless chain. E. L. PRASE. Brit. 278,105, July 7, 1926.

Apparatus for desulfurizing gases by suspended iron oxide or hydroxide. E. RAFFLOER (one-half to W. E. Leuchtenberg). U. S. 1,672,778, June 5.

Device for supplying nitrogen or other inert gases to oil-filled transformers or similar apparatus. M. E. SKINNER (to Westinghouse Elec. & Mfg. Co.). U. S. 1,671,492, May 29.

Volumetric displacement apparatus for controlling the supply of gas for chlorinating water or similar processes. B. BRAMWELL. Brit. 277,869, March 16, 1927.

Apparatus and method for testing the tensile strength of gas mantles and similar fragile articles. J. T. ROBIN. U. S. 1,672,077, June 5.

Apparatus for testing the hardness of materials. C. H. WILSON. Brit. 277,517, Oct. 15, 1926.

Apparatus (with a pivoted pendulum hammer) for testing hardness of materials. E. VON LEESEN. Brit. 277,855, Jan. 17, 1927.

Electrically heated bright annealing furnace. AKT.-GES. BROWN, BOVERI, ET C^{IE}. Brit. 277,379, Sept. 10, 1926.

Furnace recuperator assembly. J. LUNDBORG (to Surface Combustion Co.). U. S. 1,672,864, June 5.

Tunnel annealing-furnace with flared burner ports in the floor and side walls. R. SCHUBERT and C. PLETSCHE. Brit. 277,541, Jan. 26, 1927.

Firing system for muffle furnaces. W. J. HARRIS, JR. (to Surface Combustion Co.). U. S. 1,672,862, June 5.

Regenerative air heaters for furnaces. B. LJUNGSTRÖM and B. A. LJUNGSTRÖM. Brit. 278,396-7, April 12, 1926.

Apparatus for casting solutions of celluloid or other materials into sheets. E. R. ARMSTRONG (to E. I. duPont de Nemours & Co.). U. S. 1,672,403, June 5. The material is spread on a continuous sheet of electrolytically deposited Ni at least 0.01 in. thick. This layer of Ni may be formed on a cylindrical cathode.

Electric discharge device (rectifier). F. MEYER and H. J. SPANNER. Brit. 277,364, Sept. 9, 1926. A rectifier of the general type described in Brit. 275,552 (C. A. 22, 2084) has an incandescent cathode comprising a compd. of an alkali or alk. earth metal with an amphoteric oxide such as a nickelite, cobaltite or aluminate or zirconiate, a filling of a gas other than an inert gas, and highly absorbent bodies such as activated C, charged with gas, or materials such as azides of alkali or alk. earth metals capable of evolving H, N or other gas or metal vapors to prevent a decrease in gas pressure due to overloading.

Electric discharge tubes. J. DEMOULIN. Brit. 277,739, June 18, 1926. Electrodes connected in parallel comprise a spirally wound plate of metal such as W or Mo which are freed from occluded gases prior to mounting in a luminous tube by passing a discharge between them in a sep. tube filled with N until; after repeated replacement of the N, the spectrum of the N shows that the electrodes no longer liberate gases. K is placed so as to absorb gases such as NH₃ and N oxides formed by reaction between the N and gases liberated from the electrodes. The electrodes are mounted in tubes filled with N, subjected to an elec. discharge, and O and H are absorbed by an auxiliary electrode of Pd. The N is then replaced by Ne or He.

- Electric cut-out for stills or other apparatus.** L. F. BOSS. U. S. 1,672,800, June 5.
- Apparatus for separating benzene and water or other liquids of different specific gravities.** W. LINNEMANN, JR. U. S. 1,671,115, May 29.
- Degreasing metal articles, etc., with trichloroethylene or other volatile solvents.** J. SAVAGE. Brit. 278,061, June 23, 1926. An app is described.
- Apparatus for drying paper or other materials.** S. A. STAEGE (to Westinghouse Elec. & Mfg. Co.). U. S. 1,671,493, May 29.
- Whistling alarm or signal device operated by the flow of gas to burners.** A. GOODSTONE. U. S. 1,671,578, May 29.
- Antimicrophonic shield for thermionic valves.** I. R. McDONALD. Brit. 278,067, June 28, 1926. Shields are formed of rubber loaded with Pb oxide or of Pb
- Thermionic valves.** ALLGEMEINE ELEKTRICITÄTS-GESELLSCHAFT. Brit. 277,997, Sept. 23, 1926. A cathode comprises one or more alk. earth or other electron emitting oxides supported by other oxides such as those of Cb, W, Mo, Cr or U which do not volatilize or dissociate at working temp. Various details of manufacture are given
- Thermionic valves.** M-O VALVE CO., LTD. AND C. W. STOPFORD. Brit. 277,754, June 25, 1926. The filament is secured to its supports by a solder consisting of a mixture in powder form, of C, a metal such as Mo, W or Ta having a higher m. p. than the normal temp. of the joint, and a metal such as Cu having a lower m. p. Various structural details also are specified.
- Bimetallic thermostatic elements.** H. SCOTT (to Westinghouse Elec. & Mfg. Co.). U. S. 1,671,490, May 29. One element is formed of a ferrous alloy containing about 15% Mn and the other is formed of a Ni-Fe alloy. U. S. 1,671,491 also relates to the use of similar alloys. Cf. C. A. 22, 1710.
- Thermostatic electric switch.** E. GREY. Brit. 277,383, Sept. 13, 1926.
- Thermostatic electric switch.** P. MCILVENNEY. Brit. 278,234, Dec. 14, 1926
- Thermostatic electric switch control.** J. C. GOOSMANN. U. S. 1,671,985, June 5.
- Thermostatic control for electric circuits.** S. E. SKINNER (to Landers, Frary & Clark). U. S. 1,672,854, June 5.
- Thermostatic control system for electrical heating systems.** A. J. KERCHER and W. W. HICKS. U. S. 1,671,593, May 29.
- Thermostatic furnace control device.** J. W. DRAKE. Brit. 278,108, July 12, 1926.
- Combined thermostatic regulator and thermometer for use with heating apparatus.** H. PRAUD (to American Radiator Co.). U. S. 1,671,934, May 29.
- Thermostatic regulator for coal stoves, etc.** R. T. WILLIAMS (to H. M. Sheer Co.). U. S. 1,671,915, May 29.

Chemical atomic weight determination and actual atomic weight. G. KIRSCH. *Naturwissenschaften* 16, 334–5(1928).—It is suggested on the basis of slight discrepancies in at. wt. values for "uranium Pb" and Ra that in the at. wt. detn. by chem. means ($\text{RaCl}_2 : \text{Ag}$ or AgCl) an error of the order 0.01% is possible, due to imperfection of the crystals of the compds. prepd. Excess atoms of one of the components can be present in sufficient amt. in the Smekal crevices to cause this effect. B. J. C. VAN DER HORVEN

The mutual influence of the two atoms of hydrogen. S. C. WANG. Columbia Univ. *Physik. Z.* 28, 663–6(1928).—Mathematical discussion. A. L. HENNE

Molecular number. PAOLO VINASSA. *Gazz. chim. ital.* 58, 178–80(1928); cf. *C. A.* 21, 1907; 22, 192, 1535, 2314.—In drawing the general conclusion that nearly all compds., whether natural or synthetic, org. or inorg., have even mol. nos. (recorded in *C. A.* 22, 1535, erroneously as the same mol. no.), certain important exceptions must be recognized. Among inorg. compds. with uneven mol. nos., compds. of Mn, Co, Cr, Cu, Ce, Mo and Fe predominate, with a few compds. of Ti, Ir, Hg, Cl, P, N, Sn, Ni, Ru, Va, W, U, Ga, Nd and Pr. Only a small proportion of the elements form compds. with uneven mol. nos. Extremely few org. compds. have uneven mol. nos.

Crystal structure of potassium. R. POSNJAK. *J. Phys. Chem.* 32, 354–9(1928).—Normal x-ray diffraction effects were obtained for K by the powder method. The failure of previous expts. to show these effects is attributed to oxide and moisture films on the surface. The sample was very carefully prepd. and the method is described in detail. The available data indicate K to be body-centered cubic with $a_0 = 5.333 \text{ \AA. U.}$; the calcd. d is 0.851. Na and Li show $a_0 = 4.30 \text{ \AA. U.}$ and 3.51 \AA. U. in agreement with earlier results. R. L. HERSHEY

The study of micas containing fluorine by means of x-rays. CH. MANGUIN AND L. GRABER. *Compt. rend.* 186, 1131–3(1928).—Although the no. of O and of F atoms in a cryst. unit of mica varies with the type, the sum, $O + F$, is const. at 12. There are thus always 12 electronegative atoms per unit which are not necessarily all O. It is probable that the substituted F takes up the positions of the displaced O. The difference in valence does not impair the similarity of structure. The loss of a negative charge necessitates the loss of a positive; e. g., Li^+ may be substituted for Mg^{++} whenever F replaces O. It is not difficult to imagine a total substitution of LiF for MgO . Micas of the same type show identical x-ray patterns, though the F content varies. Some cell dimension detns. are tabulated. R. L. HERSHEY

Further observations on isomorphism in the cubic crystals of hexamine- and pentamine-aquo complex salts. O. HASSEL. *Norsk Geol. Tids* 10, 92–6(1928).—X-ray diffraction exams. of $\text{Co}(\text{NH}_3)_6(\text{ClO}_4)_3$ and $\text{Co}(\text{NH}_3)_5\text{H}_2\text{O}(\text{ClO}_4)_3$ show a striking similarity between the two structures and that of $\text{Co}(\text{NH}_3)_6\text{I}_3$. All are face-centered cubes with 4 mols. per unit cell. The hexamine perchlorate structure may be obtained from the luteoiodide structure* by substitution of ClO_4 for I. The similarity between the hexamine and pentamine-aquo structures suggests that H_2O may be substituted for NH_3 without changing the space group (cf. *C. A.* 22, 1507). $\text{Co}(\text{NH}_3)_5\text{H}_2\text{OI}_3$, however, shows reflections which distinctly differentiate it from $\text{Co}(\text{NH}_3)_6\text{I}_3$, the structure being definitely not face-centered. R. L. HERSHEY

Crystal structure of lithium iodide trihydrate. S. B. HENDRICKS. *Am. J. Sci.* 15, 403–9(1928).—Laue and spectral photographs were used in the analysis of $\text{LiI}(\text{H}_2\text{O})_3$. The unit cell is hexagonal and contains 2 mols. The spacings are: $d_{110} = 7.45 \text{ \AA. U.}$; $d_{001} = 5.45 \text{ \AA. U.}$. The space group is $6e-4$. The parameters were not detd. R. L. H.

Crystal structure of *p*-nitrotoluene. B. N. SREENIVASIAH. *Indian J. Physics* 2, 151–60(1928).—Powder and Laue x-ray photographs of *p*-nitrotoluene indicate the crystal to be simple orthorhombic, $a = 10.1 \text{ \AA. U.}$, $b = 11.18 \text{ \AA. U.}$, $c = 12.3 \text{ \AA. U.}$, with 8 asymmetric mols. per unit cell. The space group is Q_b^1 . *R. L. HERSHEY

Influence of the mother liquid upon the crystal form. MITUO YAMADA. *Japan. J. Phys.* 4, 159–63(1928).—In previous papers Y. investigated the surface energy of crystals relative to the vacuum, to det. cryst. forms theoretically. The effect of the mother liquid is now discussed, with the assumption of a simple law of at. action. The essential point lies in the assumption of regularity of at. arrangement in the liquid near

the cryst. surface. By this assumption the appearance of faces of high indices, so-called vicinal faces, is explained. The effect of magnetic field upon the cryst. form, observed in NiCl_2 , is also explained.

Physical purity and powder röntgenogram. N. H. KOLKMEIJER. *Proc. Acad. Sci. Amsterdam* 31, 151-4 (1928).—See *C. A.* 22, 1066.

E. H.

Supposed allotropy of zinc. M. VAN DE PUTTE AND H. THYSSSEN. *Rev. univ. mines* 14, 49-57 (1927).—An investigation was made of the allotropy of zinc, by means of the Chevenard app. and the expansion method. Pieces of electrolytic, commercial and fonte d'art (artistic casting) zinc were rolled in one direction and ground to a thickness of 10 mm. The method used does not permit of a conclusion as to the existence of different allotropic forms of pure Zn. When heated, from 300 degrees there is a much less marked expansion of the rolled Zn, the expansion being less pronounced in the direction perpendicular to the rolling than parallel to it. This is caused by the physical form of Zn and not by its chem. nature. The Zn possesses a coeff. of expansion greater perpendicular to the rolling direction than parallel to it. Tempering increases the elastic limit in all cases. The elastic limit is always greater in the direction of the rolling. In brief, it is concluded that Zn presents only one variety of allotropy. C. W. OWINGS

Polymorphism. K. LOSKIT. Dorpat Univ. *Z. physik. Chem.* 134, 156-9 (1928).—The soly. curves of monotropic polymorphic compds. show a break and are constituted by 2 different parts. This was ascertained by the following mixts.: resorcinol and H_2O ; benzophenone and benzene; salol and benzene. The measurements are tabulated. The polymorphism is chiefly due to a polymerization. The phenomenon of polymerization and depolymerization in soln. is comparable to electrolytic disson.

A. L. HENNE

Triglycerides. K. LOSKIT. Dorpat Univ. *Z. physik. Chem.* 134, 135-55 (1928).—L. investigates the polymorphic modifications and the crystn. factors of the following glycerides: tristearin, tripalmitin, trimyristin, trilaurin, tricaprinn, tricaprylin, tricaproin, tributyrin and triacetin. He detcs. 22 soly. curves of these compds. in customary solvents; never did the solvents combine with the solutes. The triglycerides are polymerized and present a colloidal character. The polymorphism is to be attributed to differences in the degree of polymerization. The triglycerides may change from cryst. aggregates to colloidal aggregates; the process is entirely reversible. A. L. HENNE

Enantiotropy, monotropy and pseudomonotropy. I. NOBORU NAGASAKO. *Bull. Chem. Soc. Japan* 3, 90-5 (1928).—A theoretical discussion permits N. to define enantiotropy at const. pressure by the 2 following conditions: there should be an equil. temp. between the 2 modifications *A* and *B* of one component; in the neighborhood of this temp., *A* should be stable above it, *B* being stable below it, or *vice versa*. The dimorphism which does not satisfy the above conditions at const. pressure is defined to be monotropy, if only one of the 2 modifications is stable. Thus monotropy is included in the following cases: (1) the dimorphism without any equil. temp.; (2) the dimorphism with equil. temp. only in the unstable domain of *A* and *B*; (3) the dimorphism with equil. temp., however, only *A* (or *B*) is stable except there. Consequently the terms enantiotropy and monotropy not only serve to express the abs. stability, but also express the mutual stability of the 2 modifications in 1 component. The thermodynamic relations connected with them and the cases of pseudoequil. are considered, and various theories are brought into conformity.

A. L. HENNE

Vapor pressure and chemical constant of chlorine. P. HARTECK. Tech. Hochschule, Breslau. *Z. physik. Chem.* 134, 21-5 (1928).—The following are, resp., the abs. temp. and the vapor pressure of Cl in mm.: 162.7, 2.6; 165.7, 3.4; 169.5, 6.1; 170.3, 7.2; 170.9, 7.7; 172.7, 9.9; 178.8, 17.4; 179.5, 18.5; 180.2, 19.6; 181.7, 22.9; 183.7, 26.9; 185.8, 31.8; 197.6, 76.0; 198.1, 78.1; 199.6, 86.4; 210.3, 169; 210.9, 175.5; 211.3, 181.4; 219.5, 288.0; 219.9, 295; 220.4, 302.4; 234.5, 611; 234.7, 619; 234.8, 624; 235.1, 630; 245.2, 634. The m. p. -100.5° , b. p. -33.95° . The chem. const. is 1.67 ± 0.07 or -0.12 .

A. L. HENNE

Measurements of the vapor pressure of silver, gold, copper, lead, gallium, tin and calculation of the chemical constants. P. HARTECK. Tech. Hochschule, Breslau. *Z. physik. Chem.* 134, 1-20 (1928).—H. describes an app. based on the Knudsen method, by which vapor pressures as low as 10^{-4} mm. Hg can be measured at 1000° . For Ag (temp. in degrees abs.; p. in mm. $\times 10^4$): 1196, 7.6; 1200, 8.0; 1216, 13.3; 1224, 15.3; 1230, 15.5; 1232, 15.8; 1238, 22.4; 1240, 19.5; 1263, 22.0; 1266, 41; 1269, 55; 1271, 54; 1273, 42; 1278, 39; 1308, 64; 1333, 90; 1319, 108; 1339, 124; 1344, 145. For Au (temp. in $^\circ$ abs.; p. in mm. $\times 10^4$): 1436, 60; 1451, 40; 1451, 65; 1457, 80; 1463, 90. For Cu (temp. in $^\circ$ abs.; p. in mm. $\times 10^4$): 1420, 1.16; 1445, 1.26; 1449, 1.63; 1463, 2.2; 1421, 1.1; 1419, 1.1; 1430, 1.1. For Ga (temp. in $^\circ$ abs.; p.

in mm. $\times 10^4$); 1198, 4.2; 1199, 4.0; 1206, 4.2; 1210, 6; 1216, 6; 1226, 7; 1247, 12; 1264, 17; 1266, 30; 1239, 14.3; 1311, 40; 1306, 40; 1322, 100; 1326, 75; 1346, 160; 1351, 120; 1358, 130; 1391, 230. For Sn (temp. in $^{\circ}$ abs.; p. in mm. $\times 10^4$): 1264, 0.5; 1281, 0.5; 1297, 0.75; 1329, 1.3; 1333, 1.3; 1339, 2.45; 1349, 2.1; 1367, 2.9; 1377, 3.6; 1386, 3.8; 1389, 3.4; 1400, 6.5; 1434, 8.5. The vapor tension of Pb was detd. by a b. p. method and the results are compared with the literature. For Pb (temp. in $^{\circ}$ abs.; p. in mm.): 1353, 3.9; 1392, 6.5; 1427, 10.0; 1477, 16.5. The chem. const. of each metal has been calcd.; it is of the general form: $j_p = -1.59 + \log M^{1/2} + k$, the values of k being: 0.39 \pm 0.36 for Pb; +0.65 \pm 0.40 for Ag; -0.10 \pm 0.40 for Cu; +0.56 \pm 0.40 for Au; +0.00 \pm 0.50 or -0.20 for C. The discrepancies from the theoretical values are discussed. The Trouton const. 22.5 may be used for high boiling metals. The Langmuir method of measuring small vapor pressures is likely to introduce considerable errors.

A. L. HENNE

Polar interpretation of the coordination valencies. E. J. W. VERWEY. Univ. Amsterdam. *Chem. Weekblad* 25, 250-4(1928).—A survey in simple terms.

A. L. HENNE

Capillarity. IX. KARL SCHULTZE. *Kolloid-Z.* 44, 120-7(1928); cf. C. A. 21, 3291.—This is a theoretical paper attempting a general formulation of capillary systems with the aid of a novel symbolic representation which is explained in detail. F. L. B.

The parachor and chemical constitution. IX. Boron compounds. J. J. ETRIDGE AND SAMUEL SUGDEN. *J. Chem. Soc.* 1928, 989-92; cf. C. A. 22, 2153.—Me and Et borates are prepd. by modifying Schiff's (*Annalen*, 1867, Suppl. 5, 158) and Coupax's (*Compt. rend.*, 127, 719(1898)) methods, repeated fractionations giving the 99.9% esters (b_{765} , 68.7 $^{\circ}$ and b_{710} , 117.2 $^{\circ}$ resp.). The max. bubble pressure method of Sugden (*C. A.* 16, 2627; 18, 1771) is used in detg. the surface tensions, the air entering the bubbler being previously dried by passing over P_2O_5 . The liquid ds. are detd. in sealed tubes with calibrated floats, the vapor ds. being calcd. according to the method in C. A. 19, 2926. The parachor is detd. from the expression: $P = M \gamma^{1/4} / (D - d)$, M being the mol. wt. and γ the surface tension in dynes/cm., the av. value for Me borate being calcd. as 243.7 and that for Et borate as 363.1. From these values and that calcd. from the data of Mills and Robinson (*C. A.* 21, 3507) for BCl_3 , the av. value of the parachor of B is detd. as 16.4. Thus, the at. parachors pass through a sharp min. at C. Incidentally, it is found that Me alc. and Me borate form a mixt. of max. vapor pressure, boiling at 55 $^{\circ}$ and contg. 30% ester.

J. BALOZIAN

Phenomena of adsorption. G. TESTONI. *Rev. gen. colloides* 6, 8-15(1928).—After observing the color changes in a grain of wheat produced by the adsorption of certain coloring substances a study of the debated question of the pre-existence of gluten in flour was made. The action of Ca salts as already observed in coagulation of blood and milk is stressed and the formation of gluten in the presence of Ca salts through the interagency of a protein substance is considered the more probable. The diminution of sensibility showed by an indicator, after absorption, was used for measuring the adsorption no. of each protein. The dissimulation of Cu and Fe salts after adsorption by gluten and gliadin is described and explained on the basis of formation of chem. combinations.

H. M. McLAUGHLIN

Bubbles, drops and Stokes' law. W. N. BOND AND D. A. NEWTON. *Phil. Mag.* [7], 5, 794-800(1928); cf. C. A. 22, 522.—B. showed that spherical drops or bubbles surrounded by a more viscous fluid might have a terminal velocity as great as one and a half times that of a solid sphere of equal size and mass. B. and N. now show experimentally and theoretically that the surface-tension of the surface of the drop or bubble decreases the terminal velocity. For any radii appreciably less than a certain crit. value the drop or bubble behaves almost like a rigid sphere. After a fairly rapid transition, for all radii appreciably larger than the crit. the effect of surface tension is small. Expts. on the terminal velocity for air in water-glass, air in sirup, Hg in sirup, and water in castor-oil, all give crit. radii of the order predicted; but the different media show appreciably mutual disagreement, the cause of which is not yet certain.

G. G.

The preparation of chloride-free colloidal ferric oxide from ferric chloride. C. HARVEY SORUM. *J. Am. Chem. Soc.* 50, 1263-7(1928).—The sols were prepd. by adding 1 M $FeCl_3$ soln. drop by drop to boiling H_2O and purifying by hot dialysis for 7 to 10 days. They were wine-red, clear to transmitted light, and stable for at least 12 months. The Fe content was from 2.07 to 3.60 g. per l. Seven methods of testing for Cl gave neg. results although the tests were positive when as little as 0.0001692 g. HCl per l. was added directly to the sols. The results do not accord with Thomas' "solution link" theory of Fe_2O_3 sols and other theories assuming that the Fe_2O_3 micelle is a definite chloride compd.

F. L. BROWNE

The reduction of gold chloride in the presence of lyophilic colloids. J. TRAUBE AND DOROTHEE JACOBY. *Z. anorg. allgem. Chem.* **170**, 85-98(1928).—AuCl₃ was reduced in aq. soln. with a number of reducing agents in the presence of many lyophilic colloids. Nearly all the colloids had a marked peptizing influence in concd soln. Usually the peptizing effect increased with the protective power of the colloids. The degree of dispersion of the Au was greatest in the most concd. solns. of colloid. In some cases coarse dispersity and pptn. were found at intermediate concns. of colloid. Often when the soln. contg. no colloid yielded stable Au sol. small amts. of lyophilic sol caused pptn. In other cases when the colloid-free soln. gave a ppt. of Au, small amts. of lyophilic colloid exerted protective action. F. L. BROWNE

The preparation of silver hydrosols of uniform particle size without the aid of protecting colloids. II. J. VOIGHT AND J. HEUMANN. *Z. anorg. allgem. Chem.* **169**, 140-50(1928); cf. *C. A.* **21**, 3512.—The sols were prepd. by reducing 0.001% or 0.005% Ag₂O soln. with hydrazine hydrate in the presence of Au or Ag nuclei. Best results were obtained with 0.001% Ag₂O soln. There must be no alkali (Na₂CO₃) present during the reduction because it gives rise to a pseudonucleus formation that interferes with the proper function of the Au or Ag nuclei. This action of alkali is so pronounced that Ag sols can be prepd. in solns. contg. it without adding Au or Ag nuclei. F. L. B

Silver nucleus sols containing no protective colloid. A. GALECKI. *Z. anorg. allgem. Chem.* **170**, 45 8(1928).—Ag sol reduced with P was made as follows. To 100 cc. of thrice-distd. H₂O 1.5 cc. of 0.1% AgNO₃ soln. and 0.5 cc. of NH₄OH (d. 0.925) were added. The soln. was heated to the beginning of boiling and 5 to 6 cc. of P dissolved in ether added dropwise with stirring. A yellow, amicroscopic Ag sol formed at once. Ag nucleus sols reduced with HCHO were made as follows: To 100 cc. of thrice-distd. H₂O 2.5 cc. of 0.1% AgNO₃ soln. and 0.5 cc. of NH₄OH (d. 0.925) were added followed by 5 cc. HCHO soln. (0.3%). Some of the Ag sol reduced with P was then added and the soln. heated to about 80°. Bluish green, fluorescent Ag sol was obtained. Au nucleus sols may be used in place of Ag. F. L. BROWNE

The preparation of a lead selenide hydrosol. J. BROOKS. *J. Phys. Chem.* **32**, 698-708(1928).—PbSe sols with gelatin as protective agent were prepd. from Pb(C₂H₃O₂)₂ and from a mixt. of Pb(C₂H₃O₂)₂ and PbCO₃. "With the first method the percentage transformation into colloidal PbSe rapidly decreased as the initial concn. of Pb(C₂H₃O₂)₂ was increased above a certain limit. This effect could be attributed to the presence of acetate ion or acetic acid into which the acetate ion is mainly transformed. As these had no pptg. action on the colloid when once formed it was concluded that the effect was exerted during the process of formation. It is suggested that acetate ion or acetic acid decreases the velocity of formation of nuclei while leaving unaltered the velocity of growth of the nuclei. Above a certain concn. the disparity in these velocities is sufficient to produce particles of non-colloid (macroscopic) dimensions. A quant. treatment has been attempted. With the first method of prepn. the rate of stirring had a small effect on the amt. of colloid formed. With the second method a very rapid rate of stirring decreased markedly the yield of colloid." F. L. BROWNE

Colloid syntheses with titanium trichloride. VI. Colloidal palladium. A. GUTBIER AND H. WEITHASE. *Z. anorg. allgem. Chem.* **169**, 264-6(1928); cf. *C. A.* **21**, 3511.—The colloids were prepd. by reducing a 1% PdCl₂ soln. with 15% TiCl₃ which was previously almost neutralized with NaOOCCH₃, heated to boiling, and cooled. The sol consists of colloidal TiO₂ with adsorbed Pd. The sol is very stable toward acids. On dialyzing for 10 to 12 days it formed an irreversible jelly, which still yielded Cl on further dialysis. By wetting the jelly with HCl it could be reprecipitated in H₂O. The jellies exhibit thixotropy. F. L. BROWNE

Peptization of ferric hydrate in solutions of arsenic trioxide. A. BOUTARIC AND G. (MLE.) PERRAUD. *Rev. gen. colloides* **6**, 1-7(1928).—A quant. study of this phenomenon has been made by detg. the different wts. of hydrate peptized under various influences. The effect of variation of (1) time, (2) concns. of solns. of As₂O₃ with a const. quantity of hydrate, (3) quantities of hydrate with the same soln. of As₂O₃, (4) age of the hydrate and (5) temp. was detd. Peptization was a rather slow process, completed only after approx. 24 hrs. With a quantity of hydrate corresponding to 80 mg. of Fe₂O₃ and increasing concns. of As₂O₃, the amt. of hydrate peptized increased rapidly at first and then decreased without ever being completely peptized; with 380 mg. of Fe₂O₃ the amt. of peptized hydrate attained a max. but did not decrease after the first rapid increase. With increasing quantities of hydrate and the same soln. of As₂O₃, when p/P (wt. of peptized hydrate per g. of initial hydrate) was represented as a function of σ/P (wt. of As₂O₃ per g. of initial hydrate) the curve rose rapidly from 0 to a max. (considerably flattened) and then decreased somewhat less rapidly to 0.

The quantity of hydrate peptized decreased in proportion to the age of the hydrate used. Temp. did not seem to have any influence on the phenomena. H. M. McL.

Advances in the preparation of colloidal solutions of the metalloids and their compounds as well as a survey of the most important protective colloids and the procedures for purification of colloids. J. REITSTÖTTER. *Oester. Chem.-Ztg.* **31**, 47-51 (1928).—A table is given contg. a list of 43 protective colloids and the sols for whose prepn. each protective colloid is especially suited. References to the original literature are given.

H. M. McLAUGHLIN

The behavior of deaminized gelatin. Z. C. LOEBEL. *J. Phys. Chem.* **32**, 763-78 (1928).—The behavior of deaminized gelatin was compared with that of gelatin. "The isoelec. point of deaminized gelatin is found by the dye technic at p_H 4.0. The optical rotation, viscosity, surface tension and foaming of the solns., are studied as functions of H-ion concn. The optical rotation at 10° and the foaming at room temp. are at a max. at the iso-elec. point. Surface tension is at a min at this point. Whether the solns. were effected at 50° or at 75° , or whether the viscosities were run at 10 , 25 or 50° , the viscosity- p_H curve of deaminized gelatin was of the same shape, showing two min., at p_H 4.0 and 7.3. Ordinary gelatin solns. effected at 75° gave viscosity- p_H curves at 25 and 50° similar to those obtained by Loeb at 25° with a min. at the iso-elec. point. Titration of deaminized gelatin and gelatin with NaOH indicates that the hydroxy groups which replace the amino groups in deamination are acidic in character. The difference in the base combining capacity of the two substances is equiv. to their difference in N content. The results indicate that the base-combining capacity of deaminized gelatin is 9.7×10^{-4} equiv. per gram. The second point of abrupt change in properties is discussed."

F. L. BROWNE

Membranometric studies of colloidal solutions. WOLFGANG OSTWALD AND MARTIN MEISSNER. *Kolloidchem. Beihefte* **26**, 1-57 (1928).—Membranometry is a procedure for observing the formation of skins at the meniscus of capillary threads of liquid. More uniform results are obtained when the area of the skins is reduced to less than 1 sq. mm. instead of the area of many sq. mm. used in previous work. Quant. measurements of solns. of saponin and peptone usually vary less than 10% from the av. Skin formation was observed on solns. of proteins, soaps, dyes and alkaloids. Soap solns. gave skins that were clearly elastic, dyestuffs gave inelastic skins. A graphical method of characterizing the membrane effect is described, based upon the differences in behavior in a capillary tube between ordinary liquids and liquids that form skins. The "foaming power" and the depression of the capillary rise are also expressed in simple terms. The close connection usually assumed between surface tension, membrane formation, and foaming power is true only for solns. that are closely related. For certain dye solns. the 3 properties are symbatic, while for certain soap and protein solns. they are not symbatic but uniform relations are observed between them. The principles governing the formation of skins on solns. of different substances vary widely and the skins may differ greatly.

F. L. BROWNE

Gum arabic. A. W. THOMAS AND H. A. MURRAY, JR. *J. Phys. Chem.* **32**, 676-97 (1928).—Gum arabic was studied as a typical colloidal polysaccharide. It was purified by pptn. with alc. and by electrodialysis. The electrometric titration curves with HCl, NaOH, and $Ba(OH)_2$ and an electrometric study of the amt. of NaOH bound in solns. contg. widely varying concns. of gum and varying ratios of gum to NaOH show that the gum is a strong acid, having a p_H of 2.70, and that it is not amphoteric. The equiv. wt. is 1000 to 1200. The reaction between the gum and alkalies is a simple chem. neutralization. The calcd. values of osmotic pressure agree with observed values (collodion membranes) fairly well, provided that the solns. are not too alk. The qual. application of the Donnan theory of membrane equil. accounts for the observed osmotic pressures and viscosities in solns. of varying p_H and of varying content of NaCl.

F. L. BROWNE

The theory of the electrical charge and the coagulation of colloids. HANS MÜLLER. *Kolloidchem. Beihefte* **26**, 257-311 (1928).—Smoluchowski's theory of rapid coagulation is extended by the assumption that particles of different size will coalesce more readily than particles of the same size. New equations are developed that more nearly represent exptl. facts. The relation between the concn. of electrolyte added to a hydrophobic colloid and the electrokinetic potential of the particles is discussed, the electric double layer being considered as a diffuse layer. A graphic method of calcg. the potential gradient for spherical particles is given and the results of expts. on As_2S_3 are explained by assuming a change in electrokinetic potential alone. In general, however, a change in the charge on the particle must be assumed.

JAMES G. McNALLY

The state of polarization of the Tyndall light from colloids. B. LANGE. *Z. physik.*

Chem. 132, 1-26(1928).—An app. is described for the spectral study of the polarization of Tyndall light. The *depolarization* is used to describe the state of polarization; it is defined as the ratio of the intensity of the vector of natural light vibrating horizontally to the intensity of the vector vibrating vertically, provided that the vertical vector does not come from the natural light. The depolarization for a single particle of a colloid is characteristic and can be computed from measurements of the depolarization at two concns. by means of a math. formula which was verified for several sols. The depolarization increases as the particle size increases and particle size can be detd. by depolarization measurements under certain conditions. For sufficiently small spherical particles the depolarization is 0; that is, the light is completely polarized. Gamboge, mastic, As_2S_3 , and CeO_2 sols belong to this class. Sols of Fe_2O_3 , Al_2O_3 , and V_2O_5 , whose particles are known to be non-spherical, give depolarization values greater than 0. Sols of V_2O_5 on aging change in depolarization in such a way as to indicate that the particles become larger and more markedly rod-shaped. H_3AsO_4 prevents the aging. Depolarization increases on solidification of the thixotropic CeO_2 sols and decreases again when the jelly is broken up by shaking, indicating that the particles become longer during gelation.

F. L. BROWNE

Depolarization and absorption of light by colloidal gold solution. B. LANGE. *Z. physik. Chem.* 132, 27-46(1928).—Au sols of uniform particle size varying from 6 to 160μ were prepd. carefully by the nucleus method in such a way as to avoid formation of Au_2O as far as possible. The consts. for the light absorption agree with concns. based on Mie's theory, assuming spherical particles. The absorption is a max. for particles of moderate size. The particle size detd. by light absorption differs from that obtained by ultramicroscopic count because a small amt. of the Au is present in a very finely divided state. The particle size detd. by sedimentation agrees with that computed from the light absorption. In sols of very fine subdivision, Mie's theory indicates that the absorption is independent of particle size but expt. shows that it still changes. The discrepancy is attributed to dependence of optical consts. on the thickness of the layer of sol observed. L.'s formula for depolarization (see preceding abstract) holds for Au sols. The depolarization is not zero for very small particles as Gans' theory demands, indicating that a small portion of the particles are rod-shaped. Other workers find evidence to that effect in the anisotropy of Au sols in the elec. field and during flow. The depolarization diminishes during coagulation; whence it follows that the particles remain spherical but become larger. The color change during coagulation depends upon change in particle size as Mie's theory indicates. The content of Au_2O in a sol reduced with P was shown to be 1.26% by a newly devised microanalyt. method.

F. L. BROWNE

Some chemical reactions in the presence of lyophilic colloids. T. IRO. *Z. anorg. allgem. Chem.* 170, 99-106(1928).— $AgNO_3$ was reduced with such reagents as hydroquinone, hydrazine hydrate, $NaHSO_3$, Na_2S and tannin in the presence of gelatin, dextrin, gum arabic, starch, agar and colloidal Fe_2O_3 . Numerous metathetical pptns. were made in the presence of gelatin. In general a considerable amt. of the lyophilic colloid exerted a pronounced peptizing action, but slow pptn. took place when the amt. of lyophilic colloid was small.

F. L. BROWNE

The electrokinetic and chemical behavior of the aluminosilicates. SANTE MATTHEWSON. *Soil Science* 25, 289-311(1928).—On mixing increasing quantities of Na silicate with an $AlCl_3$ soln., an electropositive sol, an isoelectric ppt., and finally (with an excess of silicate) an electronegative sol are successively formed. The electropositive sol may be pptd. isoelectrically by alkalization and the electronegative sol by the addn. of acid provided that the proportion of silicate is not greater than the quantity which the alumina is able electrically to neutralize. Each proportion of silica and alumina forms, within certain limits, isoelectric precipitates at definite H-ion concns. ranging in p_H values from somewhat below 5 to about 7, at which the alumina is itself isoelec. The nearer a p_H of 7 the greater must the proportion of alumina be for an isoelec. pptn. The mol. ratio SiO_2/Al_2O_3 in the isoelectric precipitates decreases with an increase in p_H , approaching zero at a p_H of 7. At p_H values somewhat below 5 the ratio reaches a max. but remains always smaller than 3. The proportion of alumina in the isoelec. ppts. is increased by the action of multivalent anions, whereas the proportion of silica is increased by the presence of cations. In the latter case isoelec. ppts. may be formed in which the ratio SiO_2/Al_2O_3 considerably exceeds a value of 3. Mixts. contg. so much silica as to render the sol electronegative at any p_H may be pptd. by adding bases of the bivalent cations, but the ppts., which contain a large proportion of silica and bases, remain electronegative and exhibit no ampholytoid character at any p_H . The isoelec. ppts. are, like kaolinite, ampholytoids, becoming electropositive when acidified and elec-

tronegative when alkalinized. Evidence obtained by the electro dialysis of feldspar indicates that the kaolinite cation $(\text{AlSiO}_2)^+$ is stable and may be formed at certain H-ion concns. The conditions governing the formation of the different soil gels in nature are discussed in this connection. The base-exchange capacities of the several ppts. prepd. were found to increase with the ratio of silica to alumina and to be of the same order of magnitude as those of the natural gels. The adsorption of base by the natural gel has been shown to embrace the adsorption of both ions, the OH as well as the cation, indicating true adsorption instead of the neutralization of an acid. The mechanism of adsorption and exchange is discussed. The conclusion is reached that the acidoid behavior of adsorbents is associated with a polar orientation of the interfacial layer of water mols. Twenty references are appended.

A. L. MEHRING

Constitution of the colloidal micelle. ALBERTO SCALA. *Staz. sper. agrar. ital.* 59, 75-98 (1926).—Cabbage leaves, yellow turnip roots and potato tubers were cut into very thin slices or ribbons and treated with successive (25-52) 200-cc. portions of distd. H_2O at approx. 0° for 12-24 hrs. The decanted liquors, evapd. to eliminate CO_2 and conc. to small vol., were titrated with 0.01 *N* acid or alkali (to phenolphthalein). In every expt. occurred a series of changes from acidity to alky., or *vice versa*, in these wash waters, which indicates not only that there exist in vegetable tissues free acids, bases or basic salt but also that the alternations are caused by anions or cations of salts combined with the tissue itself. The forces holding these combined ions vary and this variation is necessary for the evolution of life in different conditions and seasons so that

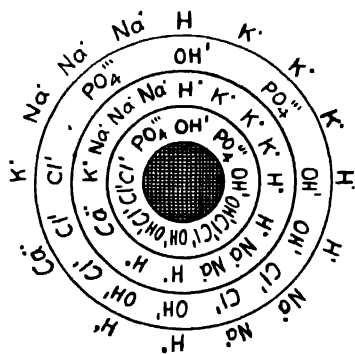

Fig 1.

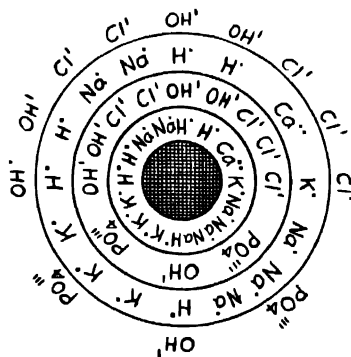

Fig 2.

the tissues and their complex combinations never have identical compns. at different times. The longer acid periods in the expts (the initial alk. periods only were long) is perhaps due to the greater mobility of the anions and also to the slow elimination of cations in periods of acid hydrolysis with their transformation into neutral salts. The expts. strengthen van Bemmelen's hypothesis of the constitution of hydrocolloids and furthermore indicate that the micelle is combined with electrolytes which are split into their respective ions arranged in an arbitrary number of concentric spherical strata about the micelle. Extn. at higher temps. increased the hydrolytic action, the acidity of the 35th ext. from 50 g. potato tuber at 45° for 15 min. rising to 11.5 cc. 0.01 *N* KOH (required) from 3 cc. for the 34th ext. at 0° . Successive exts. at the higher temp. gradually decrease in acidity to reach an equil. dependent on the temp. Previous expts. (*Ann. Igiene* 31, 214 (1921)) showed that heating at various temps. up to 100° when alk. exts. were being given at 0° caused the formation of acid exts. (max. acidity at 60°). Heating horse or human blood serum gives a similar increase in acidity (max. at 30° for horse blood) which reverses, however, to alky. at 70° . ALBERT R. MERZ

The solubility diagram of cobalttriethylenediamine chloride. A. P. ROSTKOVSKI. *J. Russ. Phys.-Chem. Soc.* 59, 347-50 (1927).—The prepn. used by Bergman (*C. A.* 20, 1344), whose soly. in water at 25° was 29.3% (after recrystn. 29.2%), was dried at 105° . Soly. detns. were carried out in a thermostat regulated to $\pm 0.1^\circ$; duplicate detns. agreed within 0.2%. The soly. curve of ice was detd. by the cooling method, solns. of known concn. being used. The eutectic lies at -2° and 12.5% of the salt by wt. (0.6% molar). Between -2 and $+110^\circ$ the curve is continuous, thus proving the presence

of a single solid phase (trihydrate). The compn of this phase possibly changes gradually, solid solns of tri- in the monohydrate and of the monohydrate in the anhyd. salt being formed with increasing temp.

BASIL C. SOVENKOFF

A cryoscopic study of benzene solutions. J. M. PETERSON and W. H. RODEBUSH. *J. Phys. Chem.* **32**, 709-18(1928).—The app. originally designed by Hovorka and R. was modified because of the peculiar waxy nature of solid benzene and was used to measure the f. p. depressions of benzene solns. of MeOH, EtOH, toluene, AcOH, BzOH and H₂O. The f. p. lowering was linear except for AcOH and MeOH. The molal f. p. const. for benzene is 5.10, accurate to 1%. P. and R. emphasize the fact that a mol. wt. as detd. by f. p. method depends only upon the vapor d. of the solute and not upon the vapor d. of the solvent.

ARTHUR FLEISCHER

Some physical properties of aqueous hydroxybenzene solutions. L. E. SWEARINGEN. *J. Phys. Chem.* **32**, 785-93(1928).—The surface tensions, ds., viscosities, and *n*'s of aq. solns. of phenol, catechol, resorcinol, hydroquinone, pyrogallol, and phloroglucinol were measured by standard methods at 25°. The ds. referred to concns. may be represented by straight lines. Increase in OH groups increased the viscosities. The surface tension lowering was greatest in the case of phenol and increased for the dihydric phenols in the order of their m. ps.

ARTHUR FLEISCHER

The dissociation constant of naphthylaminesulfonic acid. I. M. KOLTHOFF. *Chem. Weekblad* **25**, 234(1928).—The dissocn. consts. of naphthylaminesulfonic acid are to be considered as hydrolytic constns. of the amphoteric ion ${}^+\text{NH}_3\text{RSO}_3^-$. For a measured acid const. (Ibersbach) of 10^{-4} at 20° the true K_b of the amino group is 10^{-10} . The true K_a of the sulfonic group is probably of the order 10^{-1} .

B. J. C. V. D. H.

The velocity coefficient for bimolecular reactions in solution. L. S. KASSEL. *Nature* **121**, 746-7(1928).—A few reasons are tentatively suggested why the coeff. *P* proposed by Norrish and Smith (*C. A.* **22**, 1518) should be small.

A. L. HENNE

The oxidation of the mixture of stannous hydroxide and sodium sulfite in sodium carbonate solution with air. SUSUMU MIYAMOTO. *Bull. Chem. Soc. Japan* **3**, 95-8(1928); cf. *C. A.* **22**, 1889.—M. studies the kinetics of the oxidation of mixts. of Na₂SO₃ and Sn(OH)₂ in Na₂CO₃ soln. The reaction is an example of a negative induced reaction; the oxidation of Sn(OH)₂ has an inhibiting action on the oxidation of Na₂SO₃. The mechanism of the reaction is discussed.

A. L. HENNE

The solution velocity of oxygen into sodium hydroxide, sodium carbonate and hydrochloric acid solution. SUSUMU MIYAMOTO. *Bull. Chem. Soc. Japan* **3**, 98-101(1928); cf. preceding abstract.—The soln. velocity of O when air is passed through NaOH, Na₂CO₃ and HCl solns. is calcd. from the oxidation velocities of Na₂SO₃, Sn(OH)₂ and SnCl₂. The mechanism of some negative induced reactions is discussed.

A. L. H.

Chemical dynamics in a rigidly coherent phase. D. H. BANGHAM. *Phil. Mag.* [7], **5**, 737-49(1928); cf. *C. A.* **18**, 1933.—The equations of the form $s = \text{const.} \times l^2/m$ found empirically to govern in many cases the rate of the sorption process are not peculiar to this phenomenon alone, but are somewhat widely applicable to the time-course of processes involving the disturbance of the "linear equilibrium" of solid substances (either by mech. deformation or by other phys. or chem. means), provided the solid after disturbance remains rigidly coherent. It is shown that the rate of such a change may be limited by conditions which do not apply in a liquid reaction medium, and which are not concerned in any way with the distance of the reaction from completion. Because of the incongruity of the initial and final stages of the groups of atoms undergoing transition, the partial occurrence of the reaction disturbs the balance of elastic forces, and therefore influences the internal work that must be done before further groups of atoms can rearrange themselves. On the hypothesis that the condition for rearrangement is the momentary occupation by the groups of a vol. considerably greater than the av. calens. are made of the mode of variation during the progress of the reaction of the force restraining their thermal movements. A tentative explanation of the form of this variation is offered as an alternative to the linear variation required by an extension of Hooke's law to the conditions in the interior of the solid. According to this the intensity of the internal stress set up by the partial occurrence of the reaction is given by the difference between the hydrostatic pressures with which the initial and actual states of the solid would be in complete equil. On this basis it is shown that the index-const. of the "power"-time equation is given by the ratio $[(V_A - V_2)/(V_1 - V_2)]$ where $(V_A - V_2)$ is the difference of vol. between the activated and final states of the at. groups, and $(V_1 - V_2)$ the difference between their initial and final vols. Application of these ideas to the sorption problem provides an immediate explanation of the dependence of the activity of the sorbent on its past history, and leads to a revised conception of the mutual relations of sorbent and sorbate in cases where the "power" time-

equation holds. The sorbed mols. are regarded as distending the rigidly coherent structure of the sorbent, which consequently becomes stressed. This distension may occur even if the structure is a sufficiently open one to permit easy penetration by the gas mols. in their free state.

GEORGE GLOCKLER

Inertia phenomena and chemical reactions. E. PUXEDDU. *Gazz. chim. ital.* **58**, 95-103(1928).—When an inorg. reaction does not proceed instantaneously but exhibits an inertia or induction period, the latter is usually attributed to 2 or more successive reactions or to low ionization. Thus in the reduction of HIO_3 by SO_2 , I does not appear immediately, and in the reaction of aq. HgCl_2 and NaHCO_3 a red ppt. is formed only after a period of inertia. If individual reactions occur instantaneously, it is illogical to assume that the sum of 2 such reactions should require a disproportionately long time. Moreover, the increase in the inertia period with decrease in concn. has not been explained satisfactorily. In all chem. reactions there is probably a period of inertia which under ordinary conditions is extremely short. This period is independent of the velocity of the subsequent reaction, but varies with the temp. and the concns., the lower the temp. and the greater the diln. the longer this period of inertia. When reactions are apparently instantaneous, it is because the temp. and concns. are such that, for the particular reaction, the period of inertia is negligible in magnitude. The inertia is comparable with a state of dynamic equil., with limits of temp. and concn. beyond which the time becomes too short to measure. This condition represents some preparative stage or state of adjustment of the mols. and it ends abruptly and not gradually when the reaction begins. The periods of delay in complex reactions where intermediate products are actually formed represent the summation of the inertias of the reactions where the conditions are favorable for at least one of the reactions to show a notable period of delay. To confirm these points of view, 5 reactions were studied experimentally: (1) $\text{Na}_2\text{S}_2\text{O}_3 + \text{H}_2\text{SO}_4$; (2) $\text{Na}_2\text{S}_2\text{O}_3 + \text{HCl}$; (3) $\text{Sr}(\text{NO}_3)_2 + \text{H}_2\text{SO}_4$; (4) $\text{CaCl}_2 + \text{H}_2\text{SO}_4$, and (5) $\text{BaCl}_2 + \text{H}_2\text{SO}_4$. Each reaction was carried out at various temps. and concns. with const. vols. of the solns., and the periods of delay were judged from the moment of mixing to the first visible evidence of the insol. product. The variation of the period of delay with the temp. and with the concn. is illustrated by the following typical results. With equal vols. of N $\text{Na}_2\text{S}_2\text{O}_3$ and N H_2SO_4 , S appears after 15 sec. at 0° , after 5 sec. at 15° , after 1.5 sec. at 30° and instantaneously at 50° . With 0.5 N solns. it appears after 25 sec. at 0° , after 10 sec. at 15° , after 2 sec. at 30° and instantaneously at 60° . As the diln. becomes greater, the periods become longer. With 4 N CaCl_2 and 4 N H_2SO_4 , CaSO_4 appears after 1.5 sec. at 0° , after 0.5 sec. at 30° and instantaneously at 60° . With 2 N solns. it appears after 35 sec. at 0° , after 12 sec. at 20° and after 5 sec. at 30° ; with N solns. after 180 sec. at 0° , after 100 sec. at 50° , after 30 sec. at 70° , etc. Similar results were obtained with $\text{Sr}(\text{NO}_3)_2$ except that the periods of delay were notably shorter for given concns. On the contrary, pptn. of BaSO_4 was instantaneous above 0.1 N concns. and only at 0.02 N concn. is the delay even 1.5 sec. The reaction of 2 N CaCl_2 and 2 N H_2SO_4 at 0° is particularly satisfactory as a demonstration, for the soln. remains absolutely clear for 35 sec., when suddenly it becomes filled with a white ppt.

C. C. DAVIES

Formation and decomposition of sodium salicylate. I. A. DAVIES. *Z. physik. Chem.* **134**, 57-86(1928).—The thermic decompn. of Na salicylate occurs in two steps. Above 140° , CO_2 and Na phenolate are formed. The equil. is unilateral. Subsequently disodium salicylate and phenol are formed by double decompn. of sodium salicylate and sodium phenolate. This reaction has been studied in the range 220 - 160° and is completely reversible. The p - t curve of this tricomponent system presents a break at 190° and 4.15 atm. This point is a quintuple point; below it, the system Na salicylate, di-Na salicylate, Na phenolate, gas is stable; above it Na salicylate, di-Na salicylate, soln., gas represent the stable system. The synthesis of Na salicylate from Na phenolate and CO_2 is obtained through 2 intermediary products, called ester salt I and II. Both exhibit appreciable disson. tensions. Ester salt I is metastable with regard to ester salt II; the latter is metastable with regard to Na salicylate, but the transformation is not favored by a pressure reduction because an integral transformation of Na phenolate + CO_2 into Na salicylate cannot occur.

A. L. HENNE

Sodium salicylate and salicylic acid and the unilateral equilibrium. EMIL BAUR. Eidgen. Technische Hochschule of Zurich. *Z. physik. Chem.* **134**, 87-91(1928).—Criticism of Davies (preceding abstract.)

A. L. HENNE

Equilibrium of the reduction of tungsten bisulfide by hydrogen. N. PARRAVANO AND G. MALQUORI. *Atti accad. Lincei* [6], **7**, 189-92(1928).—The expts. were carried out in the same way as those with MoS_2 (cf. C. A. **22**, 2091). The equil. are established much the more rapidly by starting with WS_2 and H. Only at the highest

temps. did the reaction: $2\text{H}_2\text{S} + \text{W} \longrightarrow 2\text{H}_2 + \text{WS}_2$ proceed at a rate sufficient to be used in the measurements. The solid phases comprised only W and WS_2 . No other phase contg. less S than WS_2 being found. The Q values were 73400, 73500, 73700 and 73000 cal. at 795° , 895° , 985° and 1065° , resp., an av. of 73400 cal. A comparison of these values with those of MoS_2 shows that WS_2 is more easily reduced than MoS_2 . C. C. DAVIS

The equilibria in certain binary mixtures of trinitrocresol. N. N. LEFREMOK AND A. N. PIKHOMIROVA. *J. Russ. Phys. Chem. Soc.* 59, 373-90 (1927).—Most of the cooling curves were plotted with the aid of the Kurnakov registering pyrometer, although in the later expts. an ordinary thermogalvanometer and thermocouple (nichrome-constantan) were used. Liquid trinitrocresol (m. 101.2°) tends to supercooling; when cooled rapidly, a viscous mass is obtained which may not crystallize for 3-5 days. Reproducible results are obtained with the aid of repeated inoculation and stirring, as well as choosing the optimum velocity of cooling. With acenaphthene (m. 96.2°) a compd. $\text{C}_{12}\text{H}_{10}\cdot\text{C}_7\text{H}_4\text{OH}(\text{NO}_2)_3$ results, m. 117.9° ; the first eutectic is at 9.1% by wt. of acenaphthene and 88.2° ; the second at 79.8% and 84.8° . This system is most suitable for crystallizations, supercooling being more marked on the cresol portion of the curve above the first eutectic. The compd. is bright orange-red and can be heated above the m. p. without charring. Phenanthrene (m. 99°) similarly combines with 1 mol. of the cresol. The eutectics are at 13.5% (85.6°) and 77.5% (84.2°). The compds. m. 113.1° , is brown-red, stable and crystallizes readily. The fluorene (m. 112.3°) compd. (1:1) (m. 107.2°) is brown in the liquid state, gray when solid; decomp. above $140-50^\circ$. One eutectic is at 13.8% fluorene and 85.4° (crystallizes with difficulty); another at 67.4% and 90.5° . Retene (m. 95.2°) forms with 1 mol. of the cresol a compd. m. 118.3° ; the eutectics are at 6.7% (89.5°) and 88.6% (73.5°). The color is brown-violet in the fused, lilac-gray in the cryst. state. The mixts. as well as retene solidify slowly and with difficulty; they char easily on superheating. The system $\text{C}_7\text{H}_4\text{OH}(\text{NO}_2)_3$ —anthracene could not be completely examined, because of the high m. p. of some of the mixts., violent decompn. occurring before the liquid state was reached. No compds. of $\text{C}_7\text{H}_4\text{OH}(\text{NO}_2)_3$ with $\text{C}_6\text{H}_5\text{OH}(\text{NO}_2)_3$ (m. 122.4°), tetryl (m. 126.8°), T. N. T. (m. 78.8°) and $m\text{-(NO}_2)_2\text{C}_6\text{H}_4$ (m. 90.1°) were found: the eutectics are very low. The liquid mixts. are viscous and very hard to crystallize, especially at the eutectic points. The tetryl and T. N. T. mixts. with the cresol are the worst, the coordinates of the second eutectic having been found only after repeated expts. The eutectic mixts. of tetryl and the cresol, m. 64.4° , contains 42.3% tetryl by wt. (as previously detd. by interpolation, it was expected at 68° and 63%). Because of the low heat cond. and sp. heats of the mixts. heating curves do not exhibit abrupt changes of slope. Faulty technic may cause fictitious discontinuities to appear. Traces of the solvent (AcMe) impede crystn. Solid solns. were not formed. $\text{C}_7\text{H}_4\text{OH}(\text{NO}_2)_3$ and $\text{C}_6\text{H}_5\text{OH}(\text{NO}_2)_3$ form a eutectic at 52.5° and 35.6% of the latter; no solid solns. $\text{C}_7\text{H}_4\text{OH}(\text{NO}_2)_3$ and $m\text{-(NO}_2)_2\text{C}_6\text{H}_4$ exhibit a distinct eutectic at 55.4° and 44.8% by wt. of the $m\text{-(NO}_2)_2\text{C}_6\text{H}_4$. The solidified mixts. are very dense and hard; a plastic mass is obtained upon sudden cooling with freezing mixt. which can be drawn into threads. The solns. are quite stable when heated above m. p. $\text{C}_7\text{H}_4\text{OH}(\text{NO}_2)_3$ and T. N. T. form difficultly crystallizable mixts., especially between 30 and 50% of the latter. Repeated inoculations are necessary. No solid solns. were found to exist. The eutectic is at 41.3° and 42.3% of T. N. T. The mixts. are fairly stable, although resinification may occur when the cresol content is large. A slight amt. of charring will prevent crystn. Tables of m. ps. are included. BASIL C. SOVENKOFF

The synthesis of water over nickel and copper catalysts. The mixture effect and promoter action. F. E. SMITH. *J. Phys. Chem.* 32, 719-33 (1928); cf. C. A. 19, 1219.—The synthesis of water from hydrogen and oxygen (with an O_2 concn. of 2.4% at temps. from 75° to 180°) was studied over Cu, Ni, mixts. of Cu and Ni, and Cu- Al_2O_3 catalysts. The most efficient catalysts are those which tend to form the greatest amount of oxide and which suffer the least change in physical structure on reduction and heat treatment. Heating to 444° decreased the efficiency of all but the Ni catalysts. The Cu- Al_2O_3 catalyst had the highest efficiency in the final steady state. The most probable mechanism of catalysis by Ni and Cu is the activation of O_2 mols. or atoms with resulting formation of indefinite oxide, by which they are opened to attack by H_2 . This mechanism is much more rapid than can be accounted for by the reduction of stable oxide. ARTHUR FLEISCHER

The heats of solution and dilution of salts from extreme dilution to saturation. IV. Lithium bromide. F. LANGE AND E. SCHWARTZ. *Z. physik. Chem.* 133, 129-50 (1928); cf. C. A. 22, 905.—LiBr was prepd. from the carbonate and fused in an atm.

of HBr, N_2 , and H_2 . The calorimeter was improved with several modifications. The above heats were detd. at 25° up to the satd. soln., which contained 32.26 mols. $LiBr/100$ mols. H_2O . The differential heat curve resembles that of $LiCl$. A. F.

Studies on metal crystals. VI. The temperature law for the thermal resistance of regular metals. E. GRÜNEISEN. *Z. Physik* 46, 151-9(1927).—The thermal resistances of various Cu, Al, and Au specimens, differently worked, are closely expressed by the equation: $w = [w] + \zeta/ZT$; where w is the total resistance; $[w] = w_i + [w_m]$, where w_i is the non-metallic resistance, and $[w_m]$ is proportional to $(1/Z)(C/\theta/T)$. Since $w_i/w_m = k\theta/T$, $[w]$ is proportional to $(1/Z)[1 + (k\theta/T)C(\theta/T)]$. In these equations ζ , Z , θ , and k are considered as const. T is the abs. temp.; and $C(\theta/T)$ is a Debye at. heat function. Expt. indicates that θ , ζ , and Z are not truly independent of temp. R. L. HERSHEY

Molecular weight of nitrocellulose in camphor. C. TROGUS AND M. ABDEL SHAHID. *Naturwissenschaften* 16, 315(1928).—From the m. p. diagram of nitrocellulose in camphor the mol. wt. of nitrocellulose is found to be between 280 and 315 (calcd. 286). The nitrocellulose was prepd. from nitrated paper, recrystd. from acetone to a white powder of 13.5% N (2.76 NO_2 groups per $C_6H_{10}O_5$). The mol. m. p. depression of camphor was detd. with naphthalene at 40° in agreement with Rast; its m. p. was 179° . B. J. C. VAN DER HOEVEN

Important sources of error in the determination of the heat of combustion of organic substances. ENDRE BERNER. *Tids Kemi Bergvesen* 7, 17-20, 31-4, 47-9(1927).—Incomplete combustion can be detected and eventually corrected by weighing the amt. of soot found in the bomb and by passing the residual gas through a soln. of $PdCl_2$ to det. any traces of CO by pptn. of metallic Pd. Incomplete combustion is sometimes caused by too high or too low O_2 pressure. The CO test is very sharp when carried out as follows: The gas residues from the bomb are introduced into a 2-l. flask contg. 10-15 cc. of a dil. soln. of $PdCl_2$ and shaken thoroughly. If very small amts. of CO are present the flask should be set aside for a few hrs. The pptd. Pd will then appear as a brilliant shining film on the surface of the liquid. In this way 0.3 cc. of CO can be detd. with a calorific value of about 1 cal. Impurities in the oxygen are always present. Electrolytic O_2 contains H_2 and cannot be used. Atm. O_2 contains amts. of CH_4 and other combustible gases depending on the purity of the air at the place of manufacture. Every new O_2 flask should be tested before use by detg. the (known) water equiv. of the calorimeter. Combustible impurities in the O_2 can be detected and detd. by passing the O_2 on the way to the calorimeter bomb through a thick-walled narrow heated Cu tube filled with pieces of Pt sheet and Pd asbestos. An increase in the water equiv. of the calorimeter will then be found corresponding to the heat of combustion of the impurities now removed. In one case Berner found a difference of 14 cal. with a good com. brand of air-distd. O_2 using a bomb pressure of 35 atm. The ignition by an Fe wire is a source of various errors. For exact detns. it is much better to use a thin Pt wire. The N_2 content of the O_2 is partly oxidized to HNO_3 , the amt. of which has to be detd. The effect is small when pure O_2 is used, often less than 1 cal. The temp. cannot be detd. with a greater accuracy than 1-2 per thousand by means of the best Hg-in-glass thermometers. For exact measurements Pt resistance thermometers must be used; by these the temp. can be detd. with an accuracy of 0.0001° . With regard to the detn. of the correction for the exchange of heat between the calorimeter and its surroundings reference is made to H. C. Dickinson, *Bulletin of the Bureau of Standards* 11, 189 (1915). An insufficient purification of the substance to be analyzed will often render the results less accurate and much stress must be laid upon a careful purification if very exact detns. have to be made. Some substances have a tendency to keep in soln. or adsorption small amts. of the solvent from which they have been crystd. which cannot be removed by repeated crystn. nor by the usual drying methods. In such cases when there is no way to remove the last traces of the solvent it is recommended to make use of solvents which have very nearly the same heat of combustion as the substance itself. C. A. ROBAK

Studies on oxidation-reduction I-X. W. M. CLARK, BARNETT COHEN, *et al.* Hyg. Lab., *Bull.* 151, 1-363(1928).—A compilation in 1 vol. of the oxidation-reduction studies carried on in the Hygienic Lab. for the past several years. C. R. FELLERS

The entropy and thermodynamic potentials of real gases and mixtures of real gases, and a mass action law for chemical reaction between real gases. I. General thermodynamic relations. J. A. BEATTIE. *Phys. Rev.* 31, 680-90(1928).—From the two assumptions that at infinitely low pressures, the energies of real gases are additive and that the equil. pressure is given by the product of the total pressure into the mol. fraction, there are deduced general thermodynamic equations for the energy, heat content,

entropy, thermodynamic potentials of gas mixts. and the chem. potential of a gas in a mixt. in terms of the independent variables p and T and V and T . Two forms of the mass-action law are deduced, depending upon the choice of p and T or V and T as the independent variables.

BERNARD LEWIS

The application of the third law of thermodynamics to some organic reactions. G. S. PARKS AND K. K. KELLEY. *J. Phys. Chem.* **32**, 734-50 (1928).—The equil. between iso-PrOH, acetone, and H_2 was used to check the third law for org. reactions. The sp. heats were measured for iso-PrOH and acetone for the range $70^\circ K$ to $290^\circ K$. For iso-PrOH the sp. heat varied from 0.172 to 0.308, for acetone from 0.218 to 0.510. The heats of fusion found were: isopropyl alc 21.08 cal.; acetone 23.44. P. and K. carried out the equil. measurements by the dynamic method, using as catalyst finely divided Cu, which had been subjected to 20 oxidations and reductions, the final reduction being at 100° . The temp. varied from 184.3° to 201.8° . The change of entropy for the reaction at 25° from the equil. measurements was 35.9 cal/deg.; from the third law 36.0 cal/deg. The data from the hydroquinone-quinone reaction showed a similar agreement.

ARTHUR FLEISCHER

Observations on the passivity of metals. E. S. HEDGES. *J. Chem. Soc.* **1928**, 969-78, cf. *C. A.* **21**, 1217. —Expts., in which the metal is not removed from the acid, show that Fe passivated by concd. HNO_3 has a protective film of Fe_2O_3 . At 30° , the min. concn. of acid in which Fe becomes passive is 86%. If passive Fe is whirled (3000 r. p. m.) in HNO_3 it becomes active, the "induction period" (about 30 sec.) being the time required for the removal of the film. When heated in the acid the passive metal becomes partially active at 74.5 – 75.5° , and in a sec. transition, occurring at a higher temp., the film is completely destroyed and the metal dissolves violently. The temp. of the first transition is independent of the acid concn., while that of the sec. decreases with decrease in it. No allotropic change takes place during the destruction of the film. Freshly ignited Fe_2O_3 dissolves appreciably at the first transition temp. Cathodic polarization and increase in temp. give periodic phenomena during the activation of passive Fe. Under the proper conditions passivity is shown by all metals, Co, Ni and Cu becoming passive at -11° in 1.42 HNO_3 , while Zn and Mg fail to show it under these conditions, indicating by their behavior that they were between the transition temps. at -11° . When produced by chem. or electrochem. means, passivity is due to the same causes and is exhibited to different degrees dependent upon the protection offered by the film under the conditions. A theory to account for anodic polarization is advanced, being similar to that of Muller (*C. A.* **21**, 3536, **22**, 347; Muller and Noack, *C. A.* **21**, 3784).

J. BALOZIAN

Note on the purity of effluent gas from simple gas generators. J. H. HODGES AND A. M. WHITE. Univ. Michigan. *J. Chem. Education* **5**, 595-6 (1928).—By the method given, the purity at any time can be calcd. as a function of the total vol. of gas that has been delivered. Calcs. show that after a vol. of gas equal to 3 times the vol. of the generating system has been delivered, the issuing gas is 95% pure; after 5 vols. 99.3% pure, etc.

3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

S. C. LIND

The fundamental vibration quantum of the mercury molecule. H. KUHN. *Naturwissenschaften* 16, 352-3(1928).—Rayleigh (*C. A.* 22, 541) has described a Hg_2 absorption spectrum (2340 to 2297 A. U.) consisting of 50 edges at 20 per cm. distance. Kuhn suggests an explanation of this spectrum. the small edge distance represents vibrational quanta of the normal mol. the larger periods (four times the smaller ones) are due to vibrations of the excited mol., several series of each type overlapping. The fundamental vibration quantum of Hg_2 is apparently 20 per cm., in agreement with estd. figures from other mols.

B. J. C. VAN DER HOEVEN

The angular momentum of the nitrogen nucleus. R. DE L. KRONIG. *Naturwissenschaften* 16, 335(1928).—From measurements of Ornstein and van Wijk on the intensities in the N_2 band spectrum it follows that the wt. of the even rotation levels of the higher electron terms has to be multiplied by 2.0 as compared with the wt. of the odd levels. This conclusion gives an angular momentum of the N nucleus of $sh/2\pi$ with $s = 1$. Because this result does not agree with the odd no. (21) of constituents (protons and electrons) of the nucleus each with $s = 1/2$, it is assumed that the identity of these is not completely preserved. An assumption of several N nuclei, all of at wt. 14, is improbable.

B. J. C. VAN DER HOEVEN

Lead isotopes and the problem of geologic time. C. S. PIGGOT. Carnegie Institution of Wash. *J. Wash. Acad. Sci.* 18, 269-73(1928).—The intention is to measure by means of the mass-spectrograph the amt. of Pb produced by radioactive disintegration for the estn. of geologic time. Pb was converted into $Pb(CH_3)_4$. Aston identified isotopes 206, 206, 208 in ratio 4, 3, 7. He also found very small amts. of 203, 204, 205 and 209. $Pb(CH_3)_4$ was prepd from Norwegian bröggerite. The material being lost in transit, more will be prepd. and tried in the mass-spectrograph this summer.

Radioactive haloes. Possible identification of hibernium. A. S. RUSSELL. *Nature* 120, 545-6(1927).—The unexplained haloes discovered by Joly and called hibernium haloes can be accounted for in two ways. First, isolation of radioactive products from minerals by chem. means; second, feeble radioactivity of some of the "end" products.

L. D. ROBERTS

Precision methods in radioactivity. L. BASTINGS. *J. Sci. Instruments* 5, 113-22 (1928).—The gold-leaf electroscope is investigated. Errors caused by certain factors are pointed out and corrections suggested. Consistency in measurements of 1 in 1000 is shown to be possible.

L. D. R.

Theory of subelectrons. THADER PECZALSKI. *Compt. rend.* 185, 49-51(1927).—Beginning with Langevin's equation, a mathematical development is given. L. D. R.

Scattering of electrons by crystals. HANS BETHE. *Naturwissenschaften* 16, 333-4(1928); cf. *C. A.* 22, 538.—The explanation of electron scattering by crystals previously given (with refractive index μ) (cf. *C. A.* 22, 538) is now modified. For electron energies between 160 and 370 v. the value of V (potential energy of electrons inside crystal) is an irregular function of the incident wave-length λ ; the sometimes "grazing" electron beams are in disagreement with the theory; the V values found are too high and not negative. Therefore, instead of relating the electron reflection to the next larger x-ray wave-length it is related to the next shorter one, giving a μ smaller

than unity and V negative (around -15 v.), *i. e.*, acceleration of the electrons instead of retardation on entering the crystal. B. J. C. VAN DER HOEVEN

Catalysis as a mechanical action of electrons. L. V. PISARZHEVSKII. *Ukrainskii Khim. Zhurnal* 1, Sci. part. 1-18(1925).—Catalytic activity of metals is due to freely moving electrons. Adsorption of gases by metals is the result of electrostatic forces between gaseous mols. and a film of free electrons on the surface of metals. Impacts of these electrons on the adsorbed mols. produce their dissocn. and ionization and cause thereby chem. reactions. To a similar action are subjected also the mols. of dissolved gases so that catalytic reactions may take place also within the metallic particles. It has been shown in the lab. of P. that illumination by ultra-violet light of a Pt foil accelerates the catalytic combination of H_2 and O_2 . This is due to photoelectrons which activate not only adsorbed, but also free gaseous mols. Charging of a Pt foil positively or negatively diminishes its catalytic activity by destroying the favorable equil. between negative (O_2) and positive (H_2) ions of adsorbed gases. The thermal decompn. of $KClO_3$ is accelerated not only by metallic oxides but also by metals. Ultra-violet light promotes this catalyzed decompn. at room temp. The activity of metallic oxides and metals is primarily due to an activation and ionization of adsorbed gases which, when desorbed on heating, act on $KClO_3$ by destroying the electronic equil. in its mols. Therefore, as expts. show, the catalysts are active even when placed at a distance of 14 cm. from a sample of $KClO_3$. P. assumes that the catalytic actions of enzymes are due to free electrons within their mols. Confirming are the observations made in his lab. that Pt foil, illuminated by ultra-violet light, causes the inversion of sugar and decomposes albumin into albumoses and peptones. Photoelectrons are the cause of these actions. G. B. KISTIAKOWSKY

The liberation of electrons from a metal surface by positive ions. F. M. PENNING. *Proc. Acad. Sci. Amsterdam* 31, 14-23(1928).—See C. A. 22, 1097. E. H

A novel photoelectric effect of thin alkali metal films. RUD. SUHRMANN. *Naturwissenschaften* 16, 336(1928).—From satn. curves it is shown that on illumination of alkali metal films with Hg 240 μ light satn. appears at a few v. anode potential; on illumination with Hg 436 (close to the red limit of the sensitivity range), however, satn. could not be obtained. The current continued to increase with the potential applied (high vacuum). The effect is more considerable for thin films than for visible compact films. Apparently the electrons excited near the red limit become only partly free, whereas by shorter wave light they are completely liberated. It is assumed that the former are in thermal equil. with the atoms. B. J. C. VAN DER HOEVEN

Effect of the surface conditions on the intensity of reflection of x-rays by quartz. YOSHITARO SAKISAKA. *Japan. J. Phys.* 4, 171-81(1928).—The effects of grinding, polishing and etching of the surface of quartz plate upon the intensity of x-ray reflection from various net-planes were investigated. The surface condition has a great influence on the intensity whether the reflection from a surface or through a plate is concerned; a thin surface layer plays a main role in the reflection even for the latter cases. The change of reflecting power by the surface treatment is interpreted as due to the variation of primary extinction in the surface layer. C. J. WEST

Dispersion and absorption of Röntgen rays. J. A. PRINS. *Z. Physik* 47, 479-98(1928).—P. uses the "equivalent resonators" theory to calc. the dispersion and absorption of Röntgen rays as a function of λ^3 . By means of the Fresnel formula, he shows the influence of the absorption on the reflection. Actual investigations of reflection on a steel mirror give results agreeing with his theoretical expectations. A. L. H.

Spectrochemical studies of hydroxyazo compounds. VI. TAKU UEMURA AND SHOZO Tabei. *Bull. Chem. Soc. Japan* 3, 105-7(1928); cf. C. A. 22, 61.—In hydroxyazo compds., the *o*-hydroxyl group gives rise to 2 bands in their absorption curves, whereas the Me group does not seem to influence the shape of the curve. The expts. included the examn. of benzeneazo-*p*-cresol, *p* nitrobenzeneazo-*p*-cresol, *o*-, *m*- and *p*-tolueneazo-*p*-cresol and *o*- and *m*-nitrobenzeneazo-*p*-cresol. A. L. HENNE

The origin of the helium spectrum. I. S. ORNSTEIN AND H. C. BURGER. *Physica* 8, 111-8(1928).—The intensity of the He spectrum, excited in a capillary (2 mm. diam., 1 cm. long) by hot or cold cathode (440 to 1200 v., 0.3 to 40 mm. pressure, 0.03 to 250 milliamps.) was examd. by a thermoelement. From the 3P lines at low c. d. it was found that the no. of quantum jumps ending at this level was only 5.6 to 24% of the no. of transitions initiating at this level. Curves are shown of the intensity I of $^3P^4S$ ($\lambda = 108,300$) as a function of pressure (p) and c. d. (i); at high p (30 mm.) it reaches a const. level (self absorption). The I/i versus i curve at 30 mm. slopes down at $i > 2$ milliamps.; also for $i < 2$ milliamps. except for the very smallest pressures. The abs. intensity perpendicular to the capillary per unit spatial angle is 1.48×10^6 erg

per sec. and sq. cm. for $p = 1$ mm. Hg, $i = 10$ milliamps; i. e., per atom 80 quanta per sec. This figure corresponds to a ratio of 3P and ground level atoms of 10^{-4} . From the heating up of the capillary was derived a potential drop through the capillary of 45 to 75 v. per cm. At very low pressures the ratio of intensity of triplet and corresponding singlet lines decreases considerably below 3 (previously found). At sufficiently low pressure the triplet spectrum will probably be absent. It is assumed that the triplet lines are brought about by collisions with ground level atoms. At higher pressures (ratio 3) the duration of the mean free path of an excited atom will become of the order of the radiation period (10^{-8} sec.).

B. J. C. VAN DER HOEVEN

Missing lines in optically excited iodine fluorescence band spectra. PETER PRINGSHEIM. *Naturwissenschaften* 16, 315-6(1928).—The dropping out of every other line in the I_2 -He spectrum excited by Hg λ 5461 found by Wood and Loomis (C. A. 22, 1729) can be related possibly to a restriction on quantum transitions formulated by Hulthén (C. A. 22, 1100). Both phenomena depend on the improbability of transitions between conditions characterized by symmetric and antisymmetric proper functions.

B. J. C. VAN DER HOEVEN

Relative intensity of spark and arc lines in the spark spectra of various elements. GISABURO NAKAMURA. *Japan. J. Phys.* 4, 165-9(1928).—The relative intensity of spark and arc lines in the spark spectra of various elements was studied in relation to the variation of the material used as the opponent electrode. The intensity measurement was made with a registering microphotometer of the Moll type. The results show that the magnitude of intensity ratios of the arc to the spark lines is generally in the order of the no. of the outermost electrons in Bohr's atom model of the element used.

C. J. WEST

Molecular velocities, states of excitation and probability of transition into a degenerate gas. II. E. PERSICO. *Atti accad. Lincei* [6], 7, 235-7(1928); cf. C. A. 22, 1880.—Mathematical. In the earlier work formulas are given for the distribution of forces between mols. and the distribution of the mols. in various quantic states. These formulas are now applied to the 2 extreme cases of *slight degeneration* and *complete degeneration* and to the detn. of the way in which the Einstein law must be modified to show the probability of transition from one-quantic state to another.

C. C. DAVIS

Correction and addition to "Refraction in gases in the visible and infra-red (6.76μ) and determination of the characteristic vibration of calcite at 6.76μ ." MARTIN RUSCH. *Ann. Physik* 85, 581-6(1928); cf. C. A. 17, 2234.—The wave lengths of the lines Hg 1, Hg 2, Hg 3 and H α are corrected to vacuum. The center of gravity of the calcite oscillation field is located at $\lambda_{10} = 760\text{mm.} = 67,628.5$ A. U. The values for the refractive indices in air and A in the region 546 to 6763μ are 0.02 to 0.03% higher than those previously reported. Dispersion consts. in the Helmholtz-Ketteler formula vary with the spectral region.

J. E. SNYDER

A method for measuring spectral photographs. WILHELM HIRSCHHEL. *Z. Physik* 48, 293-4(1928).

W. F. MEGGERS

The line spectra of oxygen. C. MIHUL. *Ann. phys.* 9, 261-379(1928).—The complete results of wave-length measurements, Zeeman-effect observations, and spectral-line classifications are given for the O II and O III spectra (cf. C. A. 22, 359, 541). The sepn. of lines belonging to different spectra of O is obtained by studying the variations of the lines as a function of the elec. discharge through Geissler tubes contg. the gas. By varying the pressure of the gas a further subdivision of lines into 2 groups is possible in each spectrum, one group consists of sharp lines and the other of diffuse lines. Altogether 428 lines of the O II spectrum (2072.23 A. U. to 6910.75 A. U.) and 315 of the O III spectrum (2045.41 A. U. to 5592.21 A. U.) are measured, and a third list of 76 lines (2449.36 A. U. to 3411.76 A. U.) belonging to still higher-order spectra, probably O IV, is given. The Zeeman effect is studied for 111 lines of the O II spectrum and 19 of the O III spectrum. The structure of the O III spectrum is established with the identification of singlet, triple and quintet terms, combinations among which account for 112 lines. The classification of O II lines has been extended, 220 lines are accounted for by doublet and quartet terms. Discovery of the doublet-quartet inter-combinations confirm the assignment by Bowen of certain "nebular" lines to the O II spectrum. The electron configurations responsible for the terms in both spectra, O II and O III, are discussed.

W. F. MEGGERS

The influence of energetic factors on the structure of spectra. TR. NEGRUSCO. *J. chim. phys.* 25, 308-19(1928).—The general characteristics of flame, arc and spark spectra are reviewed and a contribution to the study of condensed and oscillating spark discharges is made with the aid of a cathodic oscillograph. The disappearance of

high-potential lines when self-induction in the elec. circuit is increased is simply explained by the diminution of the effect of the initial discharge. W. F. MEGGERS

Pressure broadening of absorption bands. M. C. TEVES. *Z. Physik* **48**, 244-58 (1928).—The effect of mixing an inert foreign gas with a mol. vapor upon the absorption spectrum of the latter is studied with N_2 up to 150 atm. pressure as the foreign gas and C_6H_6 and *o*- and *p*- $C_6H_4Cl_2$ as the vapors. Four phenomena were noted: (1) At 5 atm. N_2 pressure the rotation lines of the vapors broaden. (2) The band heads widen also; they are measurably displaced redward by 20 atm., and at 150 atm., they are shifted 30 cm^{-1} . (3) A progressive increase of the absorbed energy is seen with pressure, *e. g.*, in benzene with 150 atm. N_2 the absorption is what one would find in pure vapor at about 5 times greater partial pressure. (4) New bands not observed in pure vapor make their appearance with the addn. of high-pressure N_2 . For these effects up to pressures of 10 atm. the collision-damping theory of Lorentz gives a satisfactory explanation, but the effects occurring with higher pressures appear to be more or less analogous to the Stark effect on atoms, although no definite statements as to the nature of their actions can be made. W. F. MEGGERS

The variation of the absorption coefficient of fluorite and quartz with temperature in the short wave infra-red. O. REINKOBER AND H. KIPCKE. *Z. Physik* **48**, 205-15 (1928).—The absorption coeffs. of fluorspar are measured in the wave-length interval 8 to 12.5μ and of quartz in the region 3 to 6.5μ , to det. their dependence upon temp. in the range from room temp. to that of liquid air. The absorption decreases with lowering temp. but in such a way that extrapolation to zero abs. would still give an absorption coeff. different from zero. W. F. MEGGERS

Investigations of the anomalous dispersion of excited gases. IV. Anomalous dispersion of hydrogen; true intensity ratio of the hydrogen lines H_α and H_β . AGATHA CARST AND RUDOLF LADENBURG. *Z. Physik* **48**, 192-204 (1928).—Anomalous dispersion at H_α and H_β produced by strong excitation of atomic H with direct current of 0.2 to 1 amp./cm.² is photographed and studied by the Puccianti method of horizontal interference bands in a Jamin interferometer as modified by Rogestwensky (cf. *Z. Physik* **48**, 151 (1928)). The ratio of the number of dispersion electrons N_α/N_β is found to be 4.7. This ratio is equiv. to that of the transition probabilities according to the quantum-theory dispersion formula but this theoretical ratio is 5.37. The difference is thought to be somewhat greater than the error of measurement; it may be ascribed to the effect of negative dispersion, which may be appreciable with strong excitation of H. W. F. MEGGERS

Radioactive materials. A. FISCHER. *Brit.* **278,347**, Sept. 29, 1926. Ra or mesothorium or their salts are incorporated with metals or alloys such as Pt or Au which are not easily oxidized and the composite material may be hammered, rolled or drawn into sheets or wires for use in therapeutic application or for other purposes. The metal may be preliminarily highly heated and the radioactive material added in the form of a salt together with reducing agents such as glycerol, sugar or citric acid. Various modifications are described.

4—ELECTROCHEMISTRY

COLIN G. FINK

Electrochemistry and electrometallurgy. W. W. F. FRENCH. *J. (Brit.) Inst. Elec. Eng.* **66**, 537-58(1928).—A detailed review. C. G. F.

Yearly review on the electrical developments in the iron and steel industry. W. H. BURR. *Iron Steel Eng.* **5**, No. 6, 211-7(1928). F. H.

Molybdenum resistance furnace. P. W. DÖHMER. *Z. Ver. deut. Ing.* **72**, 556 (1928).—A Mo wire winding is used in this tube furnace, protected from oxidation by MeOH vapor. Temps. of 1500° and more are maintained for several hrs. without oxidation of the winding. H. STOERTZ

Electrical conductivity of aluminum. M. BOSSARD. *Schweiz. elektrotechn. Ver. Bull.* **18**, 113-22, *Science Abstracts* **30B**, 351(1927).—The influence of small additions of Fe, Si, Ti, Cu, Zn and Cd upon the cond. of Al is considered. Results are also given showing the effect of heat treatment and cold work. H. STOERTZ

Duriron as an insoluble anode for gold cyanide solutions. M. DEKAY THOMPSON, COSGROVE, SARROS, HAUSEISEN AND DINAN. *Mass. Inst. Tech. Trans. Am. Electrochem. Soc.* **54** (preprint), 5 pp.(1928).—Duriron was found to withstand corrosion well in the cyanide soln., and would make a better anode than Pb in the electrolytic extn. of gold. The corrosion of Duriron was also detd. in solns. of chloride, chlorate, hydroxide, chromium sulfate and manganate, but was not found suitable for use in any of these. C. G. F.

Electrolytic detinning of copper wastes. V. V. STENDER AND A. A. IVANOV. *Z. anorg. allgem. Chem.* **169**, 399-404(1928).—Tinned Cu waste such as cable or wire can be electrolytically detinned in NaCl or HCl solns., the material to be detinned being the anode. With a 1.2% NaCl soln. and a c. d. of 50 amp./sq. m. the Cu_2Cl_2 formed after the Sn is removed adheres to the anode. The process lasts for about 4 min., the voltage starting at 1.3, rising slowly to 1.75 in 3 min. and rapidly to 2.04 in 4 min. Best results are obtained in a 3% HCl soln. with a c. d. of 500 amp. per sq. m., the energy consumption being about 0.01 to 0.04 kw hr. per kg. of detinned material. About 75% of the Sn is found in the soln. and is easily recovered as SnCl_2 . The detinned Cu is quite pure. The voltage varies from 2.4 to 2.65. H. STOERTZ

The future significance of electrolysis in zinc production. ALFRED MARCUS. *Metall u. Erz* **25**, 133-1(1928).—A discussion. J. BALOZIAN

Maxima on current-voltage curves. I. Electrolysis of nickel salt solutions with the mercury dropping cathode. N. V. EMELIANOVA AND J. HEYROVSKY. **II. The maxima on the polarization curves of uranyl salt solutions.** P. HERASYMENKO. **Electroreduction of uranyl salts by means of the mercury dropping cathode.** P. HERASYMENKO. *Trans. Faraday Soc.* **24**, 257-79(1928); cf. *C. A.* **22**, 1282, 1283. Joint discussion of the above papers. *Ibid.* 279-81. —In answer to a question regarding the gradual increase in applied e. m. f., Heyrovsky stated that the cathodic potential between the soln. and the Hg drops was constantly and regularly increased with increasing applied e. m. f.; the sudden increase in current caused by very small changes of applied e. m. f. was due to an increase in the deposition of cations, which formed a very dil. amalgam necessary to maintain the reversible potential at the cathode, given by $\pi = (RT/nF) \log (C_{\text{amalg.}} K_{\text{Me}} / [Me^n])$. The flat parts of the curve were "satn. currents" due to diffusion of cations through the exhausted soln. layer at the cathode; at these e.m.f.s. the amalgam concn. could not increase any further and the cathode potentials were there due to "concn. polarization." Herasymenko pointed out that the sensitivity of estn. of small quantities of ions could be increased by an increase of temp. and an increase in the rate of dropping. H. STOERTZ

Preparation of catalyst by electrolytic corrosion of nickel. SADA OIKI. *Ind. Eng. Chem.* **20**, 472-3(1928); cf. *C. A.* **22**, 1282. —A very active catalyst for oil hardening and hydrogenation of naphthalene is prepd. by electrolyzing a soln. of NaOH with a Ni anode, black nickelic hydroxide being pptd. The best concn. of electrolyte is between 0.1 and 0.05N, for NaOH, KOH, Na_2CO_3 and K_2CO_3 , and the efficiency is increased by addition of 5-10 cc. alc. per l. A current density of 0.01 amp./sq. cm. at 4 to 7 v. gives good results. H. STOERTZ

Electrodeposition of tellurium. FRANK C. MATHERS AND HOMER L. TURNER. *Indiana Univ. Trans. Am. Electrochem. Soc.* **54** (preprint), 8 pp.(1928).—Te can be electrodeposited in a firm, smooth condition upon Pb cathodes from solns. of TeO_2 in mixts. of HF and H_2SO_4 . Solns. of TeO_2 in HNO_3 or in HCl give much less satisfactory deposits. All Te deposits are brittle; consequently they offer little encourage-

ment for use in commercial electroplating. The deposited Te is free from Se, thus giving a method of refining metallic Te. The Se remains as a slime on the anode.

C. G. F.

P. The common properties of addition agents in electrodeposition. V. Application of the complex cation theory of crystalloidal addition agents to base metals. (Lead) 1. GIICHIRO FUSEYA AND KWANJI MURATA. *J. Soc. Chem. Ind. (Japan)* 31, 323-31 (1928); Suppl. binding 79-80 (In English.); cf. *C. A.* 20, 2793; 21, 1597.—The formation of complex cations between glyocoll added as addition agent and Pb or Zn ions, was studied by means of a spectroscopic method (cf. *C. A.* 16, 2075, 3588) and an electro-metric method. It was found by the spectroscopic method that the mixed soln. of PbSiF_6 or $\text{Pb}(\text{ClO}_4)_2$ and glyocoll extended its absorption bands toward longer wave lengths in the ultra-violet zone than its components did, which indicated that there was complex formation in the both of these mixed solns. With the mixt. of ZnSO_4 and glyocoll no such greater absorption occurred. $\text{Fe}_2(\text{SO}_4)_3$ and $\text{Cr}_2(\text{SO}_4)_3$ form complex compds. with glyocoll, but none was detected spectroscopically in the case of NiSO_4 and CoSO_4 . From the measured values of e. m. f. of the cells of the types: Pb, $\text{Pb}(\text{NO}_3)_2$ (0.1N), $\text{Pb}(\text{NO}_3)_2$ (0.1 N) + glyocoll(M), Pb, and the degree of ionization of salt solns. calcd. from cond. ratios, the degrees of complex formation were computed. About 94% of Pb and about 75% of Zn were in complex form in their 0.1N solns. on addition of 1 mol. of glyocoll. The complex ions formed were found to be cations by the migration expts. VI. Application of complex-cation theory of crystalloidal addition agents to base metals. 2. GIICHIRO FUSEYA AND RYOJI YUMOTO. *Ibid* 331-42 (1928); Suppl. binding 80-1 (In English.).—No increase of the wt. of the deposits and no decrease of the crystal sizes was found in the electrodeposition of Pb and Zn from $\text{Pb}(\text{NO}_3)_2$, PbSiF_6 and ZnSO_4 solns. with the addition of glyocoll. The author concluded that in the electrodeposition of these base metals, the glyocoll does not behave as an addition agent, though it forms complex cations with these metallic ions.

Electroplating on aluminum and its alloys. HAROLD K. WORK. *Metal Ind. (N. Y.)* 26, 261-3 (1928).—See *C. A.* 22, 1915.

E. H.

The electrolysis of water by alternating current. A. P. ROLLET. *Compt. rend.* 185, 457-60 (1927).—R. studied the behavior of different polished metals during the electrolysis of H_2O using a. c. of 50 cycles. Figures and curves for the limiting current density that may be used with various metals and electrolytes of a given concn. are given. Further studies are being made.

A. D. SPILLMAN

Storage batteries in relation to modern supply of electric lighting and power. I. C. MCKINNON. *J. Inst. Elec. (Brit.) Eng.* 66, 453-500 (1928).—A very full description of installation requirements, maintenance, etc.

C. G. F.

The origin of voltaic electricity: the contact vs. chemical theory before the concept of electromotive force was developed. C. J. BROCKMAN. Univ. of Georgia. *J. Chem. Education* 5, No. 5, 549-55 (1928).

E. H.

Experiments which contradict the Féry theory of the lead accumulator. ERNESTO DENINA AND ARTURO FRATES. *Notiz. chim.-ind.* 3, 211-5 (1928); cf. D., *C. A.* 20, 3135.—A series of expts. was carried out to det. the potential of some couples of Pb compds. in H_2SO_4 , where the Pb was in different states of oxidation. The couples: $\text{PbO}_2/\text{PbSO}_4$ and PbSO_4/Pb are stable, whereas the couple PbO_2/Pb cannot exist in equil., and its potential can be detd. only by calcn. The causes of errors which influence the measurements are discussed, and the influence of local couples and of impregnation by acid are pointed out. These latter factors account for the contradictory results often encountered in such measurements. The true potentials of the couples: $\text{PbO}_2/\text{PbSO}_4$ and PbSO_4/Pb correspond to those of the plates of the Pb accumulator. The potential of the couple: $\text{PbO}_2/\text{PbSO}_4$ in H_2SO_4 (d. 1.22) at 23° with respect to a normal $\text{Hg}-\text{Hg}_2\text{SO}_4$ electrode in N H_2SO_4 is 1.03 v., which is identical with the positive plate of the Pb accumulator under the same conditions. The couple: Pb/PbSO_4 , under the same conditions has a potential of about 1.03 v., corresponding to the negative plate of the Pb accumulator. The expts confirm the measurements of Streintz (*W. A.* 41, 344 (1890)), Strecker (*Elektrotechn. Z.* 40, 624 (1891)), Joubert (*Trans. Am. Electrochem. Soc.* 37, 641 (1920)) and Liagre (*Bull. soc. chim. ind.* Jan. 26, 1927) and the calcs. of Allmand (*Applied Electrochemistry*, *C. A.* 20, 1567, 233), which seem to be an incontrovertible proof of the constitution of the plates of the Pb accumulator. The expts. therefore confirm the theory of double sulfation (cf. Mazza, *C. A.* 21, 3026).

C. C. DAVIS

Calcing coke (U. S. pat. 1,671,673) 21. Device for supplying N or other inert

gases to oil-filled transformers (U. S. pat. 1,671,492) 1. Coating metals with Al or Mg or their alloys (Brit. pat. 278,415) 9. Apparatus for casting solutions of celluloid or other materials into sheets (U. S. pat. 1,672,403) 1.

Electric battery. A. N. HAZLEHURST. Brit. 277,798, Sept. 13, 1926. In a cell with electrodes of PbO_2 and Cu immersed in an electrolyte of H_2SO_4 or a sulfate soln., the Cu may be coated with solder where it emerges from the electrolyte or otherwise protected from contact with the air at the surface of the electrolyte.

Dry-cell electric battery. A. T. BALDWIN (to National Carbon Co., Inc.). U. S. 1,671,566, May 29. Structural features.

Electrolytic cell for producing hydrogen and oxygen from caustic soda solution. A. E. KNOWLES. Brit. 278,447, July 9, 1926. The cell cover has ventilating traps which permit passage of air either way but remove CO_2 from entering air, *e. g.*, by use of soda lime in the traps. Various structural features are described.

Light-responsive electric cell. P. H. GRIGER (to Westinghouse Brake & Saxby Signal Co.). Brit. 277,610, Sept. 14, 1926. A plate of Cu coated with a layer of Cu_2O may be connected with terminals and placed under a glass plate through which the light impinges.

Storage-battery separator. T. A. WILLARD. U. S. 1,671,335, May 29. Structural features.

Apparatus for dipping storage-battery plates in acid. H. W. LORMOR (to Willard Storage Battery Co.). U. S. 1,672,327, June 5.

Depolarizer for electric dry-cell batteries. A. J. BRIGGS (to National Carbon Co., Inc.). U. S. 1,671,401, May 29. Structural features.

Electrodeposition of repeat designs on metal coatings for walls, doors, furniture, etc. S. DELANGE. Brit. 278,405, June 4, 1926. An app. is described.

Electroplating apparatus suitable for producing continuous metal strips. E. R. ARMSTRONG (to E. I. du Pont de Nemours & Co.). U. S. 1,672,402, June 5.

Salt. E. G. R. ANGEL. Can. 277,095, January 17, 1928. Pure table salt is made from the saliferous caustic liquor resulting from electrolysis of alkali chloride solns. by evapg. the electrolyzed liquor, sepg. the resulting salt crystals from the liquor and washing and drying the crystals.

White lead by electrolysis. R. S. CARRERAS. Brit. 277,723, May 17, 1926. A soln. of $NaClO_2$ or other suitable salt, satd. with CO_2 , is electrolyzed in a single-chamber cell; the electrolyte is withdrawn slowly, resatd. with CO_2 and returned to the cell. Details of size and spacing of the electrodes, etc., are given.

Beryllium and its alloys. SIEMENS & HALSKE A.-G. Brit. 278,723, Oct. 7, 1926. Be and its alloys are obtained by electrolysis of a molten mass contg. Be fluoride or oxyfluoride or both, further quantities of which are added as the electrolysis proceeds. Details are given for the production of alloys. The process may also be used for plating.

Electrolytic condenser. E. W. ENGLE (to Fansteel Products Co.). U. S. 1,672,714, June 5. A filmed electrode such as Al is used with an electrolyte comprising an "ionogen" such as $NaHCO_3$ dissolved in glycerol or other suitable alc.

Obtaining aluminum electrolytically. METALLBANK UND METALLURGISCHE GRS., A.-G. Brit. 277,640, Sept. 18, 1926. In the electrolysis of Al_2O_3 in a flux such as cryolite, Al_2O_3 is used which has been obtained by rapidly cooling the molten material, *e. g.*, after preliminary heating to 1300–2000°. The product dissolves easily in the flux even when in granules as large as 3 mm.

Thermostatically controlled electric annealing furnace. AKT.-GRS. BROWN, BOVERI, BT CRE. Brit. 278,352, Sept. 30, 1926.

Electric induction furnace. SIEMENS & HALSKE A.-G. Brit. 277,361, Sept. 11, 1926. The induction coil is enclosed in a refractory casing which may be formed of zircon, carborundum, corundum or highly burnt clay and immersed in the furnace charge. Various structural features are described.

Electric induction furnace. SIEMENS & HALSKE A.-G. Brit. 277,352, Sept. 11, 1926. The induction coil is placed in an annular depression in the furnace hearth.

Electric melting furnace. E. G. T. GUSTAFSSON. Brit. 278,006, Sept. 27, 1926. A furnace suitable for producing Fe or Fe alloys such as an alloy of Fe with 13–15% Cr employs a slag bath and is provided with adjustable electrodes so that the combined arc and slag resistance per electrode is at least 0.02 ohms. The compn. of the charge may be varied to give a conductive slag to enable long arcs to be used. Ferro-Si, ferro-Al-Si or Al, with or without C, or C alone, may be used as reducing agents. Al, Zn and other metals also may be produced in the furnace.

Electric resistance furnace. D. L. SUMMEY. U. S. 1,671,794, May 29. Structural features.

Electric resistance furnace. H. L. WATSON (to General Electric Co.). U. S. 1,672,667, June 5.

Electric vacuum furnace. G. D. BAGLEY (to Kemet Laboratories Co., Inc.). U. S. 1,671,461, May 29.

Electric vacuum furnace. M. D. SARBAY (to Kemet Laboratories Co., Inc.). U. S. 1,671,451, May 29.

Electric resistance. G. EGLY (to Gebrüder Siemens & Co.). U. S. 1,671,469, May 29. A resistor is formed of silit with a layer of Ag on its contact terminals, a coating of Cr-Ni alloy on the Ag and a layer of Al on the Cr-Ni alloy.

Electric oven. F. H. McCORMICK (to Edison Electric Appliance Co.). U. S. 1,672,724, June 5. U. S. 1,672,725 also specifies structural features of elec. heaters.

Electric tunnel kiln. T. C. PROUTY and W. O. PROUTY. U. S. 1,671,742, May 29.

Rectifier for alternating current. M. SINGELMANN. Brit. 278,731, Oct. 6, 1926. Layers of substances such as Cu pyrites crystals and zincite crystals are placed between pairs of metal plates.

Rectifiers for alternating currents. G. F. MARTIN (to Metropolitan-Vickers Electrical Co., Ltd.). Brit. 277,684, Sept. 16, 1926. In a device of the Cu-Cu oxide type, a neutral contact with the oxide coating on the Cu elements is formed by reducing a portion of the oxide coating to form a cond. element of reduced Cu. Details of procedure are given.

Rectifiers for alternating current. S. RUBEN. Brit. 277,405, June 9, 1926. Dry surface-contact rectifiers are formed with electropositive elements in solid integral form and electronegative elements in pulverulent form. The former may comprise Ta, Cb, Sb and Bi and the latter Mn oxides, Fe oxides, V oxides or PbO₂. The electropositive element is preferably provided initially with an oxide coating which may be formed electrolytically by use of NH₄ borate as electrolyte. Cf. C. A. 22, 1736.

Use of copper-copper oxide rectifiers for supplying high-tension direct current to gas-purifying plants. SIEMENS-SCHUCKERTWERKE A.-G. Brit. 278,710, Oct. 5, 1926.

Loaded electric signaling conductors. V. E. LEGG (to Electrical Research Products, Inc.). Brit. 278,705, Oct. 6, 1926. The central conductor and the loading material are spaced apart by an intervening layer of inert material such as fused Al₂O₃, SiC, kaolin, quartz or dehydrated talc.

Electric system for protecting surface condensers or other metallic parts from corrosion. F. VON WURSTEMBERGER. U. S. 1,671,173, May 29.

Electric system for preventing corrosion of water mains, etc. E. CUMBERLAND. Brit. 277,417, June 15, 1926.

Electric vacuum tubes. A. LEDERER. Brit. 278,019, Sept. 27, 1926. To reduce the potential drop in tubes contg. rare gases, a mixt. of compds. of alkali metals with reducing agents is introduced into the tube and heated, before or after sealing, so that alkali metal vapor is freed and deposited on the wall of the tube. A mixt. of K₂O and Mg may be heated on a Ni electrode.

Ozone. SIEMENS & HALSKE A.-G. Brit. 277,651, Sept. 14, 1926. Ozone is formed by an elec. discharge in a tube filled with glass beads or other pulverulent or granular material which is inert to the gas.

Precipitating metals on an incandescent body. A. E. VAN ARKEL and J. H. DE BOER (to Naamlooze Vennootschap Philips' Gloeilampenfabrieken). U. S. 1,671,213, May 29. Hf may be pptd. on W wire by heating the latter to incandescence in an atm. of Hf iodide; similarly, other metals such as Zr may be deposited on W.

Electric incandescent lamps. F. ECKHARDT and M. HOHNKAMP. Brit. 278,348, Sept. 30, 1926. In devices for maintaining the circuit when one of a no. of lamps connected in series fails, a resistance is used composed of ores such as pyrites, glances or blends, which may be mixed with metal oxides or other suitable substances.

Electric incandescent lamps. M. PIPKIN (to British Thomson-Houston Co., Ltd.). Brit. 277,695, Sept. 20, 1926. A diffusing coating applied to bulbs may comprise metallic oxides, sulfides, silicates or other compds. which can be dissocd. by heat to form a substance of the desired color, e. g., ferric or chromic chlorides or hydroxides. These may be applied to etched surfaces of bulbs or similar articles.

Filaments for electric incandescent lamps. R. STEWART (from Neue Glühlampen Ges.). Brit. 277,634, Sept. 18, 1926. Non-sagging filaments are produced by mech. deforming wire of single-crystal or long-crystal structure, either at sepd. points or continuously, partially to destroy the grid structure. The wire is treated cold and does not require heat treatment.

Resistances for use with electric incandescent lamps. F. ECKHARDT and M. HÖHNKAMP. *Brit.* 277,961, Sept. 27, 1926. A resistance element for use in devices for maintaining the circuit when one of a number of lamps connected in series fails is formed of a metal oxide such as Fe_2O_3 , which is not decompd. when heated.

Mercury vapor lamp with high emission of ultra-violet rays. H. GEORGE (to Hanovia Chemical & Mfg. Co.). U. S. 1,671,109, May 29. Structural features.

5—PHOTOGRAPHY

C. E. K. MEES

Contribution to the theory of photographic exposure. I. SILBERSTEIN. *Phil. Mag.* [7], 5, 464-89(1928).—Discussion of the quantum or light dart theory of photographic exposure (*C. A.* 16, 3441; 17, 2392) and Toy's criticism (*C. A.* 17, 1597). Since the quantum theory cannot explain the expts. (*i. e.*, the number of grains of a given size made developable by a given exposure) completely, S. also investigates the implications of theories based on essentially different assumptions and concepts (nuclear theories). Here the chance factor which in the quantum theories is thrown upon the incident light, making the development of a grain of silver halide depend upon the chance of it being hit by one or more light-darts, is transferred to the grains themselves, which are assumed to contain, before the exposure, certain heterogeneities of a foreign substance (Ag_2S), accompanied by some free Ag atoms, or incipient nuclei distributed haphazardly among them with respect to number as well as size. The part played by the incident light (whose possibly discrete structure becomes irrelevant) consists, then, in maturing or completing these nuclei by depositing upon them and around them further free Ag atoms and thus increasing them until they become large enough (*i. e.*, developable). The mathematical treatment of these ideas is developed and by comparison with expts. is favorable to the nuclear theory (cf. Sheppard, Trivelli and Loveland, *C. A.* 19, 2456).

GEORGE GLOCKLER

Tentative hypothesis of the latent image. I, II. A. P. H. TRIVELLI. *J. Frank. Inst.* 204, 649-62(1927); 205, 111-22(1928); cf. *C. A.* 22, 547.—Based on the investigations of Gudden and Pohl concerning photoelectric conduction in crystals, also on the work of Wightman and Quirk on the action of H_2O_2 on high-speed plates, and on Clark's expts. on sensitivity and latent image, which indicate that the sensitizing speck of high-speed photographic emulsions, as well as the latent image, may consist of both Ag and Ag_2S , a possible elementary photoelectric cell on the surface of the Ag halide grains is pictured. A mechanism of the action of this cell in producing sensitivity is described. Assuming that optical sensitizing is due to the increasing of photo-conductivity for longer wave lengths, a mechanism is suggested by which either certain dyes or silver sulfide could act as an optical sensitizer to increase the sensitivity of Ag halide for wave lengths greater than blue. This mechanism is based on the assumption that dye specks, or finely divided Ag, or Ag_2S , lying in the field of the photoelectric cell $\text{Ag}-\text{AgBr}-\text{Ag}_2\text{S}$, increases its photo-conductivity above that of such a cell without one of these substances present, to wave lengths longer than the blue. The range and intensity of the color sensitivity are dependent not only on the absorption of light of given wave lengths, but also on the size and distribution of the specks of impurity. Also in *Phot. J.* 68, 14-20(1928).

E. P. WIGHTMAN

The latent image and development. II. J. VOGLER and W. CLARK. *Brit. J. Phot.* 74, 670-1(1927).—It is generally accepted that the latent image consists of metallic Ag with perhaps Ag_2S . Since both these are possibly present in the unexposed grain, light must alter their proportions and possibly their condition. V. and C. suppose that light forms a stable space lattice of reduced Ag upon which Ag liberated by the developer is able to deposit. Peptization by the developer and adsorption contribute to the effect. The stability of the light-produced Ag lattice is increased by the presence of AgBr . Development after fixation requires longer exposure because the stabilizing grain surface is no longer present to repress peptization of the latent image by the developing agent.

G. E. MATTHEWS

The law of photographic blackening for a spark source. M. HANOT and H. GUILLEMET. *Compt. rend.* 186, 1048-50(1928).—At the single intensity used in the expt. the gamma for nonintermittent as well as intermittent (spark) exposure is the same in the wave-length band 415 to 537 $\mu\mu$.

G. CHAMBERS

The ripening process. LÜPPO-CRAMER. *Z. wiss. Phot.* 24, 291-8(1926); *Science Abstracts* 30A, 279; cf. *C. A.* 19, 1230; 20, 23; 21, 3568, 3839.—The prepn. of AgBr

emulsions by using bromides other than KBr is described. Ag_2SO_4 was used also in several emulsions and their behavior studied during ripening. In all cases the result was an emulsion with very low speed. Possible explanations are suggested for this lower sensitivity by adsorption of gases on the AgBr surface. E. R. BULLOCK

Application of copper salts in the carbro process. F. J. TRITTON. *Phot. J.* 67, 140-5(1927).—Cu salts may replace the ferricyanide of the usual carbro bleach yielding good prints except for difficulty in sepp. the bromide from the tissue. The formula contains CuCl_2 , NaCl and $\text{K}_2\text{Cr}_2\text{O}_7$. CuCl is formed, which is sol. in the salt and can disperse into the tissue where it reacts with the $\text{K}_2\text{Cr}_2\text{O}_7$, giving possibly basic cupric chromate. K. C. D. HICKMAN

The addition of photographic densities. G. A. TIKHOV. *Bull. acad. sci. union rep. soviet social* 1927, 511-32.—T. develops a method of finding the photographic magnitude of stars by means of two extra-focal star photographs. The two plates are exposed for the same time but at different distances from the focal point of the telescope and the magnitudes based on the difference between the densities of the unknown star as compared with the differences in the case of a star of known magnitude. From these he develops a method of calcg. the magnitude from the densities of overlapping images and also from the characteristic curve of the photographic plate. The article is in French. V. C. HALL

Testing gelatin. R. LUTHER. *Phot. Ind.* 25, 494-5(1927).—A colorimetric method is described using alkaline lead oxide for the detn. of the S content of gelatin. L. comments on Sheppard's investigations and states. "It is well known to many of my colleagues, that independently of the investigations of the Kodak Laboratory, on the role of Ag_2S formation in the ripening process, for some time I have had the idea that the chem. reactions in the ripening of gelatino-Ag halide emulsions consisted of a very slight sulfurization of the AgBr grain, sufficient only for the formation of solid solns. of Ag_2S in the bromide." M. A. YERGER

Hypersensitizing and ultrasensitizing of positive plates. P. GUILLEMINOT. *Rev. franc. phot.* 8, 190-1(1927); *Bull. soc. franc. phot.* 69, 234-7(1927).—If an ammoniacal soln. of AgCl is added to the regular hypersensitizing bath of alc. and dye, the color sensitivity of the emulsion is greatly increased. A very slow positive non-color sensitive emulsion, thus treated, becomes as sensitive as a rapid negative emulsion. Pinaverdol and chlorochrome give the best results. C. E. IVES

Molecular constitution of organic desensitisers. TUNBO SUZUKI AND SHINNOSUKE FUKUSHIMA. *J. Soc. Chem. Ind. (Japan)* 31, 257-64, Supplemental binding (In English.) 67-68B(1928).—Many derivs. of diphenylamine have strong desensitizing action. Exams. of desensitizing action of many org. compds. showed that the fundamental mol. constitution of org. desensitisers is the Ph_2N group, and that the introduction of an amino or a nitro group strengthens the desensitizing power. 4- or 10-Hydroxy-aminodiphenylamines are desensitizer-developers; they show desensitizing action in weak solns. and developing action in concd solns. The desensitizing action was considered to be due to oxidation of AgBr, which is induced by the oxidation of desensitizer by the atm. O. The curves of desensitizing degree plotted against the concn. of the desensitisers were of exponential form, contrary to the result of Crabtree and Dundon. Y. NAGAI

Mercury prints. A. STEIGMANN. *Phot. Ind.* 25, 390-1(1927); *Phot. Rundschau* 64, 163-4(1927).—Carefully selected and sized paper is sensitized with a mercuric chloride-iron oxalate prepn., developed in a mercuric chloride-metol developer, and toned in Senol. S. suggests the process as a substitute for Pt prints. It is of interest from theoretical considerations. M. A. YERGER

Silver xanthate. A. REYCHLER. *Bull. soc. chim. Belg.* 37, 165-7(1928).—Silver xanthate is obtained as a yellow ppt. from AgNO_3 and K xanthate. It is also obtained by leaving AgBr, AgCl or AgI for a day in a soln. of K xanthate. H_2O hardly wets it. Dil. HCl or H_2SO_4 does not act upon it, even at 100° . HNO_3 oxidizes it, yielding black Ag_2S . $\text{HNO}_3 + \text{HCl}$ yield AgCl. Concd alk. solns. blacken it. It is not acted upon by $\text{Na}_2\text{S}_2\text{O}_3$. KCN dissolves it, but it is reprecip. therefrom by acids. The Ag of a photographic negative is easily transformed into xanthate by a 2% soln. of K xanthate. A. L. HENNE

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

The formation of ammonia in the preparation of phosphorus. EDOUARD URBAIN AND VICTOR HENRI. *Compt. rend.* **186**, 1207-8(1928); cf. *C. A.* **21**, 2361.—In the prepn. of H_3PO_4 by the oxidation of P_4 by H_2O in the presence of a halogen acid, at temps. above 600° the halogen acid ceases to act as a catalyst. Under these conditions, however, N_2 is reduced to NH_3 . A quartz tube was filled with charcoal impregnated with H_3PO_4 and through it was circulated N_2 , while heated at temps. varying along its length from 240° at one end to 900° at the other. At 900° H_3PO_4 is reduced to P_4 and N_2 is reduced to NH_3 , the latter combining as $\text{NH}_4\text{H}_2\text{PO}_4$ in the cooler portions of the tube.

A. S. CARTER

Preparation of boric acid anhydride and its efficiency as a drying agent. J. H. WALTON AND C. K. ROSENBAUM. *J. Am. Chem. Soc.* **50**, 1648-50(1928).—In prepg. boric oxide for drying purposes the acid should be dehydrated at about 800° . Pouring the fused oxide into CCl_4 at 0° helps prevent the formation of a glass and the resulting powd. material is a very efficient drying agent up to a moisture content of about 25%.

S. G. SIMPSON

Chlorides of ruthenium. H. REMY AND A. LÜHRS. *Ber.* **61B**, 917-25(1928); cf. *C. A.* **21**, 1418.—Pure RuCl_3 is prepd. in H_2O soln. It is sol. in pure H_2O on long standing to a Cr-green soln. AgNO_3 ppts. Cl from this soln., and Na_2CO_3 gives a violet color destroyed by heat. In the air the sol. RuCl_3 slowly takes up H_2O and splits off Cl. RuCl_3 prepd. by the dry method is insol. in H_2O , but the authors conclude there is no difference in compn. in these 2 forms. Amalgam titration indicates the Ru is trivalent. *Potassium pentachlororuthenate*, $2\text{K}_2\text{RuCl}_5 \cdot 3\text{H}_2\text{O}$, is prepd. by warming the hydroxy-trichloride with a soln. of HCl , KCl and alc. in H_2O on a water bath for 5 hrs. After the soln. has become rose-red, the alc. is driven off, the soln. is filtered and crystallized. Ru is also trivalent in this salt. *Potassium oxydecachlorodiruthenate*, $\text{K}_4(\text{Ru}_2\text{Cl}_{10}\text{O})$, is prepd. by recrystn. of the hexachlororuthenate from moderately concd. HCl or by oxidation of $2\text{K}_2\text{RuCl}_5 \cdot 3\text{H}_2\text{O}$ with Cl. It is cryst., dark brown in color and sol. in H_2O . In this compd. Ru is quadrivalent. The hydroxy-trichloride is prepd. by the action of concd. HCl upon RuO_4 : $\text{RuO}_4 + 7\text{HCl} = \text{Ru}(\text{Cl})_3\text{OH} + 3\text{H}_2\text{O} + 2\text{Cl}_2$. In this compd. Ru is quadrivalent. By amalgam titration to a blue soln., indicating complete reduction Ru^{II} is formed. The green compd. formed as an intermediate in reduction in strong HCl soln. is derived from Ru^{III} .

H. STOERTZ

The existence and preparation of certain oxides of the platinum metals. (With a supplement regarding amorphous oxides.) CULBRAND LUNDE. *Z. anorg. allgem. Chem.* **163**, 345-54(1927).—Attempts to prep. Ru_2O_3 by heating Ru in O_2 at 800° , or by igniting dried $\text{Ru}(\text{OH})_3$ in CO_2 , gave RuO_2 and Ru. Therefore, Ru_2O_3 could not be prepd. by previously described methods in an anhydrous, cryst. condition, and apparently does not exist. RuO_2 was prepd. by heating $\text{Ru}_2(\text{SO}_4)_3$ at 600° in air, and by heating RuCl_3 in O_2 at 600 - 700° , these methods having been previously described. It formed glistening, blue crystals having the following lattice dimensions (rutile type): $a = 4.51$ A. U., $c = 3.11$ A. U., $c/a = 0.689$ A. U. Rh_2O_3 was formed by heating either metallic Rh 1.5 hrs. at 1000° in O_2 , or RhCl_3 1.5 hrs. in O_2 at 800° . It is a gray powder, crystd. in the corundum type, having for the elementary cell, $a = 5.47$, and for the rhombohedral angle, $\alpha = 55^\circ 40'$. An attempt to prep. RhO_2 by fusing RhCl_3 with NaNO_3 and Na_2CO_3 gave a yellowish brown powder whose analysis corresponded to RhO_2 and having the properties assigned by previous authors. The Debye-Scherrer diagram did not give a definite result, but neither Rh nor Rh_2O_3 was present. Pure PdO was prepd. by the method of Shriner and Adams. According to the Debye-Scherrer diagram, it crystallizes in the tetragonal system and seems to be isomorphous with PbO and SnO . The lattice constants are $a = 3.029 \pm 0.005$ A. U., $c = 5.314 \pm 0.005$ A. U., $c/a = 1.754$ A. U. Calcd. d. is 8.31. Finely divided Pd, heated 1 hr. at 830° in O_2 gave a mixt. of Pd and PdO according to the x-ray examn. IrO_2 was obtained by heating IrCl_3 1 hr. in O_2 at 800° . It formed blue crystals of a metallic luster, and of the rutile type, $a = 4.49$ A. U., $c = 3.14$ A. U., $a/c = 0.700$ A. U. An attempt to prep. Ir_2O_3 by the method of Claus gave a mixt. of IrO_2 and very finely divided Ir. The product obtained by dehydrating the hydrate of PtO_2 at 200° gave no interference lines on a Debye-Scherrer diagram. At 600 - 700° only the lines of Pt were observed. Therefore, PtO_2 cannot be prepd. in cryst. form by heating its hydrate, because of its decomp. into Pt and O_2 . PtO_2 forms no cryst. hydrate. On dehydrating $\text{Au}(\text{OH})_3$, the first lines indicating crystn. appeared after 6 hrs. heating at 111° , and were those of

Au. No other lines were noted. The existence of Co_2O_3 is doubtful, and it cannot be prepd. in cryst. form by the previously described methods. Products prepd. by these methods gave lines of CoO or of Co_3O_4 . Careful heating of $\text{Ni}(\text{NO}_3)_2$ gave a black product having an analysis nearly that of Ni_2O_3 , but the Rontgen diagram showed only the lines of NiO . CrO_2 prepd. by heating $\text{Cr}(\text{OH})_3$ several hrs. in O_2 at 330° gave no x-ray lines. In certain cases above, the oxide in question may have formed in its amorphous form; and the inability to prep a cryst. form may have been due either to the instability or to the slow rate of formation of the cryst. form at temp. below which the oxide was chemically stable.

R. H. LOMBARD

Sodium alum. HENRY LEFFMANN AND LESTER W. STROCK. *Bull. Wagner Free Inst. Science* 3, 19-22 (1928).—Gehlen discovered sodium alum in 1815. In 1816, Zellner published his very comprehensive study of this double salt, detd. its percentage compn., and named it Na alum (Natrumsalum). L. and S. find that cryst. Na alum is not readily obtained by slow cooling of its boiling satd. aq. soln., possibly because of the somewhat eccentric behavior of hydrated Na_2SO_4 , which undergoes dehydration at a temp. far below 100° . However, on evapn. at a moderate temp. or on spontaneous evapn. at room temp. crystals are obtained which are isotropic to polarized light. Perfect, clear, brilliant octahedra have been produced, approx. 1 cm. on the edge. The most common form is the octahedron modified by the cube; at times, true cubes and also monoclinic crystals are obtained. Na alum effloresces readily; exposure to the atm. for a few min. produces a white powdery material on the edges of the crystals. The refractive index has been of service in the study of these crystals. A picture of the crystals is given.

JOSEPH S. HEBURN

Univalent manganese. II. W. MANCIOT AND H. GALL. *Ber.* 61B, 1135-40 (1928); cf. *C. A.* 21, 869.—*Sodium manganese cyanide*, $\text{Na}_4\text{Mn}(\text{CN})_6$, is prepd. from $\text{Na}_4\text{Mn}(\text{CN})_6$. Ten g. of this is dissolved in 2% NaOH and 8 g. of Al powder is quickly added in small portions. After about 5 min., when the soln. has acquired a golden brown color, it is filtered and the filtrate run into a soln. of 30 g. NaOH and 60 g. NaCN, satd. with $\text{NaC}_2\text{H}_3\text{O}_2$. A white, finely divided ppt. is formed; this is removed by centrifuging. Analysis gives good agreement with the formula $\text{Na}_4\text{Mn}(\text{CN})_6$. The salt is a microcryst. colorless substance, extremely sol. in H_2O and turned blue by alc. and acetone as a result of dehydration. On standing in the air for a short time it is oxidized to $\text{Na}_4\text{Mn}(\text{CN})_6$ with sepn. of MnO_2 . It is strongly reducing. On heating the soln. in H_2O , H is liberated, while I soln. oxidizes it quant. to Mn^{++} . The K salt, $\text{K}_4\text{Mn}(\text{CN})_6$, is prepd. by reducing the Na compd. $\text{Na}_4\text{Mn}(\text{CN})_6$ as above, the filtrate being added to 200 cc. 10% KOH, then digested with 100 cc. of 20% KCN soln. and finally filtered and washed with 700 cc. of ice cold H_2O . The product is a white, cryst. powder, only very slightly sol. in H_2O , splitting off H when heated in H_2O . Indications of univalent Mn compds. contg. other proportions of Mn to K, such as $\text{K}_3\text{Mn}(\text{CN})_4$ and $\text{K}_2\text{Mn}(\text{CN})_3$, are mentioned, but these have not been isolated.

H. SROERTZ

System: lithium perchlorate-water. J. P. SIMMONS AND C. D. L. ROFF. *J. Am. Chem. Soc.* 50, 1650-3 (1928).—Soly. measurements of LiClO_4 in water were made from 0° to 170° and density values of the satd. solns. from 0° to 40° . The existence of a monohydrate (m. 149°) and a trihydrate (m. 95.1°) was established but there was no evidence of a dihydrate. The transition point between the tri- and monohydrates is 92.53° ; that between the monohydrate and anhyd. salt is 145.75° .

S. G. S.

The ternary system, manganous phosphate-phosphoric acid-water; and diphosphatomanganous acid. G. GRUBE AND M. STAESCHE. *Z. physik. Chem.* 130, 572-83 (1927).—Transference expts. showed that in solns. contg. $1/2$ to $1/10$ g.-atom of Mn per l. of 35N to 45N H_3PO_4 there is present a complex acid whose anion contains Mn. Isotherms of the ternary system $\text{Mn}_3(\text{PO}_4)_2\text{-H}_3\text{PO}_4\text{-H}_2\text{O}$ were detd. at 25° and 55° , whence, by means of Schreinemaker's indirect method, it was shown that this acid is *diphosphatomanganous acid*, $\text{H}_4[\text{Mn}(\text{PO}_4)_2]\cdot 3\text{H}_2\text{O}$. It is the stable, solid phase formed when 15.25N to 44.79N H_3PO_4 is satd. with $\text{Mn}_3(\text{PO}_4)_2$ at 25° , and it consists of faintly rose-colored crystals. When dried in a desiccator over H_2SO_4 it goes to $\text{H}_4[\text{Mn}(\text{PO}_4)_2]\cdot\text{H}_2\text{O}$. It is decompd. by H_2O to form $\text{Mn}_3(\text{PO}_4)_2\cdot 2\text{H}_2\text{O}$; but this decompn. is so slow that the monohydrate of the acid may be prepd. fairly pure by freeing the crystals from mother liquor, washing quickly with H_2O , and drying over H_2SO_4 . The salt, $\text{K}_4\text{H}[\text{Mn}(\text{PO}_4)_2]\cdot 5\text{H}_2\text{O}$, was prepd. by adding to a satd. soln. of the acid in 30N H_3PO_4 sufficient KOH to reduce the acidity to about 12N. After a time a rose-colored, cryst. powder separated, which could be recrystd. from H_2O as long, rose-colored needles. The salt, $\text{Na}_2\text{H}_2[\text{Mn}(\text{PO}_4)_2]\cdot 4\text{H}_2\text{O}$, was prepd. by adding anhydrous Na_2CO_3 to 30N H_3PO_4 , satd. with diphosphatomanganous acid, until the acidity was reduced to 7N

to 10N. The Na salt sepd. as finely divided, faintly rose-colored crystals, which could be recrystd. from H_2O . In the ternary system, from 25° to 55°, the only solid phases which are stable are $Mn_3(PO_4)_2$, $MnHPO_4$, and $H_2[Mn(PO_4)_2] \cdot 3H_2O$. • R. H. L.

Studies of the system: $Na_2O-BaO-SiO_2-CO_2$. 1. **Reactions between Na_2CO_3 , $BaCO_3$ and SiO_2 in the solid state.** H. F. KRAUSE AND W. WEYL. *Z. anorg. allgem. Chem.* **163**, 355-66(1927).—The authors studied the reactivity of powdered quartz with $BaCO_3$, with and without the addition of Na_2CO_3 , and before the mixts. began to melt. When mixts. of quartz and $BaCO_3$ are heated in a stream of CO_2 , evolution of CO_2 begins noticeably at about 700°. For mixts. in which $BaO \cdot SiO_2 > 2:1$, the ratio $BaO \cdot SiO_2$ in the reaction product is 2:1. In mixts. richer in SiO_2 the $BaCO_3$ reacts with a greater proportion of SiO_2 , but not in stoichiometrical ratios. Thus, when the % SiO_2 is greater than for $BaO \cdot 3SiO_2$ the amt. of SiO_2 which reacts may be greater than that required by the ratio $1BaO:SiO_2$. Explanations are suggested for the difference in reactivity of mixts. high and low in silica. The addition of Na_2CO_3 to mixts. of BaO and SiO_2 lowers the temp. of noticeable CO_2 evolution to about 400°, and the compn. of the reaction product depends on the compn. of the mixt. heated. For the isothermal heating of $BaCO_3 \cdot SiO_2$ mixts., at 750°, 850° and 950°, the amount of CO_2 evolved is closely proportional to the logarithm of the duration of heating. This also holds for mixts. contg. Na_2CO_3 . R. H. LOMBARD

The reduction of columbic acid. I. S. J. KIEHL AND DAVID HART. *J. Am. Chem. Soc.* **50**, 1608-20(1928).—By the method of Balke and Smith (*C. A.* **3**, 520) columbite contg. 53% Ch_2O_6 and 21% Ta_2O_6 was converted successively into $K_2C_2F_7$, $K_2C_2O_6 \cdot H_2O$, Ch_2O_6 (in H_2SO_4 soln.) and Ch_2O_6 (by pptn. with NH_4OH and drying the product). The final substance contained 17.5% H_2O . A satd. soln. of Ch_2O_6 in concd. H_2SO_4 (at 25°) was analyzed for Ch_2O_6 and H_2SO_4 , giving 8.34% and 88.11% resp., showing that approx. 15 g. of Ch_2O_6 dissolves in 100 cc. of concd. H_2SO_4 . Upon diln. such a soln. hydrolyzes, and it was detd. that a 0.038M soln. of Ch_2O_6 did not ppt. within 3 days if the final concn. of the H_2SO_4 was 3N or greater. With higher concns. of acid larger proportions of Ch_2O_6 remained dissolved. If 2 cc. of a $Ch_2O_6 \cdot 0.00032 M$ soln., in the presence of relatively high concns. of Ta (which remains colorless) be treated with 1 cc. concn. H_2SO_4 , 7 cc. H_2O and about 1 g. of mossy Zn and allowed to react 5 min., a pale green color develops. With greater concns. the soln. turns blue. By an ingenious app. designed to reduce Ch_2O_6 solns. with a Hg cathode, in an atm. of purified H_2 , and then to deliver the reduced soln. to a vessel contg. a known excess of $KMnO_4$ in O_2 -free soln., thus allowing back titration with $FeSO_4$ soln., the extent of reduction of Ch_2O_6 in a 0.025 M soln. was detd. (a) for periods of 4 to 16 hrs., (b) with H_2SO_4 of 3, 6 and 10 M concns., and (c) with a current density of 3 milliamps. per sq. cm. cathode area. In all cases, whether the reduced soln. was blue or brown in color, the valence in the reduced form was found to be 3. The limiting error claimed is 2 parts in 1000, and the measured reduction amounted to 99.80 to 99.96% of theory. In the presence of 3 M H_2SO_4 the reduced soln. is blue, increasing in intensity from start to finish of the reaction. With 6 M and 10 M H_2SO_4 reddish brown solns. are obtained, and these become blue upon diln., thus indicating the formation of complexes, but not giving evidence of valence change when examd. with $KMnO_4$ as above. W. C. EBAUGH

The deposition of alkaline earth sulfates. L. A. BHATT AND H. E. WATSON. *J. Indian Inst. Sci.* **10A**, 117-29.—The behavior of $CaSO_4$, CaS and $CaSO_3$ on heating alone and in the presence of SiO_2 has been studied at temps. of about 1100°. The effect of adding reducing agents to the $CaSO_4 \cdot SiO_2$ mixt. causes the SO_3 to be evolved at a lower temp. but the temp. for complete decompn. is higher, because of formation of CaS . A quant. decompn. of $CaSO_4$ is obtained in lab. expts. by heating with excess SiO_2 for 4 hrs. at 1100° in a slow current of air. SiO_2 accelerates the decompn. of $MgSO_4$ but to a less extent than $CaSO_4$. Similar expts. with $SrSO_4$ resulted in only 2.3% decompn. with 1 mol. SiO_2 in 1 hr. at 1100°. With $BaSO_4$ the decompn. was 5.4%. J. H. PERRY

Ferrous-ferric cyanides. I. CAMBI AND A. CLERICI. *Gazz. chim. ital.* **58**, 57-64 (1924).—Substantially the same as C. A. **21**, 1769. The formula of ferric ferrosulfopentacyanide is now given as $Fe_3(CN)_{15}(SO_3)_3 \cdot nH_2O$. The work of Reihlen and Zimmermann (*C. A.* **21**, 3324) is a confirmation of that of C. and C. C. C. DAVIS

The purification of potassium dihydrogen phosphate. R. HOLCOMB AND R. R. MCKIBBEN. *J. Am. Chem. Soc.* **50**, 1695-6(1928).—The deposits found in reagent bottles contg. phosphates of alkali metals is not derived from the bottles but is due to the sepn. of Al and Fe colloidi ally aggregated compds. No Si is in it. No salts contg. NH_4 , e. g., $Na(NH_4)_2PO_4$, form such ppts. To purify KH_2PO_4 make up a 0.2 M soln. of the salt, let it stand, sealed in a flask, for 24 hrs. at 75-85°. Filter and recrystallize

the residue obtained upon evapn., or ppt. the salt from cold satd. soln. by adding an equal vol. of cold 95% EtOH.

W. C. EBAUGH

Mercuric ammonium chloride. Facts concerning its formation and properties. F. G. GERMUTH. *Am. J. Pharm.* 100, 285-93(1928).—The addn. of an excess of NH_4 to a mixt. consisting of pptd. HgO and MgCl_2 produces an acceleration of the sublimation process due to a chem. combination of NH_4Cl with HgCl_2 resulting in the formation of the double salt, $\text{HgCl}_2 \cdot 2\text{NH}_4\text{Cl} \cdot 2\text{H}_2\text{O}$, as the sublimate. A drawing illustrating the app. employed in producing this salt is shown consisting of a bell-jar contg. an opening at its base sufficiently large to accommodate a medium-size porcelain crucible (Gooch), in which is placed the material (HgO and MgCl_2) with the excess of NH_4Cl , thoroughly incorporated. The whole rests upon a large tripod, under which a Bunsen burner is placed. To the bell-jar is affixed a movable lid, held in position by gasket, which permits the entrance of the 500-cc. Florence flask, filled with ice. The Florence flask is suspended by wires attached to supports on the under surface of the lid. The side tube of the bell-jar is connected by stout rubber tubing to a filter-flask of one l. capacity, possessing a tubular arrangement on each side. This in turn is attached to the siphon. In this manner a high vacuum is procured. A low flame is introduced under the Gooch crucible, the base of which projects to a slight extent through the opening in the bottom of the jar; sublimation of the reacting substances readily takes place on the cold surface afforded by the Florence flask. In this manner a higher yield of the compd. at a lower temp is attained; tending also to obviate the risk of contamination by volatile substances existing in the air of the lab. Some of the more important phys. properties of the salt have been detd.: m. p. (755 mm. pressure) $210-212^\circ$; sublimation temp (755 mm. pressure) $220-223^\circ$; soly in H_2O (20°) 24 parts in 100 H_2O , (90°) 69-70 parts in 100 H_2O , soly. in alc. (20°) 18 parts in 100 EtOH (60°) 29 parts in 100 EtOH; d_{20} 3.06-3.09.

W. G. GAESSLER

Preparation of the mercuriammonium iodide $\text{Hg}_2\text{N}_4\text{I}_6$ in the crystalline state. MAURICE FRANCOIS. *Compt. rend.* 186, 1205-7(1928); cf. *Ibid* 130, 571.— $\text{Hg}_2\text{N}_4\text{I}_6$ exists in weak ammoniacal solns. as an equil. product of $3\text{HgI}_2 \cdot 4\text{NH}_3$ according to the equation $3(\text{HgI}_2 \cdot 4\text{NH}_3) + n\text{NH}_3 \rightleftharpoons \text{Hg}_2\text{N}_4\text{I}_6 + 12\text{NH}_4\text{I} + (n-4)\text{NH}_3$. To obtain the compd. in the cryst. state, the equil. soln. contg. $3\text{HgI}_2 \cdot 4\text{NH}_3$, NH_3 and NH_4I was prepd at const. temp. (21°) and added to an NH_3 soln. of the same concn.; the cryst. salt pptd. in short, purple, hexagonal prisms. This method was previously applied to the prepn. of crystn. *amercurammonium iodide*, Hg_2NI . A. S. CARTER

7—ANALYTICAL CHEMISTRY

WILLIAM T. HALL

Potentiometric titration and its application to analysis. OSCAR COLLEMBERG. *Svensk Kem. Tids.* 39, 249-65(1927).—A review. A. R. ROSE

Objectives in the teaching of qualitative analysis. J. SAMUEL GUY. *Emory Univ. J. Chem. Education* 5, No. 5, 573-5(1928). E. H.

New method for the qualitative analysis of mixtures containing complex compounds of cyanogen. MICHELE COPPOLA. *Ann. chim. applicata* 18, 65-7(1928).—The method replaces the long and cumbersome Fresenius method of treatment with concd. NaOH and Na_2CO_3 and subsequently with concd. H_2SO_4 . Boil the part of the original substance which is insol. in water with dil. HCl , and filter (*residue A*). Pass H_2S through the filtrate (*ppt. B*). *B* contains all Hg and Fe , $\text{Hg}_3[\text{Fe}(\text{CN})_6]_2$ being very sol. in HCl . $\text{Hg}_3[\text{Fe}(\text{CN})_6]_2$ is also sol. in $\text{K}_4\text{Fe}(\text{CN})_6$ soln., which is of great importance in the latter procedure. *B* also contains sulfides of As and other elements which are not present as cyanides insol. in HCl . Evap. the filtrate from *B* to dryness, mix the residue with *A*, add 4 times the wt. of NH_4NO_3 , deflagrate, cool, add a very little concd. HNO_3 , dissolve in hot dil. HCl (this process destroying the metalocyanide complexes and org.

compsd.). An insol. residue after dissolving the deflagrated product is analyzed for BaSO_4 , AgCl , PbCl_2 , PbSO_4 and SiO_2 . Treat the HCl soln. of the deflagrated product with H_2S , filter on the filter contg. *B* and analyze the residue for metals of the 5th and 6th group of Fresenius. The filtrate contains all other metals and is analyzed by standard methods. If the presence of *K* and *Na* is proved or disproved in other ways and a higher temp. of deflagration is desired, NH_4NO_3 may be replaced by NaNO_3 or by KNO_3 . C. C. DAVIS

An improved rapid method for the determination of gases in metals, especially of oxygen in steel. W. HESSENBRUCH AND P. OBERHÖFFER, *Arch. Eisenhüttenwesen* 1, 583-603(1927); *Stahl u. Eisen* 48, 486-7(1928); cf. Walker and Patrick, *C. A.* 6, 3380; 7, 314, 2579.—The temp. necessary to transform all of the oxides present in steel to CO is 1600° . At this temp. the max. amt. of *O* is obtained. The investigation of secondary reactions disclosed the fact, that the presence of metals whose oxides have a higher heat of formation than FeO are causing errors in the detn. of *O*, unless very high vacuum is used. High vacuum cannot be obtained if crucibles made of refractory oxides are being used, because the reduction of the oxides present in steel comes to an end as soon as the partial pressure of *O* equals the *O* pressure of the refractory materials. The amt. of the oxides remaining in the melt is proportional to the concn. of the metals present in the steel. The disturbing influence of *Al* and *Mn* on the detn. of *O* by the hot extn. method was shown previously. In the new method their influence is not noticeable, because of the high vacuum employed. The formation of H_2O occurs only below 1000° . A normal *S* content is without any effect; with 0.050% *S* the error was 0.003% *O*. At higher *S* content H_2S and CS_2 were formed. The largest part of the gases contg. *S* is decomposed before leaving the furnace. Tests with various crucible materials disclosed the fact that only graphite could be used without being reduced. The graphite crucible used must be degasified and kept in a vacuum. The above considerations were used in the construction of the equipment, consisting of a high-frequency melting furnace in which a quartz tube is placed as the vacuum vessel. In this is placed a magnesia tube, to prevent radiation and finally the graphite crucible. The furnace is heated up and evacuated by a *Hg* diffusion pump, next a drop pump is connected before the diffusion pump and the sample which is already under vacuum is dropped into the graphite crucible which is at the required temp., by a special arrangement. The test piece melts and the gases are immediately carried away by the diffusion pump, in order to prevent secondary reactions between the gases and the metallic parts of the furnace. The gases collected by the drop pump in the analyzer are analyzed for CO_2 , CO , *H* and *N*. Reduction tests with pure oxide indicate that at 1400 – 1500° 70% of the oxides is reduced and that at 1600° there action is practically complete. The surface per g. of the sample has an influence on the results. Instead of drillings the sample should consist of one piece. The crucible has to be degasified for 3-4 hrs. before each series of 10-15 tests. The method can be adapted for the analysis of non-ferrous metals. References are given. J. A. SZILARD

The gas volumetric determination of nitrogen in ammonia, urea and ammonium salts. P. RISCHBIETH, *Z. physik. chem. Unterricht* 41, 132-3(1928).—The substance is decomposed with $\text{NaBr} + \text{NaBrO}$ and the N_2 evolved is measured. When only a part of the *N* contained in a substance is liberated, a factor is used. M. B.

Report on (the analysis of) liming materials. W. M. SHAW, *J. Assoc. Official Agr. Chem.* 11, 152-4(1928); cf. S., MacIntire and Underwood, *C. A.* 22, 1453.—Description of a device for filtering *Ca* succrate solns. out of contact with the atm.

A. PAPINEAU-COUTURE

Analysis of the residual acid from nitroglycerin manufacture. W. YOUNG, *J. Soc. Chem. Ind.* 47, 126-30T(1928).—In the examn. of waste acid, the usual practice has been to det. the total acidity, the total *N* acids and the nitrous acid but the values thus obtained show more acid than is actually present. Expts. with synthetic mixts. and an interesting app. have served to develop a more accurate method of analysis. First, the H_2SO_4 is detd. The substance is placed in a denitrification tube contg. CaCl_2 soln. in an outer compartment. The latter is heated to 120 – 150° and steam is introduced until all nitroglycerin is hydrolyzed leaving behind sulfuric and oxalic acids. The latter is oxidized by careful treatment with KMnO_4 soln. and allowance made for the diminution of acidity resulting from the formation of sulfates of *K* and *Mn*. Then 5 cc. of 3% H_2O_2 in 50 cc. of water are added and the acid is detd. by titration with standard NaOH , methyl orange being used as indicator. In another sample the total *N* acids are detd. by treating 2.5 g. of the waste acid with 10 cc. of 2.5% CrO_3 soln. The *N* acids are distd. off with the aid of steam and titrated with NaOH , methyl orange being used as indicator. In a third sample the actual HNO_3 content is detd. by the well-known

FeSO₄ method or by detg. the quantity of K₂Cr₂O₇ reduced by heating in 50% H₂SO₄. The nitroglycerin content is detd. from the difference between the K₂Cr₂O₇ reduced in this way, and the KMnO₄ reduced by similar treatment or by wet combustion with CrO₃. The values given indicate that the accuracy of the method is satisfactory. The original paper should be consulted for further details. W. T. H.

Spectrographic analysis. E. F. SCHUMACHER. *Bell Labs. Record* **6**, 289-92 (1928).—The usefulness of the Hilger quartz spectrograph is explained with reference to the detection of small quantities of certain elements and to the examn. of Pb-Su alloys. W. T. H.

Determination of chlorine, bromine and iodine in organic compounds. H. TER MEULEN. *Rec. trav. chim.* **47**, 698-700 (1928).—The method described depends upon the formation of NH₄ salt by heating the substance in a stream of H₂ which has passed through concd. NH₃ soln. The vapors are then passed over a hot spiral of Ni wire and then over some hot BaCO₃ from which Ba halide is formed. The contents of the boat contg. the Ba salt are treated with water, the tube is rinsed out, the aq. soln. made acid with HOAc and boiled to remove cyanide. The halide is then detd. gravimetrically or by means of the Volhard reaction with AgNO₃. In the latter case, the ferric soln. serving as indicator should contain no sulfate. W. T. H.

A new identity test for β -naphthol. K. REBER. *Schweiz. Apoth. Ztg.* **65**, 589 (1927).—Heat 1 cc. of a mixt. of 25% HCl (1 part) + 25% HNO₃ (3 parts) with 5 cc. of aq. β -naphthol (A) soln. to 55-60° in a water bath. Soon a crimson color forms, sol. in AmOH. The test is sp. for A and sensitive to 1:6000 aq. diln., but is negative in presence of other phenols, also when H of OH is replaced by Me. *Another test.*—To 2 cc. of 0.03% NaNO₂ soln., add 5 cc. of A and 1 drop of dil H₂SO₄, then warm to 55-60°, a yellow color turning to red, is formed, this, however, is not sol. in AmOH. S. WALDROTT

What constitutes an adequate sample? J. C. MUNCH AND G. L. BIDWELL. *J. Assoc. Official Agr. Chem.* **11**, 220-1 (1928).—A brief discussion of the considerations to be taken into account in judging of the "adequacy" of sampling. A. P.-C.

Determination of iron and aluminum in the presence of calcium, magnesium and phosphoric acid. A. J. PATTEN AND O. B. WINTER. *J. Assoc. Official Agr. Chem.* **11**, 202-8 (1928); cf. *C. A.* **17**, 3146.—Further data are given confirming previous conclusions and showing that: Fe⁺⁺⁺ and Al phosphates are pptd. from solns. below p_H 5.3, while Ca is not pptd. below p_H of about 6.5; NH₄OAc is a suitable buffer for keeping the reaction of the soln. within the range necessary for sepg. Fe⁺⁺⁺ and Al phosphates from Ca₃(PO₄)₂; Fe⁺⁺⁺ and Al can be completely pptd. as phosphates; when Fe is detd. as phosphate the results are slightly high, but the increase is practically within the exptl. error; Fe⁺⁺⁺ and Al phosphates are slightly sol. in hot 5% NH₄NO₃, but when washed 10 times the loss is practically compensated by the slight increase in the wt. of the FePO₄. The microchem. method for detn. of Al in blood described by Mull, Morrison and Myers (*C. A.* **21**, 2908) is being developed for the detn. of small quantities of both Fe and Al. A. PAPINEAU-COUTURE

Iodometric determination of small quantities of copper. C. DAHL. *Tids Kemi Bergvesen* **7**, 8-10 (1927).—The accuracy of the titration was studied in detg. amts. about a few tenths of a mg. of Cu. The titrations were carried out in a vol. of 10 cc. with 0.02 N thiosulfate from a 1-cc. buret graduated in hundredths of a cc. Portions less than 0.01 cc. could be taken out by means of a glass rod. A suitable amt. of KI was found to be 0.2 g. Known amts. of Cu in the form of a dil. soln. of CuSO₄ or Cu(NO₃)₂ were taken out by a pipet with an accuracy of 0.0005 mg. Addn. of HCl or H₂SO₄ caused too high results. Accurate detns. of amts. from 0.1 to 0.2 mg. Cu were obtained with addn. of 0.24-5.0 cc. of pure AcOH, that is even up to 50% AcOH in the titration liquid. The max error was 0.009 mg., the results being 0.001-0.009 mg. higher than the exact values. All the titrations in acetic acid soln. were finished in 1-3 min. and the limit was very sharp. If the vol. is increased or if less KI is used the titration time will be increased and the limit will be less sharp. Filtrations in neutral soln. gave the same results as in acetic acid soln. The presence of reasonable amts. of NH₄NO₃ does not interfere with the accuracy, but the titration time is a little increased. Considerable amts. of AcONH₄ will make the reaction incomplete. C. A. ROBARK

The iodometric determination of phosphorous acid and the use of sodium bicarbonate in iodometry. P. CARRÉ. *Bull. soc. chim.* **43**, 461-4 (1928).—See *C. A.* **22**, 1298. E. H.

Report on (the analysis of) fluorine compounds. G. A. SHUBY. *J. Assoc. Official Agr. Chem.* **11**, 147-9 (1928).—Berzelius' method (*Pogg. Ann.* **1**, 1169 (1824)),

as modified by Rose (*Liebig Ann.* 72, 343(1849)) and by Treadwell and Koch (*Z. anal. Chem.* 43, 469(1904)), gives low results owing to the soly. of CaF_2 in H_2O and AcOH . Schucht and Möller's volumetric method (*C. A.* 1, 279) and modifications thereof give fairly accurate results with pure fluosilicates, but in presence of impurities such as traces of alkalis, Na_2CO_3 or CaO , preliminary treatment of the sample is necessary to prevent reaction with the fluosilicate. Considerable work has been done (cf. following abstr.) on Offerman's "volatilization" method (*Z. angew. Chem.* 3, 615(1890)), modified by Wagner and Ross (*C. A.* 12, 29). Several trials of Steiger (*C. A.* 2, 1104) and Merwin's (*C. A.* 3, 2919) colorimetric method indicated that it merits further consideration in regard to its adaptability to the analysis of fluosilicates. A. P.-C.

Volatilization method for the determination of fluorine with special reference to the analysis of phosphate rock. D. S. REYNOLD, W. H. ROSS AND K. D. JACOBS. *J. Assoc. Official Agr. Chem.* 11, 225-36(1928); cf. preceding abstract.—The volatilization method (mixing the sample with SiO_2 and heating with concd. H_2SO_4 to evolve SiF_4) is the only one applicable in presence of large amts. of P_2O_5 . An investigation of the technic of the method showed that: (1) in the analysis of pure compds. as good results are obtained by digesting the sample with 95% H_2SO_4 at 200–50° as with 98–98.5% at 300°, but with phosphate rock the highest and most consistent results were obtained with 98–98.5% H_2SO_4 at 300°; (2) with pure fluorite grinding to pass an 80-mesh sieve was sufficient, but phosphate rock should be ground to a fineness of about 200-mesh; (3) approx. the same recovery was obtained when the quantity of F in the sample taken varied from 0.0121 to 0.0484 g., but with larger quantities of F the percentage recovery decreases slightly; (4) presence of Fe_2O_3 , Al_2O_3 , Na_2O , P_2O_5 and As_2O_3 do not affect the results, but $\text{Na}_2\text{B}_4\text{O}_7$ greatly reduces the recovery of F, probably due to the formation of volatile BF_3 which is appreciably sol. in concd. H_2SO_4 ; (5) org. matter can be destroyed without loss of F by mixing 2 parts of the samples with 1 of CaO and igniting 2 hrs. at 500–600° while igniting at 750–800° without CaO or at 900–25° with CaO causes considerable loss of F. The method proposed (the technic of which is described in detail) consists essentially in mixing the sample (contg. 30–40 mg. F) with CaO , igniting 2 hrs. at 500–600° to destroy org. matter, mixing with 200-mesh SiO_2 , introducing into a specially designed reaction flask placed in an elec. furnace (type 84, multiple unit, elec. crucible furnace is suitable), treating with 40 cc. 98–98.5% H_2SO_4 , heating rapidly to 250° and then to 300° in 45 min., and drawing a fairly rapid current of air through the app. consisting of a gas-washing bottle contg. concd. H_2SO_4 , a cylinder loosely packed with glass wool and P_2O_5 , the reaction flask, a Bowen potash tube contg. 98–98.5% H_2SO_4 , a Schmitz H_2SO_4 tube contg. a 10% Ag_2SO_4 soln. in 98–98.5% H_2SO_4 (to absorb any HCl that may be evolved), 2 Bowen potash tubes contg. a suspension of CrO_3 in 98–98.5% H_2SO_4 (to absorb SO_2 , HNO_3 and N oxides), a glass tube filled with glass wool (for efficient removal of SO_3) and a Meyer tube contg. 50 cc. distd. H_2O and 10 cc. 0.1 N HCl . Digestion is continued till the scum disappears (about 1 hr.) and aeration is continued 15–20 min. longer. The contents of the S tube are titrated hot with 0.1 N NaOH and the results corrected for SO_2 and SO_3 by oxidizing with Br water and detg. SO_3 nephelometrically. Duplicate detns. easily agree within 0.1% and usually to within less than 0.05% of F. A 92–4% recovery of F is obtained. A. PAPINEAU-COUTURE

The fluorine content of phosphate rock. K. D. JACOB AND D. S. REYNOLDS. *J. Assoc. Official Agr. Chem.* 11, 237–50(1928); cf. preceding abstract.—A study of the F content of the various commercial grades and types of phosphate rock from deposits in the U. S. and several foreign countries, carried out by the above-described method, gave the following results: Florida land pebble, Tennessee brown rock, Idaho phosphate rock, Wyoming phosphate rock, British-Columbia phosphate rock, North African phosphate rock and fluoroapatite, 2.64–4.24%; Norway chloroapatite 0.17%; wavellite and amblygonite 4.0%; triplite 7.72% fish teeth 3.5%, animal teeth 1.8%, animal bones 3.3%, Florida superphosphate 1.9%, etc. About 25% of the F present in phosphate rock is volatilized in the manufg. process; and the quantity thus volatilized annually in the U. S. represents a potential source of approx. 25,000 tons of pure F, most of which can be recovered as fluosilicate. Bibliography of 22 references.

The influence of impurities from glass containers on the titer of caustic soda solutions (fixanal solutions). W. BOETTGER. *Schweiz. Apoth. Ztg.* 65, 549–53. K. SEILER. *Ibid* 577–8(1927); cf. S., *C. A.* 21, 3847; B., *C. A.* 20, 1188 and *Schweiz. Apoth. Ztg.* 63, 145–7; S., *Ibid* 147–8(1926).—Polemical. S. WALDBOTT

Effect of silica dishes in the determination of potash. L. D. HAIGH. *J. Assoc. Official Agr. Chem.* 11, 219–20(1928); cf. *C. A.* 21, 2348.—If H_2O -sol. P_2O_5 is present

when the K_2O residue is ignited in SiO_2 dishes, greater variations in the results are to be expected than when the ignition is made in Pt dishes. When the phosphates are removed, the variation between the results obtained when Pt and SiO_2 dishes are used is minimized. Probably the phosphates (or free H_3PO_4 formed) attack the SiO_2 dishes and render some of the K_2O insol. A. PAPINEAU-COUTURE

Analysis of the sodium sulfate used in glass works. Direct determination of sodium sulfate. A. BESOMBE. *Bull. soc. chim. Belg.* 37, 164-5(1928).—Commercial Na_2SO_4 usually contains free acid, NaCl, and Fe, Al, Ca and Mg sulfates as impurities. In order to titrate Na_2SO_4 directly add a little excess of Na_2CO_3 of known concn.; the free acid is thus neutralized, whereas the heavy metals precipitate; filter; neutralize the excess of Na_2CO_3 with H_2SO_4 ; evaporate and calcine in a weighed crucible; subtract the weight of NaCl and of the Na_2SO_4 formed by the neutralization of the carbonate. Titrate the free acid and NaCl separately. A. I. HENNE

Precipitation of copper sulfide by sodium thiosulfate. M. G. RAEDER. *Tids. Kemi Bergvesen* 7, 94-5, 105-7(1927).—Cu is pptd. quant from mineral acid solus. by adding $Na_2S_2O_3$ and boiling. H_2SO_4 is the most suitable acid. HCl tends to delay the pptn. a little but causes no greater consumption of $Na_2S_2O_3$. HNO_3 has no harmful effect up to a concn. of 0.5 N if the boiling is not carried on too long, 3-5 min being sufficient. The ppt of Cu_2S should be washed with cold dil. SO_2 soln. Considerable amts. of Fe present (1.5-3.0 g. in the usual vol. of 300 cc.) may cause an oxidation and dissolving of some Cu_2S , if there is not an excess of $Na_2S_2O_3$, particularly if HNO_3 is present and if the boiling is carried on too long. If Fe and HNO_3 are present an excess of $Na_2S_2O_3$ has to be used. C. A. ROBAK

Electrolytic determination of zinc. M. GIORDANI. *Ann. chim. applicata* 18, 63-5(1928).—In the new method of Belasio and Mellana for detg. Zn (cf. C. A. 21, 3580), a Pt anode is used to avoid dissolving Pb by part of the H_2SO_4 formed during electrolysis. Expts. to find substances capable of destroying the H_2SO_4 as soon as formed show that the addn. of EtOH or glucose to the electrolyte accomplishes this object. Though the mechanism of their action is not explained, they are of great advantage in the analysis, a coherent deposit of PbO_2 on a Pb wire being obtained. Glucose gave the best results. The electrolyte (250 cc.) contg. $ZnSO_4$ (prepd. from 0.6 g of pure Zn) is neutralized with NH_4OH , 20 cc. of 0.5N H_2SO_4 , 5 g. of Na_2SO_4 , 12 g. of glucose are added and the soln. is made up to the vol. The current is 0.3 amp., with a cathode c.d. of 0.6 amp. The anode is a Pb wire spiral of 2 mm. diam and 18 cm. long. At the surface of the liquid the wire should be parafined. With this simplification of the B. and M. method, the results are very precise. C. C. DAVIS

Desulfurizing action of silica gel and the failure of the lamp for determination of sulfur (in oils) in the presence of mercaptans. H. I. WATERMAN AND M. J. VAN TUSSEN-BROEK. *Tech Hochschule Delft. Brennstoff-Chem.* 9, 37-9(1928); cf. C. A. 21, 1540.—The following pure S compds. were mixed with kerosene in known quantities and tested for S removal by silica gel: $(C_2H_5)_2S$, $(C_2H_5)_2S_2$, $(C_3H_7)_2S_2$, C_4H_9SH , $(CH_3)_2CHSH$, C_4H_9SH and $(CH_3)_2CH(CH_2)_2SH$. With the sulfides 10 to 50% of the S was removed by 7 hrs. treatment, removal being greatest with sulfides with lowest mol. wt. Mercaptan S was diminished, but the extent of removal was not detd. S in the purified liquids was detd. by burning in a lamp and subsequent absorption of S in the products of combustion. In the presence of mercaptans this gave low results. This was thought to be due to polymerization and retention in the lamp and wick of mercaptans. J. D. D.

Standardization of silver nitrate solutions used in chemical studies of sea water. T. G. THOMPSON. *J. Am. Chem. Soc.* 50, 681-5(1928).—In the abstract of this paper in C. A. 22, 1296, the last part of the fourth line should read "to convert Cl^- per l. (Cl_2) to Cl per kg. (Cl_w).". L. C.

Oxidation of alkaline cyanides with permanganate. H. GALL AND G. LEHMANN. *Ber.* 61B, 670-5(1928).—Oxidation of KCN to KCNO by $KMnO_4$ is quant, only in the presence of a Cu salt. The titration may be carried out at high or room temp. In the first case: add 20 cc of a 30% KOH soln. and 20 cc. of a 5% $CuSO_4$ soln. to the cyanide soln; add an excess of $KMnO_4$ which will make the soln. green; heat at 60° for 5 min.; the soln. must remain green; otherwise add more $KMnO_4$. If the soln. then does not become green, use the titration at room temp. Titrate the excess of $KMnO_4$ with strongly acid $H_2C_2O_4$ at 70°. For titration at room temp.: add KOH and $CuSO_4$ as described before and enough $KMnO_4$ to render the soln. blue. Titrate the excess with acid $H_2C_2O_4$ or $FeSO_4$. In both cases it is advisable to make blanks. Providing a Cu salt is present, KCN may be also titrated by means of permanganate. To prepare pure KCNO: dissolve 5 g. KCN and 5 g. KOH in as little H_2O as possible;

add $\text{Cu}(\text{OH})_2$ freshly pptd. from 10 g. $\text{CuSO}_4 \cdot 10\text{H}_2\text{O}$ and thoroughly washed; add 10 g. KMnO_4 dissolved in as little H_2O as possible. Heat for 2 hrs. at 60° ; eliminate slowly the KMnO_4 excess with H_2O_2 ; filter MnO_2 ; evap. the filtrate and cool it in an ice-salt mixt. KCNO ppts.; it is recrystallized from 80% alc. contg. 10% MeOH . The yield is 5 g. of pure KCNO . A. L. HENNE

Report on chemical methods for reducing sugars. R. F. JACKSON. *J. Assoc. Official Agr. Chem.* 11, 175-8(1928).—From a discussion of the present official A.O.A.C. methods it is suggested that the Meissl method be dropped as it serves no useful purpose that is not covered by the Munson and Walker method. Reliable methods are required for low sugar concns. (less than 50 mg. per 50 cc.), and Scales' iodometric method (*C. A.* 13, 1990) for concns. of 1.5-20 mg. per 10 cc. and Benedict's modification (*C. A.* 20, 3472) of Folin and Wu's method for quantities down to 0.1 mg. are suggested as suitable. A. PAPINEAU-COUTURE

The destruction of chloroform during animal putrefaction. G. SENSI AND D. SIRI. *Ann. chim. applicata* 18, 78-86(1928).—Toxicological studies on CHCl_3 have been confined to methods for its detection and have not taken into consideration its destruction as a possible explanation of failures to obtain a positive test. Therefore the behavior of CHCl_3 during putrefaction was studied by allowing mixts. of various organs of the calf and CHCl_3 -water to putrefy and detg. the CHCl_3 by a modified form of the method of Perrin, Lallemand and Duroy. The most important improvements were the bubbling of air through the mixt. and a more efficient absorption system. Control detns. were also made of the org. mixts. and of the CHCl_3 -water. The quantity of CHCl_3 in the org. mixt. diminished progressively until after about 52 days there was none detected. The mixts. of organs and CHCl_3 -water contained more CHCl_3 than would be present in medico-legal cases, and therefore the complete disappearance of the CHCl_3 shows that CHCl_3 in medico-legal cases is doubtless destroyed even sooner. This emphasizes the necessity for the earliest possible analysis. C. C. DAVIS

Analysis of opal and alabaster glasses (CAUWOOD, *et al.*) 19. Analysis of opal glasses (SINGLETON, CHIRNSIDE) 19.

8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIRER

Contributions to determinative mineralogy. III. P. C. PUTNAM, E. J. ROBERTS AND D. H. SELCHOW. *Am. J. Sci.* 15, 423-30(1928); cf. *C. A.* 22, 1558.—The preferred microchem. test for Fe is the red color of $\text{Fe}(\text{CNS})_3$, for Ga the gelatinous ppt. of $\text{Ga}_4(\text{FeCaN}_8)_3$, for In the cryst. ppt. of Cs_3InCl_6 , and for Pd the cryst. ppt. of $\text{Pd}(\text{C}_4\text{H}_7\text{N}_2\text{O}_2)_2$ produced by dimethylglyoxime. L. W. RIGGS

The determination of minerals, ores and some industrial products with the x-ray. RENÉ VAN AUBEL. *Rev. ind. minerale* 1928, 163-70, 189-95. C. W. OWINGS

Microscopic study of certain metallic minerals of Peru. J. ORCEL AND G. R. PLAZA. *Compt. rend* 186, 769-72(1928).—Three classes of ores are distinguished: (1) those principally Cu, (2) Cu and Pb, (3) Ag. Brief descriptions are given of enargite, bornite, chalcopyrite, "panabase," sphalerite, etc. L. W. RIGGS

The constituents and genesis of a few minerals produced from hot springs and their vicinities in Japan. III. Calcium carbonate minerals deposited from effervescent springs. ICHIZO SUGANUMA. *Bull. Chem. Soc. Japan* 3, 87-9(1928); cf. *C. A.* 22, 2126.—It is generally admitted that CaCO_3 ppts. as aragonite above 50° and as calcite below that temp. In fact, when the pptn. occurs in an alk. system, aragonite is formed, even at low temp.; an excess of CO_2 will form calcite. The presence of gelatin favors the aragonite form, and prevents it from transforming into the calcite form. CaCO_3 found in shells or deposited by algae is of the aragonite form. The ρ_H of native aragonite boiled with H_2O is 8.2-8.4, whereas it is only 7.6-8.0 for calcite. Aragonite powder suspended in H_2O is colored violet by a dil. soln. of $\text{Co}(\text{NO}_2)_2$; calcite becomes sky-blue. Aragonite is colored green by FeSO_4 . Sea water and effervescent springs contain Mg salts, are slightly alk., and have a tendency to form aragonite. The oolitic shape of the ppt. probably arises thus: the nucleus of the granule is deposited first with the evolution of CO_2 gas; edges or tops of crystals are mostly dissolved by CO_2 or are ground by mechanical revolution in H_2O current; thus the grains become spherical and grow gradually through the decompn. of $\text{Ca}(\text{HCO}_3)_2$. A. L. HENNE

Chemical investigations on the roosterite of San Piero in Campo (Island of Elba)

and on beryls in general. FERRUCCIO ZAMBONINI AND VINCENZO CAGLIOTTI. *Gazz. chim. ital.* **58**, 131-52(1928).—Earlier investigations on the rosterite of San Piero have left doubt about its exact compn. (cf. Grattarola, *Riv. sci. ind.* **19**, (1880)) and whether it is an altered beryl (cf. Dana). Crystallographic examn., complete details of which are given, of samples of rosterite from Facciatoia and San Piero confirmed in general the data of Grattarola, and showed that in crystallography it is identical with beryl. The *d.* was 2.761-2.768. Chem. analysis, the results of which are given in full detail, showed the following av. % compn. of rosterite, and for comparison of Siberian beryl, Pisek beryl and Muso emerald, resⁿ: SiO₂ 60.42, 65.25, 65.87, 65.26; Fe₂O₃ 0.77, 0.13, 0.06, 0.09; Al₂O₃ 15.65, 17.84, 17.83, 17.60; Cr₂O₃ —, —, —, —, 0.077; BeO 13.21, 13.29, 13.05, 13.20; MgO 0.14, 0.16, 0.14, 0.77; MnO 0.74, 0.02, 0.03, 0.06; CaO 0.39, 0.83, 0.67, 0.69; BaO 0.19, 0.21, 0.15, 0.16; SrO 0.02, 0.06, 0.01, 0.015; Na₂O 4.22, 0.63, 0.43, 0.50; Li₂O 0.43, 0.10, 0.11, 0.105; K₂O 2.25, 0.18, 0.26, 0.22; Cs₂O 0.91, 0.13, —, —, H₂O 0.84, 0.98, 1.36, 1.84. The compn. of the rosterite differed notably from that reported by Grattarola, particularly in the alk. metals, and in conjunction with the crystallographic examn. the high content of the latter shows that rosterite is beryl which is particularly rich in alk. metals. Grouping Be, Mg, Mn, Ba, Ca, Na, Li, K and Cs, the formula is approx. 4RO.Al₂O₃.6SiO₂, instead of the 3BeO.-Al₂O₃.6H₂O commonly accepted for beryl. Many analyses of beryl reported in the literature approach the former compn. more closely than the latter, and it is concluded that the constitution of beryl is not 3BeO.Al₂O₃.6SiO₂. New analyses of beryls and emeralds are tabulated. The presence of Sr and Ba is particularly noteworthy, and it is the first time that Li has ever been reported in emerald. The high proportion of MgO in emerald shows that Be and Mg are isomorphous (cf. Z and Carobbi, *C. A.* **20**, 694). A review and discussion of the literature in conjunction with expts. on the evolution of water from beryls heated at different temps. leads to the conclusion that the water is in some cases simply an inclusion, in other cases represents an incipient alteration which is not far enough advanced to affect the homogeneity and the transparency of the crystals, and in still other cases it is an essential constituent (water of constitution) of the original compd. C. C. DAVIS

Note on a manganeseiferous anthophyllite asbestos from the Jacobeni-Arsita mine. FR. SLAVIK. *Ann. sci. univ. Jassy* **15**, 133-5(1928).—The sample examined evidently formed the filling of a small vein passing through compact, blackish brown oxide ore and belongs to the group of anthophyllite asbestos. It differs from most of the asbestoses of this class by fusing more easily in the blowpipe, giving a blackish mass which is not colored in a flame, and by being manganeseiferous instead of magnesian. It is apparently the same as the asbestic anthophyllite of Chvaletice, Eastern Bohemia. It is probably the 1st known variety of anthophyllite of which MnSiO₃ is an essential constituent.

Geology and oil and gas prospects of northeastern Colorado. K. F. MATHER, JAMES GILLULY AND R. G. LUSK. U. S. Geol. Survey, *Bull.* **796-B**, 65-124(1928).—The area covered extends from near Denver to the State lines on the north and east. Both oil and gas have been found in this area.

L. W. RIGGS

Petroleum at Martinique. LOUIS BARRABÉ. *Ann. office nat. comb. liquides* **3**, 7-42(1928).—Report of an investigation on the probability of the occurrence of petroleum in the sedimentary formations in the south and east of the island of Martinique. From a discussion of the geology of the district (which is described in detail), of previously observed or reported indications of the presence of petroleum, and of the situation of the island as compared with that of neighboring islands, B. concludes that, though the presence of petroleum is not impossible, it is very improbable.

A. PAPINEAU-COUTURE

Liquid silicate immiscibility in the laboratory and in the rocks of Agate Point, Ontario. J. W. GREIG. *Am. J. Sci.* **15** [5], 375-402(1928); cf. *C. A.* **21**, 1240; Tanton, *C. A.* **20**, 3412.—The criticisms by T. of G.'s paper on the immiscibility of silicate melts are discussed.

L. W. RIGGS

Geology and petrology of the Sulitelma District. THOROLF VOGT. *Norg. Geol. Undersökelse* No. **121**, 1-447, English summary 449-580, plates 40(1927).—In this extensive paper 35 analyses of the rocks studied are tabulated, and 26 photomicrographs shown.

L. W. RIGGS

An exceptional vein of augitic porphyrite in the triassic dolomites of the high valley of Neva (Ligurian Alps). S. FRANCHI. *Atti accad. Lincei* [6], **7**, 192-4(1928).—Chiefly geological. The veins are characterized by their newness compared with rocks of the

same family which have undergone more profound metamorphism to glaucophane and lawsonite rocks.

The geochemistry of iodine and its importance as a biogenic element. C. C. DAVIS, BRAND LUNDE. *Tids. Kemi Bergvesen* 7, 57-61, 67-72 (1927); cf. *C. A.* 22, 1785.—I seems to be present everywhere. Higher concns. are found in org. nature and in vadose mineral deposits. Upon the first phase sepn. of the earth, the I was distributed in all the 4 phases, though mostly in the atmophile and lithophile phases. In the eruptive rocks the concn. is about 0.2-0.3 mg. I per kg. and in the magmatic sulfides about 0.2 mg. In the Fe kernel the concn. can be estd. at 0.1-0.15 mg. per kg. I is present in meteoric Fe and in all manufd. Fe. It is also present in all living organisms. The relation of I insufficiency to goiter is discussed. Fish contain much I, and are good prophylactics against goiter. C. A. ROBAK

Gold, silver, copper, lead and zinc in Idaho and Washington in 1925. C. N. GERRY. Bur. Mines, *Mineral Resources of the U. S. 1925*, Pt. I, 517-62 (preprint No. 22, published June 7, 1927). E. H.

Mercury in 1926. J. W. FURNESS. Bur. Mines, *Mineral Resources of the U. S. 1926*, Pt. I, 125-40 (preprint No. 10, published October 20, 1927). E. H.

The extraction and utilization of molybdenum. G. M. DYSON. *Chem. Age* (London) 18, No. 458, Monthly Metallurgical Sec., 25-7, No. 462, 33-4 (1928).—A review. E. H.

Uniform notation and formulas for the mathematical comprehension of ore-dressing. H. MADEL. *Metall u. Erz* 25, 77-82 (1928).—A summary of formulas used in ore dressing, with a uniform notation, compiled by the professional committee of the *Gesellschaft deutscher Metallhütten- und Bergleute*. These are explained by M. J. BALOZIAN

Researches on the practicability of dressing silver-rich ores as well as the complex lead-zinc ores of the "Alte Hoffnung Gottes" mine at Klein-Voigtsberg i. Sa. GORRHOLD QUITTKAT. *Metall u. Erz* 25, 1-7, 32-9 (1928).—The geological and mineralogical characteristics of the "Heinrich" and "Christliche Hilfe" mines of the "Alte Hoffnung Gottes" are studied. Chem. and microscopic analysis of the ores from the first show that the galena (4%) contains 240 g. Ag/ton of ore, the Zn blend (10%) contains 1230 g. Ag/ton and pyrite (7%) contains 28 g. Ag/ton, the remaining 40% of Ag being com-

bined in Ag-rich ores (pyrargyrite and proustite). In the "Christliche Hilfe" the ore contains, 16% PbS, 18% ZnS and 10% FeS₂, and shows that nearly all the Ag (0.0594% to 0.06%) is present in these minerals. Eleven photomicrographs of the ores of the two mines are given. The Ag content of various sizes of grains is detd. by chem. and microscopic methods, from screen analyses. Various methods of dressing the ore are discussed. Wet methods of dressing proved unsuccessful because of a large loss of metal. The dry methods used at the mines are unsatisfactory because of the insufficient concn. Ag-rich mixed concentrates are prepd. and the Ag-contg. Pb and Zn compds. are sepd. in flotation expts. J. BALOZIAN

The new central ore-dressing plant in Bad Ems of the "Aktiengesellschaft" for mining; lead and zinc production at Stolberg and Westphalia. O. KALTHOFF. *Metall u. Erz* 25, 125-32(1928).—The new dressing plant is described. The methods of flotation, classifying, thickening of slimes, filtering and clarifying the wash-waters are outlined. J. BALOZIAN

Trend of flotation. A. J. WEINIG AND I. A. PALMER. *Quart. Colorado School Mines* 23, No. 2 (1928); cf. *C. A.* 21, 1080.—The classification of all reagents as to uses is given. The theory of flotation is briefly discussed. The practice of flotation at several mills is outlined. This quarterly contains comprehensive information concerning the present methods of flotation. L. D. ROBERTS

Metal recovery from bronze-foundry slags. E. R. DARBY. *Am. Inst. Mining Met. Eng., Tech. Pub.* No. 113, 3 pp.(1928).—D. points out by means of 2 illustrations the desirability of metal recovery from bronze-foundry slags either by concn. or smelting. A. W. COFFMAN

The solubility in citric acid of the phosphoric acid from Thomas slag. AUGUST SÜLLWALD. *Arch. Eisenhüttenwesen* 1, 565-70(1927), *Stahl u. Eisen* 48, 547-8(1928).—No change in the soly in citric acid of P₂O₅ from the slag during the transfer of the slag from the converter to the silos was observed. The spraying of slag with water has no influence. Annealing of the slag contg. some SiO₂ causes a reduction in the soly. J. A. SZILARD

The smelting industry in 1927. VICTOR TAFEL. *Metall u. Erz* 25, 101-6(1928).—A review. J. BALOZIAN

The smelting industry in 1927. C. MATZEL. *Metall u. Erz* 25, 208-10(1928).—Various points in Tafel's article (preceding abstract) are criticized. Tafel answers these criticisms. J. BALOZIAN

The firing of smelteries from a central producer-gas plant, with special regard to conditions in zinc smelteries. HUGO WIDMANN. *Metall u. Erz* 25, 173-5(1928).—Zn smelteries are described in which the firing of a no. of ovens from single producers is found to be profitable. J. BALOZIAN

Suggested improvements for smelting copper in the reverberatory furnace. G. L. OLDRIGHT AND F. W. SCHROEDER. *Am. Inst. Mining Met. Eng., Tech. Publ.* No. 49, 20 pp.(1928).—Preheating the solid charge and using powd. coal or oil as fuel has increased the intensity of the firing and made it possible to charge the furnace more rapidly and increase its capacity over that in practice a few years ago. The use of a finely divided charge has made the smelting easier. Preheating the air, extending the length and increasing the temp. of the smelting zone are suggested as means of increasing the capacity of the modern reverberatory furnace. More refractory bricks in the "hot zone" of the arch would permit the use of higher temps. The authors describe in detail the condition of the brick lining at various parts of the furnace, the slag penetration of the bricks and the compn. of slag drips and the "zoning" of the fluid slags penetrating the bricks in the arch. Water-cooling the silica bricks is not considered feasible in lengthening their life. The max. practical temp. for the operation of the furnace is detd. by the fusion point of the silicates made by the interaction of the "dust" of the charge with the brick lining above the fire zone. J. W. SHIPLEY

Copper extraction by the cementation process in the Huelva district of Southern Spain. G. HOPPE. *Metall u. Erz* 25, 197-204(1928).—A description. J. B.

The copper country Katanga. FRANZ KROLL. *Metall u. Erz* 25, 49-53, 150-8 (1928).—A description of the geography, geology and mineralogy of the district is given. The principal Cu mines are owned by the Union Minière Co. and contain for the greatest part oxide and sulfide ores. In 1925 1,390,000 tons of ore was produced, giving 90,100 tons of Cu; in Dec. 1926 the ore reserves were calcd. as 77,000,000 tons, contg. 5,250,000 tons of Cu. The methods of grinding, wet-dressing and flotation of the ores are outlined, flow sheets being given. A description is given of the methods used, direct smelting or lixiviating and electrolyzing, for extg. Cu from the oxide ores. CoO occurs in some of the ores and is sepd. from CuO by metallurgical methods. In

1926, 20 g. of radium was produced, uranium being a by-product. *Sn, Au and Pt* are also found in the district. J. BALOZIAN

The El Teniente copper mine of the Braden Copper Co. Ltd., Rancagua, Chile. J. KUNTZ. *Metall u. Erz* 25, 25-32(1928).—The geography, geology, nature of the deposits, means of obtaining power and H₂O and methods of mining, dressing, smelting and transportation used, are described. In 1927, the output of Cu was 250 tons daily. J. BALOZIAN

Effect of melting and pouring conditions upon the quality of No. 12 aluminum alloy sand castings. T. W. BOSSERT. *Trans. Am. Foundrymen's Assocn.* 1928, 427-38; *Metal Ind.* (London) 32, No. 21, 520-1; No. 22, 542(1928).—Drawing and cracking can be minimized by changes in the molding methods but the tendency increases with the coarseness of the cryst. structure of the casting Expts. indicate that control of both melting and pouring temp. are important. The effect of a high pouring temp. is more harmful than that of a high melting temp. alone. Allowing the metal to remain in the furnace in the molten condition is harmful. When this is unavoidable, the temp. should be kept as low as practical. The detrimental effect of a high melting, pouring or soaking temp. can be removed by casting and remelting, provided proper precautions are taken on the remelt. The general effects of time and temp are not altered by variations in the Fe or Si content from 0.5 to 1.5%. J. W. BOESCK

The formation of complex silicates in the roasting of blends. V. HASSEIDTER. *Metall u. Erz* 25, 53-5(1928).—In the roasting of blends contg. Cu, it is assumed that all the CaO, MgO and BaO are converted into the corresponding sulfates or are already present as such. Actually, there is much uncertainty as to the degree of sulfatization of Pb and MgO, only CaO and BaO being completely sulfatized. The silicates of CaO and MgO, present in the ore not decompd. by HCl, or very difficultly so, are changed, in the presence of Pb at the roasting temp., to complex Pb, Ca and Mg silicates. These are much more easily decompd. by HCl than are the unroasted blends. Contradictions in the analytical results on raw and roasted ores are explained by this. J. B.

British blast-furnace and cupola practice. J. E. FLETCHER. *Fuel Econ. Rev.* 6, 43-5(1927); cf. *C. A.* 21, 2112. E. H.

The cleaning of blast furnace gas. II. A. J. BOYNTON. *Blast Furnace Steel Plant* 16, 623-8(1928); cf. *C. A.* 22, 2131.—A comparison of German methods. The disintegrator and its operation are briefly described. All types have a similar basic principle, consisting of the passage of a mixt. of gas and water between rapidly rotating and stationary bars. Power and water consumption in disintegrators are discussed, also sludge disposal. Bag filter systems and elec. pptn. with the variations in elec. devices employed are also discussed. Activity is shown in the development of methods of dry sepn. of dust prior to wet washing. A plant is under construction in Germany, proposing the centrifugal sepn. in a plurality of parallel horizontal pipes about 18 in. in diam., within which the gas is given a whirling motion by means of stationary screws. These pipes open on the lower side into a chamber without inlet or outlet, excepting for dust removal, the gas being carried through the chamber within the pipes. While in the U. S. the disintegrator method is regarded as the simplest, cheapest and most flexible of the thoroughly tried-out Continental systems, broad experience which is indicated in the near future in Germany may lead to a considerable application of elec. pptn. W. H. BOYNTON

Gas analysis index of furnace operation. HUGO BANSSEN. *Ber. No. 86, Hochofen.* Ver. deut. Eisenhuettenlaute; *Blast Furnace Steel Plant* 16, 615-6(1928).—An outline of work in Germany towards the evaluation of the blast-furnace gas analysis in terms of the operating conditions of the furnace. The method consists of calcg. instantaneous heat and material balances from a knowledge of the gas analysis and of the vol. of air blast. Gas analysis as performed is reduced to a basis of the actual combustion reactions. By subtracting the C equiv. of CO₂ from the total mols. of C leaving the furnace, it is possible to set up a heat balance showing the instantaneous disposition of the C charged as coke to the furnace. This permits calcg. the rate at which coke is burning at the tuyeres and the rate at which heat is being supplied. The rate of ore reduction can be calcd. and a balance made between the heat available and the heat required for the metallurgical purposes. Any discrepancy indicates improper functioning, such as C deposition, increased direct reduction, or oxidation of the scrap by CO₂, which is ascertained immediately after showing the calcd. effects of factors such as blast temp., gas temp., etc., on the coke consumption per ton of pig iron. W. H. BOYNTON

Recording and controlling instruments in the iron and steel industry. C. C. EAGLE AND R. M. WALKER. *Iron Steel Eng.* 5, No. 6, 263-77(1928). E. H.

Fuel requirements in iron and steel production. E. C. EVANS. *Fuel Econ. Rev.* **6**, 39-43 (1927). E. H.

Variables in steel-foundry practice. F. A. ΜΕΛΜΟΙΗ. *Trans. Am. Foundrymen's Assoc.* **1928**, 323-58.—The major variables influencing the production of steel castings are the human element, molding operations, metallurgical behavior of the steel and heat treatment after casting. The human element can be reduced by the introduction of standard methods, machines, etc., on repetition work, and by the satisfactory training of the operator on other classes of work. The construction of the pattern, position of the runners and feeding heads and molding materials are considered. For small and medium-size sand castings extreme refractoriness is not vital. The main variables are moisture and permeability. For large, heavy castings, the silica-base sands are not suitable and are replaced by mixts. of old crucible pots, used fire bricks, fire clay, sand and coke dust, ground and moistened so as to produce the necessary bond. The most likely variables attributable to mold materials are listed. The effects of variations in chem. compn. are discussed. In plain C steels the C content is the controlling factor of the phys. properties. Si is present to assist soundness by the removal of oxides and has little effect on the phys. properties. High Si appears to increase the soly. of mold gases. Low Si, in the absence of other deoxidizing agents, allows free oxide of Fe to exist in the steel at the time of casting, which reacts with the C, producing unsound castings. Mn functions primarily as a deoxidizer and assists soundness greatly. Tensile strength and yield point are materially increased without great loss of ductility. An ample percent of Mn by the formation of MnS prevents the formation of FeS, the latter being very detrimental to the phys. properties. In the presence of a reasonably high Mn content S, present in the usual amts., is unlikely to be the cause of serious trouble. High S causes red shortness. P has very little effect on the phys. properties when in normal amts. The belief that an increase in P causes an increase of fluidity is not confirmed. M. is rather of the opinion that the increased fluidity is due to melting conditions, which coincidentally produce high P. The various types of furnaces and the use of deoxidizers, such as Al, ferro-titanium and Ca silicide are discussed. The necessity of correct heat treatment after casting is emphasized. In the majority of cases a suitable anneal is all that is necessary. In special cases, especially with alloy steels, further improvement is obtained by a quench and draw. Typical phys. properties and micrographs are given. J. W. BOECK

Sand control and sand conservation in a gray-iron jobbing foundry. T. F. KILEY. *Trans. Am. Foundrymen's Assocn.* **1928**, 359-76.—The value of sand tests as found in control, conservation and reclamation is discussed. Sands are tested for relative moisture, permeability and bonding strength. The app. and procedure are described. Methods of reclaiming, difficulties met with in rebonding sands and methods used for overcoming them are discussed. Reclaimed sand mixts. for both light and heavy work are given. The results obtained by using different types of clays to rebond sand over a period of time are tabulated. J. W. BOECK

Waste-heat recovery from open hearth. T. J. ESS. *Blast Furnace Steel Plant* **16**, 646-8 (1928).—A brief study from theoretical and practical viewpoints, of the service rendered by waste-heat boilers. Heat available, boiler heating surface required, velocity of gases, and testing of boilers are taken up. "Every plant presents a different problem and should be subjected to an individual investigation." W. H. B.

Carbons to meet tensile specifications. J. R. MILLER. *Blast Furnace Steel Plant* **16**, 629 (1928).—A table provides for the ready application of open-hearth melts at the mill on the ladle test figures against the usual run of structural requirements. A margin of safety makes allowance for the usual variations met with in mill practice. W. H. BOYNTON

Standardization of a small impact test. FR. P. FISCHER. *Stahl u. Eisen* **48**, 541-7 (1928).—Discussion of the impact tests in use. The Mesnager test is proposed to be used as the small impact test beside the large Charpy test. J. A. S.

Re-heating and heat treatment furnaces. F. G. BELL. *Fuel Econ. Rev.* **6**, 46-51 (1927).—A review. E. H.

A metallographic study of the path of fatigue failure in copper. H. F. MOORE AND F. C. HOWARD. Univ. Ill., Eng. Expt. Sta., *Bull.* **176**, 27 pp. (1928).—The study of failure of metals under repeated stress, usually carried on by means of mechanical tests of strength, was made in this case by use of metallographic technic. By etching with concd. HNO₃ rolled copper showed an intra-granular structure consisting of laminae sepd. by planes especially sensitive to chem. attack. Specimens of rolled copper subjected to repeated flexure until a fatigue crack developed showed a surface disturbance of the metal in the vicinity of the crack, which seems analogous to that

found by Lucas in Armco iron but which is more clearly marked. This same copper etched after the development of a fatigue crack showed no evidence of change in crystal structure. H. L. OLIN

The structure of metals and its significance in foundry practice. J. CZOCHRALSKI. *Giesserei-Ztg.* 24, 1-12(1927); *J. Inst. Metals* 38, 467.—A description with many illustrations is given of the use of the microscope in examining the grain structure and microstructure of metals and in detecting the presence of objectionable impurities. The variation of the structure of Al alloys and white metals with the casting temp. is described, together with the effect on Cu and Al of melting in different oxidizing and reducing atms. H. G.

Characteristic graphite crystallization in pig iron and cast iron. HANS PINSL. *Stahl u. Eisen* 48, 473-7(1928).—Peculiar forms of graphite crystn. and segregation are discussed and illustrated with photomicrographs. J. A. SZILARD

Growth of cast irons. I. MORGAN. *Bull. Brit. Cast Iron Research Assoc.* 20, 7-17(1928).—Reference is made to the most extensive investigations published concerning various agents contributing to and retarding the growth of gray cast iron. Any recommendations for heat-resisting irons must be made for each particular case. DOWNS SCHAAF

Test results for centrifugally cast iron pipe. H. KOESTER. *Gas u. Wasserfach* 71, 391-3(1928).—Test results for ordinary and for centrifugally cast iron pipe show that the latter are much stronger. R. W. RYAN

Malleableizing hard iron in tunnel kilns. J. H. HRUSKA. *Fuels and Furnaces* 6, 611-2(1928).—Malleableizing hard iron is affected by chem. compn., time and temp. conditions and the thickness and design of the castings. In American practice the iron should be within the following approximate limits: Total C 2.20-2.80, Si 0.70-1.20, Mn 0.20-0.35, S max. 0.06, P max. 0.18%. The only effect of compn. upon the tensile strength of properly malleableized material is due to changes in C content. The tensile strength ranges from an av. of 57,000 for 2.20% total C to 43,000 for 3.00% C. The most important factor in satisfactory malleableizing is the proper relationship between time and temp. conditions. A time-temp. and a tensile strength-carbon content chart accompany this paper. J. W. SHIPLEY

Effect of various elements on malleable cast iron. L. E. GILMORE. *Trans. Am. Foundrymen's Assoc.* 1928, 287-92.—The elements present in ordinary malleable iron are: Fe, P, Mn, S, Si and C. In solu. P is harmless, but Fe phosphide causes brittleness and loss of strength. The Mn-S ratio must be carefully controlled with Mn in slight excess, but the abs. amts are not so important. Low C with high Si makes the strongest and most ductile Fe. Ti, Ni, U and Zr act like Si in pptg. C. Inhibitors of graphitization are abnormal amts. of S or Mn, and Sb, B, Ce, Cr, Mo, Se, Te, Sn and V. Malleable Fe should be regarded as a mixture of compds and interacting elements, which, when properly balanced, det. the quality of the Fe. H. C. DAVIS

The removal of iron from old zinc. RICHARD THEWS. *Metallhölse* 15, 1183, 1407-8(1925); *J. Inst. Metals* 36, 565.—The importance of refining of old zinc melted in Fe vessels is discussed. Various preventive precautions to be observed during the melting of Zn are dealt with. If steel vessels are used, and if the temp. is kept as low as possible, then the Fe content in the remelted Zn can seldom reach 0.1%. The use of S and some other media for the refining of Zn is considered. H. G.

Cementation of iron, steel, nickel and cobalt with boron and beryllium. J. FETCHENKO-TCHOPIWSKI. *Collected Papers from Przeglądu Technicznego* 1926, 525-30, 545-7, 657-60, 692-4, 705-7; 1927, 73-8, 787-92, 832-6; *J. Inst. Metals* 38, 460.—[In Polish, with French summary.] Expts. on the diffusion of B and Be into Fe, steel, Co and Ni show that diffusion is more rapid the greater the difference in at. vol., the greater the difference in the m. ps., and the simpler the crystallographic symmetry of the solvent metal. Data on the depth of penetration at varying temps., together with analytical and micrographical examn. of the cemented layers, indicate that the limit of soly. of B in Ni below 1140° is 7% and is independent of the temp.; the soly. of Be in solid γ -Fe decreases from 30% at the eutectic temp. (1155°) to about 24% at 650°, at which point the Fe reverts to the α phase. Be appears to be completely insol. in solid Co below 1300°, but dissolves to a limited extent in solid Ni; B, likewise, dissolves to a limited extent in Co. The surface layers formed by cementation in most cases display age-hardening phenomena after quenching from suitable temps. H. G.

Oxygen in iron and steel. P. OBERHOFFER, H. J. SCHIFFLER AND W. HESSENBRUCH. *Arch. Eisenhüttenwesen* 1, 67-8; *Stahl u. Eisen* 47, 1540-3(1927).—The effect of O on the primary and secondary structure of Fe was investigated. Electrolytic Fe and FeO were melted *in vacuo*. All samples showed after etching with alc. CuCl₂

a dendritic structure, which is caused by segregation of the O retained in solid soln. The limit of soly. of O is between 0.05 and 0.06%. Fe-FeO solid soln. has a more positive potential than pure Fe; therefore etching with primary etching agents is slower. There is a sudden increase in the rate of etching if the limit of the soly. of O in Fe is passed, because of the higher potential of the FeO particles sepd. from the solid soln.; the primary structure appears faded as the solid soln. is also attacked.

J. A. SZILARD

Examination and properties of steel with physical peculiarities. F. STABLEIN. *Z. tech. Physik* 9, 145-7(1928).—A short review is given, with curves, of the relations between the compn. of steels and their magnetic qualities, thermal expansion and specific resistance.

B. J. C. VAN DER HOEVEN

Defects in soft, non-silicon steels due to methods of production. K. VON KERPELY. *Mitt. staatl. tech. Versuchsanst. (Wien)* 16, 108-17(1928).—Defects are usually the result of using low-grade materials, although sometimes the rolling process introduces irregularities into the material. Failure is most often due to (1) non-metallic inclusions which have their origin in the deoxidation process, (2) differences in grain size, (3) local coarsely cryst. areas, (4) oxide inclusions. Detailed directions are given for the production of boiler-tube steel. Since non-siliceous steel has a greater tendency to release gases than siliceous steel, it is advisable to give the former a uniform preheating before rolling. The best rolling temp. is 1300°. Elec. furnace steel is uniformly better than open-hearth steel for tubes, since a higher temp. is reached in its production. As a means of deoxidizing, ferro-C-titanium with Al is recommended. W. F. H.

Behavior of unalloyed and alloyed boiler plate at elevated temperatures and in respect to aging and recrystallization. FRIEDRICH KÖRBER AND ANTON POMP. *Mitt. Kaiser-Wilhelm-Inst. Eisenforsch. Dusseldorf* 9, 339-400(1927).—Fourteen specimens of boiler plate were examd. In the unalloyed plate, C varied between 0.06 and 0.29%, Mn between 0.42 and 0.64%, P between 0.016 and 0.037%; S between 0.024 and 0.046%, Cu between 0.11 and 0.21%, with only 2 samples contg. 0.12 and 0.18% Si, the others traces. In the alloyed plate, 2 types were studied, one contg. 3% Ni, the other 5% Ni, each with about 0.10% C, 0.06% Mn, 0.10 to 0.20% Si, 0.02% P, 0.016% S and 0.05 to 0.12% Cu. In all specimens, elastic limit (0.01 and 0.03% permanent deformation), limit of stretch, tensile strength, elongation and reduction in area were detd. between 20 and 500°, fatigue strength at 300, 400, 500°, and notch test between 0 and 500°. In varying the testing temp. from 20 to 500° the following effects were obtained: Elastic limit and limit of stretch decrease only slightly up to 200° and then decrease rapidly. Tensile strength increases up to 200°, falls off slightly to 300°, and then rapidly above 300°. Elongation and reduction in area fall off up to 200° and then rise again. The values for notch test increase up to 50 or 100° and then fall off. In natural aging, the specimens after cold working were loaded to about 4 kg./sq. mm. above the lower limit of stretch and allowed to stand at room temp. for 3, 14, 30, 90 and 270 days. Except for a decrease in the notch test on the unalloyed steels, little change took place in natural aging. In artificial aging, the specimens were heated in an oil bath at 200° for 2 hrs., and the notch test was then made at 20°, 50°, 100° and 200°. To produce recrystn. the unalloyed steels were heated for 1 hr. at 780° and slowly cooled while the Ni steels were heated for 1 hr. at 650°. Both mech. tests and photomicrographs indicated better properties in the 5% Ni steel after recrystn. than before. H. SROGRTZ

Electrical resistance of molten metals and alloys. YOSHII MATSUYAMA. *Kinzoku no Kenkyu* 3, [9], 439-55(1926); *J. Inst. Metals* 37, 480.—[In Japanese.] The object of the investigation was to measure the elec. resistance of binary systems in their liquid state, and from the resistance-concn. curves to decide the question whether an inter-metallic compd. exists as such in its molten state or whether it exists in at. state being completely dissoed. The exptl. method was the same as that given in a previous paper (C. A. 22, 2309) and the results of the investigation may be summarized as follows: (1) In binary alloys, the components of which form no compds. with each other in the solid state, the resistance-concn. relations can be expressed by a curve bending slightly from one component to another without showing any max. or min. (2) In binary alloys, the components of which form one or more intermetallic compds. with each other, the resistance-concn. curve shows a max. in the concn. of the compd.; and the temp. coeff.-concn. curve shows a min. in the same concn. (3) Usually the max. and min. are very sharp; but in some cases they are more or less rounded, showing some degree of disso. of the compd. (4) From the above results, it is concluded that in the Fe-C system the cementite (Fe₃C) is present as such in the molten alloys, though some degree of disso. may result. H. G.

Heat treatment of aluminum-alloy castings. R. J. ANDERSON. *Am. Metal Market* 35, 5-12, 44(1928).—The reasons for the improvement in hardness and strength of Al alloys upon heat treatment are given with reference to the equil. diagrams. The heat-treating process usually consists in (1) heating the casting to a suitable temp. (about 500°) and "soaking," (2) quenching in cold, hot or boiling water or in oil, and (3) aging, by warming to some temp. between 20 and 230°. The various factors of importance in the technical heat treating of Al alloys are discussed at length. Detailed drawings are shown of an electrically heated and operated soaking furnace and of a similar type of furnace for aging.

WILLIAM F. EHRET

Aluminum alloys. HUGO MAINZ. *Metallbörse* 15, 2357-8, 2414(1925); *J. Inst. Metals* 36, 431.—The phys. and chem. properties of Al and its alloys are discussed. The remelting of Al shavings is dealt with.

H. G.

Various kinds of aluminum alloys. MASAJI GOTÔ AND TOKUSHICHI MISHIMA. *Nihon-Kôgyôkaishi* 41, [477], 1-17(1925); *J. Inst. Metals* 38, 410-1[In Japanese.].—Molten Al-Mn alloy separates into two layers in the range from 90% to 55% Al, and also 5% to 10% Al; this is contrary to Hindric's view. Compds. such as Al₃Mn, AlMn, and Al₂Mn were observed in this alloy. In investigating various ternary alloy systems, such as the Al-Cu-Fe, Al-Si-Cu, Al-Si-Ag and Al-Cu-Ag systems, their modifying temps. were measured and diagrams of their compns. and temps. were obtained. In the Al-Cu-Ni system the authors did not recognize the line at 55° which was observed by Gwyer.

H. G.

Aluminum alloys and their significance in industry. WILLI HAAS. *Zentr. Hütt.-Walzwerke* 31, 115-7(1927); *J. Inst. Metals* 38, 571.—The compn. and some of the phys. and mech. properties of all the light Al alloys that have been developed within the last few yrs. are described briefly, and some indication is given of their uses in industry.

H. G.

New light aluminum alloys C6 and MC. TOMOJIRÔ TANABE. *J. Soc. Mech. Eng. Tokyo* 28, [102], 820-35(1925); *J. Inst. Metals* 38, 410[In Japanese.].—T. prepd. two new series of strong light Al alloys by special heat and mech. treatment. One of them, called C6 alloy, contains Cu 6% and Al 44% (?). The other, called MC, contains Cu 1.2%, Mg 0.5-1%, and Al remainder. T. claims for these alloys mech. qualities that are not inferior, but rather superior, to those of Duralumin.

H. G.

Investigation of special hard aluminum alloys and theory of temper hardening of aluminum alloys. TOMOJIRÔ TANABE. *Tetsu-to-Hagane* 11, [6], 437-57(1925); *J. Inst. Metals* 38, 411[In Japanese.].—The special hard alloy contained 5% Mn and 0.5-2.0% Si. A good alloy was obtained by rolling after aging at ordinary temp. or by tempering at 200°, in both cases the alloy having been quenched at 500° or 600°. The quenching might be done by air-cooling. To explain the temper hardening, a systematic study was carried out with Al-Cu and Al-Mg alloys, and some new facts were found from curves showing elec. resistance and heat-expansion. Conclusion: The temper hardening might be explained by the colloidal chem. theory.

H. G.

The aluminum bronzes. R. GUERIN. *Rev. Aluminium* 3, 172-4(1926); *J. Inst. Metals* 36, 439.—The properties of the aluminum-bronzes were described by Sainte-Claire Deville as far back as 1859, but difficulties in manuf. hindered their general use. These have now been overcome by the Durville process. The properties of the 10% "aluminum-bronzes" are outlined, and the effects of tempering the quenched alloy illustrated by photomicrographs. A number of engineering details for which these alloys have been found suitable are listed.

H. G.

Aluminum-copper-tin alloys of high aluminum content. MASA HARU GOTO AND TOKUSHICHI MISHIMA. *Nihon-Kôgyôkaishi* 39, 714-21(1923); *J. Inst. Metals* 36, 433[In Japanese.].—With regard to Al-Sn alloys, contrary to Gwyer's view, Al makes a solid soln. by dissolving 2% Sn. The hardness of Al-Cu-Sn alloys increases (at about 200°), but again decreases rapidly; this appears to be due to the transformation of Sn at 200°. The decrease of hardness at 230° may be attributed to the fact that Sn is not absorbed in the alloy either as a solid soln. or a compd., but exists as a eutectic.

H. G.

Aluminum-tin alloys. KYOSUKE KANEKO AND MIYOICHI KAMIYA. *Nihon-Kôgyôkaishi* 40, [472], 509-16(1924); *J. Inst. Metals* 36, 436[In Japanese.].—The Al-Sn equil. diagram has been completed and the eutectic point found to be at 1.3% Al and 98.7% Sn. The hardness of these alloys is max. at 5% Sn; on approaching pure Sn it decreases suddenly. The sp. gr. increases with Sn content. This does not differ greatly from the calcd. value, and shows that there is no special contraction or expansion, whatever the proportions. The max. soly. in acids occurs at 5% Sn,

and gradually decreases as the Sn content increases, pure Sn being practically insol.

H. G.

Heat treatment of aluminum and its light alloys. R. J. ANDERSON. *Fuels and Furnaces* 6, 617-18(1928); cf. C. A. 22, 1941.—Al alloys are heated to about 500° and quenched in water, oil or an air blast. The time period at the soaking temp. prior to quench permits the solid soln. of such intermetallic compds. as CuAl₂ and Mg₂Si. In general the higher the quenching temp. the greater the hardening on aging. Heating in the case of castings should be longer than for wrought metal. Transferring from the furnace to the quench should be as rapid as possible. Rapid quenching produces hardness, while a slow quench is required for metal used in annealing processes.

J. W. SIMPLEY

Influence of aluminum on white metal with lead base. YOSHIO FUKUTANI. *Suiyo-Kwaishi* 4, [9], 1289-99(1925); *J. Inst. Metals* 38, 422.—[In Japanese.] By adding Al to lead-base white metal the hardness was increased, blowholes were removed, the compd. of Sb-Sn became uniformly distributed, the compressive strength and toughness were increased, and the friction loss was reduced. These facts show that white metal contg. Al is a suitable material for use as bearing metal.

H. G.

Cobalt and its alloys. RICHARD THEWS. *Metallhorse* 15, 1799-1800, 1854-5, 1910-11(1925); *J. Inst. Metals* 36, 586.—The origin, production, impurities, working, properties, and application of Co and its alloys are described. Co electroplating is considered.

H. G.

Copper and copper alloys. W. H. BASSETT. *Mining and Metallurgy* 9, 170-4; *Metal Ind.* (London) 32, No. 21, 517-20(1928)—B. discusses in a general way the optimum conditions for copper refining and considers briefly the alloys of copper with zinc, tin, silicon, manganese, cadmium, nickel, and their use for various purposes.

A. W. COFFMAN

Effect of heat treatment on some mechanical properties of 87:7:5:1 copper-zinc-lead alloy. R. J. ANDERSON. *Am. Metal Market* 35, No. 71, 1-4(1928).—The alloy 87 Cu - 7 Sn - 5 Zn - 1 Pb was sand-cast into suitable test bars, annealed for various periods of time up to 700°, and quenched in H₂O from various temps. Mechanical tests showed that, in general, annealing this alloy has the effect of improving the ductility. Quenching in H₂O from temps. above 500° has very harmful effects on the tensile properties. The alloy may be annealed for the release of casting strains with simultaneous improvement of ductility. The alloy machines and casts well and is useful as a general casting bronze.

S. G. SIMPSON

Experimental researches on alloys of iron, chromium, and nickel. P. CHEVENARD. Reprint from *Trav. et Mém. Bureau Internat. Poids et Mesures*, 12, 144 pp(1927); *J. Inst. Metals* 37, 471; cf. C. A. 22, 1752.—The various transformation points in Fe, Ni, and Cr and in binary and ternary alloys of these metals, have been investigated by differential dilatometric methods, with Pyros alloy (82% Ni, 3% Fe, 4% W, 3% Mn, and 8% Cr) as a standard. Fe-Ni alloys may be divided into two classes—those contg. less than 27.3% Ni and those contg. more; the former may be regarded as Ni steels, and the latter as ferro-nickels. Ni widens the temp range of the allotropic change in Fe and rapidly depresses the Ar₃ point, which reaches 0° with 27.3% Ni; the A₂ curve of Fe falls slowly with addn. of Ni up to 3.6%, then follows the Ar₃ curve down to -20° with 28% Ni, and finally rises in a smooth parabola to 600° at 70% Ni, falling again to 360° with pure Ni. Dilatometric analysis confirms the existence of the compd. Fe₃Ni. The min. coeff of expansion of Fe-Ni alloys at 0° occurs with 35.6% Ni (Invar), but the properties of all these alloys are appreciably affected by cold-work and by quenching, because of the effect of these treatments in lowering the magnetic change point and increasing the magnitude of the anomaly in the expansion. Cr, up to at least 40%, forms solid solns. with both Fe and Ni with a slightly lower d. than the theoretical. The A₂ point of Fe rises to 775° with 6% Cr, then falls in a straight line to 0° with 80% Cr, whereas 5.4% Cr is sufficient to lower the magnetic change point of Ni to 0°. Addn. of Cr to Ni steels lowers the allotropic transformation point of those poor in Ni, increases the thermal hysteresis, and tends to restrain the spontaneous physicochemical changes of alloys having a high Fe content, i. e., it extends the region of austenite stability. In the ferro-nickels the higher the Cr content for a constant Ni content the lower is the magnetic change point and the feebler are the expansion and elasticity anomalies; this action of Cr appears to be due to the formation of the compd. Ni₃Cr₄.

H. G.

Alloys of lead and antimony. KYÔSUKE KANEKO AND MORITARÔ FUJITA. *Nihon-Kogyôkwaishi* 40, [471], 439-49(1924); *J. Inst. Metals* 36, 445.—[In Japanese.] Two kinds of solid solns., α and β , exist at both extremes of Sb content, say from 0 to 5%

and from 97 to 100%. In the equil. diagram an arrest line was located at 243° in the range 30–97% Sb, and an unstable compd. Sb_2Pb was recognized at that point. The hardness at the extreme point of the solid soln. of Sb (5% content) increases slowly, but at 97% Sb it decreases suddenly, and there is a point of change at 63% Sb in the hardness curve. The soly. of these alloys in acids increases with the addn. of the other component, and reaches the max. point at 45% Sb, between them two scarcely sol. points being observed. H. G.

Alloys of lead, cadmium and tin. KYÔSUKU KANEKO AND AKIRA ARAKI. *Nihon-Kôgyôkwaishi* 41, [482], 437–55 (1925); *J. Inst. Metals* 38, 422.—[In Japanese.] The eutectic temp. was detd. at the eutectic point, which is at 6.28% Sn. At the eutectic temp. very faint unstable changes were observed at 162° and 148°, but it seemed that such transformations did not occur in alloys which were annealed completely. These alloys are stable in the following cases: Tin-side, up to 1% Pb, when they are solid solns., and in the lead-side up to 18% by 181° and up to 15% in the cold state. A Pb-Sn compd. was observed at 36.3% Sn. The hardness changes greatly at about 36.3% and 99% Sn. Regarding their soly. in a 0.1 N soln. of HCl, pure Pb has a min. soly. gradually increasing up to 18% Sn, and then remains nearly const. up to pure Sn. The soly. in concd. HCl is nearly uniform in the range from pure Pb to 20% Sn, and gradually increases up to 50% Sn, then again becoming const. up to pure Sn. H. G.

Sand-cast manganese-aluminum alloys. W. HAAS. *Giesserei-Ztg.* 23, 328–9 (1926); *J. Inst. Metals* 36, 435.—Mn-Al alloys generally offer a higher resistance to the corrosive action of sea-water than any of the common Al alloys. For making castings an alloy contg. 2.0% Mn is recommended; it has a tensile strength of 30 kg. per sq. mm. with an elongation of 5%. For rolling purposes the alloy should contain 1.25% of Mn, when a tensile strength of 29 to 81 kg. per sq. mm. and an elongation of 25 to 1%, according to heat and mech. treatment, is obtained. A stronger alloy for casting purposes and one that resists sea-water better than Duralumin contains 4.5% Cu, 1% Si and 0.75% Mn; this alloy is susceptible to aging treatment (cf. Daniels, C. A. 20, 733). H. G.

Profound alteration of an alloy of nickel-copper in superheated steam at 350° to 400°. J. P. SAFFY. *Compt. rend.* 186, 1116–8 (1928).—In an attempt to discover a cheap and satisfactory material for the construction of turbine blades, the action of water vapor under operating conditions upon a large no. of alloys was noted. An alloy of C 0.2, Mn 1.6, Ni 68.6 and Cu 28.9% gave especially important results. A treatment of 17 months in satd. vapor at a pressure of 6 kg./sq. cm. and at 150° which sufficed to produce corrosion fissures in other metals and alloys, did not destroy the excellent mech. (bending) properties. Higher temps. (475°) induced intercrystalline attack, fracture on bending always occurring between the crystallites. Expts. at intervening temps. are given showing a gradation in behavior. ROBERT F. MEHL.

Study of the nickel-zinc alloys with a low nickel content. PIERRE CHARRIER. *Compt. rend. assoc. sci.* 47, 330–3 (1924); *J. Inst. Metals* 36, 452.—At the m. p. of Zn, Ni and Zn combine to form the crystalline compd. $NiZn_3$. These crystals were found cemented together by Zn when pure Zn was melted in a Ni crucible; after remelting in a great excess of Zn their compn. remained unchanged. H. G.

Silver, gold and copper amalgams. ALEKSANDER WERYHA. *Compt. rend. soc. polonaise phys.* 7, 57–63 (1926); *J. Inst. Metals* 37, 469–70.—[In German and Polish.] Examn. of the mechanism of diffusion of Hg into Cu, Ag and Au by means of the Debye-Scherrer x-ray app. indicates that diffusion is not a phys. process at all but a purely chem. one assocd. with the formation in every case of a series of compds. The compd. Ag_3Hg_4 appears to be the final product of the action of Hg on Ag. It crystallizes in hexagonal needles belonging to the regular system. Its lattice parameter is 10.09 Å. U. Apparently two other Ag-Hg compds exist, and at least one Au-Hg compd. with characteristic lattice structures. H. G.

Electrical conductivity of silver alloys. M. HANSEN AND G. SACHS. *Z. Metallkunde* 20, 151–2 (1928).—The elec. cond. of Ag alloys with Cd, Zn, Mg, Mn, Sb, Al and Sn was detd. by means of a Thomson bridge. The wires were drawn from 1.8 mm. diam. to 0.70 to 0.72 mm., and tempered at 500° for 1/2 hr. Hardness tests run about parallel to elec. resistance, except for Ag-Mg, which gives the greatest hardness while its resistance is about av. The decrease in elec. cond. with added metal is greater the farther removed in the periodic system is the added metal from the Cu, Ag, Au column. H. STROETZ

Action of zinc, tin, aluminum and magnesium on copper containing cuprous oxide. O. BAUER AND H. ARNDT. *Giesserei-Ztg.* 23, 671–7 (1926); *J. Inst. Metals* 37, 380–1.—Zn and Mg diffuse readily into Cu at temps. well below their m. p., but Sn and Al

not only do not diffuse into Cu below their m. p., but even when molten diffuse only relatively slowly. On the other hand, solid Cu dissolves slowly in molten Zn, more rapidly in molten Al, and extremely rapidly in fused Sn or Mg. The differences are ascribed to differences in the lattice structure, metals of widely varying structures diffusing into each other more rapidly than do those with the same or similar structures. Diffusion of liquid Zn into Cu containing Cu_2O effects reduction of the latter with the formation of loose, dusty inclusions of ZnO; under the same conditions reduction with Sn proceeds by zones somewhat slowly, and with Mg rapidly throughout the metal. Al diffuses only slowly into Cu containing O, as the Al_2O_3 produced by reduction of the Cu_2O forms thin, scaly, almost impervious layers which tend to retard diffusion.

H. G.

Effect of the testing method on the determination of corrosion resistance. H. S. RAWDON AND E. C. GROESBECK. *Bur. Standards, Tech. Paper No. 367*, 409-46 (1928).—A series of com.-grade Cu-Ni alloys from all Cu to all Ni were tested in normal solns. of the following. HCl, HOAc, NaOH, NH_4OH , NaCl and $\text{K}_2\text{Cr}_2\text{O}_7$. The methods used were simple immersion both aerated and non-aerated, repeated immersion both continuous and intermittent, spray and electrolytic. Considerable variation in the relative corrodibilities was found by the various test methods, indicating that the essential features of the corrosive conditions to be met must be incorporated in the test. Conclusion: The degree of aeration of the corroding soln. was one of the most important factors; the formation of protective films may be a controlling factor in some cases; in general, binary metallic solid solns. corrode at rates intermediate between those of the 2 components.

J. K. ROBERTS

Application of electric resistance measurements to the study of the atmospheric corrosion of metals. J. C. HUDSON. *Proc. Phys. Soc. London* **40**, 107-31 (1928).—A description of a quant. exposure test of non-ferrous wires to atm. corrosion. Measurements of the elec. resistance of wires were made by the Wheatstone bridge method and the percentage increase in resistance correlated with increase in wt. Sufficiently good agreement was found that the test was concluded to be applicable as a quant. test for atm. corrosion. Details of the method are given, including prepn. of the specimens, elec. connections, wt. measurements, etc. Data are given for Cu, 80/20 Cu-Ni, Ni, 60/40 brass and several silicon bronzes.

J. K. ROBERTS

Relative corrodibilities of ferrous and non-ferrous metals and alloys. I. Results of 4 years' exposure in the Bristol channel. J. NEWTON FRIEND. *J. Inst. Metals* advance copy, No. 456, 23 pp. March, 1928; *Iron Steel Can.* **11**, 102-11; *Metal Ind.* (London) **32**, 449-54, 522-5 (1928); cf. *C. A.* **22**, 373.—Bars of Ni, Sn, Pb, Zn, Al, various coppers and bronzes, bare and galvanized steel and iron, cast iron and stainless steel were immersed for 4 years in sea water. The rack was covered with water about 93.5% of the time, being exposed for short intervals at some low tides. Detailed descriptions of drawing and analyses of the bars are given. After the test, the bars were cleaned, weighed (both before and after cleaning), measured, tested for tensile strength (simultaneously with unexposed bars) and closely examd. A description of the appearance of each bar is given. Of the non-ferrous metals common tin was best, the resistance varying through Ni, Pb, Cu, bronzes and Zn to Al which was worst. Galvanized Armco iron was fair, while steel and wrought iron were approx. equal. Stainless steel pitted badly.

J. K. ROBERTS

Influence of the thermal and mechanical treatment of aluminum on its resistance to corrosion. W. WIEDERHOLT. *Korrosion Metallschulz* **2**, 126-33 (1926); *J. Inst. Metals* **36**, 459; cf. *C. A.* **21**, 2420.—When technical grades of Al sheet are annealed the max. sepn. of the Fe and Si impurities occurs at 300°. Annealing above 300° causes the Si especially to go into solid soln. to a degree depending on the temp. and duration of anneal, whereas annealing below 300° results in the slow sepn. of the impurities at a rate proportional to the time of annealing. Corresponding differences are noticed in the resistance of annealed metal to corrosion as judged by the Mylius oxidizing salt test, metal annealed at 300° having the smallest resistance to this test. Annealing above 300° in N increases the resistance to corrosion; a similar anneal in O still further increases the resistance, in consequence of the formation of a tenacious oxide film on the surface of the metal. Coarsely crystallized sheet resists the salt test better than that having a fine cryst. structure; hence the amt. of cold-work to which the sheet has been subjected before annealing has a decided influence on its resistance to corrosion.

H. G.

The corrosion of aluminum alloys. H. SUTTON. *Metallurgist* (Supp. to *Engineer* **143**, No. 12) 36-7 (1927); cf. *C. A.* **21**, 3883.—A review with brief bibliography. Uniformity of structure, purity and soundness are most important in the production of

Al alloys of high corrosion resistance. Intercryst. corrosion in Duralumin and related alloys is due to penetration of corrosion from the surface along the crystal boundaries of the metal. Al alloys can be protected against corrosion by anodic oxidation, treatment with Na_2SiO_3 or electroplating with Cd. D. B. DILL

Influence of salt-water on Duralumin. TORD ÅNGSTRÖM. *Aéronautique* 1925, [69], 77; *J. Inst. Metals* 38, 436; cf. *Ingeniörs Vetenskapsakademien. Hand* 1927, No. 51, 5-30.—Results are given of expts. carried out with a view to detg. the behavior of Duralumin in salt-water. The most striking facts observed after immersion of test-pieces of Duralumin in salt-water for 1 to 6 months were the considerable reduction in tensile strength and elongation of the samples half immersed; 50% reduction in elongation being obtained after 1 month. Analogous results were obtained with Aludur, a Swiss alloy. Comparison was also made with steel samples. Expts. on Duralumin covered with a layer of varnish showed that this did not secure immunity from deterioration, even in the case of samples well protected from water. A comparison with wooden samples showed that there was no appreciable diminution of tensile strength. It appears to be Å.'s opinion that the method of construction of mixed steel and Duralumin, upheld by Dornier, reserving steel for the essential parts, is to be recommended in the construction of sea-planes. H. G.

The resistance of Duralumin to corrosion. DORNIER. *Aérotechnique* 1927, [51], 80-1; *J. Inst. Metals* 38, 437.—The firm of Dornier, after carrying out systematic expts. over many years, has come to the conclusion that Duralumin is, up to the present, under certain conditions, the alloy which, of those manuf. industrially, best resists corrosion in salt water. Expts. are described which showed that a fuselage of Duralumin remained unaltered after three years. A hydroplane kept in fresh water for 5 years showed no sign of corrosion. A sheet of Duralumin 1 mm. thick remained unaltered after immersion in salt water for 149 days. Diagrams are given showing the influence of corrosion on the tensile strength and elongation of Duralumin in the case both of samples as originally manufd. and also after heat-treatment. After immersion for 40 days in salt water in both cases the elongation was reduced, but in the Duralumin as originally manufd. there was no change in the tensile strength. Photographs are given of portions of floaters which were immersed for 39 days in the Mediterranean Sea, the rivets which were immersed remaining unaltered, while those which were not immersed were attacked. Tests on samples from different parts of another floater immersed for 144 days showed that the mech. properties of the Duralumin had not altered. H. G.

Effect of corrosion upon the fatigue resistance of thin Duralumin. R. R. MOORE. *Proc. Am. Soc. Testing Materials* 27, Pt. II, 128-33 (1927).—A study has been made of the corrosion of sheet duralumin as affecting its fatigue resistance. The machine developed for this purpose is described. The specimens (short tubes of thin sheet metal) were corroded in a salt spray (20% NaCl), some for 5 days, the rest for 10 days. Fatigue and tension tests were made on corroded and uncorroded specimens. Corrosion had no effect on tensile strength; ductility was decreased about 25%; and the fatigue endurance limit decreased about 35%, the 5-day and 10-day corrosion periods having about the same effect. It is suggested that corrosion during stress would probably be more severe than prior corrosion because of the progressive nature of the intercryst. corrosion. J. K. ROBERTS

Corrosion of copper and brass in reference to the condenser-tubing problem. V. DUFFEK. *Korrosion u. Metallschutz* 4, 56-8 (1928).—Distd. and natural waters, in the presence of air cause the formation on Cu of an initial protective layer of lower oxides. This layer then becomes darker and porous, permitting attack underneath. In sea water, the behavior of Cu is irregular but corrosion proceeds rapidly once a crust of CuCl is formed. In air up to 300° oxide films form. Above 700° the attack by oxidation is rapid but decreases as the oxide scale is built up. In presence of air, Cu is readily attacked by even very dil. acids. Aq. solns. of KOH and NaOH attack Cu in presence of air. In partly immersed specimens corrosion takes place rapidly at the air-liquid boundary; localized aeration causes pitting. Brasses behave in the same manner as Cu. In cases of brasses contg. both α and β crystals, the latter are attacked first. Additions of 0.01 to 0.02% arsenic to the alloy prevent localized attack. Brasses are subjected to localized corrosion by stray currents. Grain size is found to have little effect on the corrodibility. J. K. ROBERTS

Research on an accurate determination of corrosion, and on the influence of carbon on the rate of attack of structural steel by acids. V. DUFFEK. *Korrosion* 3, 9-11, 13-14 (1928).—Descriptions of 4 series of tests in 2% solns. of H_2SO_4 , HNO_3 , HCl and $\text{H}_2\text{C}_2\text{O}_4$, with 6 cuts, 2 charts and 1 table of results. J. H. MOORE

Rust and rust prevention. M. SCHULZ. *Farben-Ztg.* 33, 329-32(1927).—A review. J. S.

Rapid and practical method of applying the ferroxyl test to protective coatings. KARL PITSCHNER. **Proc. Am. Soc. Testing Materials* 27, Pt. II, 304-9(1927).—The ferroxyl test for detecting pinholes in platings on steel or iron is modified by applying the reagents ($K_3Fe(CN)_6$ and NaCl) in a soln. to paper. When used the paper is moistened and spread over the surface. After spots are formed, the paper is removed, washed free from reagents and dried, a permanent record resulting. This method is applicable to plating shops. J. K. ROBERTS

Doubtful transformation point of aluminum at about 575°. A. MÜLLER. *Z. Metallkunde* 19, 414-5(1927); *J. Inst. Metals* 38, 366.—Earlier work is briefly reviewed. Thermal differential curves which were taken with Al (0.17% Si, 0.20% Fe), and with Al-Zn alloys with 5, 10 and 20% Zn, resp., showed no break from room temp. up to nearly the m. p. H. G.

Some observations on the creep of metals. D. HANSON. *Metallurgist* (Suppl. to *Engineer* 143, No. 13) 54-6(1927).—Creep tests on 99.5% Al at 250° showed failure in 6 min. with a tensile stress of 2.3 tons per sq. in. and in 84 to 86 days with tensile stress of 1.5 and 2.0 tons per sq. in. Hardness increased 40% in the parallel portion of the broken creep test piece. Specimens tested in the annealed condition showed no recrystn. but there was recrystn. in the "as-rolled" specimens. It appears that the effect of increasing temp. "is to increase the effects of slight amounts of strain and to render them greater than when the deformation is carried out at lower temps." D. B. D

The swelling in hydrogen of metals and alloys containing a little oxide. M. GUICHARD, CLAUSMANN and BILLON. *Compt. rend.* 186, 1121(1928).—When an alloy of Ag and Cu contg. some oxide is heated in a current of H, at the pt. of fusion bubbles form on the surface. Maintaining the alloy below the pt. of fusion produces a progressive loss in wt. and an increase in vol. Once melted in H, the metal no longer shows this behavior. Expts. are described which show that the variation in vol. increases with the amt. of Ag even though the alloy richer in Ag is the less oxidized. The mech. resistance of the metal appears to be an essential factor. Partially oxidized Cu without Ag gives rise to the same swelling observed in the above expts. Without oxide the metals and alloys do not show changes in appearance or changes in dimensions. The following explanation is advanced: H diffuses to the interior of the metal, where it reduces the Cu_2O and forms Cu and H_2O vapor. The H_2O vapor diffuses in the opposite direction, but more slowly. The mech. strength of the metal prevents the easy escape of the H_2O vapor bubbles resulting in the observed swelling. At the m. p. these bubbles escape suddenly, producing the observed projections. ROBERT F. MEHL

Metallic grains and crystal lattices. ADOLF SMEKAL. *Mitt. staatl. tech. Versuchsanst. (Wien)* 16, 72-83(1928).—The matter of improving the phys. properties (tensile strength, etc.) of metals and alloys to be used for technical purposes is discussed. Improvement is shown to depend, in the last analysis, upon our ability to improve the properties of each individual crystal or grain. Metals used in practice are composed of crystals ("real crystals") which do not possess a perfectly regular lattice of atoms throughout. This accounts for (1) the fact that they can be plastically deformed, and (2) the fact that the tensile strength of technical metals is much below the calculated "molecular" tensile strength of metals possessing an ideal, highly regular lattice of atoms in each crystal. To demonstrate the existence of abnormal or "loose" atoms with very easily removable electrons and their connection with plastic deformation and tensile strength a crystal of rock salt was irradiated with ultra-violet, x-rays or γ -rays, resulting in a coloration which gradually disappeared upon subsequent exposure to daylight. This coloration, due to Na atoms, has its origin in changes occurring in the "loose" atoms which behave as though on the free edges of a crystal. Plastic deformation of a colored rock salt crystal leads to a very rapid decolorization when exposed to daylight. Deformation is shown to increase the actual number of loose places about ten-fold. A grain is thought to be made up of crystalline areas possessing about 10,000 atoms and the ideal lattice structure. These areas interpenetrate in such a way as to leave occasional "loose" regions. The influence of the presence of foreign atoms upon the structure and deformability is usually to increase the tensile strength and decrease the tendency to slip. WILLIAM F. EHRET

Recrystallization process of 800 silver. R. GLOCKER and H. WIDMANN. *Z. Metallkunde* 20, 129-31(1928); cf. *C. A.* 21, 1615.—In the heat treatment of an alloy contg. 80% Ag and 20% Cu, recrystn. commences at a very low temp. (200°), but it cannot be detected microscopically below about 500° because of the extreme fineness of the crystals (less than 2μ). It is best detected by means of the x-ray spectrum,

the sharpening of the lines in the doublets being the first indication of recrystn., this being very clear at about 400°.

Tensile strength and conductivity changes in hard-drawn wires of copper, bronze, aluminum, Aludur and Aldrey, under the influence of rapid heating. HANS BOHNER, *Z. Metallkunde* 20, 132-41(1928).—The metals and alloys examd. were 99.5% Cu, bronze contg. only small quantities of Sn and Mg, Al contg. 0.17% Fe and 0.14% Si, Aludur and Aldrey. Two methods of heating were employed; high elec. currents for a short time, and heating in a KNO₃ bath for somewhat longer intervals. The materials were previously subjected to at least 99% hot and cold working. With elec. heating, increase in temp. results in a steady increase in cond. and decrease in tensile strength for Cu, bronze and Al. With the Al alloys on the other hand, there is first an increase in cond., the highest values being reached around 350° and then a rapid decrease with increase in temp., with finally another slight rise as the temp. rises. The results show that at sufficiently high temps. a fraction of a sec. is enough time for complete recrystn. In the Al alloys and pure Al the lowest tensile strength and highest cond. are obtained when the impurities are completely sepd. from the mixed crystals. This sepn. is better obtained on slower heating, which explains the better results secured in the KNO₃ bath.

H. STOERTZ

Increasing the strength of lead-base bearing metals. O. W. ELLIS, *Am. Metal Market* 35, 1-4, 44(1928).—The possibility of using Pb-base bearing metal in place of Sn-base is discussed. Expts. show that the pouring temp. as well as the mold temp. must be carefully regulated in making Pb-base alloys. Photomicrographs are introduced to show that the higher the pouring temp. the more coarse is the structure. The same is true of the mold temp. only in a more marked degree. The length of time taken to cool from 270° to 240° is important in detg. the size of the resulting γ -cubes and the coarseness of the matrix. High pouring and mold temps. also lead to a segregation of the γ -constituent which rises to the top. The results of expts. indicate that the addition of Tl to Pb-base alloys improves their resistance to deformation markedly. Yield point and ultimate strength tests show that an alloy contg. Pb 72, Sb 15, Sn 5 and Tl 8 is superior to the best Sn-base bearing alloy.

W. F. E.

Effect of quenching and tempering on the mechanical properties of standard silver. A. L. NORBURY, *J. Inst. Metals* 1928 (advance copy) No. 448, 17 pp.—Standard Ag (92.5% Ag, 7.5% Cu) as ordinarily annealed, contains a considerable amount of Cu in which some Ag is dissolved, distributed in the form of small particles throughout the Ag solid soln. matrix. By suitable heating, about half an hour at 770°, and quenching, these Cu particles can be dissolved and retained in supersatd. solid soln. On tempering quenched specimens, structures reminiscent of martensite, troostite, and pearlite are obtained. The alloy, when in the quenched condition, is 20 to 30% more ductile than when in the annealed condition. On suitably tempering the quenched alloy, that is about half an hour at 300°, its hardness increases 300%, while the ductility falls 50%. These effects are due to the decompn. of the supersatd. soln. of Cu in Ag. The hardening obtained by tempering is uniform and is consequently superior to the hardening obtained by cold work, which sets up stresses and strains in the alloy. It is possible to harden the quenched alloy by cold work and then further to harden it by suitable tempering. The alloy is more resistant to oxidation and tarnishing when in the quenched and tempered condition than it is when in the annealed condition.

J. W. BOECK

Viscosity (of metals) at high temperatures. JEAN COURNOT AND MACEDO SAARES SILVA, *Rev. métal.* 25, 82-6(1928); cf. *C. A.* 20, 568; 21, 1090, 2454; 22, 375.—Tests were carried out by the previously described technic on Ni wire (1 mm. in diam.), "Calypso" brand Al wire (1 and 2 mm.), Duralumin (1 and 2 mm.), and refined drawn Alpac wire (1 mm.). The results are given in tabular and graphical form and show that: (1) the period of uniform viscosity was reached very rapidly after applying the load; (2) the low value of the practical viscosity limits as compared with the usual breaking loads is clearly brought out, though Ni is somewhat better in this respect than the other metals and alloys tested; (3) Al exhibits a striking inferiority as regards the viscosity limits and is greatly improved by alloying (particularly in the case of Duralumin); (4) at 500-700° Ni behaves better than mild steel. Pomp and Dahmen's proposed definition of the practical limit of viscosity (*C. A.* 21, 1959) is criticized and an alternative one suggested.

A. PAPINEAU-COUTURE

Comparative manufacture of large-diameter bars by forging and by rolling. J. ΚΟΥΚΗΝΘΟΥ, *Rev. métal.* 25, 76-81(1928).—Comparative forging and rolling tests on 4 diff. grades of shaft steel showed that the elastic limit and elongation of rolled bars, whether or not they were subjected to a subsequent annealing treatment, were higher

than those of forged bars, annealed or not. Annealing slightly decreased the elastic limit and tensile strength and slightly increased the elongation of rolled bars. Annealing appreciably improved the forged bars, but had no appreciable effect on the rolled bars, showing that the quality of the latter is max. without requiring subsequent heat treatment. **Note on the preceding article.** E. DE LOISY. *Ibid* 81.—L. successfully manufd. shafts by rolling without any forging treatment at any stage of the manuf.

Annealing of copper. N. R. STANSEL. *Gen. Elec. Rev.* 30, 276-80(1927); *Sci. Abstracts B* 30, 405.—Annealing at the proper temp. will restore the original properties to a metal whose grain shape and properties have been altered by cold work. The essential conditions for Cu annealing are: temp. limits of 315-400°, a uniform distribution of heat flux, and a neutral atm. in the furnace. The metallic resistor type of furnace with an atm. of low-pressure superheated steam is satisfactory. With charges of 10,000 lbs. (4545 kg.), the output is 29 lbs. (13.2 kg.) per kw.-hr. Labor and maintenance costs are very low.

Oxidation phenomena during the annealing of malleable cast iron. H. A. SCHWARTZ. *Trans. Am. Foundrymen's Assoc.* 1928, 385-96.—A correlation of the researches of Schenck and others with commercial annealing conditions. It is shown that by applying the available data as to the equil. conditions in the Fe-C-O system it is possible to explain many of the phenomena which occur in the surfaces of the castings rendering machining difficult.

Annealing experiments for the improvement of transformer plates. M. VON MOOS, W. OERTEL AND R. SCHERER. *Stahl u. Eisen* 48, 477-87(1928).—Transformer plates (0.35 mm.) from melts with 0.04, 0.12 and 0.18% C were annealed at temps. from 700 to 1000°, for 1/2 to 6 hrs. either packed or in a current of H. Next to the C content the O content has a decided influence on the magnetic characteristics of the plates. Melts high in O have an irregular structure; O, therefore, has an indirect influence on the watt losses of the plates, as the latter is a function not only of the grain size, but also of the quality of the grain structure. Low watt losses are obtained only if the structure is uniform. All transformer plates can be improved by annealing in a current of H. The value of the watt losses depends also on the quality of the raw materials. Good results were obtained by annealing 4 hrs. at 900°. Annealing for more than 2 hrs. at 1100°, increases the watt losses. With short annealing periods, it should be possible to obtain good results even at 1100° and 1200°. Numerous graphs and references are given.

Froth-flotation of ores. C. H. KELLER (to Minerals Separation North American Corporation). U. S. 1,671,590, May 29. Frothing agents are used together with Ca or other alk. earth metal xanthate.

Concentrating oxidized ores by froth flotation. T. S. CARNAHAN (to Union Minière du Haut-Katanga). U. S. 1,671,698, May 29. Palm oil 1-4 and oleic acid 1 part are used together as frothing agents.

Cyanide treatment of ores, etc. S. B. McCLUSKEY. Brit. 278,742, Oct. 8, 1926. In treating ores contg. Au and Ag together with other metals such as Fe and Mn, a cyanide pulp is fed into a gas-tight agitator tank and thence to another tank to which SO₂ or other suitable acidifying agent is also supplied so that HCN is liberated and drawn off and sulfites of Fe and Mn are formed. The Fe and Mn are then pptd. with CaCO₃ or other reagent and the HCN is further used to dissolve Au and Ag. An app. is described.

Reducing iron ores. I. G. FARBERIND. A.-G. Brit. 278,167, March 29, 1926.

Reduction is effected by gases prepd. from powd. fuel and O or air enriched with O either in a sep. producer or by blowing the fuel and O on to the liquid Fe previously produced, and the reduced Fe may be melted preferably by bringing the hot gases from the producer before employing them for the reduction. A revolving or shaft furnace may be used for the reduction. Gases from the furnace may be treated with steam in the presence of Fe oxide or other suitable catalyst and may then be used in NH_3 synthesis, MeOH production or other reactions.

Zinc from ores. R. T. D. WILLIAMS and S. W. ROSS (to Electrolytic Zinc Co. of Australasia, Ltd.). U. S. 1,672,016, June 5. A ZnSO_4 sol'n. such as is obtained from a Zn ore is agitated with Zn dust under non-oxidizing conditions to ppt. impurities in the soln.

Washing apparatus for recovering gold and other metals from ores, etc. D. W. KELLY, A. H. ASHBOLT and R. A. J. ELLIOT. Brit. 278,561, Jan. 10, 1927.

Ingot mold. J. C. BECKFIELD. U. S. 1,671,806, May 29.

Ingot mold. E. R. WILLIAMS (to Vulcan Mold & Iron Co.). U. S. 1,672,479, June 5. A mold having low dilatation under repeated heating and cooling is formed of a ferrous alloy composed of ferrite plus C and other metalloids in such proportion as to produce a combined C of 0.70–1.10%.

Ingot mold with refractory sides and a chill bottom. C. A. PARSONS and H. M. DUNCAN. Brit. 278,032, April 29, 1926.

Hot tops for ingot molds. E. J. TURNER. U. S. 1,672,662–3, June 5.

Heat-regulating system for casting ingots. C. A. PARSONS and H. M. DUNCAN. U. S. 1,671,253, May 29. An app. is described.

Centrifugal apparatus for casting metals. SAND SPUN PATENTS CORPORATION. Brit. 278,560, Jan. 8, 1927.

Granulating small bodies of molten metals in liquids. E. PODSZUS (to Hartstoff-Metal A.-G.). U. S. 1,671,683, May 29. Mech. features. Tetralin covered with CO_2 may be used as a "retarding liquid."

Centrifugal apparatus for casting metals. A. POSSENTI and C. SCORZA. Brit. 277,996, Sept. 23, 1926.

Rimmed steel ingots. A. T. CAPE (to Midwest Metallurgical Corp.). U. S. 1,672,446, June 5. In order to improve the character and surface appearance of rimming steel, 1–6 oz. of a fluoride such as CaF_2 is added to each 3000 lbs. of steel, while molten and subsequent to tapping it from the furnace.

Aluminum-melting furnace. P. H. ROMPH. U. S. 1,671,546, May 29.

Rabble furnace with superposed hearths for roasting and calcining. D. BAIRD (to Nichols Copper Co.). U. S. 1,671,395, May 29.

Furnace and melting pot for melting lead or other metals. A. N. OTIS (to General Elec. Co.). U. S. 1,672,728, June 5. Structural features.

Regenerative open-hearth furnace. S. J. CORT, T. BURNS, R. S. A. DOUGHERTY and C. E. LEHR (to Bethlehem Steel Co.). U. S. 1,671,100, May 29.

Semi-muffle forge furnace. W. M. HEPBURN (to Surface Combustion Co.). U. S. 1,672,863, June 5.

Annular rotary hearth furnace for drying, distilling or gasifying loose material in a thin layer. TROCKNUNGS-, VERSCHWELUNGS- UND VERGASUNGS-GES. Brit. 278,207, Nov. 23, 1926.

Metallurgical "soaking pit" furnace. T. F. BAILY. U. S. 1,671,337, May 29.

Hearth for stereotype founding, etc. J. RABATE (to Soc. Le Matin). U. S. 1,672,142, June 5.

Apparatus for continuous annealing of sheet metal. E. G. CAUGHEY. U. S. 1,671,810, May 29.

System for annealing sheet metal plates in piles under pressure. W. REUSS (to Joh. Moritz Rump. A.-G.). U. S. 1,672,172, June 5.

Hardened cast iron. K. SPP. Can. 276,815, January 3, 1928. A hardened gray cast iron, which has a low content of C and Si, is characterized by fine evenly distributed grains produced by the reheating and cooling of a gray cast iron of uniform pearlite structure with finely divided and evenly distributed graphite.

Silicon iron. V. B. BROWNE. Brit. 277,537, Jan. 10, 1927. In making Si Fe for magnetic purposes, a bath of molten Fe is refined and the C content is lowered by means of ore; the C is still further lowered by overblowing in a converter in the presence of SiO_2 or by passing air or O into the molten metal (preferably in an elec. furnace) and P and S are removed by the action of suitable slags. Si or ferro-Si is then added in a ladle. Various other details are specified. Cf. C. A. 22, 2351.

Pickling metals such as iron and steel. J. H. GRAVELL. Brit. 278,398, April 29,

1926. Pickling baths such as those formed with H_2SO_4 are used with a "regulator" comprising the distillate produced by distn. of animal or vegetable material such as gelatin, hair, gristle or hides, which may be mixed with a small proportion of animal or vegetable fat. After pickling the metal it is treated with lime or other substance to neutralize the acid. Cf. C. A. 21, 2456.

Cleaning and pickling metals. G. D. CHAMBERLAIN (to R. T. Vanderbilt Co.). U. S. 1,671,627, May 29. H_2SO_4 is used with a small quantity of a thiazole which inhibits attack of the metal itself.

Joining manganese steel to ordinary carbon steel. C. L. DELACHAUX. U. S. 1,671,572, May 29. The materials are welded by the action of an alumino-thermic mixt. contg. 18-20% Ni.

Manganese steel. V. C. MEKEEL (to Taylor-Wharton Iron and Steel Co.). U. S. 1,671,870, May 29. The strength and wear-resisting properties of Mn steel are improved without impairing its toughness and ductility by case-hardening the shape during the regular heat treatment, and quenching with but a "minimum" exposure to air.

Alloys. W. S. SMITH, H. J. GARNETT and J. A. HOLDEN. Brit. 278,454, July 10, 1926. Alloys having high elec. resistance and high initial permeability comprise a preponderating proportion of Ni together with Fe 6-17, Al 1-5 and Cr, Mo, V, W or Si 1-5%. Mn, Cd or Mg may be used as deoxidizing agents. Fine wire or thin stampings of the alloys may be annealed for 2 min. at 880° in an inert atm. such as N and then rapidly cooled.

Alloys for valves. T. COLES. Brit. 277,381, Sept. 16, 1926. The valve member and spindle of a pressure-regulating valve are formed of an alloy of Ni 72, Fe 1.5, and Cu 26.5%, rolled, forged and annealed to restore its fibrous character; the valve seat is made from an alloy of Cu 75 and Zn 25% treated in a bath of molten solder to increase its density. Comps. of suitable solder baths and some modifications of proportions of the valve alloys are also described.

Alloy for welding rods. R. FRANKS (to Oxyweld Acetylene Co.). U. S. 1,671,417, May 29. An alloy suitable for welding rods or electrodes comprises Fe together with W 1-12, Cr 25-35, B 0.1-1.0, C 1-3.5, Si 0.5-3% and sufficient Mn to deoxidize the alloy. The ratio of Si to Mn is at least 0.9.

Welding alloy. W. P. STROONY. U. S. 1,671,384, May 29. An alloy suitable for making welding rods contains Fe together with Cr 15-35, Si 1-4 and Mn 4-16%.

Aluminum alloy. H. SCHORN. Brit. 277,701, Sept. 18, 1926. An alloy resistant to sea water contains Al together with Mg 1-6 and Ti 0.05-1.0%. Brit. 277,702 specifies Al together with Ti 0.05-1.0%.

Aluminum alloy. L. R. BRINK (to Barnhart Bros. & Spindler). U. S. 1,671,952, May 29. An alloy suitable for making printing type comprises Al 90, Cu 5 and Ni 5%.

Coating metals with aluminum or magnesium or their alloys. R. HOFFELT and C. P. NOLDEN. Brit. 278,415, July 1, 1926. Coating may be effected by spraying or electrolysis or the powd. coating metal may be mixed with Si compds. such as SiO_2 or waterglass and with an inorg. material such as kaolin or MgO and applied as a paste to the metal to be coated and the materials then subjected to heat treatment at $800-2200^\circ$.

Alloy containing copper and manganese. M. G. CORSON (to Electro Metallurgical Co.). U. S. 1,671,408, May 29. An alloy which is suitable for die-casting contains Cu together with Mn 15-25, and P and Si 0.1-3%.

Heat-treating copper alloys. M. G. CORSON. Brit. 278,355, Oct. 4, 1926. Cu-base alloys contg. Si 3.7-6.7% are heated to $500-800^\circ$ to form a solid soln. of Cu and Si which will be supersatd. at room temp. and the metal is then quenched to preserve the condition of solid soln. The metal may be hot-worked at 500° after the heat treatment and quenched from a temp. above 500° . The alloy may contain small quantities of other metals such as Sn 2% or less, Zn 5% or less and Al 3% or less.

Iron-silicon alloys. N. B. PILLING (to Westinghouse Elec. and Mfg. Co.). U. S. 1,671,484, May 29. Fe-Si alloys contg. 4-8% of Si are heated to temps. above 30° and below a "visible heat" (suitably to about 200° or lower) and subjected to hammering or other mech. treatment while heated, to avoid brittleness.

Purifying aluminum. A. KIRCHHOFF. Brit. 278,164, Sept. 16, 1926. Al is purified and rendered weldable by adding to the molten metal powd. mollusc shells and removing the scum which forms on the metal.

Coating for aluminum. W. C. PETERSON (to Packard Motor Car Co.). U. S. 1,672,280, June 5. A coating suitable for use on Al castings to close their pores is prepd. by heating PhOH and CH_2O to obtain a material of about the consistency of

molasses and of about half the vol. of the original materials, and then adding about 10% of an Al silicate (which may be in the form of kaolin).

Desilvering lead bullion. B. M. O'HARRA (to American Smelting & Refining Co.). U. S. 1,672,465, June 5. A mixt. comprising Pb, Zn and Ag, after melting, is treated with a metal halide such as ZnCl_2 capable of dissolving oxides and after dissolution of the oxides and formation of a slag the mixt. is allowed to sep. into 2 layers having a well-defined dividing line, the upper layer consisting largely of Zn and Ag and having a high m. p. as compared to Pb, and the lower layer largely of Pb. The layers are sepd. and further treated.

Heat treatment of wire rope. W. A. SCOBLE. Brit. 278,233, Feb. 7, 1927. After manuf., in as nearly as possible its final size, wire rope is given a high fatigue range of strength by heating to $780-900^\circ$ and quickly cooling it and then reheating to a lower temp., such as $200-500^\circ$ and cooling in air. The wire may be made from a C steel or alloy steel.

Treating zinc waste. E. BURY. Brit. 278,411, March 24, 1927. Zn waste such as that obtained in smelting operations or from the manuf. of Zn or galvanized products is leached with H_2SO_4 and then treated with excess of NH_3 ; the Zn sulfate soln. is thus converted to sol. $\text{Zn}(\text{OH})_2$ and Fe and Al and the like present as impurities are converted into insol. hydroxides, which are removed by sedimentation together with gelatinous silica, and by filtration. The residue is boiled down and ppts. $\text{Zn}(\text{OH})_2$ and liberates NH_3 , which is recovered. $(\text{NH}_4)_2\text{SO}_4$ is crystd. from the remaining soln.

Treating metal surfaces to prevent corrosion. W. SMITH (to Expanded Metal Co.). U. S. 1,672,180, June 5. Metal surfaces such as those of steel are subjected while heated (suitably at a temp. of about $600-700^\circ$) successively to the action of air and of CS_2 .

Protecting ferrous metals from corrosion. F. M. BRACKET (to Electro-Metallurgical Co.). U. S. 1,672,444, June 5. In order to form a coating comprising Cr and Si on ferrous metal articles, there is applied to the article an excess of a powd. ferrochrome-Si having a higher Cr:Si ratio than is to be present in the coating and the materials are then maintained at a cementing temp. to form an integral coating.

Welding. R. PALMER. Can. 277,014, Jan. 10, 1928. A method of welding oxidizable metals consists in uniting adjoining regions of the parts to be welded by fusion in the presence of atomic H and excluding deleterious gases and vapors.

Arc welding. I. LANGMUIR and P. P. ALEXANDER. Can. 277,010, January 10, 1928. A method of fusing metals by the electric arc process consists in maintaining the arc in a gaseous medium contg. N_2 and an amt. of H_2 which is so related to the traces of O_2 present that the harmful effects of N_2 in the presence of O_2 are neutralized.

Arc welding. N. B. PILLING and J. G. SCHOENER. Can. 276,842, January 3, 1928. A method of arc welding with Ni or Ni alloy electrode consists in supplying Ti and Ca to the melt.

Arc welding. I. THOMSON. Can. 277,011, January 10, 1928. Around the arc and molten portion of the work is maintained an active reducing gaseous medium composed of CO and H_2 .

Arc welding. E. THOMSON and P. P. ALEXANDER. Can. 277,012, January 10, 1928. Vapor of an alc. is supplied so as to exclude atm. air from the arc and molten portions of the work while the vapor is dissoed. in the arc to produce H_2 and CO.

Aluminothermic pressure welding. F. LANGE. U. S. 1,671,730, May 29. Mech. features.

Forming slag-free thermite welds. JOHN H. DEPPLE (to Metal & Thermit Corporation). U. S. 1,671,412, May 29. Mech. features. U. S. 1,671,413 (D. C. DICKSON) also relates to similar subject matter.

10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

Theory of mesostructure of organic compounds. I. I. KOTYUKOV. *Bulletin of the Siberian Institute of Technology* 48, No. 1, 1-35 (1927).—The more stable the link between two C, the more weakly the H is bound with C and, consequently, the greater the residual affinity. This residual affinity is called *mesovalency*. Halogens are, on the contrary, the more strongly bound to C the stronger the mutual links between the C atoms. This explains the formation of links between halogens and H. The link formed as a result of mutual satn. of mesovalencies is called *mesolink*. Cl in benzene hexachlorides

is bound not to C, but to H. When substitution reactions take place, the mesolinks formed in the primary product of addn. remain unchanged in the product of reaction. Explanations are offered of a whole series of problems, such as the speed of reactions of substitution, difference of stability of radicals in the kernel, etc., and the structures of mesoformulas are given for each case. Isomerism of ethylene derivs. is based not on the presence of a double link as such and on its rigidity, but on the presence of H atoms having mesovalency and on some atoms having an affinity to the double link. Isomerism takes place only when there are several different possibilities of formation of mesolinks. The ethylenic isomerism is never observed when the radicals at the double link are aliphatic and unsatd.; this is explained by the absence in such radicals of H atoms with mesovalencies. Substitution of H atoms with mesovalency by other radicals destroys the phenomenon of isomerism despite the presence of a double link and of different radicals. K. examines particular cases of isomerization of a large no. of org. compds. and assigns to them mesoformulas.

BERNARD NELSON

Spectrochemical investigation of the esters of selenious and selenic acids. W. STRECKER AND W. DANIEL. *Ann.* **462**, 186-94(1928).—*Di-Me selenite*, b_{16} 69°, $d_{18}^{18.3}$ 1.7084, $n_D^{18.3}$ 1.48078, 1.48398, 1.49187, 1.49843 for α , β , and γ (this order will be used below), from the chloride and MeONa. *Di-Et ester*, $b_{14.5}$ 82-3°, $d_{14}^{23.1}$ 1.4961, $n_D^{23.1}$ 1.46247, 1.46547, 1.47273, 1.47877. *Di-Pr ester*, b_{16} 109°, d_{14}^{16} 1.3428, $n_D^{14.6}$ 1.46166, 1.46316, 1.47111, 1.47675. These 3 esters were also prepd. by using the Ag salt and the corresponding iodide; since the optical consts. of the 2 preps. agree, it is probable that the esters have the formula $OSe(OR)_2$. *Di-Me selenate*, b_{16} 68-8.5°, $d_{14}^{19.6}$ 1.7305, $n_D^{19.6}$ 1.44103, 1.44358, 1.44967, 1.45466. *Di-Et ester*, b_{16} 76°, $d_{14}^{19.9}$ 1.4979, $n_D^{19.9}$ 1.43942, 1.44227, 1.44817, 1.45327. *Di-Pr ester*, b_{16} 83-4°, $d_{14}^{19.3}$ 1.3359, $n_D^{18.3}$ 1.45308, 1.45581, 1.46222, 1.46771. *Di-Me selenide*, b_{16} 54-5°, $d_{14}^{14.6}$ 1.4077, $n_D^{14.6}$ 1.47990, 1.48406, 1.49398, 1.50381; *di-Me diselenide*, b_{145} 150-1°. C. J. WEST

Action of amines on bromoanthral. ALBERT KIRRMANN. *Compt. rend.* **186**, 701-2(1928); cf. *C. A.* **22**, 1325.—The Br, as well as the aldehyde-group of α -bromoaldehydes, is very reactive. Bromoanthral (I) and Et_2NH give $Et_2NH \cdot HBr$ and 55% of *diethylaminoanthral*, $C_6H_{11}CH(CHO)NEt_2$ (II), b_{11} 106-7°, d_{22}^{22} 0.853, n_D^{22} 1.4352. II reacts with the Schiff reagent, Fehling soln., alc. $AgNO_3$, and $NaHSO_3$. Its *HCl salt*, m. 73°, can be distd. *in vacuo*. Oxidation of II by NH_4Ag_2O and KOH gives $C_6H_{11}CH(OH)CO_2H$ (III) and $C_6H_{11}CO_2H$. III m. 65° and gives $(C_7H_{15}O_3)_2Ba$, 0.5H₂O. I and Me₃N give $C_6H_{11}CH(CH_3)NMe_3Br$, m. 126°. This reaction is much slower than the reaction of I and Et_2NH ; probably the mechanism is different.

MARGARET W. MCPHERSON

The preparation of acetone. J. D. DONATH. *Chem.-Ztg.* **51**, 924(1927).—The following reaction for the prepn. of acetone was discovered by D. in 1888, *viz.*, $2EtOH + 8MnO_2 \rightarrow MeCOMe + 4Mn_2O_3 + 3H_2O + CO_2$. Alc. vapors were led over pyrolusite previously heated to drive off H₂O. If $BaO(MnO_2)_2$ be present (considered as analogous to Weldon mud) the EtOH is changed easily to AcOH, forming Ba and Mn acetates.

W. C. EBAUGH

Separation of stereoisomeric unsaturated ketones. R. LOCQUIN AND R. HEILMANN. *Compt. rend.* **186**, 705-7(1928).—Each of the stereoisomers: $RC.CO.R'$ and

R'CH

$RC.CO.R'$ could give 2 oximes, semicarbazones, etc. Two of the 4 possible derivs.

$\begin{array}{c} \parallel \\ HCR' \end{array}$

have often been obtained. In each of 2 cases L. and H. proved that 2 semicarbazones were derived from 2 forms of a ketone, and by means of the semicarbazones the 2 forms of the ketone were sepd. $MeCH:C(CH_2Me)COMe$ (I) and $MeCH_2CH:C(CH_2Me)COMe$ (II) were obtained by the dehydration of the corresponding ketones, $(RCH_2)_2C(OH)COMe$. Crude I gives a semicarbazone separable into 2 semicarbazones, $C_8H_{15}ON_3$, III m. 201° and IV m. 161°. Upon hydrolysis III gives the ethylenic ketone, $C_7H_{12}O^*(V)$, b_{147} 150-1°, d_{14}^{12} 0.8718; IV gives the ethylenic ketone, $C_7H_{12}O$ (VI), b_{147} 153-4°, d_{14}^{11} 0.8789. Upon reconversion into the semicarbazone V gives only III, and VI gives only IV. With $N_2H_4 \cdot H_2O$, V and VI give the same pyrazoline $EtCH.CMe:N.NH.CHMe$, b_{10} 72-3°; *benzenesulfonate*, m. 29-30°; *p-bromobenzene-sulfonates*, m. 110°, then 125° after resolidification, and m. 90-1° resp. Crude II

bromide, sol. in hot, insol. in cold C_6H_6 , m. 220° ; *clupanodonoarachidonozoomarin bromide*, sol. in AcOEt but not in hot C_6H_6 , m. 105° ; *clupanodono-I-arachidonin bromide*, insol. in all the above solvents, m. 240° (decompn.); *linoleodizoomarin bromide*, oily.

C. J. WEST

Nucleus synthesis of γ,γ -dimethyl- δ -methylcyclohomotetronic acid. RICHARD ANSCHÜTZ AND HARRY QUITMANN. *Ann.* **462**, 97-104 (1928).— α,α -Dimethyl- β -acetoxybutyryl chloride, pale yellow oil, b. 101° ; with $NCCHNaCO_2Me$ in abs. Et₂O (heating 18 hrs. on the H_2O bath), this gives *Me* α,α -dimethyl- β -acetoxybutyrylcyanooacetate, b. 108° ; $FeCl_3$ gives a deep red-violet color; NH_4 salt, very hygroscopic; *Ag* salt. *Et* ester, b. $110-2^\circ$; *Ag* salt. The above chloride and $CHNa(CO_2Me)$ give 48% of *Me* γ,γ -dimethyl- δ -methylcyclohomotetronic acid carboxylate, b. $112-4^\circ$; sapon. of this ester and the action of HCl on the above esters give the free acid, b. $116-7^\circ$, m. 106.5° , which cryst. with 1 H_2O ; $FeCl_3$ gives a red-violet enol reaction; *Ag* salt. With 1 mol. $HCHO$ to 2 mols. acid there results *methylene-bis- γ,γ -dimethyl- δ -methylcyclohomotetronic acid*, m. 191° ; the corresponding ethylidene deriv. m. 154° (decompn.); the *trichloroethylidene deriv.* m. 143° (decompn.).

C. J. WEST

The enzymic breakdown of polypeptides of various composition. EMIL ABDERHALDEN AND HANS BROCKMANN. *Fermentforschung* **9**, 446-61 (1928).—A series of peptides (I, II, III, IV) was obtained by lengthening the chain step by step according to the Fischer synthesis. *d*-Alanine + $ClCH_2COCl \rightarrow$ *chloroacetyl-d-alanine*, m. $90-1^\circ$, $[\alpha]_D^{20} -44.5^\circ$, \rightarrow *glycyl-d-alanine* (I), m. $235-6^\circ$ (decompn.), $[\alpha]_D^{20} -50^\circ$, + *d*-Me₂-CHCH₂CHBrCOCl \rightarrow *d- α -bromoisocaprolylglycyl-d-alanine*, m. $132-3^\circ$, $[\alpha]_D^{20} 31.2^\circ$, \rightarrow *l-leucylglycyl-d-alanine* (II), m. $245-6^\circ$, $[\alpha]_D^{20} 19.5^\circ$, + *d*-MeCHBrCOCl \rightarrow *d- α -bromopropionyl-l-leucylglycyl-d-alanine*, m. $157-8^\circ$, $[\alpha]_D^{20} -27.95^\circ$, \rightarrow *d-alanyl-l-leucylglycyl-d-alanine* (III), decomp. 240° , $[\alpha]_D^{20} -28^\circ$, + $ClCH_2COCl \rightarrow$ *chloroacetyl-d-alanyl-l-leucylglycyl-d-alanine*, m. $143-7^\circ$, $[\alpha]_D^{20} -45.5^\circ$, \rightarrow *glycyl-d-alanyl-l-leucylglycyl-d-alanine* (IV), decomp. 232° , $[\alpha]_D^{20} -70.6^\circ$. In the prepn. of II, a small quantity of *d- α -bromoisocapronamide*, m. 118° , $[\alpha]_D^{20} -48.3^\circ$, was obtained as a by-product. The pentapeptide IV was finally obtained cryst.; it gave a red biuret reaction, a white ppt. with phosphotungstic acid sol. in excess of reagent, and was salted out by $(NH_4)_2SO_4$ soln. Erepsin readily attacks II, doubling the quantity of amino N, and changing the direction of rotation. The cleavage products are therefore *l*-leucine and glycyl-*d*-alanine. III is less readily attacked by erepsin, and IV is attacked scarcely at all. Trypsin-kinase, on the other hand, leaves II unaltered, has a slight action on III and attacks IV readily. The change in rotation in this case affords no clue as to the products of hydrolysis. *N* NaOH at 37° causes considerable cleavage of IV, whereas the effect of *N* HCl is very slight. Erepsin, as prepd. by Waldschmidt-Leitz free from trypsin, thus attacks the lower peptides and pure trypsin-kinase the higher peptides.

A. W. DOX

Further studies on the enzymic breakdown of polypeptides of various composition. EMIL ABDERHALDEN AND HANS SICKEL. *Fermentforschung* **9**, 462-84 (1928); cf. preceding abstr.—The pentapeptide IV was built up step by step through the intermediate di-, tri- and tetrapeptides (I, II, III). *d*-Valine + *d*-Me₂CHCH₂CHBrCOCl \rightarrow *d- α -bromoisocaprolyl-d-valine*, obtained in 2 fractions, m. 144° , $[\alpha]_D^{19} 21.8^\circ$, and m. 139° , $[\alpha]_D^{19} 17^\circ$, resp., \rightarrow *l-leucyl-d-valine* (I), m. 273° , $[\alpha]_D^{19} 18^\circ$, obtained optically pure by prepn. of the difficultly sol. Cu salt. I + MeCHBrCOCl \rightarrow *d- α -bromopropionyl-l-leucyl-d-valine*, m. 165° , $[\alpha]_D^{20} 34.1^\circ$, \rightarrow *d-alanyl-l-leucyl-d-valine* (II), 2 isomeric forms: 60% *a*, m. $243-5^\circ$, $[\alpha]_D^{19} -60.2^\circ$, and 30% *b*, m. 243° , $[\alpha]_D^{20} -79.5^\circ$; *b* is 10 times as sol. in H_2O as *a*. IIa + $ClCH_2COCl \rightarrow$ *chloroacetyl-d-alanyl-l-leucyl-d-valine*, m. $204-5^\circ$, $[\alpha]_D^{20} -69.6^\circ$, \rightarrow *glycyl-d-alanyl-l-leucyl-d-valine* (III), m. 240° (decompn.), $[\alpha]_D^{21} -98^\circ$, + *d*-Me₂CHCH₂CHBrCOCl \rightarrow *d- α -bromoisocaprolylglycyl-d-alanyl-l-leucyl-d-valine*, m. 187° (decompn.), $[\alpha]_D^{19} -34.8^\circ$, \rightarrow *l-leucylglycyl-d-alanyl-l-leucyl-d-valine* (IV), m. 205° (decompn.), $[\alpha]_D^{16} -60.4^\circ$. The products up to and including III are all cryst., but the pentapeptide is amorphous. It contains 2.5 H_2O , is acid to litmus, gives a red biuret reaction and is partially salted out of soln. by satn. with $(NH_4)_2SO_4$. Its solns. resemble protein solns. in their tendency to foam. I is readily hydrolyzed by erepsin but not attacked by trypsin-kinase. Of the 2 isomeric tripeptides II, one is almost completely hydrolyzed by erepsin and the other not attacked. III is partially hydrolyzed by erepsin but scarcely at all by trypsin. IV is hydrolyzed

by both erepsin and trypsin, the hydrolysis being still more vigorous if both enzymes are present simultaneously. Probably the 2 enzymes attack the pentapeptide in different places.

A. W. DOX

Deaminized polypeptides. I. The action of erepsin on deaminized polypeptides. II. The action of expressed yeast juices on deaminized polypeptides. RYO MURACHI. Kyoto Univ. *Acta Schol. Med. Univ. Imp. Kioto* 9, 269-78, 279-84 (1927).—*Glycolylglycine* (I) was prepd. by adding with shaking the calcd. amt. of 30% NaNO_2 and AcOH to 5 g. *glycylglycine* (II) in H_2O , keeping below 20° , evapg. *in vacuo*, dissolving the residue in H_2SO_4 - MeOH , filtering and repeating this operation until free from Na , evapg. the filtrate *in vacuo*, dissolving in H_2O , adding Ba(OH)_2 to remove H_2SO_4 , removing the excess Ba(OH)_2 with CO_2 and then quant. with H_2SO_4 , evapg. *in vacuo*, extg. the residue with MeOH , then EtOH , removing the ales. from the ext. by distn., dissolving the residue in MeOH , pptg. with Et_2O , filtering and drying the ppt. *in vacuo* over H_2SO_4 ; it forms a white, amorphous powder, sol. in H_2O or EtOH and insol. in Et_2O ; a better method of prepn. is to treat II with AcOH and $\text{Ba(NO}_3)_2$ (prepd. by neutralizing Ba(OH)_2 with gaseous HNO_3), evapg. to dryness *in vacuo*, dissolving the residue in H_2O and quant. pptg. the Ba with H_2SO_4 , filtering, evapg. the filtrate *in vacuo*, dissolving the residue in MeOH , adding abs. EtOH and pptg. with Et_2O ; aq. I neutralized with KOH , EtOH added, allowed to stand in a desiccator for several weeks, gave prismatic crystals of the K salt. *Glycolylglycylglycine* (III) and *glycolyl-diglycylglycine* (IV), prepd. in a similar manner from the corresponding polypeptides, formed white, amorphous powders. When these deaminized polypeptides (0.1-0.2 g.) are dissolved in H_2O , neutralized with Na_2CO_3 , dild. to 50 cc., a 5-cc. portion of this added to 5 cc. alk. borate soln. (12.404 g. boric acid in 100 cc. N NaOH , dild. to 1000 cc., and adjusted to pH 8.02 by adding 44 cc. 0.1 N HCl to 56 cc.), 1 cc. erepsin soln. (a well-scraped beef intestine was ground in 2.5 parts of glycerol, after standing 24 hrs. was filtered through cloth and dild. with 5 parts H_2O), a little PhMe added and then incubated at 37° , it was found that IV was partially split into amino acids but I and III remained unchanged. Beer yeast was ground with an equal amt. of purified quartz sand and forced through a Buchner press. This liquid was added to solns. of I, III and IV neutralized with Na_2CO_3 , a little PhMe added and then incubated at 37° . It was found that I, III and IV are split into amino acids. N. A. LANGE

Synthesis of diethyl β -methyl- α,γ -dicyanoglutaconate. YOSHIYUKI URUSHIBARA. *Bull. Chem. Soc. Japan* 3, 102-5 (1928).— $\text{MeC(OEt):C(CN)CO}_2\text{Et}$ (I) is obtained easily by the condensation of 1 mol. MeC(OEt)_3 and 1 mol. $\text{NCCH}_2\text{CO}_2\text{Et}$ under the influence of 2 mols. of Ac_2O . The condensation of I and $\text{EtO}_2\text{CCH(CN)Na}$ in abs. alc. yields EtOH and $\text{EtO}_2\text{CC(CN)NaCMe:C(CN)CO}_2\text{Et}$; the latter treated with dil. HCl yields $\text{EtO}_2\text{CCH(CN)CMe:C(CN)CO}_2\text{Et}$. Its Ag deriv. is obtained by treatment with AgNO_3 . A. I. HENNE

The reduction of α -eleostearic acid. The 10,12-linoleic acid and the 11-oleic acid. J. BORSEKEN AND J. VAN KRIMPEN. *Proc. Acad. Sci. Amsterdam* 31, 238-40 (1928).—See C. A. 22, 1953. E. H.

The constitution of C-methylasparagine (homoasparagine). D. MIGLIACCI AND M. FURIA. *Gazz. chim. ital.* 58, 103-10 (1928).—Homoasparagine (I) (2 g.) and urea (2-3 g.), heated 10-12 hrs. at $125-30^\circ$, extd. with hot water, filtered, concd., then evapg. *in vacuo* over H_2SO_4 , the ppt. filtered, washed free of urea, and recrystd. from hot water with evapn. *in vacuo* (if crystn. does not ensue, the soln. was too concd. and evapn. too rapid, in which case add 3-4 vols. of hot water or hot 50% EtOH and if possible inoculate with crystals), yields 1.7 g. of *anhydroureidohomoasparaginic monoamide*, $\text{H}_2\text{NOCCH}_2\text{CMe.NH.CO.NH.CO}$ (II), m. $266-7^\circ$ (decompn.), monoclinic.

Homoasparaginic acid (III) (2 g.) and urea (2-3 g.) heated 10-12 hrs. at $125-30^\circ$, and treated as before, yield 1.8 g. of *anhydroureidohomoasparaginic acid*, $\text{HO}_2\text{CCH}_2\text{CMe.NH.CO.NH.CO}$ (IV), m. $264-5^\circ$ (decompn.); its aq. soln. is acid

and decomp. carbonates. II (1 g.) refluxed 1 hr. with 15% HCl (3-4 cc.) yields 0.9 g. of IV. The phys. and chem. properties of II and IV are very similar to those of *anhydroureidosuccinic amide* and acid, so that probably here too a CH_2 group seps. the groups, thus explaining a structure which has long been in doubt (cf. *Compt. rend.* 81, 325 (1875); *Gazz. chim. ital.* 7, 404 (1877); 17, 185 (1877); Lippich, C. A. 3, 59). The formation of II and IV from I and III, resp., shows that the amino and amido groups of asparagine are sepd. by a CH_2 group, and therefore that of the 2 formulas of I given by Beilstein without preference (cf. *Beilstein* [IV] 4, 495 (1922)), $\text{H}_2\text{NOCCH}_2\text{C(NH}_2)_2\text{MeCO}_2\text{H}$ is the correct one. This confirms the opinion of Piutti (*Gazz. chim. ital.*

18, 147(1898)) and of Schiff (*Gazz. chim. ital.* 29, 285(1899)). The best method for the prepn. of I remains the autoclave method with alc. NH_3 (cf. Piutti, *loc. cit.*). It cannot be prepd. by the action of liquid NH_3 (VIII) on citraconic anhydride (IX) as the following expts. will show. IX (5 cc.) agitated 48 hrs. with VIII (4-5 cc.) in a sealed tube (4-5 cc. of VIII may be condensed on IX in the tube immersed in CO_2 snow and Et_2O in a Dewar flask and the tube then sealed), the product washed out with hot water, residual NH_3 expelled by heating, filtered and the ppt. crystd. from water, yields NH_4 citraconate (X). When I and II are heated 3 hrs. at $50-60^\circ$ or 8 hrs. at $65-70^\circ$, sealed as before, X is again obtained.

C. C. DAVIS

The reactivity of *o*-diketonic groups placed between two nitrogen atoms. P. K. DE AND A. C. SIRCAR. *Quart. J. Indian Chem. Soc.* 4, 531-4(1927).—This investigation was intended for the prepn. of azine derivs. by the condensation of diphenylthioparabanic

acid with *o*-diamines: $\text{SC} \begin{array}{c} \text{NPh} \cdot \text{CO} \\ | \\ \text{NPh} \cdot \text{CO} \end{array} \text{ (I)} + o\text{-C}_6\text{H}_4(\text{NH}_2)_2 \rightarrow \text{SC} \begin{array}{c} \text{NPh} \cdot \text{C:N} \\ | \\ \text{NPh} \cdot \text{C:N} \end{array} \text{C}_6\text{H}_4$

+ $2\text{H}_2\text{O}$. But both *o*- $\text{C}_6\text{H}_4(\text{NH}_2)_2$ and 1,2- $\text{C}_6\text{H}_6(\text{NH}_2)_2$ gave condensation products contg. no S. It is evident that *o*-diketo groups placed between N atoms behave quite differently than those placed between two C atoms, as in phenanthraquinone. The search was then made to cover other *o*-diketo compds.: dinitrodiphenylthioparabanic acid, diphenylparabanic acid, *N,N*-diphenyl- α,β -diketopiperazine and dimethylxanilide. None of these yields an azine. The parabanic acids behave similarly toward the *o*-diamines; while the other 2 compds. do not react with them. The reaction with I

probably proceeds as follows: $\text{I} + \text{C}_6\text{H}_4(\text{NH}_2)_2 = \text{C}_6\text{H}_4 \begin{array}{c} \text{NH} \cdot \text{CO} \\ | \\ \text{NH} \cdot \text{CO} \end{array} \text{ (II)} + \text{SC}(\text{NPh})_2$;

$\text{SC}(\text{NPh})_2 + \text{C}_6\text{H}_4(\text{NH}_2)_2 = \text{SC}(\text{NH})_2\text{C}_6\text{H}_4 \text{ (IV)} + \text{PhNH}_2$. II and PhNH_2 were identified in the reaction mixt. and that the 2nd part of the reaction can occur was proved by a blank expt. In the case of diphenylparabanic acid, the 2nd reaction does not take place; both II, does not m. 300° , and $\text{OC}(\text{NPh})_2$, m. 238° , were isolated and no PhNH_2 could be detected. IV, sol. in alkalis and insol. in acids, m. $294-7^\circ$.

H. W. GIBSON

Attempts to synthesize sucrose. J. C. IRVINE, J. W. H. OLDHAM AND A. F. SKINNER. *Chemistry & Industry* 47, 494-5(1928).—Attempts to synthesize sucrose have included 3 general methods: (1) Condensation of tetraacetylchloro(or bromo)glucose with γ -tetraacetylfructose; (2) Condensation of tetraacetylglucose with tetraacetylchloro-fructose; (3) Condensation of tetraacetylglucose with γ -tetraacetylfructose. Poor yields of disaccharide were obtained from the 1st of these methods. The 2nd method gave mainly pentaacetylglucose, together with a disaccharide isomeric with sucrose, which m. $129-30^\circ$, $[\alpha]_D^{20} 19.2^\circ$ in CHCl_3 . The 3rd method yielded a product which contained reducing sugars together with the disaccharide mentioned above. T. S. CARSWELL

Cyclopentanic compounds. A new preparation of 1,2-dimethylcyclopentane. GEORGES CHAVANNE AND MILE. LUCIENNE DEVOGEL. Brussels Univ. *Bull. soc. chim. Belg.* 37, 141-52(1928).—Tertiary methylcyclopentanol (I), m. 36° , b_{760} (cor.) $135-6^\circ$ (allophanate, m. 157°), is obtained with a 65-75% yield from cyclopentanone and MeMgI . Sometimes a mixt. of H_2O and 1-methylcyclopentene (II) is obtained. II m. -127.2° , b_{760} (cor.) $75.5-76^\circ$, $d_4^{20} 0.7979$, $n_D^{15} 1.4319$, $n_D^{16} 1.4347$, $n_D^{16} 1.4416$, $n_D^{16} 1.4512$; its constitution is ascertained by its oxidation with 2% KMnO_4 , which gives $\text{MeCO}(\text{CH}_2)_3\text{CO}_2\text{H}$, m. $14.5-6.5^\circ$, $b_{10} 149-51^\circ$, whose oxime m. $103.5-4.5^\circ$ and semicarbazone m. 180.5° . II treated with nascent HOCl (Detoeuf, *C. A.* 16, 1395, 2113) yields at least 2 compds., of which one m. $35-7^\circ$, $b_{10} 75^\circ$, the other one showing $d_4^{20} 1.1240$, $d_4^{20} 1.1039$, $n_D^{20} 1.4764$, $n_D^{20} 1.4785$, $n_D^{20} 1.4853$, $n_D^{20} 1.4970$; the theory admits 4 isomeric chlorohydrins. The mixt. of these chlorohydrins with KOH powder in Et_2O gives the oxide (III) of II (43% yield), $b_{760} 110.8-111^\circ$, m. -80.5° , $d_4^{13} 0.9266$, $d_4^{19} 0.9212$, $n_D^{16} 1.4290$, $n_D^{15} 1.4311$, $n_D^{15} 1.4364$, $n_D^{15} 1.4407$. III treated with MeMgI gives exclusively a mixt. of the stereoisomer of 1,2-dimethyl-1-cyclopentanol (IV) (yield 40%). IV very easily loses H_2O , yielding 82% of 1,2-dimethyl-1-cyclopentene (V) by distn. over $p\text{-HO}_3\text{SC}_6\text{H}_4\text{Me}$. The hydrogenation of V with Pt black yields 99% of 1,2-dimethylcyclopentane, $b_{760} 94-99^\circ$, $d_4^{20} 0.764$, $n_D^{20} 1.417$. During the prepn. of V, α -methylcyclopentanone has been isolated as a by-product; its presence could not be explained.

A. L. HENNE

The *o*-cyclohexylcyclohexanols. VAVON AND V. M. MITCHOVITCH. *Compt. rend.* 186, 702-5(1928).—V. and M. predict 2 *o*-cyclohexylcyclohexanols on the basis of the

Baeyer theory, and many more on the basis of the Sachse theory. Formerly they prepd. *cis*- (I) and *trans*-*o*-cyclohexylcyclohexanol (II) (C. A. 21, 375). Although other forms are recorded in the literature, they have not been able to prep. any other form. Hydrogenation of *o*-PhC₆H₄OH with Pt black gives I. The reaction of C₆H₁₁MgCl with *o*-chlorocyclohexanol or with cyclohexene oxide gives an alc., C₁₂H₂₂O (III). Following are the m. ps. of I, II and III and their derivs: 60°, 54°, and 34°; *phenylurethans*: 148°, 132° and 122°; *acid phthalates*: 126-7°, 123-4°, and 92-3°; *dinitrobenzoates*: 122.5-3.5°, 124-5° and 102°; *p*-nitrobenzoates: 112-3°, 87° and 96-7°, and 49-50°. The velocities of sapon. of the acid phthalates at 69° in 96% alc. are: 0.20, 2.2, and 0.16, resp. CrO₃ and I or II give *o*-cyclohexylcyclohexanone (IV). CrO₃ and III give a ketone whose velocity of sapon. is ¹/₂₆ that of IV. III is *cyclopentylcyclohexylcarbinol*, C₅H₉CH(OH)C₆H₁₁, formed by the rupture of a C₅-ring, analogous to the rupture which Godeliot and Cauquil established for the C₇-ring. $\text{CH}_2(\text{CH}_2)_4\text{CHCHO}$ and $\text{CH}_2(\text{CH}_2)_5\text{CHMgCl}$ give III.

MARGARET W. MCPHERSON

Several cyclic α -nitroketones. H. WIELAND, P. GARBSCH and J. J. CHAVAN. *Ann.* 461, 295-308(1928) —K (4 g.) in 30 cc. abs. EtOH and 70 cc. abs. Et₂O, cooled to -10° to -15°, treated with a soln. of 10 g. cyclohexanone and 9.3 g. EtNO₂ in 150 cc. Et₂O, gives 12-15 g. of the *K* salt (of which about 50% is lost during purification, light yellow needles, decomp. 215-20° and gives an intense brownish red color with FeCl₃) of *aci*-nitrocyclohexanone, m. 37°, but often obtained as an oil; FeCl₃ gives a brownish red color, which disappears on the addn. of Br; NaOH and Na₂CO₃ give yellow solns. The *Br* deriv. is an oil. *Semucarbazon*, m. 184° (decompn.); FeCl₃ gives no color. PhN₂Cl gives light yellowish brown prisms, decomp. 118°, which may be HO₂C(CH₂)₄C(NO₂):N₂IHPh. A phenylhydrazone or oxime could not be obtained but PhNHNH₂ gives an *osazone* of cyclohexane-1,2-dione, yellow, m. 150°. From twice the quantity of K and EtNO₂ there results the *di*-K salt of the *dinitro*-cyclohexanone, m. 110.5°; with 4 *N* H₂SO₄ the aq. soln. of the *di*-K salt gives a *mono*-K salt, red, decomp. 221°. Cyclopentanone yields an α,α' -*dinitro* deriv., crystals quickly changing to an oil; *di*-K salt, deep yellow, m. 241-5° (decompn.); *mono*-K salt, orange-yellow, decomp. 154-8°. Nitrocyclohexene dibromide, m. 100-1°; with MeOH-KOH this splits off KBr and gives the *aci*-K salt, pale yellow; aq. solns. give with FeCl₃ an intense dark olive-brown color; with HNO₂ it gives an *isonitroso* compd., pale yellow, decomp. 122.5°. The pseudonitrosite, suspended in abs. EtOH and treated with NH₃, gives 10% of *di*-[α -nitrocyclohexyl]amine, m. 96.7°; *HCl* salt, m. 163°; *nitrosamine*, m. 145-50° (decompn.). α -Hydrazonitrocyclohexane, m. 138-40°, in 25% yield from the pseudonitrosite and N₂H₄·H₂O in EtOH.

C. J. WEST

The preparation of vanillin from safrol. ALFRED WAGNER. *Chem.-Zig.* 52, 379(1928).—A claim for priority over F. Boedecker's process English (Patent 285,156 (1928)) of making vanillin from safrol

W. C. EBAUGH

Catalytic actions of mercury and bismuth. J. B. MENKE. *Rec. trav. chim.* 47, 668-72(1928).—Benzene can be nitrated at 80° with a mixt. of Ac₂O and a nitrate, but in general not with a mixt. of AcOH and a nitrate. With Hg nitrate and also to some extent with Bi nitrate, AcOH as well as Ac₂O can be used, but in these cases nitrophenols as well as PbNO₂ are formed. The action of the Hg salt on the nitrophenols gives rise to the formation of complex Hg compds. which, however, are different with HgNO₃ and Hg(NO₃)₂. On passing a mixt. of benzene vapor and N-O compds. over Bi oxide or through Hg vapor at about 400° PbNO₂ and nitrophenols are formed. The formation of complex compds. of the nitrophenols takes place with the Hg vapor but not with Bi oxide and the amount of PbNO₂ obtained with Hg vapor far exceeds the amount obtained with Bi oxide. H₃PO₄ destroys the catalytic action of Bi and therefore Hg cannot be replaced by Bi in the Kjeldahl process; in the process of Gunning and in the oxidation of C₁₀H₈ to phthalic acid this replacement is possible.

C. F. VAN DUIN

Velocity measurements of intramolecular changes in arylacylhalogenoamines. CORNELIA CH. J. FONTEIN. *Rec. trav. chim.* 47, 635-67(1928).—Expts. previously carried out by Blankma (*Verslag. Akad. Wetenschappen Amsterdam* 1902, 159, 378; *Rec. trav. chim.* 21, 366(1902); 22, 290(1903)) have shown that the conversion of arylacylhalogenoamines into *o*- and *p*-halogenoacylamines is a monomol. reaction, HCl acting as a catalyst, the velocity of the reaction being nearly proportional to the square of the quantity of HCl added. Further it was shown that the reaction is accelerated by sunlight and that the velocity was largely dependent on the solvent, addn. of water to the solvent slowing down the velocity of the reaction. In the present investigation the influence of light, the solvent, the acyl, halogen and aryl groups was investigated.

A. *The influence of the solvent and of light on the velocity of intramol. change of phenyl-acetylchloroamine into p-chloroacetanilide.*—In these investigations the concn. of the HCl was kept const. (0.2 N), the temp. being 25°. Results obtained:

Vol. % MeOH	Vol. % EtOH	Vol. % AcOH	K in MeOH	K in EtOH	K in AcOH
0	0	0	0.0037	0.0037	0.0037
...	1.92	0.0042
...	4.8	0.0044
9.3	9.6	10	0.0050	0.0051	0.0053
18.7	19.2	20	0.0062	0.0065	0.0086
28.8	28.8	30	0.0075	0.0097	0.0136
37.3	38.4	40	0.0151	0.0161	0.0234
46.6	48.0	50	0.0200	0.0264	0.0538
57.6	57.6	60	0.0351	0.0454	0.1450
67.2	67.2	70	0.0646	0.0873	0.5260
76.8	76.8	80	0.1471	0.2791
86.4	86.4	90	0.5528	0.7860
...	96.0	100	1.8530

From these results it appears that the reaction velocity in MeOH, EtOH and AcOH decreases by the addn. of water and that, for equal %, the reaction velocity increases in the order MeOH, EtOH, AcOH. Comparative investigations in the dark and in sunlight showed that the reaction is greatly accelerated by sunlight. B. *The influence of the acyl group on the velocity of intramol. change of the arylacylhalogenoamines.*—The results of the measurements carried out with the formyl-, acetyl-, propionyl-, butyryl- and benzoylphenylchloroamines at 25° in the presence of 0.2 N HCl are given in the following tables:

Vol. % EtOH	0%	19.2%	38.4%	57.6%	76.8%
Phenyl-formyl-chloroamine	0.0027	0.0056	0.0142	0.0365	0.1089
" -acetyl- "	0.0037	0.0065	0.0161	0.0454	0.2791
" -propionyl- "	0.0025	0.0040	0.0077	0.0254	0.1345
" -butyryl- "	0.0028	0.0046	0.0017	0.0259	0.1290
" -benzoyl- "	0.0134	0.0315	0.0521	0.1287	0.4562

Vol. % AcOH	0%	20%	40%	60%	80%
Phenyl-formyl-chloroamine	0.0027	0.0086	0.0182	0.0757	0.3598
" -acetyl- "	0.0037	0.0086	0.0234	0.1450
" -propionyl- "	0.0025	0.0040	0.0125	0.0662
" -butyryl- "	0.0028	0.0056	0.0144	0.0859
" -benzoyl- "	0.0134	0.0163	0.0554	0.3313

These figures show that the reaction velocity increases in the order EtCO, PrCO, HCO, Ac, Bz, and that with all these compds. the velocity is greater in AcOH-H₂O mixts. than in alc.-water mixts. of the same strength. C. *The influence of the halogen atom on the velocity of conversion of arylacylhalogenoamines into halogenoacylamines.*—PhAcNBr is converted far more easily into p-BrC₆H₄NHAc than the corresponding chloroamine into p-ClC₆H₄NHAc. Under otherwise similar circumstances, in order to obtain reaction velocities of the same order of magnitude, the quantity of HCl must be 10,000 times as great as the quantity of HBr. D. *The influence of the aryl group on the isomeric change discussed in this paper was investigated with m-methyl-, m-chloro- and m-bromophenylacetylchloroamine in the presence of 0.2 N HCl at 25°.*

Vol. % EtOH	0%	19.2%	38.4%	57.7%
phenylacetylchloroamine	0.0037	0.0064	0.0158	0.0455
m-methyl- "	0.0061	0.0134	0.0316	0.0845
m-chloro- "	0.0183	0.0308	0.0969	0.4102
m-bromo- "	0.0105	0.0347	0.1157	0.3778

Vol. % AcOH	0%	20%	40%	60%
phenylacetylchloroamine	0.0037	0.0086	0.0234	0.1449
m-methyl- "	0.0061	0.0131	0.0371	0.5674
m-chloro- "	0.0183	0.0334	0.1118	0.8244
m-bromo- "	0.0105	0.0354	0.1342

These figures show clearly that *m*-Me, *m*-Cl and *m*-Br groups increase the velocity of the reaction, the acceleration brought about by the Cl and Br atom being much greater than that of the Me group.

C. F. VAN DUIN

The position occupied by the acetatomercuric groups in anilines which contain a halogen group and a hydrocarbon residue in the nucleus. II. L. VECCHIOTTI. *Gazz. chim. ital.* **58**, 181-90(1928); cf. *C. A.* **22**, 231.—In continuation of the previous expts., the action of $\text{Hg}(\text{OAc})_2$ (I) on *m*-BrC₆H₄NH₂ (II) was studied. I (32 g.) in water (100 cc.) (filtered), EtOH (100 cc.) and a few drops of glacial AcOH, let stand 48 hrs. with II (34 g.) in EtOH (100 cc.), filtered, washed and recrystd. from EtOH, yields 4-acetatomercuri-*m*-bromoaniline, 3,4-Br(AcOHg)C₆H₃NH₂ (III), m. 181°. Let stand 24 hrs. with excess Ac₂O, III forms an *Ac deriv.*, 3,4-Br(AcOHg)C₆H₃NHAc (IV), m. 215°. III let stand 24 hrs. with 50% aq. KOH, greatly dild. with water, filtered, washed and recrystd. from EtOH, yields the hydroxide, 3,4-Br(HOHg)C₆H₃NH₂, m. 170°. III and NaBr in the min. quantity of boiling EtOH let cool after some hrs. ppt. the bromide, 3,4-Br(BrHg)C₆H₃NH₂, m. 215°. III let stand 24 hrs. with 50% aq. Na₂S₂O₃, filtered and washed with water, yields 4-monomercuri-*bis-m*-bromoaniline, [2,4-Br(H₂N)-C₆H₃]₂Hg, m. 185°. Br in glacial AcOH added to IV (calcd. proportion) in glacial AcOH, let stand 24 hrs., greatly dild. with water, and the ppt. recrystd. from EtOH, yields a dibromoacetanilide, Br₂C₆H₃NHAc (V), m. 158°. V sapond. by refluxing 8 hrs. with abs. EtOH and HCl (calcd. proportions), the solid product dissolved in water, KOH added and the ppt. recrystd. from EtOH, yields 3,4-Br₂C₆H₃NH₂, which establishes the constitution of III. II (17 g.) added to I (32 g.) in water (100 cc.), filtered, the filtrate let stand 48 hrs., the semigelatinous ppt. washed repeatedly, dissolved in hot glacial AcOH, reprecipd. by diln. with water, and the purification repeated several times, yields after drying *in vacuo* over H₂SO₄, 2,4,6-triacetatomercuri-*m*-bromoaniline, 3,2,4,6-Br(AcOHg)₃C₆H₃NH₂ (VI), m. 229°. Digested 3 days with excess Ac₂O and the product purified with glacial AcOH as before, it yields an *Ac deriv.*, 3,2,4,6-Br(AcOHg)₃C₆H₃NHAc, m. 240° (decompn.). Br (7.5 g.) in glacial AcOH agitated with VI (10 g.) suspended in glacial AcOH until the reaction mixt. is clear, let stand 24 hrs., greatly dild. with water, filtered, the residue thoroughly washed with water and recrystd. from EtOH, yields a tetrabromoacetanilide, Br₄C₆H₃NHAc (VII), m. 128°. VII in EtOH refluxed 10 hrs. with fuming HCl (calcd. proportion), filtered, washed with EtOH, dissolved in water, concd. aq. KOH added, filtered, washed and recrystd. from EtOH, yields 2,3,4,6-Br₄C₆H₃NH₂, m. 116-7°, which establishes the constitution of VI.

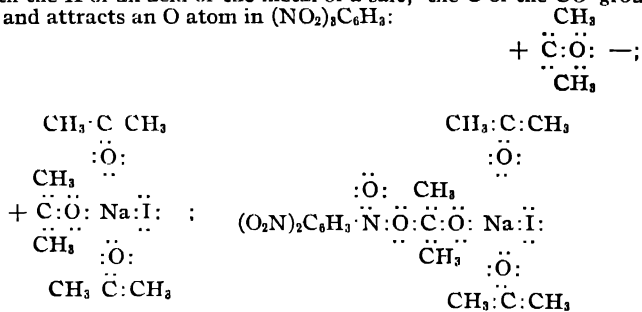

C. C. DAVIS

The Michler "sulfones." F. BERGEL AND H. DÖRING. *Ber.* **61B**, 844-5(1928).—Lecher and D. (D., *Diss. Freiburg*, 1928) obtained from *p*-MeC₆H₄SH and *p*-ClC₆H₄NO₂ the sulfide MeC₆H₄SC₆H₄NO₂, which, on reduction, methylation and oxidation gave the sulfone *p,p'*-MeC₆H₄(SO₂)C₆H₄NMe₂, m. 209-11°, while Michler describes (*Ber.* **12**, 1793 (1879)) under the same name a compd., m. 95°. The *p,o'*-sulfone, prepd. in the same way, m. 95.5°, but depresses the m. p. of M.'s compd. to 66-74°. Accurate combustions on the latter compd. now showed that it has the compn. not C₁₆H₁₁O₂NS but C₁₄H₁₀O₂NS and direct comparison proved that as a matter of fact the substance is identical with the *p*-MeC₆H₄SO₂NMePh obtained by Otto (*J. prakt. Chem.* [2], **47**, 369) from MeC₆H₄SO₂Cl and PhNHMe. The same is true of the other "sulfones" obtained by M. from arylsulfonyl chlorides and PhNMe₂; in this reaction the sulfonyl chloride apparently first splits off one Me (probably by oxidation) from the PhNMe₂, and then reacts with the PhNHMe so produced to give the final product RSO₂NMePh; as noted by M., there are formed in large amounts, as by-products, Me violet and CH₂-(C₆H₄NMe₂)₂, whose methane C atom can come only from the Me groups split off.

C. A. R.

The complexes of the aromatic polynitro compounds with unsaturated compounds and certain salts. B. V. TRONOV, L. N. D'YAKONOVA-SCHULTZ AND E. ZONOVA. *J. Russ. Phys.-Chem. Soc.* **59**, 333-46(1927).—A mixt. of C₆H₃(NO₂)₃ or its derivs. with compds. contg. a CO group assumes a red or brown coloration when an iodide is added. The color disappears on diln., and no I can be detected. The formation of a complex compd. is therefore evident. Among the aldehydes, AcH and EtCHO are colored brown-red; BzH and AmCH₂CHO pale yellow, AcMe is intensely colored, AcPh and AcCH₂CO₂Et distinctly so, more complex ketones to a lesser extent. CO₂H acids do not form colored compds., while some amides (fused ACNH₂, MeCH₂CONH₂) do. Esters are only slightly colored. Ac₂O behaves like AcMe; AcCl produces no change. MeCN, MeSCN and MeNCS exhibited a coloration of medium intensity; MeCH(OH)CN, MeCH:NOH are faintly tinged. The most intense color develops with C₆H₅N and α-MeC₆H₄N. Quinoline resembles AcMe, isoquinoline is paler. CH₂:-

CHCH₂OH becomes dark yellow. The stability of the complexes, as measured by the quantity of EtOH added before the color disappears, decreased with the color intensity (greatest for C₆H₅N, least for MeOAc). PhAc forms an intensely colored compd., however, although the coloration is discharged easily. Among the nitro compds., PhNO₂ develops only a trace of color upon the addn. of ketones and iodides. Dinitro compds. react better, while among the trinitro compds. trinitrophenols are followed by (NO₂)₃C₆H₃ and (still weaker) C₆H₂(NO₂)₃Me. Here also deeper color is associated with greater stability. Phenols form salts with amines instead of the colored complexes. Among the iodides those of K, NH₄, Ca and Ba can be used. MgI₂, CdI₂, CuI₂ and Me₄NI did not react, possibly because of their low soly. Bromides of the alkali metals are less active than the iodides. The addn. of chlorides, nitrates and sulfates does not produce any color. KCNS and NH₄CNS from colored complexes with AcMe and (NO₂)₃C₆H₃. Salts of weak acids sometimes produce a dark red coloration because of their alk. reaction. The complex could not be crystd. without decompn. The color is most intense when (NO₂)₃C₆H₃ and NaI are added to MeAc in equimol. proportions. Equimol. quantities of NaI and (NO₂)₃C₆H₃ were dissolved in AcMe, excess of the solvent evapd. and the residue weighed; its compn. roughly corresponded to (NO₂)₃C₆H₃ + NaI + 3AcMe. Similarly, BaI₂ combines with 2 mols. of C₆H₃(NO₂)₃ and 6 mols. AcMe. The complex of MeC₆H₂(NO₂)₃ + NaI + 3C₆H₅N was pptd. with petroleic ether and analyzed, found I 19.99, 21.78% (calcd. 20.67%); C₆H₅N 42.7, 40.58% (calcd. 38.8%). The secondary valences of O in CO compds. cause them to unite with the H of an acid or the metal of a salt; the C of the CO group now becomes unsatd. and attracts an O atom in (NO₂)₃C₆H₃:

BASIL C. SOYENKOFF

The styphnates of nitroanilines. N. N. EFREMOV. *J. Russ. Phys.-Chem. Soc.* **59**, 391-404 (1927).—Mol. compds. of (NO₂)₃C₆H₂OH and (NO₂)₃C₆H(OH)₂ with nitroanilines are known. Diphenylamines also are formed on heating, especially in the presence of dehydrating agents, which may account for the difference in m. p. of the mol. compds. reported by various investigators. A mixt. of equimol. amts. of PhNH₂ and (NO₂)₃C₆H(OH)₂ decomps. violently below fusion temp. The compd. (1:1) seps. in pale yellow prisms when a hot soln. of the acid in a mixt. of 1 part EtOH and 3 parts EtOAc is added to a similar soln. of PhNH₂. Yield 68%; C 42.78% (calcd. 42.59%), H 2.76% (calcd. 2.99%), N 16.33% (calcd. 16.53%), (NO₂)₃C₆H(OH)₂ 72.59% (calcd. 72.48%). In the presence of an excess of PhNH₂, the crystals are contaminated with the latter. The compd. begins to decomp. 120°. No other styphnates of PhNH₂ were found. The acid does not combine with *o*-O₂NC₆H₄NH₂; the mixts. can be melted once without decompn. and crystallize readily. The eutectic lies at 45.6° and 64.2° of the aniline by wt. No solid solns. were found. With *m*-O₂NC₆H₄NH₂ a compd. is formed m. 156.2° (50% mol. of the aniline) and one m. 106.8° (66.67% of the aniline). The eutectics are at 140.2° (17.7% by wt.) and 98.6° (76.4% by wt.). The compds. were recrystd. and the compns. detd. from m.-p. curves confirmed by titrations with Ba(OH)₂. A styphnate of *p*-O₂NC₆H₄NH₂ (1:1), m. 129.8°, exists; the eutectic is located at 124.7° (28.3% of the aniline by wt.). Solid solns. are not formed. The 2nd eutectic m. 112.2° (62.3% of the aniline). The compd. was recrystd. and titrated with Ba(OH)₂; found (NO₂)₃C₆H(OH)₂ 64.27%, calcd. 63.97%. B. C. S.

Mobile-anion tautomerism. I. Preliminary study of the conditions of activation of the three-carbon system and a discussion of the results in relation to the modes of addition to conjugated systems. HAROLD BURTON AND CHRISTOPHER KELK INGOLD. *J. Chem. Soc.* **1928**, 904-21.—This is the 1st paper dealing with a general investigation on the effect of groups in promoting anionotropic change, presenting results for the

systems $\text{ArCHXCH:CH}_2 \rightleftharpoons \text{ArCH:CHCH}_2\text{X}$ and $\text{ArCHXCH:CHAr}' \rightleftharpoons \text{ArCH:CHCHXAr}'$, where the potentially mobile anion, X, is OR or Hal. In the system PhCH(OH)CH:CH_2 (I) $\rightleftharpoons \text{PhCH:CHCH}_2\text{OH}$ (II), the degree of mobility is not very great, for the 2 alcs. can be obtained as sep. individuals; I *p*-nitrobenzoate, m. 45–6°; Valeur and Luce (*Bull. soc. chim.* 27, 611(1920)) claim to have transformed I into II by dil. H_2SO_4 but this result could not be confirmed; however, I is smoothly and completely transformed into the acetate of II by boiling with Ac_2O . I and II are converted into the same cryst. bromide (cf. Moureu and Gallacher, *C. A.* 16, 714); the correctness of this structure was proved by the action of O_3 . α -*p*-Tolylallyl alc. (III), b_{10} 120–2°, yields a *p*-nitrobenzoate, m. 82°; III is completely converted into the acetate, b_{10} 140°, of 4-methylcinnamyl alc. (IV), m. 51–2°; *p*-nitrobenzoate, m. 131–2°. III or IV with HBr gives 4-methylcinnamyl bromide, m. 64–5°; the constitution was established by the action of O_3 . PhCH(OAc)CH:CHPh and Br in CCl_4 give a bromide, m. 176–7°, an isomer, m. 122° and a viscous oil. γ -Phenyl- α -*p*-tolylallyl alc. (V), m. 78–9°; with alc. 20% KOH it gives almost quant. $p\text{-MeC}_6\text{H}_4\text{COCH}_2\text{CH}_2\text{Ph}$; Ac_2O gives a mixt. of the *Ac* derivs. of V and of α -phenyl- γ -*p*-tolylallyl alc., b_{11} 210–1°, whose constitution was proved by the action of O_3 and alc. KOH. The action of $p\text{-ClC}_6\text{H}_4\text{MgI}$ upon PhCH:CHCHO gave a mixt. of the 2 isomeric alcs., α -phenyl- γ -*p*-chlorophenylallyl and γ -phenyl- α -*p*-chlorophenylallyl; the mixed *Ac* derivs. b_{11} 225–6°; Br gives 2 isomeric bromides, $\text{C}_{17}\text{H}_{15}\text{O}_2\text{ClBr}_2$, m. 193–4° and m. 180°. The constitution of the mixt. was established as above. The following reference compds. were prepd.: *Et p*-chlorobenzoylbenzoylacetate, b_{12} 240°, m. 54–5°, from $\text{BzCHNaCO}_2\text{Et}$ and $p\text{-ClC}_6\text{H}_4\text{CH}_2\text{Br}$; hydrolysis with dil. H_2SO_4 or Ba(OH)_2 gives *Ph* β -*p*-chlorophenylethyl ketone, m. 58° (oxime, m. 117–8°). *Et p*-chlorobenzoylacetate, b_{11} 181–2°, m. 36°; benzyl deriv., b_{14} 228–33°, m. 65°; *p*-chlorophenyl β -phenylethyl ketone, m. 78° (oxime, m. 111–2°). *Et* benzyl-*p*-tolylacetate, b_{11} 232–3°; hydrolysis gives $p\text{-MeC}_6\text{H}_4\text{COCH}_2\text{CH}_2\text{Ph}$, whose oxime m. 101–2°. *Et p*-methylbenzylbenzoylacetate, b_{10} 223–5°; hydrolysis gives *Ph* β -*p*-tolylethyl ketone, waxy solid, whose oxime m. 85–6°.

C. J. WEST

Monoacyl derivatives of quinic acid. II. KARL JOSEPHSON. *Ber.* 61B, 911–7 (1928); cf. *C. A.* 22, 411.—Under certain conditions, the lactone ring in benzoylquinide (I) can readily be opened with acids without appreciable splitting off of BzOH and 4-benzoylquinic acid (II) can be obtained directly in good yield from acetone-benzoylquinide (III) in 1 operation. That no migration of the acyl radical takes place during the hydrolysis is shown by the fact that with dry Me_2CO contg. 1.5% HCl II regenerates III. 4-Cinnamoylquinic acid (IV) is obtained in the same way. The III, m. 140°, is obtained in 81% yield from acetone-quinide in cold dry $\text{C}_6\text{H}_5\text{N}$ with BzCl ; 5.3 g. in 40 cc. Me_2CO at 55° warmed 40 min. with 20 cc. 4 N HCl, then another 40 min. with 20 cc. more of acid, gives 1 g. I and 3 g. II, prisms with H_2O , $[\alpha]^{20}_{\text{D}} -3.9^\circ$ (95% alc.), m. (anhyd.) 188° (cor.). Acetone-4-cinnamoylquinide (yield, 73%), m. 189° (cor.). 4-Cinnamoylquinide (3.75 g. from 6.2 g. of the acetone compd. with aq. HCl and Me_2CO at 55°), m. 165° (cor.), $[\alpha]^{20}_{\text{D}} -18.3^\circ$ (Me_2CO); the mother liquors yield 1.12 g. IV, m. 188° (cor.), $[\alpha]^{20}_{\text{D}} 5.9^\circ$ (95% alc.). Acetone-4-acetylquinide, from acetone-quinide and $\text{Ac}_2\text{O}-\text{C}_6\text{H}_5\text{N}$, m. 109°, $[\alpha]^{20}_{\text{D}} -4.4^\circ$ (CHCl_3). Acetone-4-carbethoxyquinide (60% from acetone-quinide in $\text{CHCl}_3-\text{C}_6\text{H}_5\text{N}$ with ClCO_2Et at 0°), m. 108°, $[\alpha]^{20}_{\text{D}} -4.7^\circ$ (CHCl_3).

C. A. R.

Condensation products of diethylsuccinylsuccinic esters with primary arylamines. D. MIGLIACCI AND R. GARGULO. *Gazz. chim. ital.* 58, 110–21(1928).—Di-Et succinylsuccinate (I) (1 g.) in EtOH (10 cc.) heated gently 4–5 min. with *o*-phenetidine (II) (2 g.) in concd. AcOH (5 cc.), cooled, the ppt. dissolved in C_6H_6 and repptd. by ligroin, yields 1.25 g. (66%) *di-Et p*-di-*o*-phenetidide- $\Delta^{1,4}$ -dihydroterephthalate, $\text{CH}_2\text{:C(NHC}_6\text{H}_4\text{OEt).C(CO}_2\text{Et).CH}_2\text{:C(NHC}_6\text{H}_4\text{OEt).C(CO}_2\text{Et)}$ (III), light violet,

m. 200–1°. It is also formed by agitating II (3 g.) with I (1 g.) in warm glacial AcOH (5 cc.) for some min. at 50–70°, filtering when cool, and drying *in vacuo* over KOH, in which case it is white and m. 201°. In a similar way were prepd. *di-Et p*-di-*p*-phenetidide- $\Delta^{1,4}$ -dihydroterephthalate, m. 197°, and *di-Et p*-di-*p*-anisidine- $\Delta^{1,4}$ -dihydroterephthalate, m. 191°. I (1 g.) in EtOH (80 cc.) boiled with II (5–6 g.) in glacial AcOH (8 cc.) for 10–15 min. in a current of air, cooled, the ppt. dried, dissolved in C_6H_6 and repptd. by ligroin, yields 1.3 g. (70%) of *di-Et p*-di-*o*-phenetidide- $\Delta^{1,4}$ -dihydroterephthalate, $\text{CH}_2\text{:C(NHC}_6\text{H}_4\text{OEt).C(CO}_2\text{Et).CH}_2\text{:C(NHC}_6\text{H}_4\text{OEt).C(CO}_2\text{Et)}$ (IV), orange-red, m.

152°. I (1 g.) heated 4–6 hrs. at 125–30° with II (5–6 g.), and the ppt. treated as before yields 1.25 g. (66%) of IV. I (1 g.) refluxed 4–6 hrs. with II (5–6 g.) in *p*-xylene

(8 cc.), distd. *in vacuo*, the residue dissolved in hot concd. AcOH (25 cc.), cooled and the ppt. treated as before yields 1.25 g. (66%) of IV. I (1 g.) heated 6-8 hrs. at 140-5° with II (5-6 g.), hot concd. AcOH (30 cc.) added, cooled, the ppt. (2.5 g.) filtered, washed with C_6H_6 , the C_6H_6 soln. concd. and ligroin added, ppts. IV. On the filter remains a little V (see below). I (1 g.) heated some hrs. at 180-200° with II (5-6 g.), cooled, dissolved in hot C_6H_6 (30 cc.), filtered, washed with EtOH, and recrystd. from $PhNO_2$, yields 2.8 g. (64%) of *di-o-phenetidineurea* (*di-o-ethoxydiphenylurea*) (V), m. 222°, is not attacked by mineral acids and alkalis. By concn. of the C_6H_6 mother liquor a little IV is obtained. In a similar way were prepd. *di-p-phenetidineurea* (*di-p-ethoxydiphenylurea*), m. 220°, and *di-p-anisidineurea* (*di-p-methoxydiphenylurea*), m. 234°. I (2 g.) heated for some hrs. at 130-40° with II (2-3 g.), and the cooled mass extd. with C_6H_6 (30 cc.) yields (1) a portion insol. in C_6H_6 ; (2) a portion slightly sol. in C_6H_6 , and (3) a portion very sol. in C_6H_6 . Thoroughly washed with C_6H_6 and recrystd. from hot concd. AcOH (1) yields 0.2-0.3 g. of V. Evapd. to about $\frac{2}{3}$ its vol., the original C_6H_6 soln. deposits a yellow cryst. *compd.* (VI) which, recrystd. from various solvents, m. 178-83°, insol. in acids, sol. in boiling aq. KOH. Addn. of ligroin to the remaining C_6H_6 soln. ppts. 0.5-0.6 g. of IV, which is extremely sol. in C_6H_6 . I (2 g.) heated 6-8 hrs. at 125-30° with II (1 g.) and *p*-xylene (15 cc.), evapd. *in vacuo*, and the product treated as in the preceding prepn., yields 0.5-0.6 g. of VI, m. 177-9°, 0.1-0.2 g. of V and a little IV. In the same way, only heating at 140-50°, there are obtained 0.2-0.3 g. of VI, m. 180-1°, and 0.3-0.4 g. of V. From I and *p*-phenetidine is prepd. in a similar way an unidentified yellow cryst. *compd.*, m. 163-8°, and from I and *p*-anisidine a yellow cryst. *compd.*, m. 182-7°. IV (0.5 g.) refluxed 10-15 min. with $BzCl$ (5 cc.), steam-distd. to remove $BzOH$, the residue dissolved in hot C_6H_6 (15 cc.), animal charcoal added, filtered, and reprecipd. with ligroin, yields 0.6 g. (84%) of *di-Et p-dibenzoxy-p-di-o-phenetidinetetraphthalate*, $CH_3C(NBzC_6H_4OEt).C(CO_2Et).CH_3C(NBzC_6H_4OEt).C(CO_2Et)$ yellowish, m. 249°.

51°. IV (1 g.) in hot EtOH refluxed 0.5 hr. with 10% aq. KOH (5 cc.), dild. with water, acidified with HCl, filtered, and the residue purified by washing, drying and crystg. from boiling $PhNO_2$, yields almost 100% of *p-di-o-phenetidinetetraphthalic acid*, violet with metallic reflection, m. 273° (decompn.), dibasic. *Na salt*, greenish yellow. *K salt*, greenish maroon. *Li salt*, greenish maroon. *Ba salt*, greenish maroon. The work is closely related to that of Knorr (*Ber.* 17, 545(1884)), Liebermann (*C. A.* 8, 2150) and Kauffmann (*C. A.* 9, 2651) and earlier expts. of M. (*C. A.* 22, 1766).

C. C. DAVIS

Method of hydrogenating with sodium amalgam. RICHARD WILLSTATTER, FRANZ SEITZ AND ERWIN BUMM. *Ber.* 61B, 871-86(1928).—The nature of hydrogenation with Na-Hg is still puzzling; to obtain more thorough information as to the mechanism of the reaction, it must be followed quant. and the authors describe a method in which the total H liberated is detd. by titration of the NaOH formed and that not used up by combustion and weighing as H_2O , the difference being the H added by the *compd.* reduced. The measurements must be carried out in the absence of O; if O is present no H is set free. The effectiveness of the Na-Hg depends on its purity. With ordinary Na-Hg *p*- $C_6H_4(CO_2H)_2$ gives only the $\Delta^{2,3}$ -dihydro acid, which is itself not reducible until it has been rearranged (into the $\Delta^{1,3}$ - and $\Delta^{1,4}$ -acids), when reduction continues to the Δ^2 -tetrahydro acid and this in turn is still further reduced to the hexahydro acid only after rearrangement to the Δ^1 -tetrahydro acid. With pure Na-Hg, however, the $C_6H_4(CO_2H)_2$ in the cold gives the Δ^2 -tetrahydro acid, and of the 2 tetrahydro acids it is not the Δ^1 - but the Δ^2 -acid which is much more easily further hydrogenated (in the cold in 20-5 min., 60-70% hexahydro acid is formed, with a utilization of 90% of the H, when the pH is adjusted to 9-10.5 with glycolcol). Pure Na-Hg does not react at all appreciably with H_2O ; it evolves no H. The behavior of Na-Hg indicates that the reduction of an org. *compd.* by it consists in the addn. of Na at the position of partial affinity of the mol. and the replacement of the Na atoms by H under the influence of H_2O . The reactivity of the Na-Hg towards O and CO_2 is also to be considered as due not to the action of liberated H but to a direct action of the Na-Hg on the O and addn. of Na to the CO_2 . The coeff. of utilization is decreased by impurities in the Na-Hg because they catalytically accelerate the decompn. of the Na-Hg by H_2O , with liberation of H, a reaction which competes with the addn. of the Na atoms to the unsatd. groupings. The addn. of Na to org. *compds.* obeys other laws, is subject to other influences than the addn. of H, and it is easy to understand why in the reduction with Na-Hg there should be obtained intermediate products different from those obtained in catalytic hydrogenation, and why in many reductions with Na-Hg the

Na cannot be replaced by some other metal which liberates H. Reductions with Na-Hg are subject to various disturbing factors, especially the alkali formed, or, if it is neutralized, the resulting increased salt concn. The authors have made a beginning in the study of the influence of the p_H on the course of reductions with Na-Hg. Nucleus-hydrogenation of $p\text{-C}_6\text{H}_4(\text{CO}_2\text{H})_2$ takes place at p_H 12–5, but if the p_H is kept const. at 9–9.8 with phosphate or $\text{H}_2\text{NCH}_2\text{CO}_2\text{H}\text{-NaOH}$, there is obtained 50% $p\text{-MeC}_6\text{H}_4\text{-CO}_2\text{H}$; apparently the Na can add in 2 ways to $\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2$ —in the 1,4-positions on the C_6H_4 ring and in the 1,2-positions on the C:O group of the CO_2H . Comparative expts. showed that a Na-Hg prep. in Fe crucibles is decompd. by H_2O about twice as fast as that prep. in an earthen crucible and 30–50 times faster than electrolytic Na-Hg. A product as pure as the latter can be prep. by adding 24 g. Na (kept under Et_2O and trimmed with a glass knife) to 350 cc. Hg at 120° in a porcelain casserole provided with a glass cover having 2 holes—1 for the introduction of the Na and the other for the admission of a rapid current of N. Addn. of 0.001 part of various metals accelerated the decompn. of such a product by H_2O (Cu and Ag relatively little, Mg and Zn more, Al still more, Sn and especially Pb most). If the H_2O was previously distd. through a quartz tube heated to a high temp. and boiled in a vigorous current of N (cf. Baker and Parker, C. A. 8, 1247) it did not react at all with the Na-Hg prep. as described above.

C. A. R.

Genetic relationships in the sylvestrene group. OSSIAN ASCHAN. *Ann.* 461, 126(1928).—The di-HBr and the di-HCl salts of diprene and carvestrene are identical, but the hydrocarbons, b. $170\text{--}1.5^\circ$ and $176\text{--}8^\circ$, are different; diprene does not give the blue color reaction with Wallach's reagent, but carvestrene does. Diprene, therefore, probably belongs to the terpenes with the *m*-cymene nucleus, i. e., to the sylvestrene series. The isomer of carvestrene, b. $183\text{--}6^\circ$, now termed *carveprene*, also shows the color reaction and belongs to the sylvestrene group. Data are given for the distn. of a Finnish pine oil, a balsam turpentine oil and a sulfate turpentine oil, the values of d , and n being given for each fraction. Isodiprene, b. $167\text{--}70^\circ$, d_{20}^{20} 0.8561, $[\alpha]_D^{20}$ 5.37° , n_D 1.47536, gives with HCl in Et_2O a *mono-HCl deriv.*, $\text{C}_{10}\text{H}_{17}\text{Cl}$, b. $77\text{--}83^\circ$, d_{20}^{20} 0.9755, $[\alpha]_D$ 0.82, n_D 1.48175; with PhNH_2 the chloride gives sylvestrene. The *di-HCl deriv.* of isodiprene forms only gradually and incompletely and m. $70\text{--}1^\circ$; it does not depress the m. p. of sylvestrene di-HCl. The fraction of the mono-HCl deriv. b. above 100° contains dipentene di-HCl. The nitrosate of isodiprene is identical with that from Δ^3 -carene of Simonsen, thus establishing their identity. The fraction b. $163\text{--}7^\circ$ consists of pinonene (Δ^4 -carene), d_{20}^{20} 0.857, d_{20}^{20} 0.861; the mono-HCl deriv. b. $75\text{--}80^\circ$; PhNH_2 gives sylvestrene. Carveprene gives a di-HBr deriv., m. $48\text{--}9^\circ$, identical with that obtained from diprene.

Oxidation products of compounds of the camphane, fenchane and camphenilane series with chromic acid. IV. Preparation of *p*-ketocamphenilone, *p*-ketofenchone, *p*-ketocamphor, *dl*-*p*-ketobornyl acetate and *p*-ketobornyl chloride. Action of bromine upon these ketones and decomposition of the bromination products by alkali. J. BREDT AND P. PINTEN WITH H. GERMAR, TH. LIESER AND H. DE GREIFF. *J. prakt. Chem.* 119, 81–107(1928); cf. C. A. 21, 1109.—Oxidation of *dl*-camphenilone in AcOH by adding solid CrO_3 in small quantities during 2–3 weeks gives about 10% of *dl*-ketocamphenilone, b. 118° , m. 56° ; about 50% of the starting material is recovered. Oxidation of a camphenilone with $[\alpha]_D^{20}$ -58.65° gives an active ketocamphenilone, m. 74° , $[\alpha]_D^{20}$ -90.03° (11.4% yield after 7.5 weeks). A slightly active camphenilone gave a product which could be fractionated into products m. from 56° to 74° . *Monosemicarbazone*, m. $201\text{--}2^\circ$ (decompn.). The *monobromide*, m. 84.5° , $[\alpha]_D^{23}$ -353.64° . The bromide (11.5 g.), 50 g. NaHCO_3 and 120 cc. H_2O , warmed until soln. resulted, gave 2.4 g. ketocamphenilonic acid, m. 156° ; semicarbazone, m. 225° (decompn.); there also result a satd. acid, m. $218\text{--}9^\circ$, and 2 other products, m. $232\text{--}5^\circ$ and 251° . Ketofenchone results in from 9.4 to 15.8% yields; the *Br deriv.* m. 132° , $[\alpha]_D^{25}$ 324.05° ; with 10% KOH there results ketofencholenic acid, m. $126\text{--}7^\circ$; oxime, m. 160° (decompn.); semicarbazone, m. $212\text{--}6^\circ$ (decompn.). The acid adds Br, giving a *mono-Br deriv.* m. $156\text{--}7^\circ$, and dibromide, m. $136\text{--}7^\circ$, probably the above Br deriv. With KMnO_4 the keto acid gives $\text{Me}_3\text{C}(\text{CO}_2\text{H})_2$ and a mixt. of acids, m. $156\text{--}75^\circ$; the fraction m. $175\text{--}6^\circ$ analyzes for $\text{C}_{10}\text{H}_{14}\text{O}_4$ and titrates for a dibasic lactone acid. *p*-Ketocamphor gives a *mono-Br deriv.*, m. $144.5\text{--}5^\circ$, and 2 dibromides, m. $128\text{--}9^\circ$ and above 190° . Splitting off HBr from the mono-Br deriv. gives the acid $\text{C}_{10}\text{H}_{14}\text{O}_4$, m. 124.5° ; semicarbazone, m. $216\text{--}8^\circ$ (rapid heating), decomp. $188\text{--}9^\circ$ (slow heating). *dl*-*p*-Ketobornyl acetate, b. $136\text{--}7^\circ$, b. $140\text{--}1^\circ$, b. 147° , m. $73\text{--}5^\circ$; semicarbazone, m. 238° .

The *Br* deriv. m. 100–1°; this easily splits off HBr but a cryst. product could not be obtained. *p*-Ketobornyl chloride with $[\alpha]_D^{25}$ 70.66° yields a *bromide*, m. 184°, with $[\alpha]_D^{25}$ 98.35°; with $[\alpha]_D^{22}$ –46.34°, the bromide has $[\alpha]_D^{17}$ –85.66°. Even after long heating with KOH (1.1) no Br was split off.

C. J. WEST

Preparation of auramine by Sandmeyer's method. A. M. LUKIN. *J. Chem. Industry (Moscow)* 5, 34–7 (1928).—The process of formation of auramine begins with the reaction between $\text{CH}_2(\text{C}_6\text{H}_4\text{NMe}_2)_2$ and S with formation of $\text{CS}(\text{C}_6\text{H}_4\text{NMe}_2)_2$ and H_2S . Then the thioketone formed reacts with 3 mols. NH_3 to give $\text{HN} \cdot \text{C}(\text{C}_6\text{H}_4\text{NMe}_2)_2$ and $(\text{NH}_4)_2\text{S}$. Finally the base reacts with NH_4Cl , giving auramine-HCl. NaCl facilitates the reaction but does not take part in it. Thirty expts. of auramine prepn. under various conditions have been made and the conditions of reaction giving best yields were found to be as follows: (1) Uninterrupted operation; (2) slow and uninterrupted rise of temp. (use of Frederick's kettle for very exact control of temp.); (3) energetic and careful stirring; (4) use of absolutely dry raw materials, as water hydrolyzes thioketone; (5) purity of NaCl, as traces of MgCl_2 and CaCl_2 are very harmful; (6) sufficiently strong current of NH_3 to keep O and moisture out of the sphere of reaction; (7) fine division of all reacting materials. The slightest neglect of these conditions strongly affects the yield.

BERNARD NELSON

The oxidation of the stilbenes with peracids. J. BORSEKEN AND G. EISEN. *Rec. trav. chim.* 47, 694–7 (1928).—The oxidation of *stilbene* with BzO_2H yields *stilbene oxide*, m. 69.5–70.3°, which, however, could not be hydrated, by means of dil. acids, the oxide being too stable, and therefore the oxidation of the stilbenes was carried out with AcO_2H . Stilbene was prepd. by heating the Na salt of $\text{PhCH}(\text{NO}_2)\text{CN}$ with alc. KOH and by dehydrating $\text{PhCH}(\text{OH})\text{CH}_2\text{Ph}$, while *allo*-stilbene was obtained by careful reduction of tolane with activated Zn powder in alc. in absence of light. The oxidation of *stilbene* by means of AcO_2H yields a mixt. of acetates, which on sapon gives a mixt. of hydrobenzoin, contg. an excess of the *dl*-compd., while *allo*-stilbene, by means of the same course of reactions, gives a mixt. of hydrobenzoin, in which the *meso*-compd. preponderates.

C. F. VAN DUIN

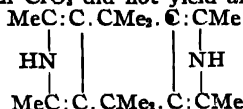

Compounds of the type 2-naphthol-1-sulfonic acid. Sulfonation of 2-hydroxy-3-naphthoic acid and its anilide. R. DZIEWONSKI AND A. LOEWENHOFF. *Bull. intern. acad. Polonaise* 1927A, 521–39.—By the action of concd. H_2SO_4 or ClSO_3H on β -naphthol at moderate temps. a substance is obtained originally called naphthylsulfuric acid and later 2-hydroxynaphthalenesulfonic acid. D. and L. investigate this reaction and also the sulfonation of some β -naphthol derivs. at moderate temps. to elucidate the influence of substitution of the hydroxyl H by an acid residue and of the *o*- CO_2H group in β -naphthol on the point of entry of the sulfo group during gentle sulfonation. From the action of ClSO_3H on β -naphthol and its derivs. at lower temps. it appears that in spite of acid substituents in the β -naphthol mol., sulfonation takes place as in β -naphthol, i. e., in the 1(α)-position. Thus, ClSO_3H with β - $\text{C}_{10}\text{H}_7\text{OAc}$ gives 2.1. $\text{C}_{10}\text{H}_6(\text{OAc})\text{SO}_3\text{H}$, which may also be obtained by acetylating 2.1- $\text{C}_{10}\text{H}_6(\text{OH})\text{SO}_3\text{H}$. 2,3- $\text{C}_{10}\text{H}_6(\text{OH})\text{CO}_2\text{H}$ and its anilide also behave thus, giving the 1- SO_3H derivs. with even greater facility than β -naphthol itself. The substituted derivs. are more stable than the mother substance, 2.1- $\text{C}_{10}\text{H}_6(\text{OH})\text{SO}_3\text{H}$, since water splits off the sulfo group much less easily and unlike the mother substance, they show no tendency to isomerize to the 8- or 6-sulfo deriv. When heated in soln., especially in the presence of mineral acids they lose the sulfo group as H_2SO_4 . Oxidized with CrO_3 , both give phthalonic or phthalic acid and thus the sulfo group is isonuclear with OH and CO_2H . On boiling with aq. alkalis or, more easily, on alkali fusion, the sulfo group is removed without replacement by OH. With diazo compds. they couple up like 2.1- $\text{C}_{10}\text{H}_6(\text{OH})\text{SO}_3\text{H}$, the sulfo group is removed, being replaced by the diazo residue with the production of azo dyes. Hence there is no doubt that the sulfo group of both compds. is in the 1-position. But many other reactions point to the contrary. Thus, 2.1,3- $\text{C}_{10}\text{H}_6(\text{OH})(\text{SO}_3\text{H})\text{CO}_2\text{H}$ gives 1,2,3- $\text{C}_{10}\text{H}_6\text{Br}(\text{OH})\text{CO}_2\text{H}$ with aq. Br and 2.1,3- $\text{C}_{10}\text{H}_6(\text{OH})(\text{SO}_3\text{H})\text{CONHPh}$ behaves similarly. Analogous reactions with concd. HNO_3 on the acetylated form give the 1-nitro deriv. for both acid and anilide. HNO_2 acid with the sulfo acid gives the 1-NO deriv., the reaction being complicated in the case of the anilide by the intermediate formation of the nitrosamine deriv. 1-Sulfo derivs. of 2,3- $\text{C}_{10}\text{H}_6(\text{OH})\text{CO}_2\text{H}$ and its anilide can be sulfonated without migration of the sulfo group already present, as distinct from the action of concd. H_2SO_4 on 2.1- $\text{C}_{10}\text{H}_6(\text{OH})\text{SO}_3\text{H}$, where isomerization migration occurs, and also when the 1-sulfo compd. is exposed to the action of ClSO_3H at 50–60°. Under these conditions it gives a sulfonated product which on the basis of the behavior on alkali fusion is proved to be 2,3,1,6-

$C_{10}H_6(OH)(CO_2H)(SO_3H)_2$ or its anilide. If the alkali salts are fused with KOH they pass into 2,6,3- $C_{10}H_5(OH)_2CO_2H$ with splitting off of one sulfo group and substitution of the other by OH. This change shows that the sulfo group removed on alkali fusion was attached to the $C_{10}H_5$ nucleus and the other, which is substituted by the OH group, is in the 6-position. The sulfonated product of 2,3- $C_{10}H_6(OH)CONHPh$ on alkali fusion gives 2,6,3- $C_{10}H_5(OH)_2CO_2H$ by splitting off an aniline residue. Hence it may be concluded that the sulfonated product is 2,6,3- $C_{10}H_5(OH)(SO_3H)CONHPh$. The prepn. of the following substances is given: 2-Naphthol-1-sulfonic acid and its Na salt; 2-acetoxy-1-naphthalenesulfonic acid and its Na salt; 1-bromo-2-naphthol m. 84°; 2-hydroxy-1-sulfo-3-naphthoic acid, m. 182°; Me 2-hydroxy-3-naphthoic acid-1-sulfonate, m. 122°; 1-benzeneazo-2-hydroxy-3-naphthoic acid, m. 232°; 1-nitro-2-acetoxy-3-naphthoic acid, m. 235°; 2-hydroxy-1,6-disulfo-3-naphthoic acid; 2,6-dihydroxy-3-naphthoic acid, m. 225-6°; 2-hydroxy-1-sulfo-3-naphthoic anilide, m. 198-9°; 1-benzeneazo-2-hydroxy-3-naphthoic anilide, m. 204-5°; nitrosamine of 2-hydroxy-1-sulfo-3-naphthoic anilide; 1-nitroso-2-hydroxy-3-naphthoic anilide; 2-acetoxy-3-naphthoic anilide, m. 152°; 2-acetoxy-1-sulfo-3-naphthoic anilide; 1-nitro-2-acetoxy-3-naphthoic anilide, m. 236-8°; 1-bromo-2-hydroxy-3-naphthoic anilide, m. 161-2°; 2-hydroxy-1,6-disulfo-3-naphthoic anilide; 2,6-dihydroxy-3-naphthoic acid, m. 225-7°; 2-hydroxy-6-sulfo-3-naphthoic anilide, m. 225-7°; phenylphthalazonecarboxylic acid, m. 221-2°; 1-bromo-2-hydroxy-3-naphthoic acid, m. 229°. S. L. B. ETHEKTON

β -Methylnaphthalene. II. Synthesis of hydrocarbons of the benzantracene group. KAROL DZIEWONSKI AND EUGENJUSZ RITT. *Bull. intern. acad. Polonoise*, 1927A, 181-92.—Pyrogenic transformation are described of several α - $C_{10}H_7$ Me derivs. from which 1,2-benzanthracene (I) and its Me derivs. may be obtained. The action of $PhCH_2Cl$ on β - $C_{10}H_7$ Me in the presence of anhyd. $ZnCl_2$ gave a colorless or yellow liquid which, distd. over red-hot Zn dust, gave cryst., yellow, fluorescent I, m. 158-9°. The 2,3-isomer (II), an orange or bronze-yellow cryst. substance, m. 335-6°, was obtained as a secondary product. $BzCl$ with $C_{10}H_7$ Me in the presence of $AlCl_3$ gave 1,2- $C_{10}H_6BzMe$, which, pyrogenically distd. with H over Zn dust, gave a good yield of I without the formation of II. These reactions indicate that the $PhCH_2$ group in the $C_{10}H_6(CH_2Ph)$ Me occupies the 2-position to the Me group. The following explanation is given of the formation of II: the $PhCH_2$ group in the starting substance migrates from the α - to the β -position at the elevated temp. and the 3,2- $C_{10}H_6(CH_2Ph)Me$ first formed loses H with the production of II. The pyrogenic transformation of 1,2- $C_{10}H_6BzMe$ into I possesses general application in the formation of hydrocarbons of the benzantracene group. E. g., by the action of α - or p - MeC_6H_4COCl on $C_{10}H_7$ Me in the presence of $AlCl_3$ 2-methyl-1- α - and 2-methyl-1- p -toluyl-naphthalene are obtained. On pyrogenic distn. over Zn dust in a stream of H each is smoothly transformed into the corresponding 8- or 6-Me deriv. of I oxidation of both the latter with CrO_3 produces the corresponding Me deriv. of 1,2-benzanthraquinone. Oxidation of benzoyl-2-methylnaphthalene with CrO_3 mixt. gave 1,2,5,6- $C_{14}H_8BzMe(CO_2H)_2$, whose structure is deduced from the production of anthracene on distn. with Zn dust. The prepn. of the following substances is described: 1-benzyl-2-methylnaphthalene, b. 221-20° (*sic*). I (naphthantracene). II (naphthacene). 1,2-Benz-9,10-anthraquinone, m. 168°. 1-Benzoyl-2-methylnaphthalene, m. 74°. 3-Benzoyl-4-methylphthalic acid (1-benzoyl-2-methylbenzene-5,6-dicarboxylic acid), m. 184°. 1- p -Toluy-2-methylnaphthalene, m. 127°. 6-Methyl-1,2-benzanthracene, m. 127°. 6-Methyl-1,2-benz-9,10-anthraquinone, m. 174°. 1- α -Toluy-2-methylnaphthalene, b. 238-9°. 8-Methyl-1,2-benzanthracene, m. 145°.

S. L. B. ETHEKTON

The condensation of certain homologs of pyrrole with ketones. B. V. TRONOV AND P. P. POPOV. *J. Russ. Phys.-Chem. Soc.* 59, 327-32 (1927).— α, α_1 -Dimethylpyrrole was prepd. by heating $(AcCH_2)_2$ with alc. NH_3 in an autoclave in boiling water for 1.5 hrs. (yield 51.9%). To 7.5 cc. of the pyrrole in 25 cc. of $AcMe$ was added 4 drops of concd. HCl (red coloration, evolution of heat); after 5 min. the mixt. was poured into water and the red crystals of $C_{18}H_{26}N_2$ recrystd. from 50% $EtOH$ (yield 72.8%). The product m. 174°, was sol. in $EtOH$, $AcMe$, PhH , Et_2O , $CHCl_3$, insol. in water, mol. wt. in $CHBr_3$ 243, 268. Oxidation with CrO_3 did not yield any definite products. The structure formula is proposed:

To a mixt. of 3 cc. of α, α_1 -dimethylpyrrole, 4 cc. of cyclohexanone and 90 cc. $EtOH$ was added 2 drops concd. HCl . No ppt. resulted on the addn. of water after 20 min.

In 12 hrs. rosy crystals sepd and were recrystd. from 80% EtOH (yield 21%). Found C 81.99%, H 9.64% (calcd. for $(C_{12}H_{11}N)_n$, C 82.28%, H 9.72%). The condensation of the pyrrole with AcEt and PhCOEt yielded only tar. The expts. with α,β_1 -dimethylpyrrole (prepd. by the reduction of a mixt. of the acetoacetic with isonitrosoacetoacetic ester) and ketones including AcMe were similarly unsuccessful. The difference in the behavior of α,α_1 - and β,β_1 -derivs. is explained as due to the asym. structure of the

latter, which precludes the formation of stable nuclei. Similarly, $\overbrace{CH_2.(CH_2)_2}^{\bullet}$ CO and $\overbrace{MeCH.(CH_2)_2.CO.CH_2.CH_2}^{\bullet}$ condense rapidly with pyrrole to sparingly sol. compds.

m. 269° and 283°, resp.; $\overbrace{MeCH.(CH_2)_2.CH_2}^{\bullet}$ forms a more sol. product, m. 172°, of the same type: 2(pyrrole) + 2(ketone) — 2H₂O. $\overbrace{MeCH(CH_2)_2.COCH_2}^{\bullet}$ and

$\overbrace{MeCHCH_2(CH_2)_2.CO}^{\bullet}$ condense slowly to a tarry residue. These differences in chem. behavior correspond to differences in the symmetry of the 5 ketones with regard to the line connecting CO and Me. (Cf. Tronov, *Proc. Univ. Tomsk* 75, 250.)

BASIL C. SOYENKOFF

Rubiadin. I. Synthesis of 1-methyl-2,4-dihydroxyanthraquinone. P. C. MITTER, MONOMHAN SEN AND P. K. PAUL. *Quart. J. Indian Chem. Soc.* 4, 535-40(1927).—Rubiadin, C₁₅H₁₀O₄, was first isolated from madder root by the hydrolysis of rubiadin glucoside by Schunck and Marchlewski (*J. Chem. Soc.* 63, 969(1893)). It m. 290° and is unchanged by further heating. It is an anthraquinone deriv. closely resembling purpuroxanthin (1,3-dihydroxyanthraquinone), and its properties would indicate that it is either 2-methyl-1,3-dihydroxyanthraquinone (I) or the 1,2,4-isomer (II). For the synthesis of I, see Schunck and Marchlewski (*J. Chem. Soc.* 65, 183(1894)), who found it m. 282° and its Ac deriv. m. 217-8° (the Ac deriv. of rubiadin m. 225°) and therefore concluded that the structure II must be assigned to rubiadin. The present authors undertook to verify this by synthesizing II. An effort was made to prep. by Fritsch's method from 2,3,5-Me(MeO)₂C₆H₂CO₂Me the corresponding phthalic acid, Me(MeO)₂C₆H(CO₂H)₂. The phthalide, Me(MeO)₂C₆H₂.CH₂O.CO, was suc-

cessfully prepd., but all attempts to oxidize it to the corresponding phthalic acid failed. However, by condensing 2,3,5-Me(HO)₂C₆H₂CO₂H with BzOH in the presence of concd. H₂SO₄ it was definitely established that rubiadin has not the structure II. The acid (cresorselenic acid) was prepd. by a slight modification of the method of Jacobsen and Wierss (*Ber.* 16, 1960(1883)) by heating 50 g. *o*-toluic acid and 200 g. fuming H₂SO₄ (65% SO₃) 12 hrs. at 160-70°, sepg. the di-SO₃H acid from the H₂SO₄ as the sol. Ca salt with CaCO₃, freeing from Ca with K₂CO₃, evapg. to dryness, fusing with 3 parts KOH, making into a paste with ice, treating with concd. HCl and extg. with Et₂O; it m. 237-9°. Di-Me ether, prepd. with Me₂SO₄ in the usual way, m. 160°; its *Me ester*, m. 289-91°, gives with chloral hydrate and cold 90% H₂SO₄ 6-methyl-3,5-dimethoxy-2-trichloromethylphthalide, m. 176°, converted by boiling 20% NaOH into the 2-carboxylic acid, m. 218-9° (*Et ester*, m. 134°), which at 225-35° loses CO₂, giving 6-methyl-3,5-dimethoxyphthalide, m. 249°. 1-Methyl-2,4-dihydroxyanthraquinone (II), from 2,3,5-Me(HO)₂C₆H₂CO₂H, BzOH and H₂SO₄ at 125-30°, orange, m. 265-6°; diacetate, yellowish, m. 181-2°.

H. W. GIBSON

Action of ethylglycolyl chloride on magnesylpyrroles. ANDREA SANNA AND GIOVANNI CHESSA. *Gazz. chim. ital.* 58, 121-7(1928).—The syntheses are another example of the use of magnesyl derivs. as developed by Oddo in his extensive researches. EtOCH₂COCl (I) was prepd. by the method of Heintz (*Poggendorf's Ann.* 109, 331, 489(1870)) except that distn. was carried out *in vacuo*, which gave an increased yield. EtOCH₂CO₂H was purified through its Cu salt. I (10.5 g.) in anhyd. Et₂O added slowly with agitation to cold α -magnesylpyrrole (prepd. from 2 g. Mg, 10.9 g. EtBr and 10.7 g. pyrrole in anhyd. Et₂O), let stand at room temp., then heated 0.5 hr. on a water-bath (blackening can be avoided by an atm. of H), cooled, ice added, neutralized with aq. NaHCO₃, extd. with Et₂O, the combined Et₂O exts. filtered, dried over Na₂SO₄, refiltered, and evapg., yields a thick, brown liquid, agreeable odor, b. above 200° (decompn.), b₁₀₀ around 173°, the distillate being colorless but becoming yellowish and ultimately black and becoming thick even when kept out of contact of air and light. The liquid has the compn. C₈H₁₁NO₂ and is probably the pyrrole- α -ketomethylcarbinol *Et ether* (II), and is formed thus: HNC₄H₂MgBr + I \longrightarrow MgBrCl + HNC₄H₂COCH₂OEt. Its aq. soln. soon becomes greenish, ppts. white compds. with HgCl₂ and

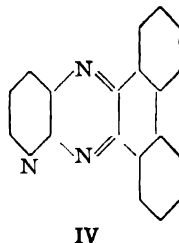

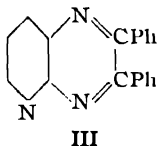

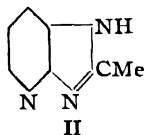

with HgNO_3 , which become brown on boiling. It also slowly ppts. *comps.* with I soln., with tannic acid and with picric acid. It is very resistant to alkalis and could not be sapond., but is resinified by mineral acids. Thus HI immediately forms a black resin insol. in all org. solvents, which decomp. without fusion. **II** heated 0.5 hr. on the water bath with PhNHNH_2 in 50% AcOH , and the black product recrystd. repeatedly, yields the *phenylhydrazone* of **II**, $\text{C}_{14}\text{H}_{17}\text{ON}_3$, greenish brown, m. 163° . By the same procedure, **I** (10.6 g.) and magnesiylmethylketole (from 1–2 g. Mg, 5.4 g. EtBr and 11.3 g. α -methylindole) yield, after crystn. from boiling water, the *cryst. compd.* $\text{C}_{13}\text{H}_{14}\text{NO}_2$ (**III**), m. 157° , probably $\text{C}_6\text{H}_5\text{NH.CMc.CCOCH}_2\text{OEt}$. With

HgNO_3 , its alc. soln. ppts. a red *compd.* **III**, is not attacked by prolonged boiling with alc. KOH , nor by cold mineral acids. Heated 2 hrs. on the water bath with PhNHNH_2 in 50% AcOH , **III** forms a *phenylhydrazone* $\text{C}_{13}\text{H}_{15}\text{ON}_3$, m. 90° . **I** (6 g.) heated 2 hrs. on the water bath with magnesiylcarbazole (from 1 g. Mg, 4.87 g. EtBr in anhyd. Et_2O and 6.86 g. carbazole), ice added, neutralized with NaHCO_3 , extd. with Et_2O , the combined exts. evapd. yields a large proportion of carbazole and a small proportion of a *cryst. substance*. The mixt. dissolved in AcMe , pptd. with water, the ppt. washed, dried, extd. with ligroin and the ext. evapd., and the product recrystd. from abs. EtOH , yields the *N-ketoethylcarbinol Et ether*, $\text{C}_{14}\text{H}_{18}\text{NO}_2$, m. 70° , hydrolyzed in boiling dil. EtOH by a trace of KOH to carbazole and $\text{EtOCH}_2\text{CO}_2\text{H}$. This tendency to hydrolyze accounts for the low yield. Its solns. in AcMe , EtOH and Et_2O have a blue fluorescence; its soln. in concd. H_2SO_4 gives an intense green color with $\text{K}_2\text{Cr}_2\text{O}_7$. C. C. D.

Behavior of dixanthylene on heating. F. ARNDT AND L. LORENZ. *Ber.* **61B**, 869(1928).—In the paper (C. A. **19**, 515) commented on by Schönberg and Schütz (C. A. **22**, 1974) dixanthylene was not "described" but merely compared with the intensely colored dipyrlylene; in such a comparison it may well be spoken of as "almost perfectly colorless." The observations of A. and his coworkers on the color of the compd. and its solns. at room and high temps. are given by Lorenz, *Diss. Breslau*, 1927. C. A. R.

2,3- and 2,5-Diaminopyridine. A. E. CHICHIBABIN AND A. V. KIRSANOV. *J. Russ. Phys.-Chem. Soc.* **59**, 405–18(1927).—2,5-(H_2N) $_2\text{C}_5\text{H}_4\text{N}$ prepd. by the reduction of 2,3- $\text{C}_5\text{H}_3\text{N}(\text{NH}_2)\text{NO}_2$ with Sn and HCl , is stable towards air and light, possibly because of the absence of impurities catalyzing oxidation. When treated with HNO_2 , the 3- NH_2 group is diazotized first, and the resulting 2,3- $\text{C}_5\text{H}_3\text{N}(\text{NH}_2)\text{Cl}$ is identical with the chlorination product of 2- $\text{H}_2\text{NC}_5\text{H}_4\text{N}$. In the prepn. of 2,3-(H_2N) $_2\text{C}_5\text{H}_4\text{N}$ from the nitro compd., the Cl deriv. of the former also results; it is less sol. in H_2O , m. $131\text{--}2^\circ$ and must have the Cl in the 2 or the 4 position since the 3-Cl deriv. (obtained by the action of Sn and HCl on 2,3,5- $\text{C}_5\text{H}_3\text{N}(\text{NH}_2)(\text{NO}_2)\text{Cl}$) m. $164.5\text{--}165^\circ$. $\text{Cl}_2(\text{H}_2\text{N})_2\text{C}_5\text{H}_3\text{N}$, m. $165\text{--}6^\circ$, also is formed with the Cl atoms in positions 6,5 or 5,4. Pt prevents the formation of Cl compds. but reduces the yield of 2,3-(H_2N) $_2\text{C}_5\text{H}_4\text{N}$. While 2,5-(H_2N) $_2\text{C}_5\text{H}_4\text{N}$ does not behave like *p*-(H_2N) $_2\text{C}_6\text{H}_4$, 2,3-(H_2N) $_2\text{C}_5\text{H}_4\text{N}$ forms bicyclic compds. similar to those of *o*-(H_2N) $_2\text{C}_6\text{H}_4$. The reduction of 2,5- $\text{C}_5\text{H}_3\text{N}(\text{NH}_2)\text{NO}_2$ is accelerated by small quantities of PtCl_4 ; the yield is little changed. To a soln. of 112 g. of the compd. in 1 l. of HCl (d. 1.19), 381 g. Sn is added at once and the mixt. shaken continuously for 0.5 hr., warmed to 60° on a water bath until no more heat is evolved, heated on the water bath for 2 hrs. and refluxed to complete soln. of Sn (about 6 hrs.). $\text{C}_5\text{H}_7\text{N}_3\text{H}_2\text{SnCl}_4$ seps. on cooling and is recrystd. from hot 20% HCl (yield 85%); it begins to decomp. 190° , m. 208° . A 96% yield of $\text{C}_5\text{H}_7\text{N}_3\text{H}_2\text{SnCl}_4$ results on treating the chlorostannite with H_2S and is recrystd. from hot 80% EtOH . Aq. solns. are colored purple on the addn. of FeCl_3 , in the absence of H_2S or an excess of HCl . 2,5-(H_2N) $_2\text{C}_5\text{H}_4\text{N}$ is obtained by treating the HCl salt with NaOH in H_2O and extg. with PhH and Et_2O . Its aq. soln. undergoes rapid oxidation; recrystd. from hot PhH , it changes slightly after a month in contact with air. The Ac_2O compd. recrystd. from boiling water m. $289\text{--}90^\circ$ (uncor.). To a soln. of 3.2 g. of the pyridine in 25 cc. *N* HCl , at 0° , was added during 10 min. 6.1 cc. of 10% NaNO_2 ; the color changed from red to light yellow during the reaction; 3.6 g. of CuCl and 10 cc. H_2O were added next. When the evolution of N_2 ceased, the mixt. was heated on the water bath and made alk. with NaOH . The 2,5- $\text{C}_5\text{H}_3\text{N}(\text{NH}_2)\text{Cl}$ was steam-distd., crystd. by satg. the distillate with KOH and recrystd. from hot PhH (m. $134\text{--}5^\circ$; yield 0.6 g.). 2,5- $\text{C}_5\text{H}_3\text{N}(\text{NH}_2)\text{I}$ was prepd. by diazotization in 2 *N* H_2SO_4 at -4° and subsequent addn. of KI . The mixt. was slowly heated to boiling, neutralized upon cooling with KOH and extd. with Et_2O . The crude product (70% yield) was steam-distd. and recrystd. from hot PhH (m. 128.5°). To obtain the 5- NaO_2As compd. 4.55 g. of the HCl salt was diazotized in dil. HCl at 0° and 2 *N* NaOH (25 cc.) and 18.75 cc. 2 *N*

Na_2HAsO_3 added. The mixt. was heated to boiling, filtered on cooling and evapd., the residue extd. with boiling 90% EtOH. The salt crystd. with 6 mols. H_2O , dissolved easily in H_2O , less readily in EtOH, not at all in Et_2O and PhH. $\text{C}_6\text{H}_7\text{N}_2\text{AsO}_3$ results on the addn. of HCl in water, it m. $137-40^\circ$ on rapid heating, $124-40^\circ$ when heated slowly. The aq. solus. have an acid reaction and form salts (blue ppt. with Cu^{++} , brown with Fe^{+++} , white with Ag^+). 2,3- $(\text{H}_2\text{N})_2\text{C}_6\text{H}_3\text{N}$ (I) was prepd. by adding to 7.5 g. 2,3- $\text{C}_6\text{H}_3\text{N}(\text{NH}_2)\text{NO}_2$ 100 cc. HCl (d. 1.19) and 25.7 g. Sn. The mixt. was refluxed with cooling when necessary) for 2 hrs., 50 cc. more of HCl added, the mixt. boiled to complete soln. and evapd. The residue was dissolved in 50 cc. hot H_2O and 75 g. NaOH in 150 cc. of soln. slowly added. The mixt. was now extd. with Et_2O , the exts. dried over KOH and the solvent distd. off. The residue was extd. with 5-10 cc. water; the insol. portion was twice recrystd. from hot water. It consisted of the Cl deriv. (see above) m. $132-3^\circ$ (yield 1.5 g.). The sol. portion was satd. with KOH and the ppt. (I) recrystd. twice from hot PhH. Yield 3 g., m. $112-3^\circ$. Neutral and slightly acid solns. are colored red on the addn. of FeCl_3 , the color being discharged by H_2S . I can be distd. *in vacuo* without decompn.; it changes slightly on a week's contact with air. To 0.22 g. of I in 20 cc. 0.25 N H_2SO_4 was slowly added 20 cc. 0.1 N KNO_3 . After 1 hr., 2 g. NaCl was added, the soln. evapd. and the residue extd. with boiling Et_2O . After recrystn. from H_2O , 0.11 g. of 2,3-aziminopyridine, m. 195° (decompn.), sol. in H_2O , alkalies and Na_2CO_3 , insol. in dil. acids, was obtained. The compd. is thus more acid than aziminobenzene, whose *p*-Br deriv. is decompd. by CO_2 in NaOH soln. Refluxing with Ac_2O yields the anhydride base (II), which was distd. *in vacuo* and re-

crystd. from PhH (m. $189.5-190.5^\circ$; yield 0.3 g. from 1.09 g. of the pyridine). Heating with Bz_2 results in III. When recrystd. thrice from 75% EtOH, III m. $136-8^\circ$; yield 1.5 g. from 1.09 g. of I. A red color develops on the addn. of concd. H_2SO_4 , yellow with HCl and HNO_3 . The color is discharged on diln. III is easily sol. in dil. acids being liberated unchanged on the addn. of alkali. The condensation of 0.31 g. of I with phenanthrenequinone in the presence of AcOH yields 0.56 g. of IV, m. $217-8^\circ$ (uncor.) and sparingly sol. in H_2O , etc. Strong mineral acids form salts easily decompd. by H_2O . $\text{Cl}(\text{H}_2\text{N})_2\text{C}_6\text{H}_3\text{N}$ (V), from 2,3- $\text{C}_6\text{H}_3\text{N}(\text{NH}_2)\text{NO}_2$, is easily sol. in EtOH, hot H_2O and PhH and in acids. It does not distil on heating. A soln. of 0.14 g. of V in 10 cc. 0.25 N H_2SO_4 was treated with 10 cc. 0.1 N KNO_3 and allowed to stand for a day. The cryst. ppt. of the azimino deriv. ($\text{C}_6\text{H}_3\text{N}_4\text{Cl}$) recrystd. from hot H_2O m. $271-2^\circ$ (uncor.) (darkens at 195°). Yield 0.06 g.; easily sol. in alkali solns. and Na_2CO_3 . When heated with 2.5 g. Ac_2O , 0.5 g. of V is converted into the anhydro base $\text{C}_7\text{H}_5\text{N}_3\text{Cl}$. When recrystd. twice from EtOH, the product melted at $176-7^\circ$, the yield being 0.48 g.; it is sol. in alkali solns., and the free base seps. on the addn. of acids. The condensation of 0.14 g. of V with phenanthrenequinone in hot AcOH results in 0.29 g. $\text{C}_{19}\text{H}_{10}\text{N}_4\text{Cl}$, sol. in strong mineral acids, the colored salts being decompd. by water. To 3.2 g. 2,3,5- $\text{C}_6\text{H}_3\text{N}(\text{NH}_2)(\text{NO}_2)\text{Cl}$ were added 37 cc. of HCl (d. 1.19) and (upon soln.) 8.8 g. Sn, the mixt. being refluxed until the Sn was dissolved and then evapd. to dryness. The residue was extd. with 20 cc. hot H_2O and neutralized with 50% NaOH (40 cc.). The ppt. was extd. with Et_2O , dried over KOH and recrystd. from H_2O and PhH 4 times. $\text{Cl}_2(\text{H}_2\text{N})_2\text{C}_6\text{H}_3\text{N}$ was obtained m. $155-6^\circ$, easily sol. in hot H_2O , PhH and mineral acids. $\text{Cl}(\text{H}_2\text{N})_2\text{C}_6\text{H}_3\text{N}$ was recovered from the residual liquors (0.15 g.). To 0.11 g. of the Cl_2 compd. in 5 cc. AcOH was added 0.14 g. phenanthrenequinone in 15 cc. AcOH; 0.19 g. of $\text{C}_{19}\text{H}_{10}\text{N}_4\text{Cl}_2$, m. $252-4^\circ$ (uncor.) (decompn.), resulted. It forms brown solns. in mineral acids and is repptd. on diln. 2,3,5- $\text{C}_6\text{H}_3\text{N}(\text{NH}_2)_2\text{Cl}$, m. $164.5-5^\circ$, is easily sol. in hot H_2O and PhH as well as mineral acids. B. C. S.

Doebner's reaction. A. CREMONINI. *Gazz. chim. ital.* **58**, 127-30(1928).—Earlier researches by various investigators have shown that the yield of cinchoninic

acid by the condensation of a primary aromatic amine with BzH and AcCO_2H varies greatly with the type of amine. To throw further light on the relation between the yield and the nature of the amine, an aminoazo deriv. was chosen, *viz.*, *p*-aminoazobenzene (I). The method of Simon (*Compt. rend.* 144, 138, 1275; *Ann. chim. phys.* [8], 13, 361) was chosen in preference to that of Doebner for the synthesis. I was therefore first converted to benzyldeneaminoazobenzene (II) (cf. *Ann.* 329, 221). II (28.5 g.) in 95% EtOH (250 cc.) refluxed 6 hrs. with AcCO_2H (8.8 g.), filtered, washed with EtOH, extd. with NH_4OH , the ext. concd., a slight excess dil. AcOH added, and the ppt. purified by resolu. in NH_4OH and pptn. by dil. AcOH, yields 1 g. (3%) of α -phenyl-4-benzeneazocinchoninic acid (III), red-yellow, m. 248° (decompn.), with mineral acids is an indicator of similar behavior to Me orange; its solns. in aq. alk. hydroxides and carbonates and in NH_4OH are ruby-red and become violet-red when greatly dild. with water. Addn. of a mineral acid to its dil. alk. solns. turns them to a violet-red color, which again becomes yellow when made alk. The violet-red color results from the formation of salts, and if dil. HCl is added to concd. alk. solns. of III, a ppt. of the *HCl* salt of III, $\text{C}_{22}\text{H}_{15}\text{O}_2\text{N}_3 \cdot \text{HCl} \cdot 1.5\text{H}_2\text{O}$, is formed, red, m. 210° ; its solns. in aq. alkalies are yellow. It was not proved whether the change of color involved a change of constitution or was merely simple halochromism. The chief product of the reaction between II and AcCO_2H is the part insol. in NH_4OH . Washed with water, dried, and crystd. from PhMe, it yields the *compd.* $\text{C}_{24}\text{H}_{26}\text{ON}_2$, dark yellow, m. 238° , formed by a reaction corresponding to the pyrrolidine condensation of Borsche (*C. A.* 3, 433; 4, 319). In a similar way 1-aminonaphthalene-4-azo- α -naphthalene (IV) and 2-amino-naphthalene-1-azobenzene (V) were condensed with BzH and AcCO_2H . From IV was obtained 0.75% of the *compd.* $\text{C}_{28}\text{H}_{19}\text{O}_2\text{N}_3$, chestnut color, m. 238° , has acid properties, probably α -naphthaleneazocinaphtho- α -phenylcinchoninic acid. From V was obtained the *compd.* $\text{C}_{26}\text{H}_{19}\text{N}_3$, light red, m. 197° ; its compn. suggests a styrylphenyl-naphthotriazine. It was not studied further.

C. C. DAVIS

The Doebner reaction. VI. R. CIUSA AND A. CREMONINI. *Gazz. chim. ital.* 58, 153-9 (1928); cf. C. and Barattini, *C. A.* 17, 1478; 20, 2331.—Earlier researches have shown that β - $\text{C}_{11}\text{H}_7\text{NHCH}_2\text{Ph}$ (I) is formed as a by-product of the Doebner reaction with β - $\text{C}_{10}\text{H}_7\text{NH}_2$, AcCO_2H and BzH (cf. C. and Zerbini, *C. A.* 15, 2285; C., *C. A.* 17, 1478), but a study of some of its reactions was reserved for the present paper. I refluxed with BzCl until HCl is no longer evolved, Na_2CO_3 added, the solid mass dissolved in EtOH, purified with animal charcoal and the boiling soln. allowed to crystallize, yields the Bz deriv. of I, m. 115° . A mixt. of boiling concd. alc. I and picric acid allowed to cool ppts. the *picrate* of I, golden yellow, m. $140-1^\circ$. Concd. HCl added to hot alc. I ppts. on cooling the *HCl* salt of I, m. 219° . Aq. NaNO_3 (3 g.) added slowly to I (5 g.), concd. H_2SO_4 (1.5 g.) and EtOH (60 cc.), and the product purified repeatedly with EtOH and animal charcoal, yields the *NO* deriv. of I (II), m. $111-2^\circ$, gives a striking Liebermann reaction. II (4 g.) in EtOH heated 3-4 hrs. with Zn dust (6 g.) and glacial AcOH (14 g.) until the Liebermann reaction is negative, cooled, filtered, made strongly alk., extd. with Et₂O, evapd., excess concd. HCl added, filtered, the residue washed with concd. HCl, and recrystd. from dil. HCl, yields benzyl- β -naphthylhydrazine-HCl (III), m. 177° . Excess AcONa added to aq. III, then NaCl, the ppt. dissolved in boiling EtOH and recrystd. by diln. with water, yields benzyl- β -naphthylhydrazine, $\text{C}_{10}\text{H}_7\text{N}(\text{CH}_2\text{Ph})\text{NH}_2$ (IV), rose-colored, m. 79° ; in EtOH it reduces energetically Fehling reagent and $\text{NH}_3\text{-AgNO}_3$. IV is also readily formed from III by the aid of 10% KOH. Aq. Na picrate added to aq. III and the product recrystd. from dil. EtOH yields the *picrate* of IV, yellow, m. 152. IV reacts easily with aldehydes and ketones, forming the corresponding hydrazones. The AcMe deriv. was prepd. from aq. III and AcONa, the other derivs. directly from the AcOH liquor obtained by the reduction of II with Zn after sepn. of the $\text{Zn}(\text{OAc})_2$. There were thus prepd. the following *hydrazone* derivs. of IV, the data giving the deriv., its color, the solvent used in its purification and its m. p. resp.: *AcMe*, pale red, EtOH, 104° ; *BzII*, yellowish, EtOH, 178° ; *o*- $\text{O}_2\text{NC}_6\text{H}_4\text{CHO}$, vermilion, glacial AcOH, 137° ; *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{CHO}$, orange-red, glacial AcOH, 160° ; *m*- $\text{O}_2\text{NC}_6\text{H}_4\text{CHO}$, yellow, glacial AcOH, 168° ; vanillin, white, glacial AcOH, 170° ; *p*-peronal, white, glacial AcOH, 156° ; *anisaldehyde*, white, glacial AcOH, 150° ; *cinnamic aldehyde*, yellow, glacial AcOH, 214° . I (0.5 g.) in EtOH added below 10° to PhN:Cl (from 2 g. of PhNH₂) in water, the ppt. washed with a min. of EtOH, and recrystd. from EtOH and then from glacial AcOH, yields 2-benzylaminonaphthalene-1-azobenzene α,β - $\text{C}_{10}\text{H}_8(\text{N:NPh})\text{NHCH}_2\text{Ph}$ (V), vermilion with green reflection, m. $138-9^\circ$. Concd. H_2SO_4 (10 g.) and subsequently I (23.5 g.) in EtOH and NaOH (4 g.) added very slowly to a soln. prepd. by adding NaNO_2 (7 g.) in water to sulfanilic acid (17.3 g.) in 10% NaOH (40 cc.) with addn. of ice (200 g.), and the ppt. recrystd. from

dil. AcMe, yield Na 2-benzylaminonaphthalene-1-azobenzene-*p*-sulfonate, β , α -C₁₀H₈(NHCH₂Ph)(N.NC₆H₄SO₃Na) 3.5H₂O, red, dyes wool an orange-red color. I (10 g.) in EtOH added to a soln. prepd. from *p*-O₂NC₆H₄NH₂ (6 g.), NaNO₂ (4 g.) and concd. HCl (14 g.), the ppt. washed with EtOH, and recrystd. from AcMe, yields 2-benzylaminonaphthalene-1-azo-*p*-nitrobenzene, violet-black, with golden reflection, m. 199°. In the same way was obtained 2-benzylaminonaphthalene-1-azo-*o*-nitrobenzene, violet, with bronze reflection, m. 165°. Similarly from I (10 g.) in boiling EtOH and α -C₁₀H₇NH₂ (6.14 g.), crystg. from EtOH, was obtained 2-benzylaminonaphthalene-1-azo- α -naphthalene, violet, with golden reflection, m. 168°. These derivs. are to be studied further.

C. C. DAVIS

Formation of asymmetric $\alpha\beta$ - $\alpha'\beta'$ -dinaphthazine. I. M. KARIAKIN AND V. A. LENKHOLOD. *J. Chem. Industry (Moscow)* **4**, 996(1927).—On heating α -C₁₀H₇NH₂ with cast-Fe turnings to 300–400° the surface of the latter becomes covered with yellow needle-like fluffy crystals of *asym*- $\alpha\beta$ - $\alpha'\beta'$ -dinaphthazine. The reaction is analogous to that of the formation of phenazine on heating aniline in an Fe tube. The yield, calcd. on the C₁₀H₇NH₂ used up, is 3%. The product, recrystd. 3 times from benzene, m. sharply 284.6°. Water formed in the reaction decomp. part of C₁₀H₇NH₂ into naphthol and NH₃. On heating 7.7 g. of previously calcined sand with 1 g. C₁₀H₇NH₂ and 0.5 g. K₂Cr₂O₇ in a glass flask, dinaphthazine was obtained in 2% yield calcd on the amount of C₁₀H₇NH₂ used up.

BERNARD NELSON

Bivalent triazenes. HANS KLEINFELLER. *J. prakt. Chem.* **119**, 61–73(1928).—EtMgBr (from 13.3 g. EtBr) and 8 g. *m*-C₆H₄(N₃)₂ in a freezing mixt. give 6.4 g. *bis*-[ethyltriazeno-1,3]-benzene, yellow, m. 104°; explodes on rapid heating, decomp. in cold AcOH with vigorous evolution of N. *Bis*[phenyltriazeno-1,3]-benzene, yellow, m. 161°; Ag compd., brownish powder, which explodes on heating; with PhCNO there results a urea, m. 230°; the N is practically quant. split off on heating with 20% H₂SO₄. *Bis*[phenyltriazeno]acetylene (I), m. 170° (Ag compd., citron-yellow; urea, C₂H₁₇N₇O, yellow, m. 197°), sep'd from the isomeric compd. C₄H₁₂N₆ (II), m. 156°, by the greater soly. of the latter in Et₂O; II is transformed into I by shaking the CHCl₃ soln. with concd. NH₄OH or 33% NaOH or more rapidly by warming an EtOH soln. with 33% NaOH. On heating to boiling with 20% H₂SO₄ there results 50% of a compd. C₈H₈N₄, m. 107°, which may be 2-phenyl-1,2-dihydro-1,2,3,4-tetrazine. II gives an analogous compd., m. 172°. *Bis*-[4-bromophenyltriazeno]-acetylene, brownish leaflets, m. 215°; Ag compd., brown powder, m. 153°; with Br it gives a yellow compd., C₄H₁₁N₆Br₂, which, crystd. from EtOH, gives the compd., C₄H₁₁N₆OBr₂, m. 204°; the Et₂O-sol. *by-product*, C₄H₁₀N₆Br₂, m. 198° (Br gives the compd. C₄H₁₁N₆Br₂, yellow, m. 176°; boiling with 96% EtOH gives the compd. C₄H₁₀N₆Br₂(OH), m. 186°). The action of *m*-C₆H₄(N₃)₂ upon BrMgC:CMgBr gives the compd. C₈H₈N₄, amorphous yellow product, which explodes on heating.

C. J. WEST

1,3,4-Oxidiazines. J. VAN ALPHEN. *Rec. trav. chim.* **47**, 673–82(1928).—On adding 3.5 g. (COCl₂)₂ in 15 cc. benzene to 3.5 g. PhNHNHAc and letting stand at room temp. for 2 hrs., Δ^1 -2-methyl-4-phenyl-5,6-diketo-1,3,4-oxidiazine, CO . O . CMe (I),

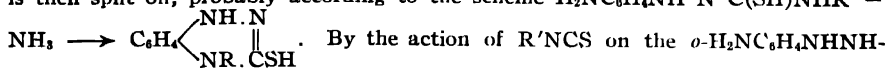

CO.NPh.N

m. 141°, is formed. On dissolving I in water an acid soln. is obtained which, however, does not contain any (CO₂H)₂; on keeping the soln. overnight (CO₂H)₂ is formed together with PhNHNHAc. On boiling alc. I with strong NH₄OH a ppt. of oxamide, m. 217°, is formed in a few min., with MeNH₂; with aniline (CONHPh)₂, m. 245°, with hydrazine (CONHNH₂)₂; and with PhNHNH₂ (CONHNHPh)₂. On evapg. a soln. of I in abs. alc. α -ethoxyoxalyl- β -acetylphenylhydrazine (II), m. 95°, is obtained. This substance was synthesized from EtO₂CCOCl and PhNHNHAc by boiling 6.8 g. of the ester chloride in 20 cc. benzene for 1 hr. with 7.5 g. of the hydrazine compound. In the same way in which I was prepared from PhNHNHAc Δ^2 -2,4-diphenyl-5,6-diketo-1,3,4-oxidiazine (III), m. 175°, was prep'd. from PhNHNHBz. III behaves in the same way as I when treated with water, aniline, PhNHNH₂ and alc., in the latter case α -ethoxyoxalyl- β -benzoylphenylhydrazine, m. 154° (IV), being formed. Again in the same way Δ^2 -2-diphenylmethyl-4-phenyl-5,6-diketo-1,3,4-oxidiazine (V), m. 167–8°, was prep'd. by means of PhNHNHCOCHPh₂. V has the same properties as I and III and, on boiling with absolute alc. yields α -ethoxyoxalyl- β -diphenylacetylphenylhydrazine (VI), m. 189°.

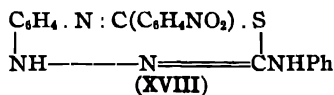

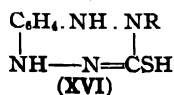

C. F. VAN DUIN

o-Aminophenylhydrazine and some interesting heterocyclic compounds derived from it. III. Lengthened *o*-derivatives of benzene and their ring closure. PRAFULLA CHANDRA GUHA AND TEJENDRANATH GHOSH. *Quart. J. Indian Chem. Soc.* **4**, 561–72(1927); cf. C. A. **21**, 2132.—*o*-O₂NC₆H₄NHNH₂ has been condensed with tolyl,

xylyl and allyl mustard oils to the 4-substituted-1-nitrophenylthiosemicarbazides I, II, III ($\text{O}_2\text{NC}_6\text{H}_4\text{NHNHCSNHR}$, $\text{R} = \text{MeC}_6\text{H}_4$, $\text{Me}_2\text{C}_6\text{H}_3$, and $\text{CH}_2\text{:CHCH}_3$, resp.). I and II on reduction with Sn and HCl give 2 compds. each, I yielding 1-aminophenyl-4-tolylthiosemicarbazide (IV) and 1-tolyl-2,3-benzo-6-thiol-1,4,5-triazine (V), and II the corresponding xylyl compds. (VI and VII). The triazine structure of V and VII follows from the fact that both are sol. in cold dil. alkali, give disulfides with I and insol. mercaptides with HgCl_2 . IV, VI and the corresponding Ph deriv. (VIII) give the triazines with Ac_2O and concd. HCl, showing conclusively that during reduction with Sn and HCl the NO_2 group in the corresponding NO_2 derivs. is first reduced to NH_2 and NH_2 is then split off, probably according to the scheme $\text{H}_2\text{NC}_6\text{H}_4\text{NH N C(SH)NHR} \rightarrow$

CSNHR are obtained compds. of the type $o\text{-R}'\text{NHCSC}_6\text{H}_4\text{NHNHCSNHR}$ (IX). 1-Tolylthiocarbamido-2-phenylthiosemicarbazidobenzene (X) (IX, $\text{R} = \text{Ph}$, $\text{R}' = \text{MeC}_6\text{H}_4$) with concd. HCl yields 2-tolylamino-4,5-benzo-8-thio-1,3,6,7-octathiotriazine (XI). VIII reacts readily with KOON and PhNCS to yield 1-carbamido-2-phenylthiosemicarbazidobenzene (XII) and the 1-phenylthiocarbamido analog (XIII), both of which on ring closure with cond. HCl or 20% KOH give the same 2,3-benzo-6-phenylamino-9-keto-1,4,5,7-octatetrazine (XIV), which is acidic in character (possibly because of the presence of the grouping $-\text{CO.NH}-$) and dissolves in NaOH to form a Na salt. With FeCl_3 the $\text{H}_2\text{NC}_6\text{H}_4\text{NHNHCSNHR}$ yield 3,4-benzo-1,2,5,6-thioheptatriazines (XV), and with $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$ 3,4-benzo-7-thiol-1,2,5,6-heptatetrazines (XVI), all of which give the characteristic reactions of a mercaptan. The *o*-nitrobenzal deriv. (XVII) of VIII with FeCl_3 gives 2-anilino-5,6-benzo-8-nitrophenyl-1,3,4,7-thiooctatriazine (XVIII). By a modification of the earlier method of reduction of the NO_2 compd. (10 g.) the yield of VIII.HCl has been increased to 3 g. instead of 1.5 g. and that of the thioltriazine from 0.4 g. to 1 g. The free VIII (0.5 g. from 1 g. of the HCl salt), brownish white, m. $102-3^\circ$. Thioltriazine, m. 151° ; disulfide, yellowish white, m. $175-6^\circ$. 1-*o*-Nitrophenyl-4-*p*-tolylthiosemicarbazide (I), obtained almost quant., m. 176° . IV, m. $252-3^\circ$ (decompn.), becomes reddish brown in the air. V, light yellow, m. 182° ; disulfide, m. $97-8^\circ$ (decompn.). 4-1,3,4-Xylyl homolog (II) of I (19 g. from 10 g. $\text{O}_2\text{NC}_6\text{H}_4\text{NHNH}_2$), m. 112° . VI, m. $255-6^\circ$ (decompn.). VII, m. $173-4^\circ$. 4-Allyl analog (III) of I, yellow, m. 160° , sol. in alkalies with bluish violet color; amino deriv., m. $247-8^\circ$ (decompn.). 1-Ph homolog (IX, $\text{R} = \text{R}' = \text{Ph}$) of X, m. above 290° , sol. in cold concd. alkali; yield, 2 g. from 2 g. VIII. X (2 g. from 2 g. VIII.HCl), does not m. 290° . 1-Xylyl homolog, does not m. 290° . 1-Allyl compd., does not m. 290° . 1-*p*-Tolylthiocarbamido-2-*p*-tolylthiosemicarbazidobenzene, m. $281-2^\circ$. XI, m. 200° , dissolves readily in cold dil. alkali. XII (0.8 g. from 1 g. VIII.HCl), brownish white, does not m. 290° . XIV (1.3 g. from 2 g. XII), brownish white, m. 145° . XIII, m. above 290° . 3,4-Benzo-7-phenylamino-1,2,5,6-thioheptatriazine (XV, $\text{R} = \text{Ph}$), isolated as the *HI* salt, red, m. 140° ; 7-*p*-tolyl homolog-*HI* salt, reddish brown, does not m. 290° . 1-Phenyl-3,4-benzo-7-thiol-1,2,5,6-heptatetrazine (XVI, $\text{R} = \text{Ph}$), m. $83-4^\circ$, sol. in cold dil. alkali, forms with I an amorphous yellow disulfide and with HgCl_2 a yellowish white mercaptide; 1-allyl analog, m. $81-2^\circ$. 1-Benzal deriv. of VIII (1.5 g. from 2 g. VIII), m. $168-9^\circ$. XVII (1.5 g. from 2 g. VIII), brownish white, m. 260° . XVIII.*HI* salt, brownish, m. $216-7^\circ$.

H. W. GIBSON

Correction (synthesis of evodiamine). Y. ASAHINA AND T. OHTA. *Ber.* 61B, 869(1928).—The attention of A. and O. has been called to the fact that *N*-methylisatoic anhydride, the starting material in their synthesis (*C. A.* 22, 1777) had already been described by Houben (*C. A.* 3, 2953).

C. A. R.

Constitution of thebenine. J. M. GULLAND AND C. J. VIRDEN. *J. Chem. Soc.* 1928, 921-34.—From stereochem. considerations and from the fact that thebenol (the product of exhaustive methylation of thebenine (I)) is converted into pyrene when distd. with Zn or reduced by HI and P, it seems probable that the side chain of I is in position 5;

the work here reported shows beyond doubt that this is actually the case. Schöpf and Borkowsky (*C. A.* **21**, 2698) explain the formation of I from codeinone by 1,4-addn. of H_2O to the conjugated system produced in an enolic form of codeinone, followed by the codeine-pseudocodeine transformation; 14-hydroxycodeine is quite unaffected by boiling HCl (d. 1.07, the strength used in the prepn. of I) and prolonged action of Ac_2O yields no tri-Ac deriv. of I but a mixt. of 2 bases, 1 m. 304° and the other amorphous, this seems to indicate that S.'s theory is improbable. The *Me ester*, m. $149-51^\circ$, of 3,4,8-trimethoxyphenanthrene-5-carboxylic acid (m. $236-7^\circ$) and $N_2H_4 \cdot H_2O$ in EtOH gives the *hydrazide*, m. 177° ; $NaNO_2$ and AcOH give the *azide*, decomps. 65° (heated slowly) but explodes at 80° if immersed in a bath at that temp. The Me_2CO filtrate from the prepn. of the acid gives *5-aldehyde-3,4,8-trimethoxyphenanthrene*, m. 151° ; *semicarbazone*, m. $243-6^\circ$ (decompn.); *oxime* (II), crystg. with 0.5 mol. C_6H_6 , m. 153° . With $AcONa$ and Ac_2O , II gives the *5-cyano deriv.*, pale brown, m. $145-6^\circ$ and a small quantity of a base, probably *3,8-dimethoxythebenidine*, orange, m. $229-30^\circ$; the dil. HCl soln. is orange-yellow and the base ppts. unchanged on addn. of alkali; HCl solns. exhibit a green, concd. H_2SO_4 , an intense emerald-green and $CHCl_3$ a blue fluorescence, *picrate*, orange, m. 255° (decompn.). The *lactone of 4-hydroxy-3,8-dimethoxyphenanthrene-5-carboxylic acid*, pale yellow, m. $246-7^\circ$, results from the above azide by heating at 65° , from the hydrazide and $MeNO_2$ or $AmNO_2$ in EtOH- HCl , from the nitrile and concd. HCl and AcOH or by satg. a $MeOH-C_6H_6$ soln. with HCl . *6-Methoxy-3-ethylbenzaldehyde*, b. $261-2^\circ$; *semicarbazone*, m. $226-7^\circ$. With hippuric acid this gives *5-keto-2-phenyl-4-[6'-methoxy-3'-ethylbenzylidene]-4,5-dihydrooxazole*, bright yellow, m. 159° ; hydrolysis gives $MeOC_6H_3EtCH_2COCO_2H$, whose *Na salt* crysts. with 0.5 H_2O . The *acid*, yellow, m. 185° , was analyzed as *3-hydroxy-2-[6'-methoxy-3'-ethylbenzyl]quinoxaline*, m. $184-5^\circ$. Oxidation with H_2O_2 gives *6-methoxy-3-ethylphenylacetic acid*, m. $68-9^\circ$. Condensation with 2-nitroveratraldehyde gives a mixt. of *trans- α -[6'-methoxy-3'-ethylphenyl]-2-nitro-3,4-dimethoxycinnamic acid* (III), pale lemon-yellow, m. $193-4^\circ$, and *trans-2-nitro-3,4-dimethoxycinnamic acid*, m. 229° (*amino deriv.*, m. $173-8^\circ$ (decompn.)); HCl salt, m. 253° (decompn.); Ac_2O and H_2SO_4 give *7,8-dimethoxycarbostryl*, m. $166-8^\circ$. Reduction of III gives the *2-NH₂ deriv.*, lemon-yellow, m. $151-2^\circ$; with $NaNO_2$ this yields *3,4,8-trimethoxy-5-ethylphenanthrene-9-carboxylic acid*, m. 207° ; elimination of CO_2 from this acid or reduction of 3,4,8-trimethoxy-5-vinylphenanthrene from thebaine gives *3,4,8-trimethoxy-5-ethylphenanthrene*, m. $112-3^\circ$; in the 1st method of prepn. there also results a yellow compd., m. 165° , which may be the *lactone of 8-hydroxy-3,4-dimethoxy-5-ethylphenanthrene-9-carboxylic acid*.

C. J. WIST

Porphyryn syntheses. XIII. Synthesis of porphinmonocarboxylic acids and several of their complex salts. H. FISCHER, H. GROSSEFINGER and G. STANGLER. *Ann.* **461**, 221-44(1928), cf. *C. A.* **22**, 1362.—Heating $\dot{I}tC \cdot Me : CBr \cdot NH \cdot CCH \cdot$

$C \cdot N : CBr \cdot CMe : CEt$ (I) and $MeC \cdot C(CH_2CH_2CO_2H) \cdot CMe : NC : CHC \cdot NH \cdot CMe \cdot CEt \cdot C$

Me (II) with $AcOH \cdot HBr$ gives only about 11% of an impure ester; heating an equimol amt. with $CH_2(CO_2H)_2$ gives 25%, while 3.5 g. of the mixt. of I and II with 7 g. $CH_2(CO_2H)_2$ and 15 cc. concd. HBr , followed by esterification, give 35% of the *ester* (III), $C_{34}H_{40}N_4O_2$, brownish red with bluish black luster, m. 216° (cor.), of *1,4,6,7-tetramethyl-2,3,8-triethyl-5-propionic acid porphin* (IV), $C_{38}H_{48}O_2N_4$, asbestos-like needles; the HCl salt crysts. from 20% HCl as red prisms; *Cu salt*, light red, m. 280° , from IV and $Cu(OAc)_2$ in $AcOH$. Heating III with $Fe(OAc)_2$ and a little $NaCl$ in $AcOH$ gives the *hemin* of III, brown rhombs with 1 $AcOH$, which is lost at 110° . $MeMgI$ and III give the *phyllin* of III, brown tablets with bluish violet luster; this is completely decompd. by 15% HCl ; the spectra in Et_2O are given. The *Cu salt* of III forms light red needles. *Me 1,4,5,8-tetramethyl-3,6,7-triethylporphin-2-propionate*, needles, m. 263° , results in 20% yield from 0.6 g. [2-bromomethyl-3-ethyl-4-methylpyrryl]-[2-bromomethyl-4-methyl-3-propionic acid pyrrolenyl] methylene- HBr and 0.57 g. bis-[2-bromo-3-ethyl-4-methylpyrryl]methene- HBr (V), with 5 g. $CH_2(CO_2H)_2$ 1 hr. at 200° , followed by esterification; *Fe salt*, m. above 270° . [2,4-Dimethyl-3-ethylpyrryl]-*Me 2,3-dimethyl-4-propionate pyrrolenyl*methene- HBr , red, m. 180° , in 0.3 g. yield from 0.18 g. *Me hemopyrrolecarboxylate* and 0.15 g. cryptopyrrolaldehyde in 2 cc. $MeOH$ and 0.5 cc. HBr ; with Br in $AcOH$ this gives the *di-[2-bromomethyl] deriv.* (VI), dark red, decomps. 225° . VI (0.27 g.), 0.24 g. V and 2 g. $CH_2(CO_2H)_2$, heated 1 hr. at 200° , and the product transformed into the ester, give 30% of *Me 1,3,5,8-tetramethyl-2,6,7-triethylporphin-4-propionate*, needles, m. 220° ; this also results from VI and bis-[2-bromo-3-methyl-4-ethyl-5-pyrryl]methene- HBr ; *Fe salt*, dark, glistening needles,

m. 263°; *phyllin*, m. 200°. Cryptopyrrolecarboxylic acid (0.5 g.) and 0.45 g. hemopyrrolaldehyde give 0.8 g. [2,4-dimethyl-3-propionic acid pyrrol]-[2,3-dimethyl-4-ethylpyrrolenyl]methene-HBr, reddish yellow, decompd. 176°; Br in AcOH gives the di-[2-bromomethyl] deriv. (VII), red needles. VII (0.27 g.), 0.24 g. V and 2 g. $\text{CH}_2(\text{CO}_2\text{H})_2$, heated at 200° for 0.5 hr. and the product esterified, gives 37% of *Me* 1,3,5,8-tetramethyl-2,4,7-triethylporphin-6-propionate, m. 238° (cor.); *Fe* complex, dark glistening needles, m. 258°. [*Me* 2,3-dimethyl-4-propionate pyrrol]-[2,3-dimethyl-4-ethylpyrrolenyl]methene-IBr, prisms with green surface luster, m. 185°; di-[2-bromomethyl] deriv., red prisms; with V this gives 20% of *Me* 1,4,6,7-tetramethyl-3,5,8-triethylporphin-2-propionate, m. 214°; *Fe* salt, dark prisms, m. 254°. A thorough comparison of phylloporphyrin, pyrrorporphyrin and III shows that they are not identical. XV. Synthesis of β,β' -substituted pyrroles and porphyrin syntheses from simple pyrroles. H. FISCHER, E. STURM and II. FRIEDRICH. *Ibid* 244-77.—F. and Wiedemann (C. A. 20, 3455) have shown that β -methyl- β' -carbethoxypyrrole does not yield porphyrins. The same is true of β -methyl- β' -acetylpyrrole (VIII). The condensation of 8.4 g. aminoacetone and 12.5 g. oxalacetone according to Piloty (C. A. 7, 1193) gives 1.5-2 g. β -methyl- β' -acetylpyrrole- α' -carboxylic acid (IX) (*Me* ester, m. 100°), 0.5-1.0 g. of the *Et* ester of X, m. 124°, and 0.8-1.0 g. of the isomeric acid (probably 2,4-dimethylpyrrole-3-glyoxylic acid) (X). IX or its ester and PhNHNH_2 in 60% AcOH give β -methylpyrrole-1-phenyl-3-methyl-6-keto-1,6-dihydropyridazine, yellow, m. 297° (cor.). IX and $\text{N}_7\text{H}_4 \cdot \text{H}_2\text{O}$ with EtONa, heated 6 hrs. at 180°, give only a little opsoyrrole, the principal product being a compd., $\text{C}_8\text{H}_5\text{ON}_3$, sublimes above 400°. Heating IX in 10% NaOH at 140° for 2 hrs. gives 60-70% of VIII, m. 117°. VIII condenses with Me_2CO , AcH and HCHO but the products show no porphyrin spectra and were not further investigated. Reduction of VIII with $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$ and EtONa by heating 8 hrs. at 160-80° gives 70% of β -methyl- β' -ethylpyrrole (XI). Removal of CO_2 from X gives a compd. $\text{C}_7\text{H}_5\text{ON}$, m. 88-9°, which may be a dimethylpyrrolaldehyde; reduction gives 70% of an oil, $\text{C}_7\text{H}_{11}\text{N}$, b_{D}^{20} 74-5°, termed *iso-opsoyrrole*; $\text{HO}_3\text{SC}_6\text{H}_4\text{N}_3\text{X}$ gives a yellow azo dye, $\text{C}_{15}\text{H}_{11}\text{O}_3\text{N}_5\text{S}$, m. 240-50°; attempts to form porphyrins failed. XI and HCO_2H 1 hr. at 160° give etiopyrphyrin. XI, condensed with an excess HCO_2H , gives opso-pyrrolemethene-IBr, $\text{C}_{15}\text{H}_{21}\text{N}_7\text{Br}$, which yields a di-Br deriv., m. 175-6°, identical with the product from hemocarbethoxypyrrole. 2,5-Dimethyl-3-carbethoxypyrrole (6 g.) and 24.5 g. SO_2Cl_2 in 175 cc. Et_2O give 30-5% of 2,5-diformyl-4-chloro-3-carbethoxypyrrole, m. 131°; from the free acid, there results 38% of the acid, decomp. 237°. 2,4-Dimethyl-3,5-dicarbethoxypyrrole (15 g.) and 51 g. SO_2Cl_2 in 250 cc. Et_2O give 86% of 2,4-di[trichloromethyl]-3,5-dicarbethoxypyrrole (XII), m. 72°, monoclinic, prismatic, $a:b:c = 1.4041:1.16005$; β 111° 20'; other crystallographic data are given; this is decompd. by KOH (2:3) at 60-70°. Oxidation of XII with $\text{CrO}_3\text{-AcOH}$, cold HNO_3 or concd. H_2SO_4 gives a pentachlorohydroxypyrrole, m. 110°, while reduction with Zn and AcOH gives 70% of 2-hydroxymethyl-4-methyl-3,5-dicarbethoxypyrrole, m. 116°. Two mols. SO_2Cl_2 (1.6 g.) and 1 g. 2,4-dimethyl-3-carbethoxypyrrole give 23-4% of [2,4-dimethyl-3-carbethoxypyrrol]-[3-carbethoxy-4-methyl-5-chloropyrrol]methene-HCl, red, m. 143°. 2,4-Dimethyl-3-carbethoxypyrrole Ph 5-sulfide, rose, m. 111°, in nearly quant. yield from the pyrrole and PhSCl in Et_2O ; 2,4-dimethyl-5-carbethoxypyrrole Ph 3-sulfide, m. 157°; 2,5-dimethyl-3-carbethoxypyrrole Ph 4-sulfide, m. 134°. The action of 2 mols. SO_2Cl_2 upon 2-methyl-3-ethyl-4-methyl-5-carbethoxypyrrole gives the 2-chloromethyl deriv., m. 130° (cor.); heating with H_2O splits off HCHO and gives bis-[3-ethyl-4-methyl-5-carbethoxypyrrol]methane. Boiling the product of the action of 3 mols. SO_2Cl_2 with H_2O gives a mixt. of 4-methyl-3-ethyl-5-carbethoxypyrrole-2-carboxylic acid (XIII), m. 211°, and 2-formyl-3-ethyl-4-methyl-5-carbethoxypyrrole (XIV); the use of 2.5 mols. SO_2Cl_2 gives about equal quantities of the 2 products, while 4 mols. give 70% of XIII. XIII, Ac_2O and AcONa give the pyrocoll of XIII, $\text{C}_{22}\text{H}_{22}\text{N}_4\text{O}_6$, pale yellow, m. 150° (cor.). Heating XIII at 215-20° gives opso-carbethoxypyrrole (XV), b_{D}^{20} 135-45°, m. 25°; with HCN and HCl this gives XVI. The oxime of XVI, heated with Ac_2O and AcONa, gives the nitrile, $\text{C}_{11}\text{H}_{11}\text{O}_2\text{N}_3$, m. 131°. Sapon. of XIV gives the free acid (XVI), m. 199° (cor.); the dicarboxylic acid, $\text{C}_9\text{H}_{11}\text{O}_4\text{N}$, m. 222° (cor.). XIII and Br in AcOH give the 2-Br deriv., m. 103° (cor.), CO_2 being split off (62% yield); this also results from XV and Br. Methene-HBr derivs. were formed from XIV and cryptopyrrole, m. 160° (decompn.); Me hemopyrrolecarboxylate, m. 168° (decompn.); and cryptopyrrolecarboxylic acid, m. 197° (decompn.); 80-90% yields. No porphyrin is formed on heating cryptopyrrole or a mixt. of this with the corresponding acid with HBr-AcOH; with HCO_2H and HClO₄, there results cryptopyrrolemethene. A porphyrin does result from Et cryptopyrroleglyoxylate or bromocarbethoxycryptopyrrole and HBr-AcOH. 2-Bromomethyl-4-methyl-5-carbethoxypyrrole-3-propionic acid and HBr-

AcOH, heated 2 hrs. at 180°, give, after esterification, a mixt. of tetra-Me coproporphyrin and isocoproporphyrin, m. 239°; the corresponding 2-Me deriv. also gives a porphyrin with HBr-AcOH. XVI. Synthesis of porphyrins with nitrile functions. H. FISCHER AND HANS WESENEGGER. *Ibid* 277-95.—2-Bromomethyl-3-[ω -cyano- ω -carbethoxy]-ethyl-4-methyl-5-carbethoxypyrrrole, m. 129°; warming with MeOH gives the 2-methoxymethyl deriv., m. 113°; EtO deriv., m. 123°; anilino deriv., m. 138°. Warming the Br deriv. with H₂O for 6 hrs. gives nearly quant. bis-[2-carbethoxy-3-methyl-4-(ω -cyano- ω -carbethoxy)-ethylpyrrol]-5-methane (XVIa), m. 172°; Br deriv., m. 131° (40% yield). Sapon. with 10% NaOH gives the free acid corresponding to XVIa, m. 220°; upon melting, there results a poor yield of bis-[2-carbethoxy-3-methyl-4-propionitrile-pyrrol]-5-methane (XXII), m. 194°. 2-Bromomethyl-3-propionitrile-4-methyl-5-carbethoxypyrrrole, m. 185°; 2-MeO deriv., m. 140°; 2-EtO deriv., m. 113°; 2-anilino deriv., m. 188°; heating with H₂O 8 hrs. gives XVII. Sapon. of XVIa with EtOH-HCl gives bis-[di-Et 3- β -methylmalonate-4-methyl-5-carbethoxypyrryl]-2-methane, m. 126°. Sapon. of XVII with NaOH gives a mixt. of bis-[3-propionic acid-4-methyl-3-carbethoxypyrryl]-5-methane and the free acid. Bromination of 2,4-dimethyl-3-[ω -cyano- ω -carbethoxy]vinyl-5-carbethoxypyrrrole gives a sticky mass; the 2-MeO deriv., m. 101°; the 2-EtO deriv., m. 120°; AcOH-HBr and the EtO compd. give the 2-bromomethyl deriv., m. 135°. 2,4-Dimethyl-3-formylpyrrole-5-carboxylic acid and NCCH₂CO₂Et are condensed by PhNH₂ in EtOH, giving 2,4-dimethyl-3-[ω -cyano- ω -carbethoxy]vinylpyrrole-5-carboxylic acid, m. 242°; the pyrocoll, C₂₂H₂₄O₆N₄, m. 276°. 2,4-Dimethyl-3-[ω -cyano- ω -carboxyl]vinylpyrrole, yellow, m. 210°, by sapon. of the Et ester; with HCN the Et ester (XVIII) gives 2,4-dimethyl-3-[ω -cyano- ω -carbethoxy]vinyl-5-formylpyrrole, m. 200°; oxime, m. 185°; semicarbazone, m. 253°; azlactone, m. 185°. The aldehyde condenses with XVIII (HCl) to give the methene, dark red, sinters 250°. With cryptopyrrolaldehyde XVIII gives the methene, C₂₁H₂₆O₂N₄, dark red, m. 132°; HCl salt, orange, m. 220°. XVIII and formalin give bis-[2,4-dimethyl-3-(ω -cyano- ω -carbethoxy)vinylpyrrol]-5-methane (XIX), m. 217°; the free acid, m. 268°, does not cryst. With Br in AcOH there results from XIX the methene-HBr, m. 215°. 2,4-Dimethyl-3-[ω -cyano- ω -carboxyl]vinyl-5-formylpyrrole, m. 240°, by sapon. of the Et ester with a little NaOH; with KOH (1:1) there results 2,4-dimethyl-3,5-formylpyrrole, m. 166°.

C. J. WEST

Bios. V. BUNSUKE SUZUKI AND YASUJI HAMAMURA. *Proc. Imp. Acad. (Japan)* 4, 158-60(1928); cf. *C. A.* 22, 1362.—From the mother liquor of the γ -acid there have been isolated nicotinic acid, ferularic acid, *p*-HOC₆H₄CO₂H and the β -acid.

C. J. WEST

Work preliminary to hemin syntheses. I. H. FISCHER AND KARL ZEILE. *Ann.* 462, 210-30(1928).—Syntheses of pyrroles with unsatd. and HO groups are described as a preliminary step to hemin syntheses. 2,4-Dimethyl-3-vinyl-5-carbethoxypyrrrole (I), adds Br in petrol. ether, giving 2,4-dimethyl-3-[α,β -dibromoethyl]-5-carbethoxypyrrrole, m. 133°. With 3 mols. Br in AcOH I gives 2,4-dimethyl-3-bromo-5-carbethoxypyrrrole (II), decomps. 166° (about 15% yield). I and CS₂-HCl or I and dry HCl in petrol. ether, give 2,4-dimethyl-[α -chloroethyl]-5-carbethoxypyrrrole (III), m. 95°; MeOK in MeOH gives the α -MeO deriv., m. 115°, also obtained from I and MeOH-HCl; oxidation gives a mixt. of I and the 3-CO₂H deriv.; bromination gives II. 2,4-Dimethyl-3-formyl-5-carbethoxypyrrrole and MeMgI give 2,4-dimethyl-3-[α -hydroxyethyl]-5-carbethoxypyrrrole (IV), m. 100.5° (80% yield); PCl₅, followed by MeOK, gives the above Me ether. Heated to melting *in vacuo* IV gives a dimol. I, C₂₂H₂₀O₄N₂, m. 187° (about 20% I sublimes during the operation); this also results by heating III several hrs. in petrol. ether. 2,4-Dimethyl-3-[β -nitrovinyl]-5-carbethoxypyrrrole in MeOH and MeOK give a red K salt, which is easily hydrolyzed; the Br deriv. of the pyrrole, yellow, m. 177°; several hrs' heating with H₂O gives the 3-CHO deriv. 2,4-Dimethyl-3-formyl-5-bromopyrrole, red, m. 149° (decompn.), from the pyrrole (V) and AcOH-Br. V and 40% HCHO in EtOH give bis-[2,4-dimethyl-3-formylpyrrol]methane, m. 286°; the PhNH₂ condensation product m. 165°; the Wursters' base product, C₂₁H₂₄N₄, m. 145°, quickly turns yellow in the air and then red; oxidation with Br in AcOH gives the methene-HBr, blue needles; the free base, brown, sinters 207°, decomps. 255-60°. V and MeNO₂ give 2,4-dimethyl-3-[β -nitrovinyl]pyrrole, dark yellow, m. 149°; with HCHO it yields bis-[2,4-dimethyl-3-[β -nitrovinylpyrrol]methane, red needles. V and CH₃(CN)₂ give 2,4-dimethyl-3-[β -dicyanovinyl]pyrrole (VI), yellow, m. 148°; cooking with alkali regenerates V. The corresponding 5-[β -dicyanovinyl] deriv., yellow, m. 148°. Bis-[2,4-dimethyl-3-[β -dicyanovinylpyrrol]methane, yellow needles; alkalis give the aldehyde. VI and HCN-HCl in CHCl₃-Et₂O give the 5-formyl deriv., m. 207°; with NaOH this gives 2,4-dimethyl-3,5-diformylpyrrole, m. 165°. 2,4-Dimethyl-5-

carbethoxypyrrole, $\text{ClCH}_2\text{CH}_2\text{COCl}$ and AlCl_3 in CS_2 give the 3-[β -chloropropionyl] deriv., m. 138° (55% yield). 2,4-Dimethyl-3-chloroacetyl-5-carbethoxypyrrole and Me_2NH in EtOH give 50% of 2,4-dimethyl-3-[β -dimethylaminoacetyl]-5-carbethoxypyrrole-HCl, m. 214° ; the free base does not cryst. well and m. $87-8^\circ$. The corresponding 3-[β -dimethylaminopropionyl] HCl salt m. 184° (65% yield); the free base m. 78° . 2,4-Dimethyl-3-[β -hydroxyacetyl]-5-carboxylic acid, m. 231° , from the 3- ClCH_2CO deriv.; heated 24 hrs. at $210-30^\circ$, it yields 30% of 2,4-dimethyl-3-[β -hydroxyacetyl]-pyrrole, m. 143° . Bis-[2,4-dimethyl-3- β -hydroxyacetylpyrrol]methane, m. 252° . 2,4-Dimethyl-3-[β -methoxyacetyl]pyrrole, m. 127° (65% yield). 2,4-Dimethyl-3-ethoxyacetyl-5-carbethoxypyrrole, m. $113-4^\circ$ (quant. yield). C. J. WEST

Hydrolysis of polypeptides by *N* alkali and by enzymes of the pancreas (ABDERHALDEN, BROCKMANN) 11A. Conversion of CII_4 into H and CO (FISCHER, TROPSCH) 21.

Unsaturated organic compounds. FRICH FREUND (to Chemische Fabrik auf Aktien (vorm. H. Schering). U. S. 1,672,378, June 5. In the formation of compds. such as tetrahydrobenzene, an org. compd. such as cyclohexanol which carries H and OH on 2 adjacent C atoms in an aliphatic system is heated with a "bleaching earth" such as frankonite as a catalyzer, and the unsatd. compd. thus formed is sepd., e. g., by distn. Acrolein may be made from glycerol and camphene from borneol.

Methane and other hydrocarbons. H. C. J. AARTS (to General Carbonalpha Co.). Brit. 278,745. Oct. 7, 1926. Active C is heated with H or gases contg. H at $150-600^\circ$ with or without a catalyst at ordinary or only slightly increased pressure. Reduced Ni is a suitable catalyst. At $150-400^\circ$, satd. hydrocarbons are mainly produced, and at $400-600^\circ$ unsatd. hydrocarbons. Coal, peat, wood, brown coal or like materials may be gasified to produce a gas contg. CO, which is then heated to $300-500^\circ$. The decompn. may be started by a catalyst such as Fe, Ni or Co oxide. Hydrocarbons adsorbed in C may be used as fuel in internal-combustion engines.

Hydrocarbons and phenols. I. G. FARBENIND. A.-G. Brit. 277,394, March 13, 1926. Aromatic hydrocarbons or phenols, or tar fractions contg. them, are converted into lower hydrocarbons or phenols by passing their vapor together with more than twice their vol. of water vapor at a high temp. (suitably $300-500^\circ$ or higher) over catalysts possessing both hydrogenating and dehydrogenating properties, among which are specified: Ni, Co, Fe, Cu, compds. of light metals such as those of the alkali, alk. earth or earth metals, Zn and its compds., and the difficultly reducible oxides of metals belonging to the fourth to seventh groups such as Ti, V, Cr and Mn. Several examples are given.

Organic arsenic compounds. R. W. F. STICKINGS AND MAY & BAKER, LTD. Brit. 278,444, July 8, 1926. 1,4-Arylisoxazinearsonic acids are prepd. by condensing an *o*-aminohydroxyarylarsonic acid with an α -halogenacyl halide. The α -halogenacylaminohydroxyarylarsonic acid is first formed and, by elimination of H halide, condenses to the isoxazine although the process may be carried out as a one-stage process without isolation of the intermediate product. The first reaction is preferably effected by the Schotten-Baumann reaction and the second by boiling with alkali. Examples are given of the production of 3-hydroxy-1,4-benzisoxazine-6-arsonic acid and 8-acetamido-3-hydroxy-1,4-benzisoxazine-6-arsonic acid. 3-Acetamido-4-hydroxy-5-amino-

benzenearsonic acid (used as a starting material in making the last-mentioned product) is made by nitrating 3-acetamido-4-hydroxybenzenearsonic acid and reducing the nitro compd. thus formed.

Catalyst for partial oxidation of benzene. C. R. DOWNS. U. S. 1,672,308, June 5. A metal oxide catalyst such as V or Mo oxides is carried on pieces of Al having rugged scraggy prominences and depressions.

Benzanthrone derivatives. I. G. FARBENIND. A.-G. Brit. 277,670, Sept. 20, 1926. Benzanthronecarboxylic acids are made by oxidizing alkylbenzanthrone in the presence of alk. agents such as caustic alkalies; the reaction may be applied to compds. contg. the alkyl group either in the benzene ring or in the anthraquinone nucleus. Examples are given.

Benzanthrone derivatives. J. Y. JOHNSON and I. G. FARBENIND. A.-G. Brit. 278,047, May 31, 1926. 2,2'-Dibenzanthronyls are made by treating with alk. condensing agents ("under moderate conditions") mixts. of 2-halogenbenzanthrone with benzanthrone having a free 2-position. The reaction takes place more readily than that of Brit. 203,533 (C. A. 18, 756) and renders possible the production of unsym. substituted 2,2'-dibenzanthronyls. Condensation is effected in a current of N. Examples are given for the production of 2,2'-dibenzanthronyl, 6-methyl-2,2'-dibenzanthronyl, 6- or 7-chloro-2,2'-dibenzanthronyl and 6,6'- or 7,7'-dichloro-2,2'-dibenzanthronyl. 2,6-Dichloro- and 2,7-dichlorobenzanthrone are obtained by condensing 2,6- and 2,7-dichloroanthraquinone with glycerol in the presence of H₂SO₄ and a reducing agent.

Naphthalene derivatives. I. G. FARBENIND. A.-G. Brit. 278,100, July 6, 1926. Dinaphthylidicarboxylic acids and their substitution products are obtained by treating diazo compds. derived from *o*- or *peri*-aminonaphthoic acids or their derivs. with suitable reducing agents such as an ammoniacal soln. of Cu₂O or a neutral soln. of Na₂SO₃ or a ferrous salt. Examples are given of the production of 1,1'-dinaphthyl-8,8'-dicarboxylic acid, 2,2'-dinaphthyl-3,3'-dicarboxylic acid, 1,1'-dinaphthyl-2,2'-dicarboxylic acid, 2,2'-dinaphthyl-3,3'-dicarboxylic acid diethyl ester, 1,1'-dichloro-2,2'-dinaphthyl-3,3'-dicarboxylic acid, 4,4'-dibromo-1,1'-dinaphthyl-8,8'-dicarboxylic acid, 4,4'-dichloro-1,1'-dinaphthyl-8,8'-dicarboxylic acid, 1,1'-dinaphthyl-4,4'-disulfo-8,8'-dicarboxylic acid, 5,5'-dimethoxy-1,1'-dinaphthyl-8,8'-dicarboxylic acid and the corresponding diethoxy compd. Cf. C. A. 23, 2380.

Derivatives of 3- and 5-iodopyridine. C. RATH. U. S. 1,672,340, June 5. Chlorination of β -iodopyridine yields an iodochloride m. 128-30° and only slightly sol. in the usual cold org. solvents. α -Chloro- β -iodopyridine yields a corresponding iodochloride m. 104-6°. α -Chloro- β -iodochloropyridine yields α -chloro- β -iodosopyridine, which decomposes at about 200-205°. When steam is blown through an aq. suspension of α -chloro- β -iodosopyridine α -chloro- β -iodoxypyridine is carried off and may be crystd. as white needles from the steam distillate. This compd. detonates, with sepn. of I, at 210-5°.

2-Amino-5-iodopyridine. C. RATH. U. S. 1,671,256, May 29. See Brit. 246,842 (C. A. 21, 415).

Hydrazinopyridine compounds. C. RATH. U. S. 1,671,257, May 29. In forming a β -hydrazinopyridine compd. such as β -hydrazinopyridine or α -chloro- β -hydrazinopyridine the corresponding β -aminopyridine is diazotized and the diazonium compd. is reduced, *e. g.*, by use of SnCl₂.

***p*-Alkyloxyphenylglycinamides.** J. ROSIN (to Merck & Co.). U. S. 1,672,689, June 5. A *p*-alkyloxyaminobenzene such as *p*-phenetidine is condensed with a halogenated deriv. of HOAc such as Et chloroacetate, *e. g.*, by heating in alc and adding NaHCO₃ to neutralize the acid formed. *p*-Ethoxyphenylglycinamide is a white cryst. solid m. 142-5°, slightly sol. in cold water and C₆H₆, more sol. in hot water and very sol. in alc. and acetone. It forms salts with acids and is decompd. by alkalies. Me, Pr, Al and other corresponding derivs. are mentioned as being capable of production from their corresponding starting materials but are not described in detail.

Anthraquinonesulfonic acids. J. THOMAS (to Scottish Dyes, Ltd.). U. S. 1,671,455, May 29. Hg sulfate 4.8 and benzoyle-*o*-benzoic acid 325 parts are mixed with 70 parts of anthraquinone recovered from a previous melt and this mixt. is added to about 450 parts of a 65% oleum, at such a rate that the temp. does not rise above 100°; after the addn. is complete the temp. is slowly raised to about 150° and maintained at this point for about 45 min., the melt is worked up for isolation of anthraquinone-sulfonic acid and anthraquinone is recovered.

Bismuth salts of arylarsonic acids. A. HAYTHORNTHWAITHE and MAY & BAKER, Ltd. Brit. 277,774, July 16, 1926. Stable solns. of Bi salts of 3-acetyl-amino-4-

hydroxyphenylarsonic acid or similar arylarsonic acids are prepd. by the addn. of a base such as piperazine, NaOH or NH_3 soln. to a suspension of the salt to render it sol. and of a salt of an aliphatic hydroxypolybasic acid such as K tartrate or citrate.

2-Hydroxy-4-formylaminophenylarsonic acid. ÉTABLISSEMENTS POULENC FRÈRES AND E. FOURNEAU. Brit. 277,586, Oct. 29, 1926. 2-Hydroxy-4-aminophenylarsonic acid is heated with formic acid. The Na and NH_4 salts of the product are described.

Acetaldehyde. I. G. FARBENIND. A.-G. Brit. 278,324, Sept. 28, 1926. Gaseous mixts. contg. C_2H_2 (such as are obtained by decompn of CH_4 by elec. or catalytic treatment) are treated under pressure (suitably 3 atm.) with acid solns. contg. Hg salts. A temp. of about 80° is preferred.

Butyraldehyde. M. MUGDAN and J. WIMMER. Can. 276,824, January 3, 1928. Butyraldehyde is produced by treating crotonaldehyde in the liquid phase with H_2 at elevated temp. and pressures up to 30 atms. in the presence of a hydrogenating catalyst.

Butyrene. H. DOLTER (to F. Germain). Brit. 277,975, Sept. 22, 1926. Ca butyrate is heated in an app. (which is described) by a current of hot inert gas which carries off the vapors produced.

Chlorinated amines. I. G. FARBENIND. A.-G. Brit. 278,729, Oct. 6, 1926. 3-Chloro- and 5-chloro- or 3,5-dichloro-1-amino-2,4-dimethylbenzene are produced by the reaction of 1 or 2 mols., resp. of Cl on a soln. of 1-amino-2,4-dimethylbenzene. The 3,5-dichloro compd. forms a sulfate sparingly sol. in concd. H_2SO_4 by which it may be sepd., or it may be sepd. by addn. of water. Catalysts such as I or FeCl_3 may be used.

Ethylidene diacetate. M. J. L. LÉDRU and E. J. BACHMANN (to Soc. chimique des usines du Rhone). U. S. 1,672,646, June 5. See Can. 269,818 (C. A. 21, 2274).

Purifying carbazole. C. J. THATCHER. U. S. 1,672,630, June 5. A solvent such as CCl_4 , C_6H_6 or toluene is used in such quantity as to dissolve only a portion of the carbazole together with substantially all the impurities.

Inactive menthol. K. SCHÖLLKOPF (to Rheinische Kampfer-Fabrik G. m. b. H.). U. S. 1,672,346, June 5. The racemate of natural menthol, m. $34-6^\circ$, with isomeric menthols, is obtained by hydrogenation, solidifiable menthol is sepd. from liquid constituents of the mixt., the sepd. solidifiable menthol is converted into an ester such as the acid phthalic acid ester and the latter is crystd. from alc. or other suitable solvent, sapond., and the menthol produced is distd.

Methyl ether. F. R. BICHOWSKY (to Delcolight Co.). Brit. 278,353, Sept. 28, 1926. A mixt. of CO and H is passed at an elevated temp. and pressure (suitably 500° and 125 atm.) over a hydrogenation catalyst (suitably ZnO and reduced Cu or Cr salts, but excluding Fe) and then over a dehydration catalyst or over a mixt. of both catalysts; or, MeOH may be passed over a dehydration catalyst. Alumina prepd. by partially dehydrating $\text{Al}(\text{OH})_3$ at 300° , partially dehydrated Ti hydroxide, Th hydroxide or silica gel may be used as dehydration catalysts. Various details are given and an app. is described.

Aromatic nitriles. I. V. GILES (to American Cyanamid Co.). U. S. 1,672,253, June 5. In forming nitriles such as benzonitrile a halogenated aromatic hydrocarbon, e. g., PhCl , is treated with a mixt. of Cu cyanide and NaCN or other alkali-forming metal cyanide and the mixt. is heated (suitably to about 325°). An app. is described.

Symmetrical diarylized guanidine compounds. H. SCHOTTE (to Chemische Fabrik auf Aktien, vorm. F. Schering). U. S. 1,672,431, June 5. See Brit. 262,155 (C. A. 21, 3625).

Aminoguanidines and their alkyl derivatives. M. HEYN (to C. A. F. Kahlbaum Chem. Fabrik, G. m. b. H.). U. S. 1,672,029, June 5. In forming compds. such as aminobutylene(or pentylene)guanidine sulfate, an S-alkylthiourea is used to react with tetramethylenediamine or other similar compds. contg. at least 1 amino group. The quantity of the S-alkylthiourea used (e. g., S-methylisothiurea sulfate) does not substantially exceed that required for introducing guanidine in a single amino group. The reaction may be effected in aq. soln.

11—BIOLOGICAL CHEMISTRY

A—GENERAL

FRANK P. UNDERHILL

The enzymic origin of hexose phosphate. H. VON EULER, KARL MYRBACK AND D. RUNEHJELM. *Archiv Kemi, Mineral. Geol.* 9, No. 49, 6 pp.(1928).—Hexose diphosphate arises as a product of fermentation. The hexose monophosphates arise from the diphosphate in fermentation. The hexose monophosphate of Neuberg is completely decomposed to CO_2 and H_3PO_4 by fermentation while from the 2 mols. of the monophosphate of Robinson, hexose diphosphate and CO_2 but no free H_3PO_4 originate. A new monophosphate has been prep'd. from 5 l. H_2O , 500 g. very active yeast, 500 g. glucose, 175 g. KH_2PO_4 , and Na_2HPO_4 . After 3 hrs the hexose monophosphate is purified and isolated by pptn. as the Ba salt with EtOH. The Ba salt has a specific rotation of $+33^\circ$ while the free hexose monophosphate has a rotation of $+63^\circ$. By starting with 4 l. H_2O , 400 g. glucose, 140 g. KH_2PO_4 , 120 g. Na_2HPO_4 , 400 g. dry yeast and some hexose diphosphate, and allowing the mixt. to stand at room temp. for 7.5 hrs. a hexose monophosphate was prep'd. with the properties of the Robinson comp'd with a specific rotation of $+15^\circ$ instead of one of $+12-14^\circ$ as previously described. It is believed that there are a number of different hexose monophosphates.

H. J. DEUEL, JR.

Contribution on the knowledge of mutase. HANS VON EULER AND ELSA GRABER. *Archiv Kemi, Mineral. Geol.* 9, No. 50, 6 pp.(1928); cf. C. A. 22, 1984.—A study of the Cannizzaro reaction with furfural and formaldehyde which is brought about by dried yeast or with washed yeast to which is added a boiled yeast ext. or purified coenzyme. The index of the rate of reaction was taken as the rate of disappearance of the aldehyde. Furfural in 30 mins. was broken down 50%. Formaldehyde was rapidly acted on at first but the action ceased within an hr. when 30% had been changed. It is assumed that the formaldehyde reacts with the enzyme system and inactivates it. HCN had little effect in causing inactivation in 0.0001 N soln. but 0.005 N CdCl_2 or ZnCl_2 was very potent in preventing the enzyme and so in checking the Cannizzaro reaction. 0.1 N CaCl_2 , KI, KF and KCl caused only a slight retardation in enzyme action. In obtaining further data on the distribution of mutase it was found to be present in fresh wheat embryo, in fresh wheat embryo ext., in dried wheat embryo, and in the ext. of the latter in amts. comparable with yeast as det'd. by its effect on acetaldehyde.

H. J. DEUEL, JR.

Asymmetrical ester hydrolysis through enzymes. I. RICHARD WILLSTATTER, RICHARD KUHN AND EUGEN BAMANN. Bayer. Akad., Munich. *Ber.* 61B, 886-895 (1928).—It was previously shown that when racemic ethyl mandelate is hydrolyzed by liver esterase, more *d*-mandelic acid is formed than *l*-mandelic acid. However, when the isomers were acted on separately under like conditions, more of the *l*-mandelic acid was set free in a given time than of the *d*-comp'd. (cf. C. A. 18, 3390). In further investigating the cause of this, it was found at a concn. of sepd. ester of 0.001 N about the same amts. of the 2 isomers were hydrolyzed, at a concn. of 0.0001 N 1.7 times as much of the *d*-acid was formed as the *l*-acid, and at 0.025 N there was 1.6 times more of the *l*-acid set free. The value of $Q = \text{disappearance of } l\text{-ester} \div \text{disappearance of } d\text{-ester}$, is less than 1 at low ester concns. and greater than 1 (max. 1.6) at high concns. of substrate. The affinity of the esterase for the *d*-mandelic acid was 3.2 times that for the *l*-acid. Conversely the *l*-esterase-ester comp'd. decomposes 1.6 times faster than the *d*-comp'd. This explains the contrary results between the racemate and the sepd. esters. Although the *l*-ester is more quickly split than the *d*, in the mixt. the *d*-comp'd. is favored because its affinity for the esterase exceeds that of the antipode in the ratio of 3.2 to 1. The rate of decompn. depends on the H-ion concn. and the amt of enzyme present.

H. J. DEUEL, JR.

The mechanism of oxidation processes. XIII. About oxidases and peroxidases. HEINRICH WIELAND AND HERMAN SUTTER. Bayer. Akad., Munich. *Ber.* 61B, 1060-8(1928); cf. C. A. 22, 1065.—A prepn. was previously isolated from a fungus which caused the autoxidation of hydroquinone to quinone with the concomitant formation of H_2O_2 . This prepn. was thermostable and little sensitive to HCN and appeared to be a mixt. of salts of org. acids (cf. C. A. 20, 2981). In further investigation, an unsuccessful attempt has been made to duplicate the above expts. An oxidase was prep'd. from the juice of the *Lactarius vellereus* (expressed at 200 atm.) by pptn.

in 68% EtOH. From 10 kg. of fungi, 6 l. of juice was obtained, which yielded 20–30 g. of crude enzyme. The enzyme was further purified by dialysis against distd. H_2O . The concn. of oxidase was increased 130 times from the juice to the crude prepn. and 4 times in the purified product. The total concn. was 630. About 33% of the total enzyme of the fungi was isolated, the chief loss being in the first operation. Addn. of H_2O to the press cake followed by a second expression removed a considerable proportion of the enzyme which had been retained. One mg. of purified oxidase caused the complete oxidation of 4 mg. of hydroquinone in 10 min. When a H_2O soln. of enzyme was heated for 3 min. at 100° it was completely destroyed. The activity did not reappear on standing as claimed by Bach and Sharsky (*C. A.* 6, 99). HCN (0.002 *M*) reduced the activity of oxidase 33% and it was completely checked by a 0.01 *M* soln. However, when compared with an oxidase prepd. from potato skins, it was shown to be much less sensitive. The oxidation of hydroquinone proceeds best at a p_H of 4.6 and less at higher or lower H-ion concn. The action is independent of substrate concn. This oxidase is ineffective in catalyzing the oxidation of iodides. The properties of a peroxidase prepd. from horse-radish according to Willstätter (*C. A.* 15, 543) were also studied. It was a brown powder, sol in H_2O with a purpurogallin no. (*C. A.* 13, 454) of 280 (no. of mg. of purpurogallin formed from pyrogallol by 1 mg. of vacuum-dried substance). The normal purpurogallin no. of 280 was reduced as follows by HCN: 0.0000025 *M*, 185; 0.000005 *M*, 130; 0.00001 *M*, 66 and 0.00002 *M*, 37. The effect of HCN was not removed by evacuating and admission of air. The effect of H_2S was more marked. control, 280; 0.00000125 *M*, 160; 0.0000025 *M*, 85; 0.000005 *M*, 45 and 0.00001 *M*, 20. 0.0005 *M* NH_3NH_2 reduced the purpurogallin no. to 150 and 0.001 *M* reduced it to 120. 0.0005 *M* NH_2OH gave a result of 190 and 0.001 one of 120. Neither $(NH_4)_2SO_4$ in 0.002 *M* soln. nor 0.001 *M* alanine-HCl had any retarding effect on the peroxidase. H_3AsO_3 was also inactive. H_2O_2 , O_2 and N had no effect. Satn. with CO only reduced the purpurogallin no. to 270. Aeration (*C. A.* 20, 363) with neutral gases did not affect the peroxidase. Since all the reagents found to be deleterious react with aldehydes, these results support the conception of Woker that the active constituent of peroxidase is an aldehyde group through which H_2O_2 is activated.

H. J. DEUEL, JR.

Effects of ultra-violet light on parathyroidectomized rats. F. T. JUNG, Northwestern Univ. *Endocrinology* 12, 81–3(1928).—Ultra-violet light in daily doses 50 times that used in the unhabituated human subject was beneficial to parathyroidectomized white rats. Unless the expt. is carefully controlled, the beneficial effect obtained is overshadowed by the unfavorable result of handling and of the bright light on an animal in latent tetany. The parathyroids probably have some function secondarily related to Ca metabolism and some way connected with the photochemical function of the skin.

H. J. DEUEL, JR.

Kinetics of the tyrosinase of the potato. HUGO HAEHN AND JEANNOT STERN. *Fermentforschung* 9, 395–402(1928).—The tyrosinase-tyrosine reaction is monomol. when the H-ion concn. and the temp. remain const. and O is present in excess. The const. is independent of the tyrosine concn. but varies with the amt. of enzyme. A formula is derived for the oxidizing power of tyrosinase.

A. W. DOX

A simplified method of phagocytosis investigation in vitro. V. V. PRÁVDICZ-NEMINSKII. *Fermentforschung* 9, 411–20(1928), *Zhurnal expil. biol. Med.* 9, 74–83.—The method is a modification of the Radsma-Hamburger procedure. The blood sample is dild. with 0.9% NaCl soln., rice starch added and the mixt. kept in a thermostat at 37° . At the end of 15 min. the red corpuscles are hemolyzed by addn. of AcOH, the phagocytes stained with Bismarck brown, and a count is made of those that have ingested starch grains. Detns. can be made with 0.02 cc. of blood. The results may vary as much as 20% according to the purity of the NaCl used. No relationship was found between the degree of phagocytosis and the catalase or hemoglobin content of the blood.

A. W. DOX

Phagocytosis of tuberculosis bacteria in vitro after ingestion of fat. V. V. PRÁVDICZ-NEMINSKII WITH K. SHMAIN. *Fermentforschung* 9, 421–9(1928).—By the simplified method of phagocytosis study in vitro (cf. preceding abstr.) the phagocytosis of dead tuberculosis bacteria was observed in a drop of dild. blood. A diet confg. fatty food, e. g., butter, increases the phagocytic power of the blood. This increase varies, however, with different individuals. With an incubation time of 30 min. the % increase varied from 22 to 109. A double portion of fat in the diet increased the lymphocytes so markedly that there appeared to be a decrease in phagocytes, until a corrected count was obtained from which the lymphocytes were excluded. The tuberculosis bacteria when attacked by the leucocytes undergo a lipolysis of their lipid coating and become

less resistant to acid; then they disintegrate into sep. granules, which finally undergo digestion. Also in *Zhurnal expil. biol. Med.* 9, 131-9(1928). A. W. Dox

Comparative studies on the hydrolysis of polypeptides by *N* alkali and by the enzymes of the pancreas. EMIL ABDERHALDEN AND HANS BROCKMANN. *Fermentforschung* 9, 430-8(1928).—A no. of new tripeptides were prepd. by the usual method of coupling a dipeptide with an α -halogenacyl halide and then replacing the α -halogen by NH_2 . *dl*- α -Aminobutyryl-*dl*- α -aminobutyric acid (I) + $\text{ClCH}_2\text{COCl} \rightarrow$ *chloroacetyl-dl*- α -aminobutyryl-*dl*- α -aminobutyric acid, m. 136-7°, \rightarrow *glycyl-dl*- α -aminobutyryl-*dl*- α -aminobutyric acid (II), m. 241-2°. I + $\text{MeCHBrCOBr} \rightarrow$ *dl*- α -bromopropionyl-*dl*- α -aminobutyryl-*dl*- α -aminobutyric acid, m. 157-8°, \rightarrow *dl*-alanyl-*dl*- α -aminobutyryl-*dl*- α -aminobutyric acid (III), m. 254-5° (decompn.). I + $\text{BzCl} \rightarrow$ *benzoyl-dl*- α -aminobutyryl-*dl*- α -aminobutyric acid (IV), m. 189-90°. I + *d*- $\text{Me}_2\text{CHCH}_2\text{CHBrCOBr} \rightarrow$ *d*- α -bromoisocaprolyl-*dl*- α -aminobutyryl-*dl*- α -aminobutyric acid, m. 150-2° (decompn.), $[\alpha]_D^{20} -33.20^\circ$, \rightarrow *d*-leucyl-*dl*- α -aminobutyryl-*dl*- α -aminobutyric acid (V), m. 240° (decompn.). *dl*-Leucyl-*dl*- α -aminoheptylic acid (VI), + $\text{ClCH}_2\text{COCl} \rightarrow$ *chloroacetyl-dl*-leucyl-*dl*- α -aminoheptylic acid, m. 147.5°, \rightarrow *glycyl-dl*-leucyl-*dl*- α -aminoheptylic acid (VII), m. 240° (decompn.). I is stable to *N* alkali at 37°, but the tripeptides II and III split off the glycine and alanine, resp., while V is more resistant. IV hydrolyzes more readily than I, but the Bz group remains attached to the amino acid. VI is not attacked, but from VII part of the glycyl is split off. Pancreas ext. decomp. the dipeptide I, showing that although 2 pairs of isomers are possible, the pair actually present is *dd* and *ll* rather than *dl* and *ld*. Likewise the tripeptides II and III undergo hydrolysis by pancreatic enzymes, but not the Bz deriv. IV.

A. W. Dox

The fermentative breakdown of polypeptides containing *l*-hydroxyproline. EMIL ABDERHALDEN AND WILHELM KÖPPEL. *Fermentforschung* 9, 439-45(1928).—Two dipeptides were prepd. by the usual method. *l*-Hydroxyproline + $\text{ClCH}_2\text{COCl} \rightarrow$ 30% *chloroacetyl-l*-hydroxyproline, m. 160°, \rightarrow *glycyl-l*-hydroxyproline (I), m. 215°, $[\alpha]_D^{20} -50.79^\circ$. *l*-Hydroxyproline + $\text{Me}_2\text{CHCH}_2\text{CHBrCOBr} \rightarrow$ 38.3% *dl*- α -bromoisocaprolyl-*l*-hydroxyproline, m. 155°, \rightarrow *dl*-leucyl-*l*-hydroxyproline (II), m. 234°, $[\alpha]_D^{20} -36.97^\circ$. Neither of these dipeptides is attacked by pepsin or trypsin. Erepsin at p_H 7.8 and 37° hydrolyzes I (56% in 10 days), but not II. *N* NaOH at 37° hydrolyzes I (93% in 3 days) but its effect on II is extremely slow. A. W. Dox

The influence of natural and synthetic thyroxine, also 3,5-diiodotyrosine and thyroid substance on the rate of autolysis and on the action of erepsin and trypsin. EMIL ABDERHALDEN AND KURT FRANKIE. *Fermentforschung* 9, 485-93(1928).—Small amts. of thyroxine added to an aq. suspension of fresh liver pulp and phosphate buffer increase the rate of autolysis as detd. by increase in amino N. If the concn. of thyroxine exceeds 0.1 mg. per 200 cc. mixt the autolysis is retarded. The effect of 3,5-diiodotyrosine and thyroid substance is similar to that of thyroxine. No difference was noted between natural and synthetic thyroxine. Hydrolysis of *dl*-leucylglycine by erepsin and of silk peptone and gelatin by trypsin-kinase was also accelerated or retarded according to the concn. of thyroxine used. In the higher concns. where inhibition was noted a cloudiness developed and it is possible that enzyme was thus adsorbed and removed from contact with the substrate. Possibly the effect of thyroxine in speeding up metabolism may be due to this acceleration of enzyme action. A. W. Dox

The action of erepsin and trypsin on polypeptides containing *d*-glutamic acid. EMIL ABDERHALDEN AND ERNST ROSSNER. *Fermentforschung* 9, 494-500(1928).—*d*- α -Bromoisocaprolylglycyl-*d*-glutamic acid, $[\alpha]_D^{20} 24.6^\circ$, was prepd. in 78% yield from glycyl-*d*-glutamic acid and *d*- $\text{Me}_2\text{CHCH}_2\text{CHBrCOCl}$, and converted into the tripeptide *l*-leucylglycyl-*d*-glutamic acid (I), $[\alpha]_D^{20} 25.4^\circ$, by treatment with NH_4OH . In addn. to this, the dipeptides glycyl-*d*-glutamic acid (II), *dl*-leucyl-*d*-glutamic acid (III) and *l*-leucyl-*d*-glutamic acid (IV) were used as substrates in detg. the action of erepsin and trypsin-kinase. Erepsin hydrolyzes I and II, but not III and IV. Trypsin has practically no action on I, III and IV, but slowly hydrolyzes II. *N* NaOH at 37° hydrolyzes III and IV only very slowly, but I and II more readily. 5 *N* HCl at 37° hydrolyzes I and II. A. W. Dox

The question of the specificity of polypeptidases. EMIL ABDERHALDEN AND ERNST SCHWAB. *Fermentforschung* 9, 501-15(1928); cf. *C. A.* 22, 95.—The action of erepsin and trypsin-kinase was tested on a no. of PhNCO - and $\beta\text{-C}_{10}\text{H}_7\text{SO}_2$ -derivs. of di- and tri-peptides and on several new polypeptides. The *PhNCO*-derivs. of the following di- and tri-peptides were not attacked by erepsin but were all hydrolyzed by trypsin-kinase: *dl*-leucylglycine, *glycyl-dl*- α -aminoheptylic acid, m. 181°, *glycyl-dl*-

α-aminocaproic acid, m. 185°, glycy-l-tyrosine, glycy-l-d-serine, *dl*-leucylglycylglycine, *l*-leucylglycy-l-leucine. β -C₁₀H₁₇SO₂-derivs. of the following dipeptides were not attacked by erepsin: *glycy-l-d-phenylalanine*, decomp. 260°, *glycy-l-tyrosine*, glycy-l-leucine, *dl*-leucylglycine, glycylglycine. Trypsin-kinase hydrolyzed the first 3 of these, the 4th slightly, and the 5th not at all. Both enzymes were inert toward carboethoxyglycylglycine ester. Several new polypeptides were prep'd. and tested with the 2 enzymes. By coupling pyridonyl chloride with *l*-tyrosine ester in CHCl₃ *glutaminy-l-tyrosine* and its anhydride *pyrridonyl-l-tyrosine* were obtained. The dipeptide was partially hydrolyzed by both erepsin and trypsin. The pentapeptides, *dl*-leucyltriglycy-l-tyrosine and *dl*-leucyltriglycy-l-d-serine, decomp. 175°, were prep'd. by coupling *dl*- α -bromoisocapronylglycylglycyl chloride with glycy-l-tyrosine and glycy-l-d-serine, resp., in CHCl₃ and subsequent treatment with NH₄OH. The first of these was hydrolyzed by trypsin-kinase but not by erepsin; the 2nd by erepsin but not by trypsin-kinase.

A. W. Dox

Comparative studies on the enzymic breakdown of polypeptides by erepsin and trypsin-kinase. Polypeptides containing *l*-cystine. EMIL ABDERHALDEN AND WILHELM KÖPPEL. *Fermentforschung* 9, 516-23(1928).—The synthesis of these derivs. up to the nonapeptide (IV) was performed in successive steps by the usual procedure of coupling the amino acid or peptide with a halogenacyl halide and treating the product with NH₄OH. *l*-Cystine + *d*-MeCHBrCOCl \rightarrow 60% *di*(*d*- α -bromopropionyl)-*l*-cystine, m. 145°, $[\alpha]_D^{20}$ -97.55°, \rightarrow 73% *di*(*d*-alanyl)-*l*-cystine (I), decomp. above 200°, $[\alpha]_D^{19}$ -138.5°. I + Me₂CHCHBrCOCl \rightarrow 62% *di*(*d*- α -bromoisovaleryl-*d*-alanyl)-*l*-cystine, m. 155°, $[\alpha]_D^{18}$ -18.6°, \rightarrow 55% *di*(*d*-valyl-*d*-alanyl)-*l*-cystine (II), decomp. above 200°, $[\alpha]_D^{19}$ -102.6. II + *d*-MeCHBrCOCl \rightarrow 54% *di*(*d*- α -bromopropionyl-*d*-valyl-*d*-alanyl)-*l*-cystine, m. 163°, $[\alpha]_D^{20}$ 13.4°, \rightarrow 47.9% *di*(*d*-alanyl-*d*-valyl-*d*-alanyl)-*l*-cystine (III), does not melt, $[\alpha]_D^{20}$ -79.4°. III + *d*-Me₂CHCH₂CHBrCOCl \rightarrow 53.7% *di*(*d*- α -bromoisocapronyl-*d*-alanyl-*d*-valyl-*d*-alanyl)-*l*-cystine, m. 164°, $[\alpha]_D^{19}$ 34.3° \rightarrow 45.7% *di*(*l*-leucyl-*d*-alanyl-*d*-valyl-*d*-alanyl)-*l*-cystine (IV), does not melt, $[\alpha]_D^{18}$ -74.6°. The cleavage of these peptides during a 216-hr. digestion, expressed in % of 1 CONH linkage, by erepsin was I, 95; II, 151; III, 58; IV, 0; by trypsin-kinase it was I, 0; II, 60; III, 174; IV, 112. The tripeptide was thus resistant to trypsin and the nonapeptide to erepsin. The intermediate penta- and heptapeptides were attacked by both enzymes, but the extent of hydrolysis was in the reverse order for the 2 enzymes. None of these was hydrolyzed appreciably by *N* NaOH at 37° in 240 hrs. Di(*l*-leucylglycyl)-*l*-cystine and di(*l*-leucyl-*d*-alanyl)-*l*-cystine were attacked by both enzymes, but especially erepsin, whereas the tripeptide, di(*l*-leucyl)-*l*-cystine, like I, was attacked by erepsin only.

A. W. Dox

The enzymic breakdown of polypeptides of various composition and their behavior toward *N* alkali. Polypeptides containing *l*-leucine exclusively. EMIL ABDERHALDEN AND RICHARD FLEISCHMANN. *Fermentforschung* 9, 524-33(1928).—Polypeptides built up of a single amino acid, e. g., *l*-leucine, are resistant to hydrolysis by alkali. Glycine is the outstanding exception. Not only are the glycine peptides readily hydrolyzed by alkali, but the addn. of a terminal glycy-l group renders an otherwise resistant polypeptide amenable to hydrolysis by alkali. In such cases the glycy-l group breaks off leaving the remaining peptide chain intact. In some cases the PhNCO deriv. undergoes hydrolysis while the parent peptide itself is resistant. *Benzoyl-l-leucyl-l-leucine*, m. 133°, $[\alpha]_D^{20}$ -49.14°, was prep'd. in 70% yield from *l*-leucyl-*l*-leucine and BzCl. *Phenylisocyanate-l-leucyl-l-leucine*, m. 198°, $[\alpha]_D^{20}$ -68.66°, was obtained by addn. of PhNCO to *l*-leucyl-*l*-leucine. A no. of leucine peptides, with and without a terminal glycy-l, were prep'd. in the usual way. *l*-Leucyl-*l*-leucine (I) + ClCH₂-COCl \rightarrow 70% *chloroacetyl-l-leucyl-l-leucine*, m. 180-2°, $[\alpha]_D^{20}$ -51.72°, \rightarrow 60% *glycy-l-leucyl-l-leucine*, m. 232-4° (decompn.), $[\alpha]_D^{20}$ -67.01°. I + *d*-Me₂CHCH₂-CHBrCOCl \rightarrow 80% *d*- α -bromoisocapronyl-*l*-leucyl-*l*-leucine, m. 212°, $[\alpha]_D^{20}$ -38.04°, \rightarrow *di*(*l*-leucyl)-*l*-leucine (II), $[\alpha]_D^{19}$ -51.36°. II + ClCH₂COCl \rightarrow *chloroacetyl-di*(*l*-leucyl)-*l*-leucine, m. 193° (decompn.), $[\alpha]_D^{20}$ -76.19°, \rightarrow 60% *glycyldi*(*l*-leucyl)-*l*-leucine, $[\alpha]_D^{20}$ -78.63°. II + *d*-Me₂CHCH₂CHBrCOCl \rightarrow 70% *d*- α -bromoisocapronyl-*di*(*l*-leucyl)-*l*-leucine, m. 224°, $[\alpha]_D^{20}$ -70.55°, \rightarrow 60% *tri*(*l*-leucyl)-*l*-leucine (III), $[\alpha]_D^{20}$ -89.95°. III + ClCH₂COCl \rightarrow 50% *chloroacetyltri*(*l*-leucyl)-*l*-leucine, $[\alpha]_D^{20}$ -83.89°, \rightarrow 60% *glycytri*(*l*-leucyl)-*l*-leucine, $[\alpha]_D^{20}$ -118.1°. III + *d*-Me₂CHCH₂CHBrCOCl

→ 50% *d*- α -bromoisocapronyltri(*l*-leucyl)*l*-leucine, $[\alpha]_D^{20}$ -95.56°, → 60% tetra-(*l*-leucyl)*l*-leucine. A. W. DOX

The action of various amino acids on yeast peptidase. A. FODOR and REINHOLD COHN. *Z. physiol. Chem.* 176, 17-28(1928).—The conversion of yeast peptidase from its zymostable to its zymolabile form by transfer of the zymohaptic group to a secondary carrier is extended to include a no. of amino acids as secondary carriers. The zymolabile enzyme is characterized by its greater activity. The increased hydrolysis of silk peptone after addn of the amino acid is therefore taken as evidence that the amino acid has functioned as a secondary carrier. The expts. include glycine, *d*-alanine, *dl*-leucine, *d*-leucine, *l*-leucine, *l*-tyrosine, *l*-cystine, *d*-arginine, *l*-histidine, *d*-lysine and *d*-glutamic acid. All of these amino acids, with the exception of tyrosine, exerted approx. equal activation, when compared on the basis of equimol. concn. The activation cannot be due to a single group such as NH_2 or COOH . It is probable that a much larger grouping, e. g., $-\text{CH}(\text{NH}_2)\text{COOH}$, is concerned. The activation of yeast maceration by aging is based on the same principle, i. e., the amino acids liberated in the autolysis function as secondary carriers. This view is further supported by the fact that the activation of yeast maceration by addn. of leucine diminishes in proportion to the extent of aging. A surprising observation is that *d*- and *l*-leucine have practically the same effect. Considering the strict specificity of the enzyme toward peptides contg. the naturally occurring *l*-leucine it would appear that the activation process of elution consists merely in dislodging the zymohaptic group by means of a non-sp. substance, the active portion of which represents a comparatively simple grouping. A. W. DOX

Lactic dehydrogenase. A cell-free enzyme preparation obtained from bacteria. MARJORY STEPHENSON. Univ. Cambridge. *Biochem. J.* 22, 605-14(1928).—By autolyzing washed bacterial suspensions (*B. coli*) in phosphate buffer pH 7.6 a dehydrogenase is extd. In the presence of methylene blue the enzyme dehydrogenates lactate, and, more slowly, α -hydroxybutyrate. The enzyme is unaffected by cyanide. BENJAMIN HARROW

Medical laboratory in a children's hospital. M. G. PETERMAN. *Arch. Pediatrics* 45, 226-32(1928).—A paper of biochem. interest. JOSEPH S. HEPBURN

Address read before the 1st meeting of the Dutch Biochemical Society, Feb. 4, 1928. B. SJOLLEMA. *Chem. Weekblad* 25, 146-52(1928).—Brief summary of modern biochem. research, with special reference to physiol. micromethods, the constitution of proteins and Van Slyke's work on the distribution of electrolytes. M. J.

Glucolysis in blood samples. A. R. ROSE and F. SCHATNER. *Am. J. Physiol.* 84, 103-9(1928).—Certain halogenated hydrocarbons, particularly PhCl and PhBr , inhibited glucolysis in blood samples, but did not entirely prevent it. NaF and thymol did not check the decrease in glucose in sheep blood but did inhibit glucolysis in human blood almost as well as did PhCl . J. F. LYMAN

Cataphoresis of blood corpuscles of certain vertebrates and invertebrates. O. M. BERNARDI. *Arch. sci. biol.* 8, 1-16(1926).—Cataphoresis expts. were made on the red blood corpuscles of certain animals by the Michaelis technic. The corpuscles of mammals and batrachia in isotonic solns. of electrolytes and nonelectrolytes (sugars) showed a gradual but const. movement toward the anode. Only rabbit corpuscles remained stationary in isotonic solns. of MgCl_2 , MgSO_4 , CaCl_2 and CaSO_4 . The corpuscles migrated faster in hypertonic solns. than in isotonic solns. of NaCl and sucrose. The current facilitated sedimentation and morphological alterations. The velocity of migration was as follows: pig > man > guinea pig > sheep > cat > bull > frog > toad > rabbit. The velocity of migration of several species of invertebrates was: *Thysanozoon brockii* > *Sipunculus nudus* > *Strongylocentrotus lividus* > *Phallusia*. The velocity of migration of vertebrates and invertebrates within certain limits varied according to the nature of the menstruum. PETER MASUCCI

The application of the Donnan effect to nucleic acid compounds. EINAR HAMMARSTEN. *Acta Med. Scand.* 68, 189-98(1928).—Expts. show that nucleic acid owing to its relatively strong acidity and the non-diffusibility of its anion can produce considerable variations in H-ion concn. in the cell nucleus under the alternating influence of CO_2 and of neutral salts. S. MORGULIS

Studies on microchemical reactions. I. Compounds of protein nucleic acid compounds with dyestuffs. EINAR HAMMARSTEN, GRETA HAMMARSTEN and TORSTEN TSORELL. *Acta Med. Scand.* 68, 219-26(1928).—Nucleic acid is stained by basic dyestuffs at pH 2-10. The compd. resulting was insol. only in an acid medium except for that with malachite green, which is also insol. in alkali. Acid dyes gave only a

surface coloration. Proteins were stained by acid and basic dyes in an acid or basic medium, resp. The compds. formed are sparingly sol., but lose color continuously on washing. Protein nucleic acid mixts. stain like protein. Even minute amts. of protein prevent the staining of nucleic acid in acid media. In cell cultures the cells are stained by acid dyes in a strongly acid medium, while the nuclei were not stained by basic dyes either in an acid or neutral medium. II. Precipitation of protein nucleic acid with lanthanum and sulfosalicylic acid ions. EINAR HAMMARSTEN AND TORSTEN TEORELL. *Ibid* 226-38.—Proteins are pptd. by sulfosalicylic acid and nucleic acid by $\text{La}(\text{NO}_3)_3$. However, protein-nucleic acid mixts are pptd. by both reagents. With buffered solns. of these 2 reagents it could be shown that the red blood cells of lizards in a certain functional condition, presumably that of division, possess nuclei which are free or at any rate poor in protein, whereas the nuclei actually in the process of division are rich in protein. S. MORGULIS

The acidity of taurine. BERTIL JOSEPHSON. *Acta Med. Scand.* 68, 284-6(1928).—Solns. of pure taurine of 5×10^{-2} M concn. were prepd. in NaOH of various concns. (5×10^{-3} - 20×10^{-3} N) dissolved in KCl (0.02-0.10 M). The H-ion concn. of these solns. was detd. at 18° against a 0.1 N calomel electrode. The dissociation const. was detd. from the formula $K = \text{HC}_1^-/\text{C}_1$, where C_1^- and C_1 are the concns. of dissociated and undissociated taurine. The value of $K = 5.77 \times 10^{-10}$. This acid dissocn. const. is about $1/3$ that found by previous investigators. S. MORGULIS

The permeability of artificial collodion membranes. I. The effect of acid-base swelling on the permeability of gelatin and agar membranes. K. J. ANSELMINO. *Biochem. Z.* 192, 390-425(1928).—Gelatin membranes can be made permeable for glucose, or for capillary inactive nonelectrolytes in general, by increasing the swelling of the membrane colloid by changes in H-ion concn. The min. permeability is at the isoelec. point of the gelatin. The curve of swelling and permeability runs the same course. It is concluded that the H_2O in the swollen gelatin is in such combination that it no longer can serve as a diffusion medium. In studies of the diffusion of dyestuffs through the gelatin membrane, the mutual relationships of the elec. charges of both membrane and dye acquire a predominating influence. On the contrary, in the case of agar membranes it is possible to eliminate capillary elec. forces and to study the influence of H and OH ions on the dispersion of the membrane colloid and the diffusion of various org. substances. S. MORGULIS

Note on the reduction of hemin by cysteine. WERNER CREMER. *Biochem. Z.* 192, 426-7(1928).—If cysteine and hemin are mixed in a CO atm. the reduction of the latter can be demonstrated. A mol. CO is absorbed per mol. hemin. S. M.

Studies on diastase. IV. The content of extractable and non-extractable α -diastase in various kinds of grain. VIKTOR SYNIEWSKI. *Biochem. Z.* 192, 457-62(1928).—The larger the size of the grain the greater is the α -diastase content. S. M.

The transformation of α -diastase into β -diastase. F. POLAK AND A. TYCHOWSKI. *Biochem. Z.* 192, 463-78(1928).—The optimum activity for α -diastase is $p_{\text{H}} = 5.1$ and for β -diastase 4.3. A normal barley ext. has a $p_{\text{H}} = 6.30$. By changing the p_{H} to 4.30 there is an increase (17 times) in the rate of disappearance of the I_2 reaction of amylopectin and of dextrin I, which is ascribed to β -diastase. Barley which has been leached out with a papayotin soln. yields exts. which at the optimum p_{H} has twice the amt. of β -diastase. It is assumed that the α -diastase changes to β -diastase through an alteration in H-ion concn. S. MORGULIS

Studies on lipase. I. The optimum activity of stomach lipase. KENSUKE GYOROKU. *Biochem. Z.* 193, 18-26(1928).—The optimum activity of stomach lipase from rabbits and man is at about $p_{\text{H}} = 6.0$. Following purification the optimum is at $p_{\text{H}} 7.6-7.8$. The optimum for pig-stomach lipase is generally on the alk. side, and rarely at neutrality or even on the acid side, but here also the optimum p_{H} shifts after purification. In pig-stomach lipase preserved dry the p_{H} of the optimum activity approaches 6.0-6.5, but this shifting of the optimum p_{H} is not found in human, dog or rabbit stomach lipase thus kept. If the lipase is kept several days as a soln. the optimum shifts to the alk. side, this shift being favored by an alk. reaction, while an acid reaction or a low temp. slows this up considerably. It is supposed that stomach lipase is accompanied by other substances which activate the enzyme in acid and inhibit its action in alk. media. II. Organ lipases and their resistance to acids and alkalies. *Ibid* 27-38.—Stomach lipase is more resistant to acids than to alkalies, a phenomenon which is more pronounced in human and dog than pig and rabbit preps. This behavior does not depend upon the fact that it is found in an acid medium of the stomach since the same holds true for the pig lipase with an optimum activity on

the alc. side and in a stomach with a const. alk. reaction. Pancreas and liver lipase, though much more resistant towards alkali, are still more sensitive than stomach lipase, which thus has a greater stability than other organ lipases. Purified gastric lipase loses its greater resistance towards acids and is not different from the enzyme prep'd. from the pancreas. Strong acids and alkalies exert a more potent effect on the lipase than the weak acids and alkalies, the lipase being protected by the presence of substances capable of combining with the acid or base (protein, peptone). III. The effect of quinine on the organ lipase. *Ibid* 39-52.—Pancreas lipase is sensitive to quinine, while liver lipase has a variable response. The stomach lipase from various pigs behaves in the same manner towards quinine, the observed differences being only quant. The refractory lipases become also sensitive to quinine when they have been purified, their activity being inhibited. There is no difference then between the pancreas and stomach enzymes, so that the difference in behavior must be attributed to admixtures. Organ lipase preps. which have been preserved for months in the dry state are very much less sensitive than fresh preps. and pig pancreas lipase is then even activated by the addn. of quinine. Upon purification this property is again lost. The activating action increases in the arithmetic ratio when the quinine concn. increases in a geometric ratio, in other words, in accordance with the adsorption isotherm. The effect is the composite of the action of the quinine on the lipase itself and on the admixtures. The organ lipases of man and dog are much more susceptible to the action of quinine than those of the rabbit, pig, cat, guinea pig, etc. However, it is not possible to differentiate organ lipases according to their sensitivity against quinine. S. M.

Spectrophotometric studies of the two components of trypan blue. N. OKUNEV. *Biochem. Z.* 193, 70-84(1928).—Aq. solns. of trypan blue have a definite light absorption const. (max. = 0.911) and an absorption max. at 580-590 μ . Although this const. does not vary within the limits of diln. 1:5000 to 1:100,000, it is quite different in different commercial preps. When strips of filter paper are placed in dil. solns. of trypan blue, the paper becomes blue, while the soln. gradually turns red. Spectrophotometric studies show a diminution of the absorption const. and a shifting to the left of the absorption max. Similar effects, of course, are observed in the filter paper strip, and a study of the kinetics indicates that these changes bear a relationship to time which resembles very much an adsorption process. The paper also adsorbs the red component of the dye but only in very slight aints. On the addn. of gelatin to a dil. soln. of trypan blue the adsorption const. increases, the max. shifting to the right, and the soln. becomes more blue. Similar results are obtained with albumin, plasma colloids or other colloids, and are explained on the basis of selective adsorption. The different behavior, therefore, of the 2 components of trypan blue in the organism cannot be attributed to differences in diffusibility but to differences in adsorption by the proteins. S. MORGULIS

Purification of the lactic acid-forming enzyme. KARL MEYER. *Biochem. Z.* 193, 139-60(1928); cf. *C. A.* 21, 2281.—The purification of the lactic acid-forming enzyme of muscle is carried out by (1) repeated pptn. at p_H 5 with acetate soln. and subsequent leaching out with dil. phosphate of p_H 7.5-8.0; or (2) by adsorption with $Al(OH)_3$ and subsequent leaching with phosphate. The first method gives good but not easily reproducible results while the second method gives very uniform results. Solns. are thus obtained with 20 times the activity of the original ext. This, however, takes out only the heat-sensitive part; so that the thermolabile co-enzyme must always be added. The purified enzyme is more stable than the muscle ext., and loses $1/2$ of its activity in 24-48 hrs.; it is very much less affected by NaF showing that this must act indirectly by affecting the protein impurities. The effect of arsenate is the same in both pure enzyme and in muscle ext. S. MORGULIS

Behavior of proteins towards alkali and some deductions from this as to their constitution. J. TILMANS AND P. HIRSCH. *Biochem. Z.* 193, 216-36(1928).—The acid and basic characteristic of proteins and their derivs. is a property easily defined quant. and finds expression in the typical I-curves. Both egg albumin and gliadin possess small I-curves in the unaltered condition, and especially the gliadin has a very slight binding capacity for acid or alkali, giving very large equiv. wts. for the acid or basic action. This indicates that the mol. must be large, or very long in case it is a peptide chain. The I-curves are greatly modified through the action of NaOH on the proteins, especially the egg albumin, where the I-value increases very rapidly. This is not due to adsorption of unaltered protein and its liberation during the subsequent titration. Under the influence of NaOH new acid or basic groups must originate from the protein, probably from the peptide linkage. However, since it is known that peptides are acted upon by NaOH with difficulty it is suggested that the free

COOH and NH_2 groups must come from a diketopiperazine ring, which is easily and quickly split open by alkali.

The distribution of the respiratory enzyme between carbon monoxide and oxygen. OTTO WARBURG AND ERWIN NEGELEIN. *Biochem. Z.* 193, 334-8(1928).—If E-O_2 and E-CO are the combinations of enzyme with O_2 and CO , A_0 is the respiration in air and A the respiration in a CO-O_2 mixt., then $A_0/A = n$, and $\text{E-O}_2/\text{E-CO} = n/(1 - n)$.

S. MORGULIS

The effect of wave length on the distribution of the respiration enzyme. Absorption spectrum of the respiration enzyme. OTTO WARBURG AND ERWIN NEGELEIN. *Biochem. Z.* 193, 339-46(1928).—The distribution of the respiration enzyme of yeast kept in a CO-O_2 mixt. between CO and O_2 is greatly affected by radiation. S. M.

The effect of carbon monoxide and light on hemin catalysis. H. A. KREBS. *Biochem. Z.* 193, 347-9(1928).—Hemin catalysis, *i. e.*, the transfer of O_2 to cysteine with the aid of hemin, behaves similarly to the respiration of living substance towards CO and light.

S. MORGULIS

Biological effects of the Wiesbaden hot-spring waters. III. Studies on the biological significance of the heavy-metal catalysis. KARL HARPUDER. *Biochem. Z.* 193, 372-9(1928); cf. *C. A.* 21, 2280.—Dialysis of serum against Wiesbaden spring water results in increased peroxidase and oxidase action while the catalase activity and the methylene blue reaction are inhibited. The dialysis also causes a demonstrable increase in Fe content of the serum. Treatment with the Wiesbaden water, which is a salt soln. contg. catalytically active heavy-metal salts, does not induce the oxidation of amino acids or of carbohydrate cleavage products in serum, red cell stroma or in inactive C . IV. The influence of ferrous and manganous ions on enzymes. *Ibid* 380-3.— Fe^{++} and Mn^{++} ions in concns. ranging from 1×10^{-3} to $0.5 \times 10^{-3} M$ have a definite effect on enzymes. Salivary diastase and pepsin are inhibited by the larger concns. and stimulated by the lower concns. Trypsin showed only a slight inhibition through high Fe concns.

S. MORGULIS

Surface tension of aqueous solutions of salts with large molecular weight. G. ETTISCH AND R. KOGANEL. *Biochem. Z.* 193, 390-2(1928).—Na glycocholate and taurocholate surface tension curve at different concns. shows a very distinct min. Na oleate under similar conditions shows no min. in the surface-tension curve.

S. MORGULIS

The biology of uranium. JULIUS STOKLASA, JOS. PÉNKA, FILZ, ZDOBNICKÝ, SEBOR, ŠTRUPL AND ŠTRÁDAL. *Biochem. Z.* 194, 15-76(1928).—Minute amts. of U in the form of $\text{UO}_2(\text{NO}_3)_2$ stimulate the assimilation of elementary N and formation of new protoplasmic substance in N -fixing bacteria. This occurs very strikingly in the presence of O_2 . The NH_3 production is not influenced by the UO_2 ions. Starting with a U quantity of 0.000003125 g. atom per l. of nutritive soln., the toxicity rises with increasing amts., and in a concn. of 0.0005 g.-atom U per l. collagen is no longer decomposed. Denitrification is not affected by the UO_2 ion. Within the limits of concn. indicated above UO_2 stimulates the process of germination of seeds and development of the embryo. Larger concns., however, depress the process, producing a toxic effect upon the protoplasm, especially marked in the root system. The photosynthetic CO_2 assimilation is improved. In the presence of KHCO_3 increased photosynthetic CO_2 assimilation does not occur in the presence of UO_2 ions, which is attributed to an antagonism between the radioactivity of U , Ra and K , since the same was found to hold for radioactive waters. Plants grown in the presence of the radioactive U transpire much larger quantities of H_2O than otherwise. This increased transpiration together with the improved absorption of individual ions from the nutritive medium results in greater growth. The medium contg. 0.0014-0.0042 g. $\text{UO}_2(\text{NO}_3)_2$ turns slightly alk. owing to the increased absorption of the anions. The interesting point is that whereas these concns. stimulate growth in the light, they produce an injurious effect in the dark, where also death is caused sooner than in light. It follows therefore that small U concns. stimulate growth only in the light. A further interesting observation is that plants showing the greatest increase in mass also assimilate the largest amt. of H_2PO_4 . Contrariwise, where the growth had been depressed there was a diminution in the P content while the assimilation of Si ions and other anions (Cl , SO_4) has increased. Soil fertilization with $\text{UO}_2(\text{NO}_3)_2$ leads to luxurious plant growth. The expts. show further that the β and γ radiations (also pure γ -rays) have a depressing action on the germination and development of the plant; they stimulate photosynthesis and growth (γ -rays in large doses depress the vital activity of the protoplasm). In plants grown in the shade radiation with 15 g. $\text{UO}_2(\text{NO}_3)_2$ has an injurious effect, this effect being somewhat offset if the plants are also exposed to ultra-

violet radiation. The β and γ radiations have their beneficial influence only in the presence of intense sunlight. $\text{UO}_2(\text{NO}_3)_2$ in glass tubes inserted inside the plant (about 71.1 g. U per 100 g. dry substance) causes complete destruction of the living plant. The β rays of U penetrate the cell wall and permeate the cytoplasm and karyoplasm and stimulate in small doses the reduction and photosynthetic processes in the chlorophyll portions. The γ -rays act very much in the same way. The α -rays stimulate the oxidation processes in the cells. The result is that U radiation causes a more intense oxidation and reduction to take place in the chemistry of metabolism. A fact of great importance is that the addn. of relatively small amts. of U (2-10 kg. per hectare, depending upon the individual plant) gives to the cultivated plants greater resistance against parasites.

S. MORGULIS

Studies in the colloid chemistry of hemoglobins. I. BR. JIRGENSONS. *Biochem. Z.* 194, 140-50(1928).—In the presence of org. substances the visible spectrum of hemoglobin instead of the usual 3 bands (525-550; 575-585; and 629-639 μ) shows only 2 bands at 520-550 μ and 560-580 μ . Capillary inactive org. substances produce the effect more slowly than active substances and only at higher temp. salts (KCl or MgCl_2) have no effect on the absorption bands of hemoglobin.

S. MORGULIS

The carbon monoxide combination with ferrocysteine and its decomposition by light. WERNER CREMER. *Biochem. Z.* 194, 231-2(1928).—The compd. formed when cysteine and FeSO_4 are mixed reacts with CO , 2 mols. of the latter being combined with 1 mol. Fe. Like the hemin- CO , this compd. is broken up by light. The orange yellow ferrocysteine- CO compd. differs from the CO combination with the respiration enzyme or with hemin by its absorption spectrum.

S. MORGULIS

Studies on the catalytic decomposition of hydrogen peroxide by blood. I. The chemical dynamics of blood catalase. KADZUE NOSAKA. *J. Biochem. (Japan)* 8, 275-99(1928).—The catalytic decompn. of H_2O_2 in concns. of 0.009-0.036 N by blood solns. was studied. The kinetics of the reaction does not follow the monomol. equation but corresponds closely to Yamazaki's formulation, $-dc/dt = kEC$, and $-dE/dt = k'EC$, from which $k = (\Delta \ln C / \Delta t)_t = 0$ can be calcd. (E = concn. of catalase; C = concn. of H_2O_2). With variable enzyme quantities there is no strict proportionality in the k values, which increase somewhat more than E . This discrepancy can be corrected thus, $k_1/k_2 = (E_1/E_2)^m$, the value of the exponent m remaining const. (1.07) under different temps. Blood serum has no catalytic action but it does exert a protective effect on the blood catalase against the H_2O_2 . The H-ion concn. plays a considerable role in the reaction but the optimum concn. for blood catalase is about $p_H = 7.0$ with a distinctly wide range. The H-ion concn. has practically no influence on the destruction of catalase by the H_2O_2 . **II. The effect of temperature on blood catalase.** *Ibid* 301-9.—It is impossible to study the effect of temp. on blood catalase without due consideration of the very potent influence of temp. on the simultaneous destruction of catalase by H_2O_2 . The temp. curve of blood catalase has a very wide optimum range in the neighborhood of 40° , and for the temp. range between 0° and 20° the temp. coeff. is 1.49 per 10° and the temp. const. $A = 6430$. On the contrary, the temp. curve of the destruction of catalase by H_2O_2 is very steep and has no optimum. For the range between 0° and 35° the temp. coeff. is 2.22 per 10° and $A = 14600$. The velocity of heat inactivation at $p_H 7.0$ was studied at 40° , 50° , 60° , 65° and 70° , but this does not follow the monomol. reaction.—Blood catalase is completely inactivated by heating 30 min. at 65° or 15 min. at 70° . **III. The catalytic activity of the red cells.** *Ibid* 311-30.—A suspension of red blood cells in physiol. NaCl soln. decomposes H_2O_2 , but the process is quite different from that effected by a blood catalase soln. (laked blood). The blood cell catalase in dil. H_2O_2 solns. (0.0057-0.0228 N) follows exactly the mass-action law, $-dC_{\text{H}_2\text{O}_2}/dt = kC_{\text{H}_2\text{O}_2}C_{\text{cells}}$. Both the serum and plasma have a distinctly stimulating influence on the red-blood cell catalysis. The reaction in all concns. of NaCl soln. is monomol. so long as there is no hemolysis. In the presence of hemolysis, however, the reaction proceeds much more rapidly and is no longer monomol. The red-cell reaction is regarded as a special case of H_2O_2 catalysis without the intervention of catalase. **IV. The so-called heat-activation and the influence of some organic substances on the red-blood cell catalysis.** *Ibid* 331-40.—Heating the red-cell suspension to 45° increases considerably its catalytic effect on H_2O_2 , which is due to the resulting hemolysis. Likewise, the activation by various protoplasmic poisons (ether, chloroform, toluene) is similarly occasional.

Application of the ultramicroscopic method to the study of changes in dispersion of protein solutions under the influence of electrolytes. V. N. SHREDER. *Zhurnal expil. biol. Med.* 8, 301-13(1928).—A systematic study of a series of anions and cations

of physiologically important salts by means of the ultramicroscope shows that these shift the reaction where the max. number of ultramicroscopic particles appears (iso-electric point) either to the acid or to the alk. side.

S. MORGULIS
Peroxidase properties of leucocytes. K. NICOLAJEV. *Zhurnal expl. biol. Med.* 8, 33-41(1928).—Leucocytic exts. have peroxidase properties which disappear on boiling. The intensity of the oxidation process has no relation to the Fe content.

S. MORGULIS
The role of the iodine component of the thyroxine molecule. B. ZAVADOVSKII, N. RASPOPOVA, T. ROLITCH AND E. UMANOVA-ZAVADOVSKII. *Zhurnal expl. biol. Med.* 8, 600-11(1928).—Implantation of I_2 surrounded by moist cotton has been found the most reliable and certain method for inducing metamorphosis in axolotls. By this method relatively large amts. of I_2 can be introduced without causing damage to surrounding tissues. Placing axolotls in a soln. of I (0.00001) calls forth peculiar shivering. The min. quantity of cryst. I_2 necessary to produce metamorphosis in axolotls weighing 8-15 g. is 0.5 mg. so that this is about 80 times as potent as thyroxine, of which 0.003-0.010 mg. was found necessary. Obviously the I_2 must first form an org. complex before it becomes effective in producing metamorphosis, this synthesis apparently being the function of the thyroid gland. Expts. by the implantation procedure with diiodothyroxine show that this cannot replace thyroxine, and that the cryst. I_2 is a very much more effective agent than the diiodothyroxine, making it doubtful if the latter is really an intermediate step in the synthesis of thyroxine.

S. M.
Digestibility of racemized casein and egg albumin. KUO-HAO LIN, HSIEN WU AND TUNG-TOU CHEN. *Chinese J. Physiol.* 2, 131-8(1928).—Like denatured protein racemized egg albumin is sol. in dil. acids and alkalies but is precipitable by bringing the reaction of the soln. to its isoelec. point, which is about p_H 4.45. Racemized protein may be considered as a kind of denatured protein. Contrary to the findings of Dakin and Dudley and of Dakin, racemized casein and egg albumin are digestible by pepsin and trypsin and racemized egg albumin is susceptible to putrefaction. It is therefore concluded that loss of digestibility of a protein does not follow its racemization. The loss of the antigenic power of racemized egg albumin is due probably not to racemization but rather to the same changes which decrease the antigenicity of alkali-denatured albumin.

L. W. RIGGS
Ultra-violet radiation from sunlight and incandescent lamps—its transmission through window glass and substitutes. H. N. BUNDESEN, H. B. LEMON, I. S. FALK AND E. N. COADE. *J. Am. Med. Assoc.* 89, 187-9(1928); *Expt. Sta. Record* 57, 792-3.—The variations in the limits of the solar spectrum during the year were detd. by means of calibrated photographs. Comparatively little ultra-violet of known physiol. value is in the sunlight of Chicago during the winter months. Incandescent 300 w. lamps with ordinary glass bulbs emitted radiations comparable to sunlight in the winter months, and Vitaglass bulbs emitted radiations as far as the region of 2800 to 2900 A. U. Sunlight spectra through Vitaglass and through a sample of M. G. Co. glass were practically the same, both glasses transmitting the sunlight available at the time to 3000 A. U.

L. W. RIGGS
The sulfonated proteins. I. The action of the proteolytic enzymes on the sulfonated proteins. AKISUKU MATSUMOTO. *Acta Schol. Med. Univ. Imp. Kioto* 10, 219-27(1928).—M. examd. the digestive power of pepsin, pancreatin and erepsin on β -naphthalenesulfocasein, using the liberation of amino N as a quant. measure of the process. The β -naphthalenesulfocasein was found to be more resistant toward these enzymes than casein. Pepsin had no effect at all. Pancreatin split it to a considerable extent, but less than when acting on casein. Erepsin alone was without effect; it was ineffective also, when applied after the β -naphthalenesulfocasein had been treated with pepsin. A previous digestion of β -naphthalenesulfocasein with pancreatin caused the erepsin to split the sulfocasein to a certain degree; yet its activity was smaller than when acting on casein. II. The effect of erepsin on the sulfonated polypeptides. *Ibid* 229-33.—For the expts., β -naphthalenesulfoglycylglycine (I) and β -naphthalenesulfodiglycylglycine (II) were prepd. I (from glycylglycine and β -naphthalenesulfonyl chloride), m. 178-80°, is not attacked by erepsin, while II (from diglycylglycine and β -naphthalenesulfonyl chloride), m. 233-5°, is slightly hydrolyzed by it.

G. SCHWOCH
Manna. E. M. HOLMES. *Chemist and Druggist* 107, 429(1927).—Tamarisk manna (cf. C. A. 18, 2724), recently again observed in Palestine, is probably not the manna of Scripture. A substance described by A. J. Swann, of African origin (between Tanganyika and Nyassa lakes), more nearly agrees with it. It resembles coriander seed, is white, sweet, melts in the sun, and when kept overnight is full of worms in

the morning. "Baking" it will cause the material to keep better. It is evidently a fungus probably as yet unknown and cultivated by ants. S. WALDBOTT

Properties of the bactericidal substance in milk. F. S. JONES. *J. Exptl. Med.* **47**, 877-88(1928); cf. *C. A.* **21**, 1136.—The bactericidal substance is present in the colostrum and milk of the first few days of lactation as well as later. Its concn. varies in the secretion from various quarters of the same cow. Its activity is diminished by heat and cannot be restored again by the addn. of active milk. The principle is present in whey and readily passes through the coarsest Berkefeld filter although a considerable portion is retained by N candles. The finest filter (W) completely retains it. It is adsorbed by animal charcoal but not by kaolin, kieselguhr or bolus alba. It can be desiccated and its presence has been demonstrated in one brand of dried milk. C. J. WEST

B—METHODS AND APPARATUS

STANLEY R. BENEDICT

Manometric method for determination of lactic acid. J. P. BAUMBERGER AND JOHN FIELD, II. *Proc. Soc. Exptl. Biol. Med.* **25**, 87-9(1927).—A method for detn. of lactic acid is described which gives very good agreement of detns. of lactic acid in a total quantity of less than 1 mg. C. V. B.

Determination of blood p_H without transferring the sample. L. MCQUARRIE. *Proc. Soc. Exptl. Biol. Med.* **25**, 134-6(1927).—An app. and the procedure are described which permit detn. of p_H of blood without transferring the blood sample and without using mineral oil. C. V. B.

New method for the identification of blood in the insoluble state. FRANCESCO PISANI. *Arch. farmacol. sper.* **44**, 260-4(1928).—The blood stains are extd. with 50% KOH and the soln. is treated with a satd. soln. of $(NH_4)_2SO_4$ and shaken with a few drops of pyridine. By this treatment the hemoglobin is broken up into globin and hematin, the globin salted out and the hematin extd. by the pyridine. With actual blood stains the pyridine layer thus obtained has a red color which may be identified spectroscopically, or the solvent may be evapd. and the residue treated with AcOH and a trace of NaCl for the prepn. of characteristic hematin crystals. A. W. DOX

Method of determining trypsin in pancreatic juice. BORIS GOLDSTEIN. *Fermentforschung* **9**, 322-8(1928).—The method is based on a measurement of the time interval between the beginning of proteolysis and the first evidence of free tryptophan. The reagents required are (1) a 5% casein soln. prepd. by dissolving 2.5 g. casein in 16 cc.

0.1 N NaOH and 20 cc. H_2O and dilg. to 50 cc., (2) 3% AcOH, (3) 0.5% Br soln., (4) a buffer soln. prepd. by adding 9 cc. $N/3 Na_2HPO_4$ to 1 cc. $N/3 NaH_2PO_4$ ($pH = 7.73$). To 15 cc. of the casein soln. add 2 cc. of the phosphate buffer and a definite vol. of the soln. to be tested for trypsin. Mix thoroughly and place 1.5 cc. portions in each of 10–11 test tubes of colorless glass. Place the tubes in a thermostat and every 5 min. remove one tube for the tryptophan test. To perform this test add 10 drops of the 3% AcOH which gives a white ppt. of casein, and 1 drop of the 0.5% Br water. The first tube to give a rose-violet color represents the end point. The color may be brought out more distinctly by centrifuging 0.5 min. The time interval between the addn. of enzyme soln. and the first appearance of the tryptophan reaction is inversely proportional to the trypsin content. The tryptic unit is arbitrarily taken as the amt. of trypsin required to give an incipient tryptophan reaction with 15 cc. of 5% casein and 2 cc. of phosphate buffer in 100 min. Instead of detg. the time interval as above, the series may be made up with enzyme soln. in progressive dilns. and all incubated the same length of time. The lowest concn. giving a positive tryptophan reaction would then be taken as the end point.

A. W. DOX

Processes in the sulphydryl titration with starch iodide and sodium nitroprusside. R. BIERICH AND K. KALLE. *Z. physiol. Chem.* 175, 115–34(1928).—Both the starch iodide and the Na nitroprusside spot method for detn. of SH entail certain errors requiring correction. The latter method is the more accurate when the appropriate diln. factor is applied. With either method the SH values of tissue exts. tend to be high in proportion to the diln. with H_2O . Acids do not alter the diln. factor appreciably. The I consumption of a tissue ext. increases with increase in the temp. at which the titration is performed. After fixation of the tissue by CCl_3CO_2H the I consumption decreases on exposure of the tissue to air, due to oxidation of the SH group. On the other hand, the I consumption of a tissue ext. increases with exposure of the fresh tissue to air, due probably to a splitting off of cysteine from the SH complex.

A. W. DOX

The determination of minute quantities of metals in biological material. I. The determination of lead in urine. H. B. TAYLOR. *J. Proc. Roy. Soc. N. S. Wales* (reprint) 61, 315–36(1928).—The lead in this method is sepd. from the urine sample by means of adsorption on CaC_2O_4 . The lead is then brought into soln. by HCl and the soln. made faintly acid to methyl red. The detn. is made by comparing the opalescence produced on the addn. of 1 cc. of a freshly prepd. 10% $NaHSO_4$ soln. to 5 cc. of the Pb-HCl soln., with that of standards contg. known amounts of Pb. The method is suitable for detecting as little as 1 part of Pb in 50 millions of urine. Samples which were acid to methyl red contained on the av. slightly more Pb than neutral or alk. ones.

RUSSELL C. ERB

Histochemical detection of nucleins. J. VERNE. *Bull. his. appl. physiol. path.* 4, 110–22(1927); *Physiol. Abstracts* 12, 193.—The methods hitherto applied are very inadequate. Important progress has recently been reported by using a hydrolytic reaction which liberates from the nuclear complexes one of their essential constituents, thymic acid, which is easily recognized by Schiff's reaction (violet with H_2SO_4 fuchsin). Verne gives a precise study of this nuclear reaction describing the technic minutely.

H. G.

The determination of sugar in normal urine. M. R. EVERETT AND M. O. HART. *J. Lab. Clin. Med.* 12, 579–89(1927); *Physiol. Abstracts* 12, 375.—The methods of Benedict and Osterberg, of Folin and Berglund, and of Sumner give somewhat different sugar values; this may be due to the presence in urine of substances which alter the amt. of color given by the sugar. Irregular changes, not prevented by antiseptics, occur in the sugar content after the sample is voided; these are affected by the H-ion concn.

H. G.

Estimation of acetone in urine. M. RUDOV. *Klin. Wochschr.* 6, 1359–60(1927); *Physiol. Abstracts* 12, 500.—The method is based on Legal's test. Ten g. Na nitroprusside is dissolved in 170 cc. water, and 20 cc. glacial AcOH added. To 1 cc. urine or dild. urine 1 drop 50% $(NH_4)_2SO_4$ soln. is added, and 1 to 2 drops of the above reagent; the soln. is mixed and covered with a layer of NH_3 . A definite bluish violet ring appears within 3.5 to 4 min. when the urine (or diluted urine) contains 0.85 mg. % acetone. If the ring appears sooner than this dilns. are made, and the test is repeated until that diln. is found which causes definite ring formation in $3\frac{1}{2}$ to 4 min. The diln. multiplied by 0.85 gives the acetone concn. in the original urine in mg. %.

H. G.

The determination of bilirubin in blood. L. JENDRASSIK AND A. CZIKE. *Deut. med. Wochschr.* 54, 430(1928).—A modification of the van den Bergh method for detg. bilirubin is described. To 2 cc. of the serum or plasma are added 0.5 cc. of 50% caf-

feine-sodium benzoate and 1 cc. of the diazo mixt. After 5 to 10 min., 6.7 cc. of 96% alc. are added and the pptd. proteins removed by filtration. The filtrate is compared colorimetrically with a standard of known concn. ARTHUR GROLLMAN

The determination of cholesterol in blood. D. ACEL. *Deut. med. Wochschr.* 54, 431-3(1928).—A rapid method for the detn. of the cholesterol in 0.5 cc. of blood is described. Results on 18 clinical cases are given. ARTHUR GROLLMAN

Estimation of the diamino nitrogen in the products of hydrolysis of proteins. J. C. KERNOT AND JOHN KNAGGS. *Biochem. J.* 22, 528-34(1928).—The percentage of N pptd. by phosphotungstic acid depends upon the concn. of N in soln., the temp. of pptn. and the temp. of the soln. while the ppt. is settling, the concn. of the acid used for the hydrolysis of the protein, and the period of contact of the protein with the cold acid before hydrolysis. BENJAMIN HARROW

Purification of secretin. EINAR HAMMARSTEN, OLOF WILANDER AND GUNNAR AGREN. *Acta Med. Scand.* 68, 239-47(1928).—The Dale-Laidlaw method of prepn. was improved so as to produce a better yield in a shorter time. The crude secretin was extd. with 95% alc. The active principle seps. between water and CHCl_3 and under certain conditions goes into soln. in benzene. This soly. is apparently conditioned on the presence of a water-sol. lipid. The greatest concn. of the active principle was obtained by adsorption of the ppt. formed at the junction of H_2O and CHCl_3 . S. MORGULIS

Automatic gas analysis for respiration experiments. M. KLEIBER AND A. WIRTH. *Biochem. Z.* 192, 241-9(1928).—An automatic gas analysis app. for respiration expts. is described. The method consists in recording photographically the difference in pressure between a measuring and a compensation buret. S. MORGULIS

Monomolecular layer spreading as a method for determining blood fat. E. GORTER AND F. GRENDL. *Biochem. Z.* 192, 431-56(1928).—The detn. is carried out essentially with the procedure of Langmuir-Adams. The fat is extd. from about 0.2 cc. blood with a mixt. of ether and alc. (1:3). This is heated to boiling and filtered. The dry residue of the filtrate is taken up in petr. ether and made up to a 5 or 10 cc. vol. Of this 0.1 or 0.2 cc. is used for the detn. S. MORGULIS

The availability of the quinhydrone electrode for measuring the pH of whole blood and serum. JULIUS GEWYCKE. *Biochem. Z.* 193, 181-6(1928). S. MORGULIS

Calculation of results of a calorimeter experiment with animals. PAUL HÄRI. *Biochem. Z.* 194, 91-5(1928). S. MORGULIS

A micromethod for determining dihydroxyacetone in blood. F. SILBERSTEIN AND F. RAPPAPORT. *Biochem. Z.* 194, 105-10(1928).—The Hagedorn-Jensen microsugar method is applicable for the detn. of dihydroxyacetone if this is carried out in the cold. Glucose under these analytical conditions causes no reduction. In blood, the preliminary boiling in the deproteinization process does induce a small loss of dihydroxyacetone. This is limited by diminishing the time of boiling to $1\frac{1}{2}$ min. and an empirical correction is suggested for the slight loss still occurring. S. MORGULIS

A new method for the preparation of collodion tubes and membranes. TH. HUZELLA. *Biochem. Z.* 194, 128-31(1928).—The essential feature of this method is the use of a sugar sirup as the support for the membranes. A concd. soln. of sucrose is boiled with a few drops of AcOH , caramel formation being avoided. The thick sirup is poured into an enameled dish and on cooling gives a perfectly smooth surface. The collodion is poured over this and after evapn. of the ether is covered with distd. water. This causes the collodion membrane to sep. neatly, and it is now possible to cut it in various shapes. Collodion tubes are prepd. by dipping glass rods or test tubes of desired diam. into the sirup and after allowing this to dry in a smooth coating, dipping into the collodion soln. The tubes are again very neatly removed upon dissolving the sugar with water. Very fine, capillary collodion tubes can also be made by drawing out fine threads of the sugar sirup and dipping them in collodion. These capillary collodion tubes can be sterilized by boiling, and may be wound on a spool and kept sterile in boiled out distd. water to which a few drops of CHCl_3 had been added. The permeability of the tubes, sacs or membranes is regulated by their water content, by the alc./ether ratio of the solvent (up to 3:1), and by the collodion concn. (2-8%). With increasing permeability the articles become more fragile, the permeability not being much influenced by the thickness of the collodion. The shorter the time of drying in the air the more permeable is the membrane. S. M.

Notes on the determination of cholesterol. H. DAM. *Biochem. Z.* 194, 177-87(1928).—The cholesterol pptd. with an alc. soln. of digitonin varies in compn., depending upon the excess of digitonin. Washing with alc. removes appreciable amts. and

should therefore be made with a satd. alc. soln. of cholesterol digitonin. The calcn. of the results should be made in accordance with a previously prepd. standardization curve. In detg. the total cholesterol in the presence of a small ester fraction, the free cholesterol should be first pptd. with digitonin and the esters detd. colorimetrically in the filtrate.

S. MORGULIS

Determination of bismuth in urine. H. BAGGESGAARD-RASMUSSEN, K. A. JACKEROTT AND S. A. SCHOU. *Biochem. Z.* 193, 53-61(1928); cf. *C. A.* 21, 3643.—The detn. of Bi in urine is based upon its reaction with I_2 which in acid soln. gives a complex yellow salt: $Bi^{+++} + (3 + n)I^- \rightleftharpoons BiI_{3+n}^{n+}$. The light absorption of this compd. was detd. with the spectrophotometer, the blue Hg line at 4359 Å. U. being used. The light absorption is found from the formula $E = \log \lg \alpha - \log \lg \beta$, where α and β are the 2 angles measured with the spectrophotometer. As the standard a soln. contg. 0.1 mg. Bi per cc. is used which is prepd. by the following method. A g. of Bi subnitrate is dissolved in 10 cc. dil. HNO_3 and poured into 200 cc. 1% NH_4OH . The ppt. is washed with boiling water and ignited to const. wt. 0.115 g. of the Bi_2O_3 are dissolved in a few drops of hot dil. HNO_3 which is then boiled off after the addn. of 10 cc. 4 N H_2SO_4 , and finally dild. to 1 l. with N H_2SO_4 . In urine analyses the org. matter must first be destroyed and this is done by the Neumann wet combustion procedure, the last traces of HNO_3 being driven off by boiling with 10 cc. satd. $H_2C_2O_4$. By proper choice of acid concn. the final sample has practically the same acidity as the standard. To 20 cc. soln. are added 1 cc. of 10% KI, 1 cc. of a 15% Na citrate (to remove Fe salts) and 1 cc. of 10% Na_2SO_3 (to destroy the slight yellow color resulting from the mixt. of KI, SO_2 and H_2SO_4), and 2 cc. H_2O . The standard is prepd. similarly with 1 cc. of Bi soln., 1 cc. of each reagent and dild. to 25 cc. The colors are then compared in a colorimeter. The Bi concn. in the urine is detd. from the formula: mm. standard/mm. unknown \times 0.1 mg. per 100 cc.

S. MORGULIS

The isolation of various natural phosphoric acid compounds and the problem of their identity. K. LOHMANN. *Biochem. Z.* 194, 306-27(1928).—The true inorg P is detd. as follows: to 5 cc. of soln. contg. 0.1-0.6 mg. P_2O_5 is added 1 cc. of a 5-10% NH_3 soln. and 2 cc. of Mathison's Mg citrate reagent (*C. A.* 4, 1997). The pptn. is made in a narrow centrifuge tube. The NH_4MgPO_4 is allowed to crystallize out at least 20 hrs., and centrifuged off. The ppt. is now washed with 8 cc. 1% NH_4OH , dissolved in 5 cc. molybdate reagent and transferred to a 25 cc. volumetric flask. The P is detd. colorimetrically. The phosphagen-phosphate is detd. by the Fiske-Subarow method, and is the difference between the 2 detns. The total P was detd. by washing the material in a 25 cc. Kjeldahl flask with a 1:5 mixt. of 2 N HNO_3 and H_2SO_4 . The phosphagen phosphate detn. depends upon the fact that this substance is unaffected in a neutral or alk. soln. but is completely hydrolyzed in 5-8 min. at 37° in an acid medium contg. molybdic acid. Embden's hexosemonophosphoric ester and creatine phosphoric acid (phosphagen) are found in the water-sol. fraction of the alk. earth salts obtained from the trichloroacetic acid ext. from fresh muscle. Their sepn. is accomplished by fractional pptn. of the Ba salt with dil. alc. and the final removal of Embden's ester from the phosphagen by pptn. with $Cu(OH)_2$ in $Ba(OH)_2$ soln. The kinetics of the acid hydrolysis of the H_3PO_4 from the org. combination (Embden and Robison, and the Neuberg esters) leads to the conclusion that the 2 are different, and that the Embden-Robison esters contain an aldose while the Neuberg ester contains a ketose component. The hydrolysis of the creatinephosphoric ester always shows a monomolecular course.

S. MORGULIS

Micromethod for determining blood sugar. KURT DRESEL. *Biochem. Z.* 194, 466-72(1928).—On the av. 2.5% of the sugar is lost from blood preserved 24 hrs. in dry condition on filter paper. If the papers are not kept in a thoroughly dry atm. the loss is much greater in consequence of glucolysis. It is also pointed out that the 3 min. boiling in the Hagedorn-Jensen method is often not sufficient, and even after 30 min. the results are only 6% too high. It is assumed that 3 min. is not always sufficient time completely to ext. the sugar from the blood cells.

S. MORGULIS

A method for the preparation of a succinodehydrogenase free from fumarase. NILS ALWALL. *Skand. Arch. Physiol.* 54, 1-5(1928).—Since fumarase, the enzyme which reduces fumaric acid, is much more temp.-labile than succinodehydrogenase, warming a suspension of washed ground muscle substance to 50° for 30 min. causes complete destruction of the former practically without affecting the latter. In this way a pure succinodehydrogenase can be prepd.

S. MORGULIS

Micromethod for determining sugar in blood. L. M. KRASNYSKI. *Zhurnal expl. biol. Med.* 8, 154-60(1928).—Various analytical conditions are discussed in

connection with the Hagedorn-Jensen blood-sugar detn. essential in securing accurate results. S. MORGULIS

Invertase. I. Preparation and purification of the enzyme. B. N. SASTRI AND ROLAND V. NORRIS. *J. Indian Inst. Sci.* 11A, 1-13(1928).—A study of the steps involved in the prepn. of invertase led to the following method: Brewers yeast is autolyzed under toluene for about 34 days, filtered through folded filter-papers, and concd. by freezing. This liquor is treated with kaolin; the protein and other impurities adsorbed upon the kaolin are removed by filtration; the invertase is pptd. with solid $(\text{NH}_4)_2\text{SO}_4$ (90% mtn.); the water soln. of the ppt. is dialyzed and then treated with $\text{Al}(\text{OH})_3$, upon which the invertase is adsorbed. The enzyme is eluted by means of 1% Na_2HPO_4 in 1% glycerol and is obtained in soln. by filtration through kieselguhr. The prepn. is white, odorless, gives neither the Molisch nor Millon test but positive biuret and xanthoproteic test, low in nitrogen and ash content and free from other enzymes. II. A simple method for concentrating enzyme solutions. *Ibid* 14-7.—A concd. enzyme ext. is obtained by subjecting a dil. soln. to freezing temp. under mech. stirring and subsequent filtration of the ice crystals. N. M. NAVLOR

Preparation of colloidal gold for biological investigations. G. REBIÈRE. *Colloides biol. clin. therap.* 1, 213-7, 229-31(1928).—In order to obtain colloidal Au of uniform quality and properties it is essential to use Zsigmondy's technic. von Veimarn's modification (consisting essentially in the use of less pure reagents, KOH instead of K_2CO_3 and longer boiling) does not give satisfactory results for biol. investigations. The precautions to be taken are described in detail and consist essentially in the use of specially distd. H_2O (ordinary distd. H_2O redistd. in an all-glass Pyrex still) and freshly prepd. pure reagents (AuCl_3HCl $4\text{H}_2\text{O}$, K_2CO_3 and recently prepd. 40% CH_2O), and scrupulously clean app. A. PAPINEAU-COUTURE

Nephelometric estimation of peptones in a solution of sodium chloride at 1 to 1000. H. SURMONT AND (MLLE.) R. PROVINO. *Bull. soc. chim. biol.* 10, 406-12(1928).—A 30% soln. of $\text{CCl}_3\text{CO}_2\text{H}$ ppts. a max. of albuminoid substances. This ppt. is stable at the end of 20 min. and remains const. for 4 hrs. after the pptn. The index of diffusion is proportional to the concn. of proteins only when the latter is greater than 1 in 1000. The concn. of the soln. should not be greater than 3 in 1000. By taking account of these statements, it is possible to make a gross quant. analysis of com. samples of peptone by the nephelometric method and by aid of $(\text{NH}_4)_2\text{SO}_4$ to det. the quantity of its separate constituents. Nephelometric estimation of albuminoid material in the gastric liquids. *Ibid* 413-4. L. W. RIGGS

Method of volumetric estimation of urea by oxidation of xanthylurea. HENRI CORDEBARD. *Bull. soc. chim. biol.* 10, 461-71(1928).—The method depends on the oxidation of xanthylurea by means of a mixt. of $\text{K}_2\text{Cr}_2\text{O}_7$ and H_2SO_4 . L. W. RIGGS

Distilled water in biology. E. CANALS AND M. MOUSSERON. *Bull. soc. chim. biol.* 10, 472-7(1928); cf. *C. A.* 21, 1664.—In prepg. "conductivity water" the app. should be of hard glass or better of Pyrex glass. The quality of the water was not improved by replacing a Pyrex tube with one of quartz. The findings of Bordas and Touplain (cf. *C. A.* 20, 1929) on the diminution of cond. of distd. water on standing were confirmed. This diminution of cond. is greater if the water is again distd. The period of repose may be shortened by rapid cooling of the freshly doubly distd. water from 22° to 4° and allowing the temp. to return to 22° in 3 hrs. To obtain water with a cond. of about $1.2 \times 10^{-6} \omega/\text{cm.}$ and a p_H 5.6 to 5.8 it is recommended to use app. of Pyrex glass and to allow the water thus obtained to stand in closed Pyrex vessels. A sheet of Pt covered with Pt black immersed in the water favors the diminution of cond. during repose. A third distn. is of no advantage, nor are distns. with $\text{K}_2\text{Cr}_2\text{O}_7 + \text{H}_2\text{SO}_4$ or $\text{Ba}(\text{OH})_2$. L. W. RIGGS

Estimation of glucose in the presence of proteins. P. FLEURY AND G. BOYELDIEU. *Bull. soc. chim. biol.* 10, 568-75(1928).—In the estn. of glucose in the presence of proteins the albumoses and peptones appear to diminish the reducing power of the glucose. Amino acids and actual albumins do not show this property. In the elimination of albumoses and peptones before detg. glucose, HgSO_4 should be used instead of $\text{Pb}(\text{AcO})_2$. L. W. RIGGS

Improvement of the technic of mercurial defecation of blood for the estimation of glucose. GEORGES FONTES AND LUCIEN THIVOLLE. *Bull. soc. chim. biol.* 10, 581-9(1928); cf. *C. A.* 21, 2712.—The defecating liquid of Bierry and Moquet is modified and made up as follows: To 400 g. $\text{Hg}(\text{NO}_3)_2$ is added 700 cc. of H_2O and the mixt. is warmed to 40°, concd. HNO_3 is added in a quantity for complete soln., then concd. KOH is added drop by drop until a permanent ppt. forms. This mixt. is made up

to one l. with H_2O . In the defecation procedure $AcOH$ is replaced by $H_2C_2H_3O_4$.

L. W. RIGGS

Estimation of uric acid in biologic liquids. RADU VIADESCO, *Bull. soc. chim. biol.* 10, 602-5(1928).—The blue color produced by the addn. of phosphotungstic acid to solns. of uric acid is discharged by titration with Cl water instead of being read colorimetrically.

L. W. RIGGS

Colorimetric determination of biliary salts in the duodenal liquid. M. CHIRAY AND L. CUNY. *J. pharm. chim.* 7, 97-106(1928); cf. *C. A.* 21, 3211.—A modification of the method of Herzfeld and Haemmerli (*C. A.* 19, 2965) is used. Into a tube graduated to 5 and 10 cc., put 1 cc. of duodenal liquid and 95% alc. to 5 cc. Heat to boiling in a hot water bath to ppt. protein, cool, fill up again to 5 cc. and filter. Collect 1 cc. and have ready for comparison of color 1 cc. each of 4 standards contg. resp., 0.20, 0.10, 0.05 and 0.025% of pure cholic acid in 80% alc. soln. Into each of the 5 tubes put 0.5 cc. of 1% furfural and sufficient H_3PO_4 (d. 1.710) to bring to 5 cc. Shake each glass well, then keep all the tubes in boiling H_2O for 5 min., then in cold H_2O , and allow to stand 5 min. Into each tube put 50% alc. to bring the vol. to 10 cc., cork and mix well; after 2-3 min. compare the color in a Dubosq app. with that nearest to it among the 4 standards. Multiply the inverse proportion of heights by 10, 5, 2.5, 1.25, resp., to obtain g. of biliary salts per l. The method is sensitive to 1:16,000; the biliary salts are not carried down by the protein ppt., and bilirubin under the conditions of the detn. does not disturb the reaction.

S. WALDBOTT

C—BACTERIOLOGY

A. K. BALLS

The aldehyde mutation of acetic acid bacteria. KARL MYRBÄCK, H. VON EULER AND ERIK SANDBERG. *Z. physiol. Chem.* 175, 316-20(1928).—The $AcOH$ bacteria examd. dismute AcH rapidly and this property is destroyed by boiling. The heated ext. contains a cozymase which activated fermentation by cozymase-free yeast.

A. W. DOX

Nitrogen fixation by *Azotobacter chroococcum*. S. RANGANATHAN AND R. V. NORRIS. *J. Indian Inst. Sci.* 10A, 79-96(1927).—The vitality and vigor of *Azotobacter* cultures are better preserved in soil extract-agar medium contg. 1% mannitol than in mineral salts-mannitol-agar-medium; CO_2 , $EtOH$, AcH , HCO_2H , $AcOH$, lactic and tartaric acids are formed when dextrose is fermented; N fixation increases in proportion to amt. of sugar fermented, 50% or more of N fixed being assimilated within the first few days; phosphates do not economize sugar consumption but do accelerate the rate of N fixation; probably NH_3 is the first product of N fixation being subsequently converted into more complex compds. through mono and diamino intermediates; cells of the organism appear to contain about 30% protein and considerable fat and phosphatide material.

N. A. LANGE

The role of pyocyanin in the metabolism of *Pseudomonas pyocyanea*. A. A. STREEMAN. *Biochem. Z.* 191, 320-36(1927).—The current views on the significance of bacterial pigments are criticized. It is shown that the decolorizing of pyocyanin and the subsequent regeneration of the pigment through oxidation in air has a biol. importance. The change of the pyocyanin into the leucobase is attributed to its function as a H acceptor. The oxidation of the leucopyocyanin to pyocyanin is not affected by HCN . It is concluded that pyocyanin acts as a H transmitter in cellular metabolism.

S. MORGULIS

The so-called "Kombucha." T. SIEGWART HERMANN. *Biochem. Z.* 192, 176-87(1928).—"Kombucha" is a culture of microorganisms. It produces large quantities of gluconic acid. It represents a dark, thick, slimy skin which grows on sweetened Chinese tea. A 0.5% tea infusion contg. 7.5% sucrose yields at room temp. a good growth. The infusion becomes acid to litmus. The culture is kept until the acidity is such that 20 cc. requires 26 cc. 0.5 N $NaOH$ for neutralization. Tannin and methylxanthine are unaffected. Apart from acetic there was formed only *d*-gluconic acid, which was demonstrated as its Ca salt. Chemically pure glucose is converted largely into gluconic acid; levulose is fermented chiefly to $AcOH$; lactose is not fermented at all; maltose gives only traces of $AcOH$. Dextrin, *t*-mannitol and glycerol promote the growth but yield only traces of fixed or volatile acid. $EtOH$ yields only acetic acid. Sugar is tolerated up to concns. of 30%. II. *Ibid* 188-99.—Bacterial examn. of "Kombucha" shows that the isolated organism is unlike any other described. It must, therefore, be regarded as a new and hitherto entirely unknown bacterium which is designated *B. gluconicum*.

S. MORGULIS

Oxidation of waxes by microorganisms. W. O. TAUSSON. *Biochem. Z.* 193, 85-93(1928).—*Aspergillus flavus* can utilize as a source of C the esters of higher fatty acids with glycerol or higher alcohols. The oxidation proceeds similarly to that of paraffins with an alkalization of the medium, so that no intermediate free acids are formed. The absolute amt. of wax oxidized by this mold varies more or less directly with the age of the culture. The suggestion that in the oxidation of paraffins, esters are formed as intermediate compds. is supported by several quant. results. S. M.

Quantitative metabolism of paratyphoid B, colon and pyocyanus bacilli. FRANZ FRIEDLEIM. *Biochem. Z.* 194, 273-91(1928).—K, Na and Cl are dispensable if they are absent singly from the lactic acid-NH₄ nutritive medium. Mg and H₂SO₄ are not essential to life but stimulate growth. C, N and phosphate are essential to life. No marked differences were observed between the different bacteria in this matter. Na lactate serves as a source of C and of energy as efficiently as does glucose or Na pyruvate. NH₄ salts are a suitable source of N; Na asparaginate is not preferable to NH₄Cl. S. MORGULIS

Formation of hydroxylamine in the reduction of nitrates by microorganisms. A contribution to the problem of amino acid formation by microorganisms. JAKOB BLOM. *Biochem. Z.* 194, 392-409(1928).—Evidence is presented to show the formation of NH₂OH by microorganisms in nitrate-contg. media. The origin and significance of the NH₂OH are fully discussed. S. MORGULIS

Influence of the medium on the growth of tubercle bacilli. V. M. KULIKOV AND Z. I. NIKOLSKAJA. *Zhurnal expl. biol. Med.* 8, 73-7(1928).—The reaction of the nutritive medium has a marked effect on the growth of tubercle bacilli in the presence of various poisons. Cu ions are much more toxic in an alk. than in an acid medium, but the toxicity of thymol does not depend upon the p_H. Guaiacol is 300% more toxic in an alk. than in acid culture. S. MORGULIS

Specific gravity of bacteria. I. F. LEONTIEV. *Zhurnal expl. biol. Med.* 8, 418-21(1928).—The sp. gr. of *Micrococcus pyogenes albus* at 15° is 1.089. The av. sp. gr. of bacteria is estd. at 1.055. S. MORGULIS

Pigment formation in cholera and certain other vibrios. F. ONOLOV. *Zhurnal expl. biol. Med.* 9, 95-7(1928).—It was observed that a cholera-vibrio strain obtained at Rostov on the Don when cultured on a peptone bouillon produced pigment which was not observed with other strains. S. MORGULIS

Growth of mold fungi on coals (FISCHER, FUCHS) 21.

THOMAS G. PHILLIPS

Respiration of iron-deficient beans (*Phaseolus multiflorus*). HANS v. EULER AND SVEN STEFFENBURG. *Arkiv. Kemi Mineral Geol.* 9, No. 48, 1-6(1928).—The intensity of respiration per g. dry wt. is higher in green leaves than in chlorotic leaves. Also the respiration intensity per mg. Fe in the green leaves is higher than in the chlorotic leaves. Chlorotic leaves are higher in Fe content than green leaves. Possibly if the cytochrome bound Fe were detd. it would be higher in the green leaves than in the chlorotic leaves. H. R. KRAYBILL

Osmotic values in the cell sap of some salt desert plants. A. V. BLAGOVESHCHENSKI, V. A. BOGOLYUBOVA AND T. A. CHERNOVA. *Bull. Univ. Asie Centrale (Tachkent)* 1926, 4-8.—High osmotic value is not a characteristic property of inhabitants of "physiologically arid" soils. Under similar conditions plants with the same ecological characters have very different osmotic values. Osmotic value is regarded as a characteristic physiol. const. of the plant. H. R. KRAYBILL

Cause of blueing in red roses. G. S. CURREY. *J. Proc. Roy. Soc. N. S. Wales* 61, 307-14(1927).—Studies were made to det. why certain red roses like Hadley tend to become blue and others like Lady Maureen Stewart show little tendency to blue. Ash analyses of the petals of the two varieties were similar. The Hadley contained 1.26% Cryst. pigment based on dry wt. and the Lady Maureen Stewart 2.39%; the Hadley showing signs of blueing contg. 6.33% tannin, the Hadley with true color 7.58% and the Lady Maureen Stewart 11.62%. The anthocyanin pigment in the two roses is diglucoside cyanin and the tannin of both is identical. The blueing is due to insufficient tannin in the cell sap of the petals. H. R. KRAYBILL

Analytical studies of pollen in Switzerland. ERNST FURRER. *Vierteljahrssch. naturforsch. Ges. Zurich* 72, Beibl. No. 14, 1-37(1927).—Results of the amount and kind of pollen on various soils of Switzerland are given. H. R. KRAYBILL

Respiration of stored seeds. P. NEKRASSOV. *Nauchno Agron. Zhurnal* 4, 545-59 (1927); *Deut. landw. Rundschau* 1, 821(1928).—A study of the respiration of stored seed and the effect of various moisture contents. The CO_2 production increases with temp., reaching a max. at 40° . With higher temps. the CO_2 decreases. A valuable table is given on optimum moisture content of various seeds. GEORGE R. GREENBANK

The influence of sulfur on the nitrogen and phosphoric acid utilization of plants. A. KALUSHKII. *Nauchno Agronomicheskii Zhurnal* 4, 643-56(1927); *Deut. landw. Rundschau* 1, 819(1928).—By the addn. of 0.03 to 0.04% by wt. of S the p_{11} of the soil is changed from 7 to 6.6-6.8. The utilization of H_3PO_4 is increased 150 to 200 times. The influence on N utilization is in a positive direction. GEORGE R. GREENBANK

Nitrate reduction through plant roots. A. SCHMUCK. *Nauchno Agronomicheskii Zhurnal* 4, 155-70(1927); *Deut. landw. Rundschau* 1, 817-8(1928).—The root substrate is very strong in reducing nitrates and aromatic N compds. One g. of root mass will reduce 1 mg. of nitrite N or 75 mg. of NaNO_3 N. An increased concn of nitrite is found in the root zone. It is simultaneously abounding in acid and of a low nitrate concn. GEORGE R. GREENBANK

Semipermeability of seed coverings and stimulation of seeds. FELIX KOTOWSKI. *Plant Physiology* 2, 177-86(1927).—The effect of 16 hrs.' soaking in 1.50% solns. of KNO_3 and $\text{MnSO}_4 \cdot 4\text{H}_2\text{O}$ was studied for viable, carefully selected uninjured seeds of *Spinacia oleracea inermis*, *Cucumis sativus*, *Capicum annuum*, *Triticum vulgare*, *Secale cereale* and of *Hordeum distichum* and in addn. non-selected com. seed of the three cereals mentioned. The intake of the salts by, and the diffusion from the seeds in subsequent soaking was detd. by elec. cond. measurements of the external solns. The intake of the salt depends on the kind of seed and on the cation and anion of the salt, but the limiting factor is apparently the seed coverings. The seed coverings exercised a distinct check in the intake of KNO_3 , especially by cereals. When the seed coverings were intact, absorbed salts were held superficially. Hence, in the selected seeds there is little probability that the cation and anion could act on the protoplasm and stimulate growth. The partially injured seeds of the cereals had a high intake of salt and slight losses due to washing, owing to the permeability of spots deprived of seed coverings. WALTER THOMAS

The use of ethylene, propylene and similar compounds in breaking the rest period of tubers, bulbs, cuttings and seeds. G. A. VACHA AND R. B. HARVEY. *Plant Physiology* 2, 187-92(1927); one plate.—A mixt. of C_2H_4 and air (1:1000 by vol.) breaks the rest period and hastens the sprouting of potato tubers by 7 to 15 days, depending upon the variety. The growth rate of the treated tubers was also increased. An aq. soln. of $\text{C}_2\text{H}_4\text{O}$ (1:1000) was toxic to both potato tubers and gladiolus. C_2H_4 is effective in securing germination of seeds of buckthorn, high bush cranberry, Tartarian honeysuckle and snowberry. Both C_2H_4 and C_3H_4 were found equally effective in breaking dormancy. WALTER THOMAS

The p_{11} values of plants and corresponding soils (BLAGOVESHCHENSKII, *et al*) 15. The relationship between ethereal oils and resins (FIGULEVSKII) 17.

E—NUTRITION

PHILIP B. HAWK

Acceleration of lipase activity by substances containing vitamin A. B. L. JOHNSON. Iowa State College. *Iowa State Coll. J. Sci.* 2, 145-53(1928).—*Pancreatic extract increases the rate of hydrolysis of ethyl butyrate* to such an extent that distillable amts. of butyric acid can be obtained in a few hrs. The activity of the lipase can be calcd. from the amt. of butyric acid produced. Specially treated sea sand or specially treated sea sand covered with a film of cottonseed oil has no effect, or a slight depressing effect on the activity of the lipase. When vitamin A concentrates from butter fat, cod-liver oil, lard and cottonseed oil were added, the rate of formation of butyric acid was found to increase as much as 50% above that in lipase-sea sand-ethyl butyrate mixts., identical except for the presence of the vitamin A concentrates. There is no accurate parallelism between the lipase stimulating activity of the vitamin A concentrates and their anti-xerophthalmic activity. *Sodium oleate and sodium palmitate accelerate lipase activity.* Nine tables of data are presented. F. E. BROWN

The effect of an excess of vitamins A and B on the nourishment of growing animals. ARTURO MAGLIANO. *Riv. biol.* 7, 619-26(1925); *Chem. Zentr.* 1926, 11, 3098.—No effect is evident. H. G.

Lipoids and metabolism. HANS REITER AND WILFRIED REISSMANN. *Klin.*

Wochschr. 7, 306-7(1928).—N excretion is increased on a diet deficient in lipoids. A normal N excretion is promptly reestablished when lipoids are added to the diet. Lipoids spare protein. MILTON HANKE

Water retention in the organism after a diet rich in fat. W. V. MORACZEWSKI. *Klin. Wochschr.* 7, 359(1928).—The protein content of the blood is lower, after a diet rich in fat, than it is after a mixed diet or one rich in protein. The output of urine is decreased and its acidity increased after a fat-rich diet. Organic acids are increased. Ingestion of fat leads to a swelling of, and a water retention by, all body tissues including the blood. MILTON HANKE

The assay of the antirachitic vitamin D. K. M. SOAMES AND J. C. LEIGH-CLARE. *Biochem. J.* 22, 522-7(1928).—Vitamin A is supplied either by 20 percent wheat embryo or 50 percent hog millet (see *C. A.* 19, 2067). BENJAMIN HARROW

Vitamins of commercially concentrated orange juice. S. G. WILLIMOTT. *Biochem. J.* 22, 535-44(1928); cf. *C. A.* 21, 3938; 22, 2188.—Five cc. of orange concentrate (obtained from the California Fruit Growers' Exchange), which represents orange juice evapd. *in vacuo* at 37° until the vol. has been decreased approx. from 7 to 1), dild. to the strength of the original juice, was adequate in vitamin A for the rat. Ten cc. of the dild. orange concentrate was needed for vitamin B. BENJAMIN HARROW

The present state of our knowledge of vitamins. R. F. HUNWICKE. *Food Manuf.* 1, 97-8(1927). E. H.

Inhalation of irradiated oils in therapy. L. M. SPOLVERINI. *Pediatria Rivista* 35, 1112(1927).—The inhalation cured rickets in 2-5 months and caused a prompt and marked increase in the milk secretion of women. The beneficial effect frequently continued for a period after discontinuation of treatment. MARY JACOBSEN

Action of ions on the metabolism of the sugars. O. KAUFFMANN-COSLA. *Bull. soc. chim. biol.* 10, 397-404(1928).—Conclusions: Ca is an indispensable factor in the oxidation of sugars in the organism. In the same dog on a complete ration the resorption of Ca is invariable. In different dogs on the same complete and const. ration the metabolism of Ca varies with the individual. By the increase of alimentary glucose, without reaching the physiol. limit of cellular oxidation, there is a mobilization of the stored Ca and the quantity of Ca mobilized is directly proportional to the quantity of glucose administered and oxidized. L. W. RIGGS

Increase of the volume, weight and total nitrogen of the liver under the influence of a diet rich in nitrogen. CL. GAUTIER AND H. P. THIERS. *Bull. soc. chim. biol.* 10, 537-52(1928); cf. *C. A.* 21, 3668.—In the frog (*Rana esculenta*) during summer fed abundantly on cheese, the vol. of the liver increased notably and its wt. increased from 2 to 5 times. The total N per unit of fresh tissue was greater in starved animals than in those abundantly fed, but the total N content of the liver of the latter was 2 to 4 times that of the starved animals. L. W. RIGGS

Growth of rats on vegetarian diets. HSIEN WU AND DAISY YEN WU. *Chinese J. Physiol.* 2, 173-93(1928).—Four week old albino rats were placed on strictly vegetarian diets consisting of cereals, legumes and vegetables common in North China. NaCl and sesame oil were added to improve the palatability but no other supplement was used. Many of the diets were rachitic, although no other deficiency disease occurred. The rate of growth of these rats was about $\frac{1}{2}$ that of the stock rats on a diet consisting of $\frac{2}{3}$ ground whole wheat and $\frac{1}{3}$ whole milk powder (Klim). Some of the diets, in which "small cabbage," Yu Ts'ai (colza), Kan Lan Ts'ai or Kai Ts'ai were used to supplement the cereal-legume ration, supported normal growth and no sign of deficiency disease. However, the young of the second generation of these animals were undersized. No known vegetarian diet affords optimum nutrition for the omnivorous animal, the albino rat. L. W. RIGGS

Effect of diet low in calcium on fertility, pregnancy and lactation in the rat. D. MACOMBER. *J. Am. Med. Assocn.* 88, 6-13(1927); *Expt. Sta. Record* 57, 65.—Low-Ca diets do not produce sterility in the rat, but they do affect fertility by increasing the intrauterine mortality. The young are born normal in wt. and Ca content. The fetus receives Ca at the expense of the mother and this loss of Ca by the mother is intensified during lactation. The young during this period still show lack of Ca by stunting, weakness and often death. L. W. RIGGS

Deriving the formula for a diabetic diet. W. S. COLLENS AND D. H. SHELLING. *J. Am. Med. Assocn.* 88, 396(1927); *Expt. Sta. Record* 56, 797.—The authors have devised a chart for the rapid calcn. of diabetic diets from the caloric requirements of the patient and the percentage of total calories to be given in the form of protein. The diets are based on the Woodyatt ketogenic-antiketogenic ratio of 1.5 to 1. L. W. R.

Changes in composition of blood in pernicious anemia treated by a diet rich in liver.

W. P. MURPHY, R. T. MONROE AND R. FITZ. *J. Am. Med. Assocn.* 88, 1211-4(1927); *Expt. Sta. Record* 57, 297; cf. *C. A.* 21, 3657, 3658.—Analyses of the blood of 10 patients receiving the dietary treatment showed a prompt and rapid remission of the anemia in every case. No changes were noted in the non-protein N of the plasma or in the plasma protein, but the protein of the corpuscles increased notably and in almost direct proportion to the increasing hemoglobin concn. L. W. RIGGS

Malabsorption in deficiency diseases. F. L. BURNETT AND P. R. HOWE. *J. Am. Med. Assocn.* 88, 1705-9(1927); *Expt. Sta. Record* 57, 295-6.—This paper is a review and discussion of the literature on malabsorption in exptl. vitamin deficiency diseases and in human deficiency disorders. L. W. RIGGS

The malnourished child: an individual, intensive method of treatment. L. W. SAUER. *J. Am. Med. Assocn.* 89, 931-4(1927); *Expt. Sta. Record* 57, 898.—The method of treatment is based upon a properly adjusted 5-meal diet rich in vitamins, a restricted daily routine and ample bed rest. The av. gains were 5 lbs. for the first month, 3.5 for the second month and 2.9 for the third month. L. W. RIGGS

Correlation of eye soreness with vitamin A deficiency among the Nez Percés Indians. C. A. BROWNE. *Science* 67, 510-1(1928).—In the report of the Lewis and Clark expedition of 1804-6, C. states that the Nez Percés Indians then living within the bounds of the present state of Idaho were afflicted with sore eyes, scrofula and rheumatism and suggests that the disorders were brought on by a too exclusive vegetable diet. At that time the diet of these Indians consisted largely of roots which are notably deficient in vitamin A. L. W. RIGGS

F—PHYSIOLOGY

R. K. MARSHALL, JR.

Filtration through living membrane. S. AMBERG AND L. G. ROWNTREE. *Proc. Soc. Exptl. Biol. Med.* 24, 309-10(1927).—The mesentery of the urethaneized bullfrog (*Rana catesbiana*) was used. The rate of filtration varied with the p_H , the temp., the NaCl concn., and the pressure. The mesentery was permeable to hemoglobin and Congo red and other dyes. Substances from the blood stream appeared in the filtrate. C. V. B.

The importance of the carbonate ion in physiological activity. A. B. HASTINGS AND H. B. VAN DYKE. *Proc. Soc. Exptl. Biol. Med.* 24, 831-2(1927).—In the course of a study of the response of the guinea-pig uterus to pituitrin when the ionic environment of the uterus was varied, the CO_3 ion was found to be of importance. It seemed to exert its influence of itself, not merely reflecting a change in Ca - or H -ion activity. Whenever the CO_3 -ion activity was increased there was a diminished response of the uterus to pituitrin. When CO_3 -ion activity was decreased there was an increased response of the uterus, while if the CO_3 -ion activity was kept const., there was no change or only a slight change in response, sometimes positive, at other times negative. C. V. B.

Bile stimulation of pancreatic secretion. A. C. IVY AND H. C. LUEBT. *Proc. Soc. Exptl. Biol. Med.* 24, 837(1927). C. V. B.

Duration of electrogram and of mechanical response of turtle ventricle. R. HOFKESBRING AND R. ASHMAN. *Proc. Soc. Exptl. Biol. Med.* 24, 883-5(1927).—The important factor detg. the duration of the electrogram appears to be the chem. condition or degree of recovery of the muscle at the instant the stimulus is applied. The degree of filling influences the duration of the electrogram very slightly, if at all. The mechanical phases are detd. not only by the degree of recovery, but also by the extent of filling of the ventricle. C. V. B.

The effect of a meal upon the titratable alkalinity of blood. R. S. HUBBARD. *Proc. Soc. Exptl. Biol. Med.* 25, 71-2(1927).—The effect of a carbohydrate tolerance test meal upon the titratable alk. of the blood was studied in 47 human subjects. The majority of the cases showed an increased amt. of titratable alkali after the meal, but the av. difference was slight. These differences may represent part of the process of the adjustment of the organism to the secretion of HCl by the stomach. C. V. B.

Resistance and capacity of stimulated and unstimulated muscle at varying electric current frequencies related to chronaxie. J. F. McCLENDON. *Proc. Soc. Exptl. Biol. Med.* 25, 202-4(1927).—The relation of chronaxie to the frequency of alternating elec. currents capable of stimulating muscle was studied. The threshold of duration of current from oscillator is about 0.05 of the chronaxie in case of fish and frog. With crab and scallop muscle the results are uncertain because of the uncertainty of the detn. of such long chronaxies by the condenser method. The resistance always decreased

on stimulation, suggesting a decrease in resistance of the individual muscle fibers. Changes in capacity were not so regular. C. V. B.

Further experiments on the fate of taurine in dogs. C. L. A. SCHMIDT AND L. R. CERECEDO. *Proc. Soc. Exptl. Biol. Med.* 25, 270-1 (1928).—A modification of the Bergell method is described for isolation of taurine from urine. Taurine when fed to dogs is excreted unchanged, and not in the form of taurocarbamic acid. C. V. B.

A relationship between phosphorus, creatinine and acidity in urinary excretion. G. J. RICH. *Proc. Soc. Exptl. Biol. Med.* 25, 307-9 (1928).—A study was made on 171 24-hour urine specimens furnished by 57 students. The correlation between the total titratable acid and the creatinine content of the urine was the highest, and was relatively independent of concomitant variation with the phosphorus content. There seems to be a tendency for these 2 elements in the urine to be high or low at the same time. The correlation between acidity and P content was the lowest of the 3 and was in large measure dependent upon a concomitant variation in the creatinine of the urine. There was a significant relationship between amts. of P and of creatinine in the urine. C. V. B.

Modifications in blood accompanying gastric secretion. III. Carbon dioxide. T. G. NI AND A. C. LIU. *Chinese J. Physiol.* 1, 355-62 (1927).—Expts. with fistula, Pavlov-pouch and Heidenhain-pouch dogs have shown that the prolonged loss of gastric secretion induced by repeated injections of histamine results in an increase in the CO₂ content of the arterial blood, the change occurring in the corpuscles as well as in the plasma. The increase in alkali reserve observed after great loss of gastric secretion is not equiv. to the loss of HCl involved. B. C. A.

Is cephalin necessary for the activation of prothrombin? C. A. MILLS. *Chinese J. Physiol.* 1, 435-8 (1927).—Exptl. evidence is cited in agreement with Bordet (cf. C. A. 15, 888) that Ca and cephalin, together with prothrombin, are the necessary precursors to the formation of thrombin. B. C. A.

The physiology of the heart. The humoral regulation of the cardiac work; direct and reciprocal effects of the "active" substances and the "vagal" substances. J. DEMOOR AND P. RYLANT. *Bull. acad. roy. med. Belg.* [5], 7, 669-92 (1927).—The hormone which causes the heart to beat has been investigated independently by Demoor C. A. 17, 1500; 18, 3648; *Archiv. intern. physiol.* 20, 29, 444, 21 (1923) and 24 (1924) and by Haberlandt (*Klin. Wochschr.* 3, 1631 (1924)). O. Loewi (C. A. 16, 592) has investigated a different type of heart regulators, *viz.*, the "vagal" substances, these are obtained by perfusing an isolated heart of a cat to which the vagus is still attached and by stimulating this vagus. The soln., thus obtained, slows down the beat of the isolated heart of a cat or of isolated auricles of a rabbit. The type of slowing is the same as that with vagus stimulation. If the isolated heart or auricles are left in this soln. of "vagal" substances, they take up beating, after a while, although these substances are neither decompd. nor inactivated. The "vagal" substances will again exert their inhibiting action if the heart is transferred to Locke soln. and then returned. The heart-beat hormones are called "active" substances by D and R; they are prepd. by extg. endocardium of fresh beef heart by means of NaCl soln. The mutual relation of these "active" and of "vagal" substances is investigated. When immersed in a soln. of "active" substances, isolated auricles become insensible to the stimulation of their own vagus, but they are still inhibited by the addn. of "vagal" substances. The "active" and the "vagal" substances do not destroy or antagonize each other. Even the isolated left auricle, which fails to beat in Locke soln. and requires the addn. of active substances for starting to beat, is normally inhibited by "vagal" substances. The "active" substances prevent, therefore, the formation of "vagal" substances, but, do not antagonize them. R. BEUTNER

The oxygen-carrying ability of the blood. KATSUO YABUKI. *Acta Schol. Med. Univ. Imp. Kyoto* 10, 25-32 (1927).—The O₂-carrying ability of the red corpuscles in defibrinated horse blood was detd. under conditions in which a portion of the serum was replaced by various solns. Replacement by isotonic NaCl caused a reduction in O₂-carrying ability proportional to the extent of replacement. Ringer-Locke soln. reduced the O₂-carrying ability still more. Addn. of gum arabic to the saline soln. had no influence, but the addn. of NaHCO₃ favored the O₂-carrying ability of the corpuscles. It was concluded that, with respect to the O₂-carrying ability of the red corpuscles, Ringer-Locke soln. contg. NaHCO₃ is the best material for intravenous transfusion, in order to secure a person from a severe hemorrhage. J. B. BROWN

Influence of the pancreas on the serum amylase. I. C. TUMMO. *Boll. soc. ital. biol. sper.* 2, 333-4 (1927).—The quantity of amylase present in a dog's body before and after removal of the pancreas was detd. by adding 1 cc. of blood serum, taken before and after the operation, and detg. how much glucose it will hydrolyze. A de-

crease of about 60% was noted in all cases; *i. e.*, whereas 15.6 mg. was hydrolyzed before removal of pancreas, only 9.0 mg. was hydrolyzed after. II. *Ibid* 335-7.—When pancreatic ext. is given to a dog whose pancreas has been removed the power of the blood serum to hydrolyze glucose is only partly restored.

A. W. CONTIERI

The amylase in saliva of a normal dog and after intravenous injection of pancreatic fluid. A. TOMASINO. *Boll. soc. ital. biol. sper* 2, 341-4 (1927).—Dogs were given injections of pancreatic fluid as well as human saliva (6 cc. per kg. wt.) and its saliva was tested for digestive power on amides. The digestive power of the dog's saliva is not increased much in either case, most of the injected fluid being recovered in the urine unchanged.

A. W. CONTIERI

Different content of "phosphogen" of striated muscles rapidly contracted and slowly contracted. G. MARTINO. *Atti accad. Lincei* [6], 7, 79-82 (1928).—Because more lactacidogen is present in active than in inactive muscles, it was thought that the recently discovered phosphogen (cf. Eggleton and Eggleton, *C. A.* 21, 2278; Fiske, *C. A.* 21, 2311) might also vary in the active and in the inactive muscles of individual animals. Inorg. P and phosphogen were detd. by the colorimetric method of Briggs (*C. A.* 16, 3493) and the technic used by E. and E. (*loc. cit.*). In rabbits, active and inactive muscles contained 22.5-24.0 and 24.5-32 mg.-% inorg. P and 25-28 and 10.5-14.5 mg.-% phosphogen. In pigeons, active and inactive muscles contained 35-39.5 and 36-42 mg.-% inorg. P and 23.5-27 and 10-12 mg.-% phosphogen. The results resemble those found for lactacidogen. Muscles capable of rapid contraction contain far more phosphogen and a little less inorg. P than more slowly contracting muscles. C. C. D.

The excretion of phosphates by the kidney and the regulation. LUCIEN BRULL. Univ. Liege. *Arch. intern. physiol.* 30, 1-69 (1928).—The excretion of phosphates in the urine depends on the inorg. P of plasma, the threshold of excretion and the concn. of phosphates by the kidney. Diuresis does not affect the excretion except with a very small urinary vol. as in narcosis when it is reduced. The increase in value of inorg. P in plasma after injection of phosphate is transitory. Injection of Ca causes an increase in plasma P. In narcosis there is a rise in plasma P followed by a lowering to the initial level. Hypophysectomy, which may retard P excretion, does not change plasma P. The threshold of excretion is higher in anesthetized animals and is increased after hypophysectomy and after Ca injection as well as after P injections. In general it follows variations of the plasma. These variations do not depend on the degree of permeability of renal endothelium or on the power of concn. by the secreting cells of the kidney but probably on changes in the proportion of P in crystalline and colloidal state in the plasma. It is assumed that a variable part of the inorg. P in the plasma is not excretable by the kidney being in colloidal state and that injected inorg. P may pass into this state. Likewise, after the injection of Ca there is an increase in the non-excretable portion. The colloidal state is possibly in the form of colloidal $\text{Ca}_3(\text{PO}_4)_2$. Alterations in the threshold are therefore only the expression of a dual physicochemical state of the inorg. P in the plasma. The degree of concn. of phosphate by the kidney is unalterable in a single animal and varies but little in different animals. It is only affected in renal anesthesia while the effect of general anesthesia is entirely on the threshold.

H. J. DEUEL, JR.

Adrenaline sensitiveness at the menopause. J. H. HANNAN. *Endocrinology* 12, 59-64 (1928).

H. J. DEUEL, JR.

The permeability of fatigued muscle. SHUNICHI MITSUYA. *Jikeikai Med. Coll. Sci-i-Kwai Med. J.* 47, No. 2, 5 (1928).—The permeability of the muscle membrane as detd. by the method of vital staining was shown to be much increased in fatigue. In spindle muscles as the gastrocnemius the permeability is increased more intensively at the end of the muscle while with muscles of the type of the sartorius the greatest permeability was found in the central portion.

H. J. DEUEL, JR.

Studies in carbohydrate metabolism. I. General considerations and conclusions from established facts. HEINRICH SCHUR AND ARTUR LÖW. *Wiener klin. Wochschr.* 41, 225-9 (1928).—Notwithstanding the accepted fact that decompn. and resynthesis of glycogen are involved in muscular activity, all heat-producing reactions should be considered possible sources of energy. Resynthesis of glycogen from its decompn. products does not necessarily take place in the muscle. The necessary quantity of carbohydrate involved in metabolism is much less than is generally assumed. II. **Fat depots and carbohydrate metabolism.** *Ibid* 261-6.—Fatty tissue contains a considerable quantity of carbohydrate. It is suggested that such tissue serves as a depot for taking up carbohydrate and converting it to fat. Carbohydrate feeding increases the carbohydrate content of the fat depots, especially of the omentum fatty body. Hunger decreases the carbohydrate content of this latter depot. Sugar formation from fat thus is indicated

when the need for sugar arises. The assumption that the insular tissue is concerned in deposition of absorbed foods and following this function, the formation and maintenance of depot tissues, especially of fatty tissues, explains all the phenomena of hyper- and hypoinsulin and conflicts with no known facts. D. B. DILL.

The breakdown of internal secretory glands in climacteric and puberty bleeding. Investigations by means of the Abderhalden reaction. LEO MELAMED. *Fermentforschung* 9, 306-21(1928).—The Abderhalden reaction was performed with blood discharged by women at the climacteric and at puberty. using ovary, thymus, pancreas, adrenal and hypophysis as substrates. With climacteric bleeding the reaction was positive for ovary and adrenal in twice as many cases as with puberty bleeding, while for pancreas and hypophysis it was $1\frac{1}{2}$ times as frequent and for thymus less frequent than with puberty. In several cases the reaction to ovarian tissue remained positive 16-20 days after total extirpation of the uterus and both ovaries. A. W. DOX

Regulation of carbohydrate metabolism. Lactic acid as activator of the liver prodiastase. ALEXANDER PARTOS. *Fermentforschung* 9, 403-10(1928).—Intravenous injection of lactic acid in quantities too small to cause any appreciable glycogen formation results in hyperglucemia. The cause of the glycogen mobilization lies in the activation of the liver prodiastase by lactic acid. In support of this view is the fact that glycogen decompn. can be brought to a standstill by CaCO_3 or ZnO and then the process resumed by removal of the CaCO_3 . A. W. DOX

Ammonia formation by illumination of the retina. HANS RÖSCH AND W. T. KAMP. *Z. physiol. Chem.* 175, 158-77(1928).—If both eyeballs of the frog are isolated and the cornea, iris, lens and vitreous body removed, the resulting capsules contain approx. the same amt. of NH_3 after being kept in the dark 10 min. The greatest variation between left and right capsule was 13%, the av. being less than 10%. If, however, one capsule is left 10 min. in the dark and the other strongly illumined, the latter invariably shows a large increase in NH_3 , the increase varying between 74 and 582%. Illumination thus results in NH_3 formation. The pulp obtained from fresh retina also forms NH_3 on standing, a max. being reached within 2 hrs. Addn. of adenosinephosphoric acid leads to increased NH_3 formation, as much as 90% of the amino N being liberated as NH_3 . Guanosinephosphoric acid, on the other hand, does not form NH_3 under these conditions. Addn. of urea to the retina pulp is also without effect. The NH_3 -forming substance of the retina cannot be the same as that of muscle, viz., adenosinephosphoric acid, since the addn. of muscle ext. to retina pulp in which the enzyme has been destroyed by 1% HCl does not result in NH_3 formation, although the same ext. gives a strong cleavage of adenosinephosphoric acid. The nature of the substance which forms NH_3 when the retina is illumined has not yet been detd. A. W. D.

Uric acid and creatinine in the urine of infants. O. S. ROUGICHURCH. *Am. J. Diseases Children* 31, 504-13(1926); *Physiol. Abstracts* 11, 426, cf. following abstract.—Detns. were made in the urine from 22 male infants varying in age from 1 to 22 months; uric acid was detd. by the microchem. colorimetric method of Folin and Denis, total N by the Kjeldhal method, and the creatinine by Folin's colorimetric method. The diet was purine-free. A fairly const. daily excretion of uric acid was found for the individual and a value of 14 to 25 mg. of uric acid per kg. of body wt. for the whole group. The creatinine varied from 10 to 15 mg. per kg. of body wt., being highest in malnourished infants due to their relatively large mass of active tissue. H. G.

Uric acid in the urine of infants. O. S. ROUGICHURCH. *Am. J. Diseases Children* 32, 530-5(1926); *Physiol. Abstracts* 12, 163; cf. preceding abstract.—The urinary uric acid 3-hour diurnal and nocturnal excretion in 5 healthy boys of 6 to 12 weeks was studied. In spite of the difficulty in obtaining the samples, it was found that the purine metabolism was remarkably regular throughout the 24 hrs., in contrast to the diurnal max. and nocturnal min. in uric acid excretion in adults. H. G.

Calcium and retinal currents. T. P. FEENSTRA. *Arch. néerland. physiol.* 11, 139-40(1926); *Physiol. Abstracts* 12, 305-6.—A frog was artificially perfused with the required modification of Ringer soln. or the excised eye was immersed in this soln.; the elec. responses were led off by non-polarizable electrodes. Removal of Ca destroys both the resting and action currents, in about 10 min. in the case of perfusion, in 3 or 6 min. in the case of the excised eye, according as the optic nerve is cut short or long. Both currents reappear on replacing the Ca. Increase of Ca or diminution of K is without effect. Withdrawal of Ca by means of a glucose soln. also produces the same reversible destruction of the elec. responses. H. G.

Uric acid and renal functions. H. LUCKE. *Klin. Wochschr.* 6, 1275(1927); *Physiol. Abstracts* 12, 500.—Detn. of the excretion of uric acid is recommended as the best test of the functional activity of the kidney. For 3 days the patient receives a

purine-free diet, and on the morning of the 4th day 1500 cc. of water is given. The urine is collected half-hourly for 4 hrs., then during longer periods until 24 hrs. have elapsed. Uric acid is estd. in the sep. portions. Disturbances of renal function are indicated by inability to conc. uric acid. In normal cases, after the preliminary diuresis, a concn. of 80 to 120 mg. % is obtained. If a concn. of 80 mg. % is not reached, then the renal function is deficient. Data for 3 cases are given. H. G.

The dielectric constant in physiology. J. GICKLHORN. *Protoplasma* 1, 124-42(1926); *Physiol. Abstracts* 12, 85.—In this review emphasis is laid on the great lack of quant. data for the dielec. consts. of biol. material. Since the dielec. const. of the medium affects the degree of ionization and the soly. of the electrolytes dissolved in the medium, and in colloidal solns. is intimately connected with the state of imbibition, viscosity, surface tension, etc., it is clear that this const. is of profound importance for the understanding of the cell. Not only does the dielec. const. probably vary from tissue to tissue, but it is likely that in the individual cell there are localized electrostatic fields. H. G.

Variations in the blood sugar and glycogen and the action of insulin in rats deprived of the suprarenals. A. ARTUNDO. *Rev. soc. Argentina biol.* 3, 47-67(1927); *Physiol. Abstracts* 12, 447; cf. *C. A.* 21, 3667.—Two weeks after double adrenalectomy the blood sugar is normal in rats. The liver glycogen is diminished on the third day, but returns to normal after 30 days. The muscle glycogen is at first raised, then falls, and returns to normal in the same time. Insulin is more toxic to adrenalectomized rats than to normals. H. G.

Fixation of glucose by red corpuscles in the presence of insulin. KARL HARPUEDER. *Klin. Wochschr.* 7, 266(1928).—The presence of insulin does not lead to an increased glucose fixation by red corpuscles. Cf. Häusler and Loewi, *C. A.* 21, 1470). M. H.

Estrual hormone in the blood of man. HANS HIRSCH. *Klin. Wochschr.* 7, 313-4 (1928).—A substance that leads to typical estrual changes in the vagina of mice can be regularly isolated from 35 cc. of human (male) blood. MILTON HANKE

The hormone-like effect of glucose on the production of insulin. E. GRAFE AND F. MEYTHALER. *Klin. Wochschr.* 7, 358(1928); cf. *C. A.* 21, 3941.—Glucose, injected into the Art. pancreatico duodenalis, leads to a secretion of insulin by the pancreas. The contradictory results of E. Geiger-Pécs were due to improper technic. M. H.

Preparation of female sexual hormone from urine, particularly from the urine of pregnant women. BERNARD ZONDEK. *Klin. Wochschr.* 7, 485-6(1928).—The method of prepn. is outlined but is not given in detail. A detailed description is to appear later. MILTON HANKE

The nature of the oxidation-stimulating action of thyroxine. KURT DRESGL. *Klin. Wochschr.* 7, 504-5(1928).—The tissue respiration method of O. Warburg was used. Thyroxine markedly increases the oxidative rate of liver and kidney tissue. The effect upon the liver is most marked; values 200% in excess of normal are obtained 3 days after a single injection of 1 mg. thyroxine into rats. MILTON HANKE

The substance that controls automaticity of the heart. R. RIGLER AND F. TIENANN. *Klin. Wochschr.* 7, 553(1928).—The substance extd. from the sinus tissue of mammalian hearts according to the method of Demoor is pharmacologically and grossly chemically identical with histamine. It contracts the excised virgin guinea-pig uterus, but not that of the rat. It lowers blood pressure and leads to respiratory distress or failure by contracting the bronchi. The ext. gives a positive Pauly reaction. It reactivates the heart that has stopped because of K deficiency (as does histamine). It is easily sol. in water, dialyzable, thermostable and easily adsorbable. M. H.

Copper in human serum. H. A. KREBS. *Klin. Wochschr.* 7, 584-5(1928).—Normal human serum contains 0.62 to 1.24×10^{-3} mg. Cu per cc. The concn. remains very const. for a given individual and does not, ordinarily, change in disease. The av. value in pregnancy is 1.94×10^{-3} mg. per cc. and in nephrosis is 0.22×10^{-3} mg. per cc. MILTON HANKE

Biological effects of the female sexual hormone. E. STEINACH, M. DORN, W. SCHÖLLER AND W. HOHLWEG. *Arch. ges. Physiol.* (Pflüger's) 219, 306-24(1928).—The authors have prepd. active placenta exts. which are sol. in water and which can be kept for at least two months at a temp. of 3-4°. The addn. of tricresol preserves the material for a much longer time. The water-sol. prepn. is free from protein, resistant to moderate changes in p_H and remains uninjured even at a temp. of 100°. Expts. on the mammary app. and on the uterus are described. BENJAMIN HARROW

Reactivation of the senile ovary and the whole female organism by means of hormone treatment. E. STEINACH, H. KUN AND W. HOHLWEG. *Arch. ges. Physiol.* (Pflüger's) 219, 325-36(1928).—By using the water-sol. hormone (cf. preceding abstract)

results were obtained which coincided with results obtained from the transplantation of ovaries: a full reactivation of sterile, senile female rats that had failed for many months to display any rut. The effect of this reactivation is shown by a resumption of ovulation, by the disappearance of the symptoms of age, and by a normal pregnancy and fecundity.

BENJAMIN HARROW

Vasodilator constituents of tissue extracts. Isolation of histamine from muscle. W. V. THORPE. *Biochem. J.* 22, 94-101(1928).—The method of extn. of the vasodilator constituents was that adopted by Best, etc (see *C. A.* 21, 2140). The whole of the depressor activity of an alc. ext. of muscle seems to be due to histamine. B. H.

Reduction of nitrates in animal tissues. FREDERICK BERNHEIM AND MALCOLM DIXON. *Biochem. J.* 22, 125-34(1928).—The nitrate-reducing system in muscle, and the corresponding system in the liver, are not identical with any of the hitherto described reducing enzymes. The reduction is prevented by the addition of *M*/500 cyanide.

BENJAMIN HARROW

Chemical changes taking place in the proteins of muscular tissue when passing into rigor. H. R. HEWER, HATTI JAIRAM AND S. B. SCHRYVER. *Biochem. J.* 22, 142-3(1928).—It has been shown that gelatin on treatment with acids yields a larger amt. of the diamino-N fraction than does untreated gelatin (cf. *C. A.* 22, 968); and now it is shown that lactic acid produced during the contraction of muscular tissue causes changes in the proteins of the tissue similar to those produced when gelatin is treated with acid.

BENJAMIN HARROW

Quantitative study of the oxidation of phenyl fatty acids in the animal organism. H. S. RAPER AND E. T. WAYNE. *Biochem. J.* 22, 188-97(1928).—Normal phenylpropionic, phenylbutyric, phenylvaleric and phenylcaproic acids when administered to dogs yield amts. of benzoic or phenylacetic acid which indicate that the fatty acid side chain is oxidized quant. in accordance with the theory of β -oxidation. Under the same conditions, phenylnonoic and phenyldecoic acids yields smaller amts. of benzoic and phenylacetic acids, resp., than would be expected if quant. β -oxidation of the side chain takes place; this suggests some other mode of oxidation, in addition to β -oxidation. Cinnamic and phenylisocrotonic acids yield the same amts. of benzoic and phenylacetic acids, resp., as the corresponding satd. acids.

BENJAMIN HARROW

Studies in purine metabolism. V. The nuclear-plasmic ratio of frogs. RICHARD TRUSZKOWSKI. *Biochem. J.* 22, 198-200(1928), cf. *C. A.* 22, 615.—The ratio has a value of approx. double that of mammals.

BENJAMIN HARROW

Studies in creatinine and uric acid metabolism. II. Ingestion of proteins and amino acids and the hourly elimination of creatinine and uric acid. HARRY ZWARENSTEIN. *Biochem. J.* 22, 307-12(1928); cf. *C. A.* 21, 437. Creatinine excretion was not affected by either protein or amino-acid ingestion. The ingestion of 200 g. of Cheddar cheese or of 250 g. boiled egg white had no influence on the uric acid excretion. After meat ingestion, however, a large increase occurred in both creatinine and urea excretions. This is ascribed to the presence of creatinine and uric acid, or their immediate precursors, in the meat. The elimination, then, of both uric acid and creatinine is independent of the amount of purine- and creatine-creatinine-free protein in the diet.

BENJAMIN HARROW

Nature of the action of pancreatic extract on the inhibition of lactic acid formation in muscle. D. R. McCULLAGH. *Biochem. J.* 22, 402-6(1928).—The pancreatic ext. added to an ext. of muscle prevents the formation of lactic acid and of carbohydrate causes an increase in free phosphate content and prevents the esterification of phosphate even in presence of fluoride.

BENJAMIN HARROW

Sexual glands and metabolism. V. Influence of lipid extracts of the testes and prostate on the nitrogen metabolism of rabbits and on the development of the genital organs of rats. VLADIMIR KORENCHESKII. *Biochem. J.* 22, 482-90(1928).—The method of extn. was based on Doys's procedure (*C. A.* 19, 319). None of the fractions from the prostate or testes, injected singly or mixed, was able to prevent the atrophy of the penis, seminal vesicle and prostate of castrated rats, or was able to produce hypertrophy of the genital organs of normal rats. There was an increase (sometimes as high as 20%) in the N metabolism with the simultaneous injection of a particular fraction from the testes and from the prostate. VI. The influence of water-soluble testicular and prostatic extracts fractionated at various isoelectric points upon the nitrogen metabolism of rabbits and the development of the genital organs of rats. VLADIMIR KORENCHESKII AND MARJORIE SCHULTESS-YOUNG. *Ibid.* 22, 491-503.—The methods employed for extn. were based on the one used by Collip for the extn. of the parathyroid hormone (*Trans. Roy. Soc. Canada* 19, 25(1925) and that used by Dudley and Starling

for extg. insulin (C. A. 18, 1361). The results were similar to those recorded above.

BENJAMIN HARROW

Anatomy, physiology and chemistry of Nasmyth's membrane. J. B. STEIN, C. F. HINCH, JR. AND MARGARET M. HOSKINS. New York Univ. *Dental Cosmos* 70, 592-9(1928).—For chem. study, Nasmyth's membrane was sepd. from the teeth by treatment with dil. HCl, followed by washing with distd. water until free from acid. The membrane responded to the Molisch, Millon, xanthoproteic and biuret tests. At times, the test for unoxidized S was positive; after oxidation with HNO_3 , BaCl_2 produced a ppt. of BaSO_4 ; most of the S was probably present in the unoxidized state. After hydrolysis with HCl, Fehling soln. was reduced by some specimens, while a positive reaction for reducing sugar was given by all specimens when the Folin and Wu procedure was used. Nasmyth's membrane is a mixt. of proteins including glucoprotein.

JOSEPH S. HEPBURN

Influence of the work of cows on the composition of the milk. FRIEDRICH HAUN. Z. *Untersuch. Lebensm.* 54, 337-41(1927).—On days when cows were used for work the fat content, sp. gr. of milk and of serum, and the refraction of the milk were higher than on days of rest; ash content and total protein varied within narrow limits.

WILLIAM J. HUSA

Variations in the reducing power (sugar) of normal human blood. H. F. PIERCE AND E. L. SCOTT. *Arch. Internal Med.* 41, 586-600(1928).—The following conclusions are drawn from 141 detns. in several groups by the Shaffer-Hartmann and Folin-Wu methods. The blood sugar of young healthy men and women under basal conditions varied between 80 and 115 mg./100 cc. The true value probably lies between 95 and 99 mg. "The probability is about 95% that the mean of any such series consisting of 25 or more observations made on as many persons will not differ more than 3 times its mean deviation from the true mean. Conclusions based on series contg. fewer than 25 observations are of doubtful significance when the observations pertain to the blood sugar of man. The slightly greater precision which is attained by making many observations on a single person is more than offset by the loss in representative characters of the series."

MARY JACOBSEN

Basal metabolism. I. Correlation of basal metabolic rate and basal pulse rate. J. H. SMITH. *Arch. Internal Med.* 41, 663-6(1928); cf. C. A. 16, 2351, 18, 2202; Sturgis and Tompkins, C. A. 14, 3716.—The relation between basal metabolism and basal pulse rate is confirmed for hyperthyroidism.

MARY JACOBSEN

A hyperglucemia-producing substance from the pancreatic juice and the pancreas of the dog. G. MARTINO. *Arch. sci. biol. (Italy)* 10, 408-37(1927)—See C. A. 22, 1395.

MARY JACOBSEN

Excretory function of the stomach. I. The uric acid, creatine and creatinine content of the gastric juice of normal children. GIOVANNI DE TONI AND ITALO MARCIALIS. *Biochim. terap. sper.* 14, 353-8(1927); cf. Cipriani and Lucca, *Minerva Medica* 1927, 557; Steinitz, *Klin. Wochschr.* 1927, 949.—The total N in the juice of normal children was 30-60 mg./100 cc. In a case of acute gastritis it rose to 143 mg. Gastric juice removed by the Einhorn tube 1 hr. after a test meal of 150 g. rice mucilage boiled in sweetened water contained in mg./100 cc. (ages 8 months to 3 years); preformed creatine (I) 0.71-3.06, total creatinine (II) 3.5-10.5, creatine (III) 3.5-10.4, uric acid (IV) 1.0-4.9, Cl (as NaCl) (V) 142-592. The juice removed from fasting children 3-6 years old 0.5 hrs. after 0.5 mg./kg. histamine had the p_{H} 2.8-3.2 and contained 0.78-1.30 I, 2.73-5.60 II, 2.48-5.70 III, 0.84-1.86 IV and 628-726 V. Neither juice contained glucose. The variations show no direct relation to the age. M. J.

Passage of hemolytic amoceptor through the placenta. F. DE CAPUA. *Pediatrica rivista* 35, 1104(1927).—The blood of young rabbits whose mothers were injected with sheep erythrocytes during pregnancy showed considerable hemolytic power, which, however, was lower than that of the maternal blood.

MARY JACOBSEN

Effect of ultra-violet irradiation of the nitrogen metabolism in the second stage of childhood. U. FERRI. *Pediatrica Rivista* 35, 1110(1927).—A series of irradiations caused only a slight increase (intense irradiation) or decrease (weak irradiation) of N metabolism. All cases, however, presented an increase of urinary NH_3 and amino acids with a parallel decrease of urea.

MARY JACOBSEN

Effect of inhaling ultra-violet rays on the glucose-regulating apparatus of children. P. GORINI. *Pediatrica rivista* 35, 1110(1927).—Direct or indirect inhalation of small doses of ultra-violet rays enhances the glucose metabolism, while large doses depress it.

MARY JACOBSEN

The presence of amino acids in human milk. C. GIAUME. *Pediatrica Rivista* 35, 1114(1927).—Amino acids are always present in colostrum and milk and are secreted

as such. In colostrum the content is 9.86 mg./100 cc. and decreases to 6.12 mg. between the 7th and 12th day after birth. Milk contains 3-9 mg., av. 5.5 mg./100 cc.; the content bears no relation to the stage of lactation or the protein content. It probably depends upon an incomplete synthesis by the mammary gland of proteins from simpler blood constituents.

MARY JACOBSEN

Morphological studies of the liver, especially of its lipoidal substances. S. NUNOSÉ. *Japan Med. World* 8, 8-11(1928).—From a study of 28 still-born and 77 new-born babies it is concluded that lipoids, especially neutral fat, differs markedly in quantity and distribution in these two groups. This fact suggests a rule of metabolism of lipoids in the liver of both still-born and new-born babies, although the chem. nature of the lipoids remains relatively unchanged as tested by microchem. methods even after the death of the baby. The importance of these facts in the medicolegal detn. of still-births is emphasized.

N. KOPPELOFF

Experimental studies on the oxidase reaction of nervous tissue and its significance. K. KUMAGAI. *Japan Med. World* 8, 508(1928).—Death of animals by air embolism, by loss of blood, etc., seems not to affect the oxidase reaction of the nerve tissue. The section of a peripheral nerve on one side produces a reduction of the oxidase granules in the corresponding central nucleus, but the reduction is slight. Under lumbar anesthesia by tropococaine, the oxidase reaction of the nerve cell of the gray matter of the lumbar enlargement becomes most marked in the motor cells of the anterior horn, and only a thin ring of oxidase granules may be seen around the nucleus. Strychnine acting directly on the eyeball brings about a strong oxidase reaction in the retina. Subcutaneous injections of lethal doses of strychnine produce no change in the oxidase reaction of the nerve tissue, but intravenous injections give rise to a slight reduction in cerebral cortex and motor cells of the anterior horn of the spinal cord. Deep anesthesia by subcutaneous injections of morphine produces no change in oxidase reaction of nerve tissue. Slight reduction of the reaction is detected in cerebral cortex after intravenous injection of lethal doses. Generally the more active the function of nerve cells, the stronger their oxidase reaction seems to appear, and the extent and rapidity of the action of a depressing agent on the nerve cell seem to parallel the changes in the oxidase reaction.

N. K.

The influence of yeast on gastric secretion. R. S. ALLEN AND G. E. BURGET. *Am. J. Physiol.* 84, 98-102(1928).—In dogs with Pavlov pouches and in normal human beings yeast did not exert a gastric secretagog action as great as that brought about by a synthetic test meal or by soda crackers and water.

J. F. LYMAN

The carbon dioxide tension of alveolar air during pregnancy. G. TESAURO. *Arch. sci. biol. (Italy)* 8, 69-79(1926).—During later pregnancy, the CO_2 tension of alveolar air corresponds to an av. of 32.6 mm. Hg in contrast to the av. of 40.1 mm. in non-pregnant women. The low CO_2 tension in pregnant women is due to acidosis and is an index of such. Twenty-four hrs. after parturition the CO_2 tension reaches its normal value.

PETER MASUCCI

The action of blood serum on intestinal peristalsis. G. VIALE. *Boll. soc. ital. biol. sper.* 2, 219-21; *Rev. soc. Argentina biol.* 3, 129-33(1927).—There is present in the blood serum of animals a substance which increases the tone and contractions of an isolated intestinal segment. V. showed that this substance is thermostable and alc.-sol.; its action is inhibited by atropine.

PETER MASUCCI

The respiratory exchange of the thyroid gland. A. CHIATELLINO. *Boll. soc. ital. biol. sper.* 2, 228-30(1927).—The respiratory exchange of the thyroid gland is greater than that of any other organ. The av. O_2 consumption for one set of expts. was 22.39 cc. and for another 25.83 cc. per 100 g. gland in one min.

PETER MASUCCI

A demonstration "in vivo" of the gaseous exchange by means of indicators. C. PULCHER. *Boll. soc. ital. biol. sper.* 2, 235-6(1927).—Phenol red and cresol red were injected into the dorsal lymph sac of frogs in order to study the reaction of tissues by means of these indicators. Observations showed that the arterial blood had a p_{H} of about 7-7.2, and the venous blood a p_{H} of about 7.6. The same values were found in the interdigital membrane and in the mesentery exposed to the air.

PETER MASUCCI

The parathyroid hormone. LUIGI CONDORELLI. *Boll. soc. ital. biol. sper.* 2, 250-2(1927).—The behavior of K, Na, P, Cl and Ca in the blood of rabbits treated with parathyroid hormone was studied. There was a decrease in K after 12 hrs. of 2 to 10 mg. % in 9 out of 11 animals. There was a decrease in Na in 8 animals. The decrease in Cl was not const. There was a decrease in inorg. P in 7 out of 11 rabbits. Ca always increased after the injection of the hormone but individual animals reacted differently to the injection of the same quantity of hormone.

PETER MASUCCI

The vasomotor action of carbon dioxide and sodium bicarbonate and hydrogen-ion concentration. GIUSEPPE RUSSO. *Boll. soc. ital. biol. sper.* 2, 756-9(1927).—R. aimed

to show if at const. p_H the tone of the blood vessels was more sensitive to the action of CO_2 (vasodilation) and to $NaHCO_3$ (vasoconstriction) than to other acid or basic substances. By using Trendelburg's technic on toads, R. was able to show (1) that the vasomotor action of CO_2 and $NaHCO_3$ depends on the concn. of H and OH ions of the perfusing fluids and not on any sp. chem. radical; (2) therefore, there is no specificity in the action of these two substances in regulating the tone of the vessels. P. M.

The variations in the iodine number of liver fats under aseptic autolysis. U. LOMBROSO AND A. DI FRISCO. *Boll. soc. ital. biol. sper.* 2, 809-11(1927).—Beef fat and linseed oil were administered to dogs orally to det. the effect on the iodine number of liver fats. A table is given showing the I no.; the variation in the % of fatty acids; and the variation in the % of I no.

PETER MASUCCI

The presence, distribution and manner of elimination of the thyroid hormone (thyroxine) in experimental hyperthyroidism and analogous observation on the behavior of adrenaline and other hormones. E. GIACOMINI. *Boll. soc. ital. biol. sper.* 2, 995-1001(1927).—Chickens, ducks, guinea pigs and dogs were fed various amts. of fresh and dried thyroid gland. The urine and feces were collected and dried. Later, the animals were killed and the blood was collected and dried. Various other organs were ground and desiccated. The dried substances were fed to tadpoles and to axolotl (*Amblystoma tigrinum*). Either complete or accelerated metamorphosis was obtained. These expts. indicate that the thyroid hormone when introduced in large doses into the intestinal tract of birds and mammals enters the circulation, is distributed to the various organs, and the organism tends to eliminate the excess hormone as rapidly as possible through the various ways at its disposal. Adrenaline behaved similarly to thyroid. Suprarenal substance fed to chickens and guinea pigs made it possible to detect adrenaline in the bile and urine by the usual chemical tests *in vitro*. Thus, there is a similarity of behavior between the hormones and certain alkaloids, between hormones and vitamins that also pass into the urine (vitaminuria).

PETER MASUCCI

Further contributions in regard to the inhibiting action of certain sugars on glucose hyperglucemia; with special regard to the mechanism determining the phenomenon. C. CIACCIO. *Boll. soc. ital. biol. sper.* 2, 1029-32(1927).—Normal and starved dogs were given intraperitoneally small doses of fructose and glucose; 30 min. after large doses of glucose were given by mouth. Blood sugar detns. made at intervals show clearly that fructose exerts a definite inhibiting action on glucose hyperglucemia. The inhibiting action is probably connected in some way with the internal secretion of the pancreas.

PETER MASUCCI

Relation between lymph and suprarenal glands. G. VIALE. *Boll. soc. ital. biol. sper.* 3, 5-8(1928).—The injection of dog lymph into other dogs produces a slight hypoglycemia. Normal dog lymph added to Ringer soln. in the proportion of 1 to 20% increases the amplitude and rhythm of the contractions of the perfused frog heart. The lymph of animals without suprarenals is inert. Normal dog lymph injected intravenously into dogs in amts. of 2-20 cc. produces a definite increase in pressure comparable to that of adrenaline. The lymph of animals without suprarenals is inert. Normal dog lymph has a mydriatic action on the isolated frog eye; lymph from animals without suprarenals has not. There are two types of lymph: one having adrenaline action, the other a choline action. Under the control of the suprarenals, the organism forms more of one or the other according to necessity. Also in *Rev. sud-americana endocrinol. immunol. quimioterap.* 11, 96-115(1928).

PETER MASUCCI

The nature of the "vagal substance." G. VIALE. *Boll. soc. ital. biol. sper.* 3, 16-7(1928).—Blood was taken from the right heart of a dog under artificial respiration and tested on an isolated intestinal strip of a guinea pig in a dil. 1:20. The vagus was stimulated for 2 min. Another sample of blood was taken from the right heart and again tested. The activity of the blood greatly increased, even tripled. The stimulation of the vagus increased in the blood of the right heart, the vagotropic substance, which has the same pharmacodynamic and chemical properties of Loewi's "vagal substance."

PETER MASUCCI

Physical and physico-chemical changes in the blood and urine in relation to sea bathing. R. MARGARIA AND A. CHIATELLINO. *Boll. soc. ital. biol. sper.* 3, 24-6(1928).—The density, viscosity, total solids, red blood corpuscles and hemoglobin were detd. on whole blood; lowering of f. p., cond. and η were detd. on the serum before and after bathing. Samples of urine also were tested for quantity, density, cryoscopy, cond., acidity and chlorides. The length of bathing was 15-30 min. and temp. of water 18-20°. There was an increase of 8.5% in the protein content of the serum, an av. increase in density of 6%, viscosity 10.8%, total solids 3.7%, red blood corpuscles 16%, hemoglobin 6.8%. The quantity of urine was increased.

PETER MASUCCI

Investigations on the variations of certain principal factors in the blood under loss of water due to perspiration from work. A. CHIATELLINO AND R. MARGARIA. *Boll. soc. ital. biol. sper.* 3, 12-4(1928).—The viscosity, n , total solids, sp. gr., lowering of f. p., cond., red blood corpuscles, hemoglobin and blood mass were detd. in exptl. subjects before breakfast and after a march of 2 to 6 hrs. without drinking. The loss of wt. was 1.6-3.5%. In general the modifications of the blood tended towards a concn. The increase in concn. was slight for osmotically active substances and electrolytes, marked for plasma proteins, and very marked for the corpuscles. There was a diminution in blood mass.

PETER MASUCCI

The action of the lactate ion on the vessel tone in relation to the hydrogen-ion concentration. G. RUSSO. *Boll. soc. ital. biol. sper.* 3, 49-52(1928).—Ringer soln buffered with phosphates but without bicarbonate was divided into 2 parts; one was tested as such, and to the other was added 0.1% Na lactate and also tested for its effect on the tone of the vessels by the Trendelenburg technic. The presence of the lactate ion in the perfusion liquid does not modify the tone of the vessels. It seems unlikely that lactic acid plays a special part in vasomotor action distinct from the equil. $[H]/[OH]$.

PETER MASUCCI

The influence of the pancreas upon protein and hydrochloric acid hyperglucemia. S. RACCHIUSA. *Boll. soc. ital. biol. sper.* 3, 101-5(1928).—The effect of HCl, peptone, and meat was studied on partly and completely depancreatized dogs before and after the operation. The results are given in a table. There was found no relation between protein hyperglucemia, HCl hyperglucemia and the external secretion of the pancreas.

PETER MASUCCI

The effect of pancreatic secretion on the alkali reserve in the blood and on the hydrogen-ion concentration in the gland. EINAR HAMMARSTEN AND ERIK JORPES. *Acta med. scand.* 68, 205-14(1928).—Protracted secretion from the pancreas caused by secretin injection causes an accumulation of H-ions in the gland but the alk. reserve of the blood is unaffected.

S. MORGULIS

The pentose content of the dog pancreas following ligation of the ducts. EINAR HAMMARSTEN, GRETA HAMMARSTEN AND HERBERT OLIVECRONA. *Acta med. scand.* 68, 215-7(1928).—Expts. lead to the conclusion that the pentose-nucleic acid compd. is found chiefly in the secreting epithelium of the pancreas.

S. MORGULIS

Coagulation of hemoglobin in the presence of organic substances. BR. JIRGENSONS. *Biochem. Z.* 193, 109-21(1928), cf. *C. A.* 22, 967.—Coagulation of hemoglobin by KCl or $MgCl_2$ is affected in a definite way by certain org. substances. Capillary active substances with a small dielec. const. (ether, $CHCl_3$, amyl alc., isobutyl alc., acetone, methylurethan) have a sensitizing effect in small doses; in large doses they have the same effect if the salt concn. is low, but produce a stabilizing effect in the presence of large salt concns. Capillary inactive substances (mannitol, glucose) have a slight stabilizing action.

S. MORGULIS

The physiology of plasmalogen. I. Resorption of plasmalogen and the conditions necessary for alimentary plasmalogenemia. R. FEUGEN, K. IMHAUSER AND M. WESTHUES. *Biochem. Z.* 193, 251-63(1928).—Plasmalogen, which is found abundantly in animal food, produces an alimentary plasmalogenemia. Plasmal does not have this effect either because the sucrose is impermeable to it or because it is at once combined or otherwise chemically altered upon entering the blood stream. Whereas plasmalogen intravenously injected can be detected in the blood for an hr., the organism does not tolerate the free plasmal which almost at once disappears from the blood stream. However, this disappearance is due to the effect of the tissues as it does occur in blood *in vitro*.

S. MORGULIS

The effect of gastric juice on the vessels of the isolated ear. M. F. NESTURCH. *Zhurnal exptl. biol. Med.* 9, 34-8(1928).—The isolated ear of the rabbit was perfused with normal gastric juice of the dog, the neutralized juice and with HCl solns. of the same strength in dilns. of 1:250-1:10000. The vasomotor response was most pronounced with the normal gastric juice dild. 1:250, 1:500 and 1:7000 which gave constriction and dilatation was obtained in dild. of 1:5000. With neutralized juice dilns. of 1:250, 1:1000, 1:5000, 1:7000 and 1:8000 produced vasodilatation, while the same effect was obtained with HCl in dilns. 1:250 and 1:500.

S. MORGULIS

Determination of body surface of pigeons. S. N. MAZKO AND O. P. MOLCHANOVA. *Zhurnal exptl. biol. Med.* 9, 37-43(1928).—The body surface of pigeons was detd. by spreading without stretching the entire skin over paper, the area of the tracing being measured by counting the sq. mm. covered. The surface calculated from Meeh's formula $S = K^3 \sqrt{W^2}$ gives an av. value for $K = 9.6$, $\pm 2.7\%$ deviation from the mean.

Respiration expts. show that the heat production of the pigeon per hr. and sq. m. is 46.8 cal. S. MORGULIS

Sugar consumption of tissue cultures of pure strains of fibroblasts. A. A. KRONTOVSKII AND U. JAZINUISKA-KRONTOVSKA. *Zhurnal ekspl. biol. Med.* 9, 140-50(1928).—A pure culture of fibroblasts from the chick embryo heart changes the sugar concn. of the medium from 0.13 to 0.05% in 48 hrs. during which the transplant has grown from 0.45-1.1 sq. mm. to 6.1-11.4 sq. mm. S. MORGULIS

Value and physiological variations in the alkali reserve of nurslings and children. E. LEENHARDT AND J. CHAPTAL. *Rev franç pédiatrie* 3, 641(1927); *Bull. soc. hyg aliment.* 16, 32-3(1928).—Measurement of the alkali reserve of the blood is at the present time the most important element in appreciating conditions of acidosis. L. and C. carried out detns on 74 normal subjects *via* Van Slyke, which allows of detg the total bicarbonates by extn of total CO₂. During the 1st few days after birth the alkali reserve is relatively high, reaching an av. of 55.8 cc. %; it gradually falls from the 2nd to the 5th month to an av. of 49 cc. %, while from 5 to 15 yrs. it rises from 55.80 to 63.68 cc. which is comparable to that of adults. To explain these variations L. and C. consider that at birth the infant receives alkali from the mother, and it generally falls off thereafter. On the other hand, growth and the high heat losses which occur during childhood cause an increase in nutritive exchanges, these may produce an increase in acid wastes, and their neutralization requires a greater amt of alkali salts than at other periods of life; in addn., there are the requirements of the bones for basic mineral salts. The basal metabolism and alkali reserve curves vary in opposite directions, so that the alkali reserve would seem to be a function of the intensity of nutritive exchanges. Diet also has a considerable effect on the alky of the blood, very distinct differences being noted, in particular, between breast-fed and bottle-fed infants. These results allow one readily to imagine the possible influence of troubles in nutritive exchanges on the alky. of the blood in children. This throws additional light on the already proven hypothesis of the existence (and at time of the function) of acidosis in states of dysnutrition. Finally, the beneficial effects of ultra-violet rays on the alkali reserve (which is also found in normal physiol. conditions) enables one to explain how this treatment acts in dystrophic conditions and constitutes a further proof of the function of acidosis in these conditions. A PAPINEAU-COUTURE

The sulfur wastes of hemolysis and their fate in the organism. M. LOEPFER, R. GARCIN, A. LESURE AND J. TONNET. *Bull. soc. chim. biol.* 10, 316-21(1928); cf. C. A. 21, 2311, 3948.—The circulating S wastes on arriving at the liver by the portal vein are either oxidized, combined, fixed or eliminated. The S is fixed by the liver cells and pigment; it is oxidized and combined as sulfoconjugates in toxic aromatic substances; and it is eliminated through the bile as taurine. The normal S content of the circulating blood or *themia* is from 0.07 to 0.10 g. per l. of which about 20% is neutral S. This ratio of oxidized to neutral S is very const. in health but may be radically changed in liver disease. Along with the liver the suprarenals regulate the *themia* by both thiopexic and thiooxidizing action. The role of S in melanin formation and skin pigmentation is discussed. L. W. RIGGS

Buffer power of gastric liquids. MICHEL, POLONOVSKI AND J. SYWNGEDAUV. *Bull. soc. chim. biol.* 10, 443-9(1928).—See C. A. 22, 621. L. W. RIGGS

Mineral composition of the tissues of man and of animals. L. LEMATTE, G. BOINOT AND E. KAHANE. *Bull. soc. chim. biol.* 10, 553-67(1928); cf. C. A. 21, 2914; 22, 2177.—P is not the sp. metalloid of the cerebral functions. In farm mammals the thymus contains more P per unit than the brain and the testicle of the bull contains nearly as much. In man P is slightly greater per unit of dry matter in the brain than in the spleen or liver. Fe is more abundant in the spleen than in any other organ and is probably of importance in the genesis or reserve of the erythrocytes. The quantity of I in organs other than the thyroid is infinitesimal. The ratios between S and N vary within large limits in the same organ in the different species. This indicates a difference in the mol. compns. of their proteins. L. W. RIGGS

Relation of clumping and disintegration of platelets to body metabolism. C. A. MILLS, H. NECHELES AND MAO-KENG CHU. *Chinese J. Physiol.* 2, 219-27(1928).—With the technic used the time of complete clumping of the platelets corresponds closely with the first appearance of fibrin in the blood. Protein food or glycooll causes more rapid platelet clumping and fibrin formation, as well as a rise in metabolism. Even when the sp. dynamic action of protein or glycooll is not greater than that of carbohydrates or fats there is a shortening of clotting time and platelet clumping. Carbohydrates or fats do not cause a quickening of these processes. Increasing the metabolic rate by thyroid feeding does not speed up platelet clumping or blood clotting. Therefore the blood

changes cannot be directly due to changes in general metabolism. Very rapid platelet clumping may be brought about by the subcutaneous injection of tissue fibrinogen, without any metabolic change. Exercise and adrenaline injections quicken platelet clumping and fibrin formation, although adrenaline is without influence on platelets or blood clotting *in vitro*. L. W. RIGGS

The hypophysis and the urinary excretion of inorganic phosphate, sulfate and chloride. PING-CHI TUNG, HSI-CHUN CHANG AND SCHMORL M. LING. *Chinese J. Physiol.* 2, 231-45(1928).—In 6 dogs the elimination of phosphate continued uninterruptedly after hypophysectomy. In 5 acute expts. there was a typical fall of the urinary chloride output after the operation. The phosphate output usually showed a preliminary rise followed by a fall up to the 4th to 5th hr. and followed by a normal recovery. The temporary disturbance of the inorg. phosphate secretion is attributed to the absorption of a hypophyseal hormone during manipulation of the gland at its removal, for the application of fresh pituitary ext. to the brain surface of dogs with hypophyses intact, duplicated the change in the urinary inorg. phosphate following hypophysectomy. L. W. RIGGS

Relation of the mitochondrial-Golgi complex to secretion. I. The pancreatic acinar cell of the toad. WEN-CHAO MA. *Chinese J. Physiol.* 2, 247-54(1928). L. W. RIGGS

Oxidation-reduction power of the kidney in the course of diuresis. Elimination of colors used for the measure of r_H . L. JUSTIN-BESANÇON AND R. WOLFF. *Compt. rend. soc. biol.* 98, 756-8(1928).—The colors eliminated in the urine following the administration of methylene blue, thionine, toluidine blue, janus green, indigo, Nile blue, phenosafranin or neutral red indicate a r_H of the renal cells ranging from 3 to 15. In the case of methylene blue the color in fresh urine was compared with that of a standard soln. of methylene blue, the color of the latter being adjusted to that of urine by the addn. of bromothymol blue. The color in the fresh urine indicated the *preformed blue*. To a second sample of the same urine was added AcOH and H_2O_2 , when after boiling the color developed was estd. as *total blue*. The ratio total blue/preformed blue is the ratio of reduction. Of the colors named above, methylene blue, toluidine blue, thionine, and neutral red color the urine and are adapted to this test; the remaining colors named are not. The substances in normal urine do not cause oxidation-reduction reactions comparable to those caused by passage through the kidney. The p_H of the urine was measured electrically using the quinhydrone or H electrode. Influence of the p_H . *Ibid* 758-60.—A total of 34 observations on 5 subjects with the p_H of the urine ranging from 5.13 to 8.0, showed that the proportion of chromogen was independent of the concn. of methylene blue. When the p_H of the urine was above 6.3 all the blue was eliminated as a leuco base. With a p_H below 6.3 there is eliminated varying proportions of blue and the leuco base. L. W. RIGGS

Functional excitation of the normal kidney by the ingestion of milk serum. MAURICE RENAUD, J. MULLER AND A. MIGET. *Compt. rend. soc. biol.* 98, 832-4(1928).—Milk serum, prepd. by removing the fat and albumins, was fed during 2 days of fasting to 80 subjects representing sound and diseased kidney conditions. Each subject ingested a measured quantity of distd. water on the first day and an equal vol. of milk serum on the following day. The emission of urine was observed by 15-min. periods during the 90 min. following the ingestion of water or milk serum. During this period the output of urine following the ingestion of milk serum was nearly 3 times that following the ingestion of an equal vol. of water, and the output of urea during the same period was often 3 or 4 times greater. Accordingly milk serum is an actual kidney stimulant and diuretic. L. W. RIGGS

Reply to B. Gayet and M. Guillaumie "on the regulation of the internal pancreatic secretion." JEAN LABARRE. *Compt. rend. soc. biol.* 98, 859-61(1928); cf. C. A. 22, 984.—It is maintained that physiol. insulinemia is under the control of the central nervous system, since the insulino-secretory function is arrested immediately after section of the pneumogastric nerves. L. W. RIGGS

Digestion of raw starch by the pancreatic juice of the dog. E. POZERSKI. *Compt. rend. soc. biol.* 98, 1196-8(1928); cf. C. A. 21, 2727.—Raw untreated starch is not digested by the pancreatic juice of the dog, but if the starch is ground or acidified with HCl and then s^{m} made alk. it is slightly digestible. If the starch is both ground and acidified and then is made alk. it is even slightly more digestible. L. W. RIGGS

Functioning of the anterior lobe of the hypophysis. F. GRUETER. *Compt. rend. soc. biol.* 98, 1215-7(1928).—The relations of the hypophysis to the organs of generation are discussed. L. W. RIGGS

Digestion of fats and proteins after excision of the stomach. I. GAVRILA AND

J. DANICICO. *Compt. rend. soc. biol.* 98, No. 9, Séance Jan. 31, Cluj, 627-9(1928).—In 13 cases of excision of the human stomach the coeff. of absorption of fats averaged 78.9%, the normal figure being about 95%. In 5 of the cases the coeff. of absorption of proteins was 90.5 to 95%, the same as in normal subjects. In the 8 other cases the coeff. of absorption of proteins ranged from 72.4 to 87.1%. L. W. RIGGS

Extraction of the hormone of the yellow body. PIERRE GLEY. *Compt. rend. soc. biol.* 98, No. 9, Séance Mar. 3, Paris, 564-5(1928).—The yellow bodies obtained from sows are ground and allowed to macerate in water acidulated with $H_2C_4H_2O_4$. The maceration contains the hormone which is sol. in water. This ext. is treated with $Pb(AcO)_2$ which ppts. various toxic substances but not the hormone. The latter is pptd. by $Cu(OH)_2$ and the ppt. is redissolved in acid. After elimination of the Cu by H_2S and neutralization, the soln., which is free from proteins, may be injected into the animal. This prepn. causes congestion of the female genital tract and inhibits the estrus. It is not toxic in doses sufficient to show its physiol. properties. L. W. RIGGS

Regulation of the glucemia of diabetic dogs by the transplanting of varying quantities of pancreatic tissue. RENÉ GAYET AND (MLLE.) M. GUILLAUME. *Compt. rend. soc. biol.* 98, No. 9, Séance Mar. 3, Paris, 584-6(1928); cf. C. A. 22, 984.—The findings show that the tissue transplanted is the seat of a process of internal secretion of insulin which is remarkably regular and precise, and in all respects comparable to that, which under physiol. conditions, the pancreas furnishes for the regulation of the glucemia. L. W. RIGGS

Metabolic changes in the body of female pigeons at ovulation. OSCAR RIDDLE. *Proc. Am. Phil. Soc.* 66, 497-509(1927).—In female doves induced to ovulate repeatedly in rapid succession the ova normally respond by the storage of addnl. material. This change in the germ-cell represents a reduction in its metabolic level and is of importance to sex theory. A series of bodily changes begins at the same time that one of the small ova suddenly attains a new rate of growth (perhaps 26 times its former rate) about 108 hrs. before this ovum is released from the ovary. Within the 108 hrs., or slightly more, the oviduct increases in wt. by 1000%, the suprarenals hypertrophy by a variable but notable amt., the blood sugar is raised 20% and the blood Ca more than 100%. Within a period of 50 hrs. the blood fat increases 35% and the lipid blood P 50%. Manoilov blood tests indicate a change toward a "male" reaction, and this is tentatively interpreted as indicating an increased somatic metabolism. L. W. RIGGS

The amide nitrogen on the blood. SIDNEY BLISS. *Science* 67, 515-6(1928); cf. C. A. 20, 2358.—The kidney contains an enzyme that is capable of liberating NH_3 from its combinations in the blood. Ammonia formed in the tissues is the source of the amide N of the blood. The amide N of the blood is to be carefully distinguished from the conception of an "ammonia-precursor" or "ammonia mother substance." L. W. RIGGS

Liquid exchange. VI. Decline of tissue swelling produced by local asphyxia in man with sound and with diseased kidneys. TOMOTKA YAMAGUCHI. *Tōkokū J. Exptl. Med.* 10, 350-69(1928); cf. C. A. 22, 984. L. W. RIGGS

The origin of indican in the fetal blood. KŌICHI SHIBAYAMA. *Japan J. Med. Sci.* Sect. II, 1, 111-7(1927).—The indican and amino acid N content of the blood of the fetus is larger, the non-protein N content is smaller than that of the mother's blood. The amount of indican and amino acid N diminishes in the following order: fetal blood, blood from the placental hematoma, blood from the cubital vein. *Bacillus coli communis* was not detected in the feces of the new-born child until 12 to 24 hrs. after delivery. S. believes that the indican in the fetal blood is originated by the metabolism of the fetus as well as of its mother; therefore, the accumulation of indican in the fetal blood. Both intestinal and extra-intestinal formation of indican occur in the human body. G. SCHWOCH

Physical basis of muscle function. I. Apparatus for determination of the elasticity and the internal friction of muscle. FRIEDRICH RICHTER. *Arch. ges. Physiol.* (Pflüger's) 218, 1-16(1927).—Description of app. used. II. Changes in the elasticity and in the internal friction of muscles during chemical contraction. *Ibid* 17-36.—Study of contraction, as induced by KCN, acetylcholine, NH_4OH , and caffeine, upon the elasticity. G. H. S.

Metabolism of birds and metabolism in general. Relation between gas metabolism and respiratory rate. FRANZ GROEBBELS. *Arch. ges. Physiol.* (Pflüger's) 218, 98-114(1927).—Study of the metabolism of 70 birds, belonging to 17 different species, showed that they could be divided into 2 categories, the distribution being unrelated to the type of food utilized or to the type of reserve substance developed. The first class is characterized by a true chem. heat regulation, a relatively low nutritional requirement, a

great resistance to hunger, a slight inclination to activity, a relatively low body temp. and a low relative O_2 utilization. The second class regulate their temp. through the specific dynamic action of their food and by bodily activity, have a relatively high nutritional requirement, slight resistance to hunger, a rapid rate of digestion, show marked activity and have a high body temp. and a high relative O_2 utilization. In birds the increase in O_2 use caused by activity is more than 20%. Specific dynamic action in pigeons is 20–30% and falls considerably with protracted hunger. Physical heat regulation appears in birds of different species at different temps., and when it becomes manifest the gas metabolism falls while the respiration and temp. increase. During brooding O_2 use is augmented, in pigeons up to 30%, and the temp. is elevated. From the standpoint of the physiology of metabolism apparently mammals may also be divided into two types. G. H. S.

Muscle contraction. VI. Reduction in volume and the action current. Ion theory of stimulation. E. ERNST. *Arch. ges. Physiol.* (Pflüger's) **218**, 137–47(1927).—The action current and the reduction in vol. taking place during muscle contraction show approx. parallel curves. G. H. S.

Regulation of metabolism. IX. Effect of the sympathetics on muscle. AUGUSTE HOFFMANN AND ERNST WERTHEIMER. *Arch. ges. Physiol.* (Pflüger's) **218**, 176–97(1927); cf. *C. A.* **22**, 109.—Study was made of the influence of the sympathetics on the utilization of glycogen by muscles. During strychnine intoxication of frogs more glycogen is used by stimulation of the sympathetic than through motor stimulation. The seasonal changes in glycogen content are also to some degree controlled by the sympathetics. The administration of adrenaline, which causes a reduction in glycogen, is less effective in the muscle deprived of its sympathetic innervation. In strychnine poisoning, which is associated with a strong sympathetic stimulation, the muscle lacking sympathetic connection shows fatigue and attendant phenomena more slowly than does a control muscle with normal innervation. G. H. S.

Connection between blood sugar content and blood coagulation time. ALEXANDER PARTOS AND FRANZ SVEC. *Arch. ges. Physiol.* (Pflüger's) **218**, 209–15(1927), cf. *C. A.* **22**, 617.—The speed of blood coagulation is directly related to the amt. of sugar present in the blood. As the sugar content is increased the coagulation time is shortened. These conclusions are based upon the changes induced by adrenaline, theobromine, morphine, novirudin, normal horse serum and glucose, through altering the Ca content, the production of alimentary hyperglucemia and through studies on animals subjected to laparotomy. G. H. S.

Respiration of fatty tissues. M. N. SHATERNIKOV, O. P. MOLCHANOVA AND M. T. TOMME. *Arch. ges. Physiol.* (Pflüger's) **218**, 216–21(1927).—See *C. A.* **22**, 982. G. H. S.

Graphic methods of determining the total gas metabolism of man in work experiments. J. G. DUSSER DE BARENNE AND G. C. E. BURGER. *Arch. ges. Physiol.* (Pflüger's) **218**, 222–38(1927); cf. *C. A.* **21**, 3659.—Description of 3 methods that may be utilized. G. H. S.

Gas metabolism of man in static work. J. G. DUSSER DE BARENNE AND G. C. E. BURGER. *Arch. ges. Physiol.* (Pflüger's) **218**, 239–60(1927). G. H. S.

Influence of the central nervous system on the deposition of fat in the liver in animals maintained in a rarified atmosphere. A. LOEWY AND J. MOSONYI. *Arch. ges. Physiol.* (Pflüger's) **218**, 285–90(1927).—Existence in a rarified atm. leads to certain changes, particularly as regards fat, in the liver of rabbits and cats, and the influence of the central nervous system on the character of these changes was detd. by section of the spinal cord in the cervical region. No clear-cut chem. differences could be detected attributable to section of the cord, although a distinct effect upon histology was readily apparent. G. H. S.

Equalization of the chloride concentration between red blood cells and sodium chloride solutions and its relationship to "osmotic resistance." E. SKUJIN. *Arch. ges. Physiol.* (Pflüger's) **218**, 343–53(1927).—Within a period of 24 hrs. a complete equil. between the chlorides of the NaCl soln. and those of the red blood cells suspended in it does not become established. The divergence from an equalization is max. in 0.6% NaCl and it appears in all hypotonic solns. At the limiting concn. (0.6%) a break in the curve appears, and as the hypotonicity increases the divergence from a state of equil. becomes less. At this limiting concn. hemolysis begins. The maintenance of this failure to establish an equil. is a property of living cells, for with dead cells a complete equalization with hemolysis takes place. Treatment with CO_2 , simple aging and narcosis tend to reduce the difference between the chloride concns. of the cells and the surrounding fluid. G. H. S.

Irradiation substances in the heart. H. ZWAARDEMAKER. *Arch. ges. Physiol.* (Pflüger's) **218**, 354-73(1927).—See *C. A.* **21**, 3628. G. H. S.

Formation of urine in the frog kidney. XIII. Mechanism of purine diuresis. WILLI WOHLBERG. *Arch. ges. Physiol.* (Pflüger's) **218**, 448-68(1927); cf. *C. A.* **22**, 108.—With the surviving artificially perfused frog kidney caffeine and theophylline cause a marked diuresis, one which is always reversible if high concns. are used. Low concns. of caffeine (1.5 or 10,000) and theophylline (below 1.100,000) have no effect on the tubules, but act rather upon the glomerulus. Suffocation and narcosis are inhibitory, but these inhibitory effects can be overcome by higher concns. G. H. S.

Blood-sugar values after ligation of the pancreatic duct. O. GALEHR, P. LADURNER AND L. UNTERRICHTER. *Arch. ges. Physiol.* (Pflüger's) **218**, 477-87(1927).—Following atrophy of the pancreas consequent upon ligation of the duct it was found that normal sugar levels were maintained, and the usual course of the "hypoglycemic reaction" took place. Such animals do, however, show a diminished tolerance for glucose. G. H. S.

Absorption of phenol red by the blood of different animals. L. BRAUN. *Arch. ges. Physiol.* (Pflüger's) **218**, 523-7(1927).—The absorption of phenol red by blood does not correlate directly with the capacity of the bloods to cause a breaking down of acetylcholine. From a dyestuff soln. having a concn. of 0.35 mg. per cc. human and rabbit bloods absorb about 74% of the dye, cat and dog bloods about 65%; of the sera, human and rabbit absorb about 21%, cat and dog 13-15%. G. H. S.

Oxygen utilization of Purkinje's fibers. W. KOLMER AND W. FLEISCHMANN. *Arch. ges. Physiol.* (Pflüger's) **218**, 530-1(1927).—Results of work with the hearts of sheep and calves showed that the trabecular substance utilized about 10 times as much O_2 per unit of wt. as did the Purkinje fibers. G. H. S.

Heart vagus. II L. OTTO. *Arch. ges. Physiol.* (Pflüger's) **218**, 532-4(1927).—The vagus appears to have a direct action on the dog heart, as is revealed by expts. involving the use of atropine and pilocarpine under diverse conditions. G. H. S.

True acidity of the surviving testis and epididymis of the steer. T. VON LANZ AND G. MALYOTH. *Arch. ges. Physiol.* (Pflüger's) **218**, 535-52(1928).—By means of a micro-electrode the p_H of the testis was found to be 6.7, of the epididymis 6.1. The values differ slightly from those obtained in living, as contrasted with surviving, tissue. G. H. S.

Secretion of pancreatic juice—a glucolytic factor in the blood. E. B. BOLDUREV. *Arch. ges. Physiol.* (Pflüger's) **218**, 553-67(1928).—In the healthy fasting animal fluctuations in blood sugar occur at regular time intervals. During periods of pancreatic secretion the sugar content is lower than during the intervening intervals. Furthermore, suppression or inhibition of secretion, or a removal of the secreted material through a fistula causes the blood sugar to rise. With intense gastric secretion the blood sugar becomes greater. Pancreatic juice contains a glucolytic enzyme and there is a direct parallelism between the appearance of this enzyme in the blood and the amt. of sugar in the blood. Some chem. compds. and drugs which stimulate pancreatic secretion also reduce the blood sugar. G. H. S.

Effect of the anterior lobe of the hypophysis upon sexual characters in the male. H. E. VOSS AND S. LOEWE. *Arch. ges. Physiol.* (Pflüger's) **218**, 604-9(1928).—The hormone of the anterior lobe is in no way species specific in its action, as is shown by the fact that the implantation of very small amts. of the tissue from the sheep has a very marked effect upon sexual development in mice. The action involves primarily changes in the testis, other changes being secondary. G. H. S.

Behavior of different protein decomposition products in intermediary metabolism in angiotomized dogs. NINA KOCHNEVA. *Arch. ges. Physiol.* (Pflüger's) **218**, 635-41(1928).—The intestinal wall is permeable for complex amino acids as well as for the simpler ones. In fasting animals there are slight but definite differences in amino N and polypeptide N between the blood entering and that leaving the different organs. In fasting animals the spleen is chiefly involved in yielding polypeptide N to the blood. During digestive periods polypeptide formation takes place not only in the liver (0.62 mg. %), but also in the spleen (0.5 mg. %), intestine (0.42 mg. %), muscles (0.14 mg. %) and kidneys (0.56 mg. %). G. H. S.

Phosphorus in intermediary metabolism in angiotomized dogs. A. J. CHARIT. *Arch. ges. Physiol.* (Pflüger's) **218**, 642-6(1928).—In the intermediary metabolism of P 5 organs are involved; inorg. P is absorbed by the intestine and a portion of this is retained by the liver and through the action of the hormones of the adrenals and the pancreas is transformed into org. compds. That portion which is not held back by the liver is removed by the kidneys and excreted in the urine. G. H. S.

Potassium and dialyzable and non-dialyzable calcium in intermediary metabolism in angiotomized dogs. S. V. NEDSVEDSKII. *Arch. ges. Physiol.* (Pflüger's) 218, 647-54(1928).—When mixts. of K and Ca are introduced into the intestine, K is the first to be absorbed. In the intestinal wall the Ca enters into combination with colloidal substances. In the liver this process is reversed, and the Ca then becomes dialyzable. In this state the Ca, together with the K, is carried through the tissues by the blood, and during its passage through the intestinal wall a portion of the Ca again enters into colloidal combination. A large part of the K is excreted through the kidneys, while but little of the Ca is disposed of in this way. The spleen retains some of the K. G. H. S.

Formation and fate of creatine and creatinine in angiotomized animals. W. O. MOCHNATSCH. *Arch. ges. Physiol.* (Pflüger's) 218, 655-60(1928).—Studies upon creatine metabolism in angiotomized animals do not indicate a strict connection between these processes and the liver. In fasting animals both the liver and the kidneys are involved, although during digestion the liver seems to be the organ concerned. Creatine thus formed passes into the circulation from which it is withdrawn by the other organs, the intestinal wall retaining relatively large amts. G. H. S.

Formation and distribution of sugar in the organs in angiotomized dogs, both during fasting and in digestion. NINA KOCHNEVA. *Arch. ges. Physiol.* (Pflüger's) 218, 661-6(1928).—In fasting dogs sugar is continuously being thrown into the circulation from the liver and reaches its highest concn. in the blood leaving this organ. From the blood it is taken up by the other organs, in largest quantities by the small intestine, duodenum and pancreas. Muscle also takes a large amt. of sugar, the kidneys but little, and practically none is withdrawn by the spleen and the adrenals. In animals on an exclusively protein and fat diet all vascular beds have the same sugar content during digestive periods. Contrasted with the fasting animal, after the administration of sugar the blood of the portal and pancreaticoduodenal veins contains the highest concns. of sugar. Most of the carbohydrate is retained by the liver while the balance that remains in the circulation is taken up by the kidneys and the muscles. The spleen is but little involved. G. H. S.

Water content of the blood of different circulation beds in angiotomized dogs. L. I. KRYŽANOVSKII. *Arch. ges. Physiol.* (Pflüger's) 218, 667-9(1928).—After the administration of moderate amts. (200 cc.) of water contg. 10-20% of solids to dogs the amt. of water to be taken up fluctuates between 0.15 and 0.95 cc. per 100 cc. of blood. On the av. absorption amts. to 0.4-0.5%. In fasting animals the water content of the portal vein is the same as that of the femoral artery. There is undoubtedly a direct connection between the rate of absorption of water from the intestine and the rate of excretion by the kidney. The excess of water taken up from the intestine is retained by the liver, as is the case after feeding with milk. G. H. S.

Origin and distribution of ammonia in angiotomized dogs. A. D. CHOLOPOV. *Arch. ges. Physiol.* (Pflüger's) 218, 670-6(1928); cf. *C. A.* 21, 1142.—The NH_3 of the blood of dogs is derived from 3 sources, bacterial decompn. being of primary importance. Portions are also assocd. with the action of the internal secretions of the kidneys and with digestive processes in the intestine. The liver retains NH_3 , but does not act upon amino acids to produce NH_3 for delivery. Pancreas, spleen and muscle neither deliver NH_3 to the blood nor remove it from the blood. G. H. S.

Oxygen deficit of arterial blood under diminished atmospheric pressure. ALFRED FLEISCH. *Arch. ges. Physiol.* (Pflüger's) 218, 690-7(1928).—In rabbits it was found that the progressive reduction of the atm. pressure from 730 to 330 mm. Hg causes the percentage O_2 satn. of the arterial blood to fall from 92 to 59%. When the pressure is reduced suddenly to 330 mm. the O_2 satn. falls to but 40.6% (av.) There is no evidence that such reductions in pressure cause an active secretion of O_2 in the lung. G. H. S.

Effect of feeding spleen on hemopoiesis. A. ZIII. *Arch. ges. Physiol.* (Pflüger's) 218, 736-48(1928).—The feeding of spleen may lead to hemopoiesis or to a reduction in blood cells. The effect of spleen feeding is detd. by the quantity fed and the individuality of the animal fed. In general, large doses reduce cell counts, small doses increase them. In anemic animals spleen feeding has but a slight effect in reducing the no. of cells, but the hemopoietic action may be very pronounced. On the contrary, animals with high counts react to large doses with a definite increase in cells; to small doses with but a very slight, or no, hemopoiesis. Tests on man indicate that only those with anemia show an increased cell count. The activity of the spleen is not lost by desiccation, and aq. exts. are effective. G. H. S.

The regulation of the acid-base balance of the body. NOAH MORRIS AND STANLEY GRAHAM. *Glasgow Med. J.* 28, 239-60(1928).—A review. M. H. SOULS

The thyroid gland and thyroxine. GEORGE BARGER. *Pharm. J.* 119, 609-14, 623; *Chemist and Druggist* 107, 700-2(1927).—A detailed review of hormones in general, of the functional history of the thyroid gland, the chem. history of thyroxine and its structural formula, and a discussion of the I content of the thyroid gland. S. W.

Calcium and inorganic phosphorus in the blood of rabbits. III. Periodic and progressive variations in normal rabbits. WADE H. BROWN AND MARION HOWARD. *J. Exptl. Med.* 47, 637-62(1928); cf. *C. A.* 22, 1800-1.—Detns. of Ca and inorg. P were made on the blood of 5 groups of normal animals over a period of 4-8 months. The material included animals from recently acquired stocks as well as animals that had been living under laboratory conditions for long periods of time. The results were analyzed with especial reference to the occurrence of periodic and progressive variations in the abs. amt. of Ca and inorg. P and the relations between the 2 substances. Among animals living in the lab., both Ca and inorg. P, as well as all expressions of the equil. between the 2 substances, exhibited a definite tendency to a progressive increase or decrease, as the case might be, and clearly defined periodic variations occurred in all classes of animals. The progressive change was most marked in the case of inorg. P, the periodic change in the case of Ca, while both conditions were clearly shown by various expressions of the relation between Ca and inorg. P. C. J. WEST

Electrophoresis of the blood platelets of the horse with reference to their origin and to thrombus formation. H. A. ABRAMSON. *J. Exptl. Med.* 47, 677-83(1928).—The cataphoretic velocity of blood platelets (horse) in plasma is between 0.40 and 0.51 μ per sec. per v. per cm. The mean velocity obtained from 5 horses is 0.45 μ . The velocity of polymorphonuclear leucocytes in similar specimens is practically identical with that of the platelets. With spontaneous agglutination of platelets, white cells and red cells, there is no change in the cataphoretic velocity incidental to aggregation. The possible surface composition of platelets and white cells is briefly discussed and the bearing of these findings on the origin of blood platelets and the mechanism of thrombus formation is demonstrated. C. J. WEST

Relative reactions within living mammalian tissues. X. Litmus constituents as vital stains: their preparation and relative usefulness. ROBERT ELMAN, D. R. DRURY AND P. D. McMASTER. *J. Exptl. Med.* 47, 777-96(1928).—Methods have been devised for the sepn. and isolation of the important constituents of litmus, azolitmin and erythrolitmin, with a view to employing them as vital stains. Analysis of the color intensities of these dyes shows slight differences in them, azolitmin being the weaker pigment, wt. for wt. Study of a 3rd coloring matter, erythrolein, which exists in litmus has shown it to be an unsatisfactory indicator and toxic for animals. Analyses with the spectrophotometer of the absorption of light by erythrolitmin and azolitmin, prepd. by the indicated methods and tested over a wide acid-alkali range, show them to be pure substances, comparable in this respect with synthetic indicators. The errors in the interpretation of the indicator phenomena on vital staining, which are incident to changes in the concn. of the dyes, are so slight as to be negligible. The salt and protein errors on the other hand are large. The factors responsible for the Donnan equil. fail to influence the distribution of the indicators between fluid and gelatin. Erythrolein was found useless when employed for vital staining and azolitmin proved unsatisfactory since it colors poorly and is toxic. But erythrolitmin can be used to great advantage. It is readily absorbed and in non-toxic doses stains intensely. The range of p_H at which it changes from red to blue fits it for the demonstration of changes in the reaction of living tissues. By reason, however, of the salt and protein errors to which it is liable, the p_H cannot be accurately ascertained. Intravital staining with erythrolitmin yields results similar to those following injection of purified "whole litmus." XI. The intracellular reaction of the kidney epithelium and its relation to the reaction of the urine. P. D. McMASTER AND ROBERT ELMAN. *Ibid* 797-820.—The tubules of the mammalian kidney, vitally stained with erythrolitmin, show a significant color pattern, the cells of certain regions appearing bright blue and others brilliant red. The dye is segregated within the cytoplasm, staining fine granules diffusely. Under normal circumstances of renal function erythrolitmin is stored in the lining cells of the glomerulus and the epithelial cells of the proximal convoluted tubules in the blue, alk. form. In the cells of the final portion of the distal convoluted tubules the dye is red. Alterations in the relative reaction of certain regions of the tubules as disclosed by the color of the dye within the cells can be induced by means that alter the reaction of the urine. C. J. WEST

Studies in blood glycolysis. I. General consideration of glycolysis in relation to the blood cells, and the production of lactic acid and carbon dioxide. ICHIRO KATAYAMA. *J. Lab. Clin. Med.* 12, 239-54(1928).—These results were obtained from extensive studies of glycolysis in animal and human bloods: The sugar of shed blood

gradually decreases on standing without bacterial contamination, under aerobic or anaerobic conditions. This decrease is greatest at 38° and least in the ice box. Plasma, serum and hemolyzed blood show no loss of sugar on standing. Satn. of whole blood with CO does not inhibit glycolysis. When washed blood cells are added to Ringer soln. or physiologic salt soln. contg. glucose, fructose or galactose, glycolysis occurs. The decrease in sugar concn. is greatest with glucose and least with galactose. The rate of glycolysis depends upon the blood cell vol. There appears to be no demonstrable difference between the rates of glycolysis in diabetic and nondiabetic bloods. Insulin therapy or insulin *in vitro* has no effect upon the rate of glycolysis. The decrease in sugar concn. is accompanied by a production of lactic acid, but the increase in lactic acid does not account for the total amt. of sugar lost. Other acids than lactic acid are evidently produced during glycolysis. There is no production of CO₂. E. W. WICKWIRE

G—PATHOLOGY

H. GIDEON WELLS

Parathyroid hypercalcemia and anaphylactic shock. S. A. LEVINSON AND S. A. MATHEWS. *Proc. Soc. Exptl. Biol. Med.* **24**, 350-1 (1927) —Anaphylaxis in dogs sensitized to egg albumin was not altered by the presence of hypercalcemia induced by the injection of Collip Para-thormone. C. V. B.

The production of immune sera for tissues. K. LANDSTEINER AND J. VAN DER SCHEER. *Proc. Soc. Exptl. Biol. Med.* **25**, 140-1 (1927) —Immune sera were obtained easily by intravenous administration of small quantities of cell or organ suspensions, *i. e.*, by 3 weekly injections of 10 mg. each of the fresh material suspended in saline. The following materials (from the ox) were used as antigens: tracheal epithelium, thymus cells, kidney and washed sperm cells. The resulting sera differentiated clearly in complement fixation tests between these 4 materials. On testing, however, with a large number (19) of other tissues group reactions were obtained, more frequently with some sera than with others, also in cases where there is neither histological nor embryological relationship, *e. g.*, trachea immune serum on brain. Only the sperm immune serum was entirely organ-specific. The immune sera were Wassermann negative and varied from none to moderate hemolytic activity for ox blood. C. V. B.

An unknown reducing urinary substance in myasthenia gravis. G. MEDES, H. BERGLUND AND A. LOHMANN. *Proc. Soc. Exptl. Biol. Med.* **25**, 210-1 (1927)

C. V. B.

Urea and creatinine concentration in the blood; a statistical study. R. S. HUBBARD. *Proc. Soc. Exptl. Biol. Med.* **25**, 261-3 (1928) —The relation was examd. between urea and creatinine concn. in the blood of patients studied over a period of 8 yrs. In the large series, composed almost wholly of chronic cases, with acute nephritis very meagerly represented, urea and creatinine concns. in the blood paralleled each other; not infrequently there was evidence of rather sudden changes in urea concn. probably associated with variations in the rate of urea formation, there was a small number of cases where some additional factor seemed to be affecting the results. C. V. B.

The change in surface tension of plasma with time. GEORGE HOMÈS. *Bull. sci. acad. roy. Belg.* **13**, 555-72 (1927) —A new app. for measuring surface tension, σ , is described, operating on the principle of the du Nouy instrument, but so arranged that the liquid can be held in an enclosed space. The plasmas of guinea pigs, rabbits and dogs were studied. Whether observed in an enclosed space or not, σ decreases as time passes after first establishment of the surface. Evapn., therefore, has nothing to do with it. Extrapolation of the σ - t curve to 0 time always gives a value less than σ measured by dynamic methods. The static σ of the plasma of guinea pigs subjected to anaphylactic shock is lower than σ for normal plasma by a characteristic amt., although the dynamic σ remains the same. The subject is developed thermodynamically in a theoretical part.

F. L. BROWNE

The theory of the colloidal reactions of cerebrospinal fluid. WILLY SCHMITT. *Kolloidchem. Beihefte* **26**, 58-160 (1928), cf. *C. A.* **21**, 2500 —The pptn. and protective reactions of cerebrospinal fluid with colloidal Au, mastic, and gum benzoin depend upon the quantities of the reacting sols present, their charge, particle size, and H-ion concn. Four types of coagulation are involved, (1) adsorptive coagulation of colloids of like sign uninfluenced by electrolytes, (2) the same influenced by electrolytes, (3) coagulation at the isoelectric point, and (4) coagulation of colloids of opposite sign. To study these reactions albumins and globulins were prepd. very carefully and purified by electrodiagnosis. A bibliography of 228 references is given.

F. L. BROWNE

The iodine content of the blood in ordinary goiter and in cretinism. F. DE QUER-

VAIN AND W. E. SMITH. *Endocrinology* 12, 177-89(1928).—The av. I content of peripheral blood in normals was 13.12 mg. %, in cases of simple goiter, 9.322 mg. %, and in cretins, 6.38 mg. %. After the administration of KI the av. blood I was 15.36 mg. % in the normals and 6.42 mg. % in the cretins. The cretins excrete I faster in the urine than normals.

H. J. DEUEL, JR.

Experimental investigations on the interferometric and chemical demonstration of the Abderhalden serum enzymes. E. KUSTER AND K. KOULEN. *Fermentforschung* 9, 265-99(1928).—An increase in amino acid content (autolysis) occurs in sterile natural serum at 37°, but a measurable increase in the interferometer value is not observed. Addn. of kaolin to a serum, even with 40 hrs' incubation, does not intensify perceptibly the natural autolysis. Dialysis of serum against distd. water leads to a stronger ninhydrin reaction in the dialyzate than dialysis against physiol. NaCl soln. This, however, does not imply an abs. increase in amino N as compared to the amino-N content of a serum incubated the same length of time without dialysis. With the original method of interferometer measurement considerable decompn. is almost invariably found. Sera of pregnant and non-pregnant individuals, active and inactive sera, cannot be distinguished with certainty. In the decompn. as indicated by the interferometer, the swelling of the substrate is shown to be an important factor. The swelling of a single substrate is not const. but is dependent on the nature of the added serum, and is not amenable to simple calcn. The action of placenta substrate on serum frequently gave an increase in residual N without any relation to the interferometer reading taken simultaneously, even when the error due to swelling was avoided experimentally. The customary sterilization of rubber stoppers with EtOH leads to appreciable errors which may be avoided by using stoppers of gray Para rubber sterilized by boiling in water. Even when all known errors, including substrate swelling, are avoided, the interferometer method shows variations when the same substrate is tested with different sera or when the same serum is tested with different substrates. The results obtained by this method are of no diagnostic value.

A. W. DOX

The nature of the Abderhalden reaction. SEVERIAN BUADZE. *Fermentforschung* 9, 362-74(1928).—No evidence could be obtained in support of the view held by numerous investigators that the Abderhalden reaction is a complement fixation. The assumption that the reacting substance is an amboceptor and requires a complement for the occurrence of the reaction should be abandoned.

A. W. DOX

Further contribution to the nature and technic of the Abderhalden reaction. EMIL ABDERHALDEN. *Fermentforschung* 9, 392-4(1928), cf. *C. A.* 22, 260.—Slight modifications are recommended. When the dialysis is performed at room temp. the time should be extended to 3 hrs., especially in winter when the lab temp. is 15°. For the isolation of protein from placenta tissue the thoroughly washed and dissected tissue is heated 5 hrs. at 100° with a 50% LiBr soln., the soln. filtered and dialyzed, 1/3 vol. EtOH added and the protein coagulated at 90°, washed with EtOH and Et₂O and dried. The photomicrographic method of detg. the action of serum on placenta protein shows little change in 10 hrs. but an almost complete disappearance of the protein in 48 hrs. when the reaction is positive.

A. W. DOX

The origin of malignant tumors. V. The free cysteine content of normal and tumor tissues. R. BIERICH AND K. KALLE. *Z. physiol. Chem.* 175, 292-9(1928); cf. *C. A.* 21, 1842.—Normal epithelial and muscle tissues after direct fixation give a negative Sullivan reaction; only kidney tissue gives a positive reaction. If the tissues have aged for some time in the air the reaction then becomes positive. An exception is the suprarenal which gives a negative Sullivan reaction even after aging. The malignant human tumors thus far examd. behaved like normal tissue. Baker's yeast under ordinary conditions gives no Sullivan reaction. Suprarenal ext. contains besides glutathione another substance which in acid soln. consumes I.

A. W. DOX

The treatment of one hundred and five cases of acid intoxication with buffer solutions. F. A. HÆCKER. *J. Lab. Clin. Med.* 12, 467-72(1927); *Physiol. Abstracts* 12, 345.—H. gives details of his method for intravenous administration of a buffer soln. in cases of acid intoxication with depletion of blood buffers. No ill effects followed, and many cases were definitely benefited. H-ion detns. of the urine were used to observe the progress of the treatment.

H. G.

The antigenic character of bacterial lipoids. F. WEIGMANN AND W. LIESE. *Klin. Wochschr.* 7, 313(1928).—An alc. ext. of tubercle bacilli, that does not give a test for either protein or N, possesses antigenic properties. It is highly specific in the complement-fixation reaction and produces a sensitization such that reinjection leads to

fatal anaphylactic shock. The sensitiveness can be transmitted, with the animal's blood, to a normal animal. MILTON HANKE

Biochemistry of scurvy. A. ABRAHAM. *Klin. Wochschr.* 7, 353-5(1928).—One case of scurvy was studied. The osmotic resistance of the erythrocytes was reduced. Cholesterol and Ca were reduced and K was increased (in the blood). The peroral administration of glucose led to a protracted elevation of the blood sugar concn. which developed slowly and subsided slowly. MILTON HANKE

Demonstration of isoprecipitins in human blood. Demonstration of four blood groups by means of isoprecipitation. H. DOLD AND RAHEL ROSENBERG. *Klin. Wochschr.* 7, 394-5(1928).—A clear ext. can be prepd. from the stroma of erythrocytes that contains isoprecipitins characteristic of the 4 blood groups. Exts. from stroma of blood group o do not ppt. with serums of either A or B. Ext. A ppts. with type B but not with type A serum. *Vice versa* for ext. B. Ext. A B ppts. with both A and B serums. These stroma exts. can be preserved for months in a cold place without deterioration. MILTON HANKE

The mechanism of alimentary hyperglucemia. ISTVAN HETENYI AND JOHANN POGANY. *Klin. Wochschr.* 7, 404-6(1928).—Glucose, administered orally, irritates the sympathetic nerve endings in the liver which leads to a demobilization of glycogen and hence to a hyperglucemia. Ergotamine paralyzes the sympathetic nerve endings which paralyzes the mechanism that leads to glycogen demobilization or mobilization. Ingestion of glucose does not lead to hyperglucemia in patients that have been treated with ergotamine. Injected glucose remains in the circulation for a protracted period in ergotamine-treated patients. MILTON HANKE

The mode of action of liver diet in pernicious anemia. PAUL JUNGSMANN. *Klin. Wochschr.* 7, 441-5(1928).—The liver diet treatment of pernicious anemia is symptomatic and does not remove the cause of the disease. The active substance is contained in meat and in kidney as well as in liver. It does not lead to blood regeneration, but retards the rate of blood destruction. It acts upon the reticuloendothelial metabolism app., not upon the blood. This treatment is, therefore, useful in all of the many disturbances that are assocd. with a dysfunctioning of the reticuloendothelial system. MILTON HANKE

Action of ether narcosis on liver function. KURT BOSHAMER. *Klin. Wochschr.* 7, 445-7(1928).—The liver is always injured by an ether narcosis. An impaired liver may be seriously injured. MILTON HANKE

Sensitiveness of the cancer cell to heat. BRUNO MENDEL. *Klin. Wochschr.* 7, 457-8(1928).—Cancer cells, whose glucolytic action has been reduced 70-80% by exposure to heat, die. This requires 3 hrs. at 44°, 5 hrs. at 43°, 7 hrs. at 42.5°, 10 hrs. at 42° and 20 hrs. at 41.5°. The body temp. can be elevated to 41.5° to 42° without causing death. The suggested treatment is obvious. Spirochetes are less heat stable than are cancer cells. MILTON HANKE

The colloidal structure of the plasma during pregnancy. HEINRICH EUFFINGER. *Klin. Wochschr.* 7, 492-4(1928).—The stability of the plasma colloids is progressively reduced during pregnancy and reaches its greatest degree of instability during the week following delivery. The total protein content decreases steadily from 8.5 to 7.2%; the euglobulin content increases from 0.09 to 0.5% and the fibrinogen content increases from 0.15 to 0.21%. The cholesterol content increases from 120 mg.% to 297 mg.%; but the fraction that is directly extractable with ether decreases from 80 to 73.7%. MILTON HANKE

Sensitization against chemically defined substances. I. Neoarsphenamine in man. WILHELM FREI. *Klin. Wochschr.* 7, 539-42(1928).—The intracutaneous injection of small quantities of neoarsphenamine into normal individuals may, in some cases, lead to a hypersensitiveness of the skin as a whole. Syphilitics that are undergoing treatment with neoarsphenamine do not, as a rule, react in this way. M. H.

Blood urea in scarlet fever and angina. FRIEDRICH WAHLIG. *Klin. Wochschr.* 7, 542-3(1928).—Blood urea is not increased in mild cases of scarlet fever. The av. blood urea concn. is 16.3 mg.% in angina. MILTON HANKE

Is the sugar-tolerance test of use in the diagnosis of pregnancy? O. BOKELMANN AND J. ROTHFELT. *Klin. Wochschr.* 7, 543-5(1928).—The sugar-tolerance test is not trustworthy as a means of diagnosing pregnancy. MILTON HANKE

The isoagglutinin content of tissue juice and its relation to tissue transplantation. GEORG LENART AND JULIUS KÖNIG. *Klin. Wochschr.* 7, 549-50(1928).—See C. A. 22, 1190. MILTON HANKE

Hyperfunction of the Islands of Langerhans. D. E. ALFERN AND W. P. BESUGLOW. *Klin. Wochschr.* 7, 586-9(1928).—Ligation of the ductus pancreaticus or of a portion of

the tail of the pancreas leads to changes in the metabolism of carbohydrate, fat and minerals that are identical with those produced by a hyperfunction of the pancreas. The islands of Langerhans are hypertrophied. MILTON HANKE

Lipoid nourishment and infection. HANS REITER. *Klin. Wochschr.* 7, 589-90 (1928).—The addn. of lipoid (promonta) to the normal diet of mice increases the ability of the animal to produce agglutinins against mouse typhoid and appears to enhance the resistance of the animal against infection with this microorganism. M. H.

Excess sugar in spinal fluid as an important diagnostic factor in pernicious malaria of infancy. G. A. PIANA. *Pediatria Rivista* 36, 24-38(1928).—The sugar content of the cerebrospinal fluid is consistently and markedly raised in proportion to the concurrent hyperglucemia in all cases of malaria with meningeal symptoms. It does not exceed the highest physiol. values when the disease runs a normal course. M. J.

Old and new studies of infantile paralysis. F. L. O. PRESTI-SEMINARIO. *Pediatria Rivista* 36, 143-55(1928).—Review. MARY JACOBSEN

Alimentary fevers. A. LAURINISCH. *Pediatria Rivista* 36, 257-65(1928). MARY JACOBSEN

Modifying the toxicity of acidified zootoxins and phytotoxins by the addition of bile. A. CLEMENTI AND DE GAETANI. *Boll. soc. ital. biol. sper.* 3, 34-5(1928).—HCl (0.2%) was added to tetanus and diphtheria toxins and to ricin, followed by 6% bile. The solns. were centrifuged and the ppt. was recovered. The supernatants and also the ppts. dissolved by the aid of a little NaOH were injected into guinea pigs. The animals receiving the ppts. invariably died, showing that a part of toxin is carried down by the flocculation caused by the acid and bile. PETER MASUCCI

The relation between Thomsen's phenomenon and autohemoagglutination by cold. LEONE LATTES AND CARLO CREMA. *Boll. soc. ital. biol. sper.* 3, 52-5(1928).—The supposed Thomsen agglutinin agglutinates fresh corpuscles at 0°; the supposed cold agglutinin agglutinates Thomsen's corpuscles at 19°. There is no substantial difference between Thomsen's agglutination and cold agglutination. PETER MASUCCI

The specificity and behavior of the double ring in precipitation tests. C. CREMA. *Boll. soc. ital. biol. sper.* 3, 56-8(1928).—The formation of the double ring is a specific characteristic for species identification. The observation should be limited, otherwise, if extended to one hr the double ring is obtained with heterologous serums. Attempts to make the reaction entirely specific by centrifugation and absorption were negative. The double ring reaction properly read is a valuable diagnostic test. PETER MASUCCI

The behavior of total lipoids, lipid phosphorus, and adrenaline of the suprarenal capsules in late deaths from burns. C. CREMA. *Boll. soc. ital. biol. sper.* 3, 59-62 (1928).—The dorsal side of guinea pigs was immersed in boiling water for 30-60 sec. The animals either died eventually or were killed. The total lipoids and phosphorated lipoids in the suprarenal capsule of the burned animals showed a marked diminution. The ratio of P to total lipoids was smaller in burned animals than in normals. The chem. findings confirm the microchem. findings of Esposito, namely, that the lipid content of the capsule phosphatides, cholesterol and fats is rapidly diminished as a result of the burns, and this may account for the sudden death in numerous cases. The adrenaline content is also reduced. PETER MASUCCI

Cholesterol in the blood of lepers. GIUSEPPE BORGATTI. *Boll. soc. ital. biol. sper.* 3, 84-6(1928).—Cholesterol detns. were made at various times on the blood of 8 lepers. There was a diminution of cholesterol content in most cases. P. M.

Further investigations on the metabolism of fatty substances under pathological conditions. II. Conditions in which colloidal silver inhibits infiltration liposis by phosphorus. C. CIACCIO AND G. TRIMARCHI. *Boll. soc. ital. biol. sper.* 3, 106-8(1928); cf. C. A. 22, 2406.—White mice were treated with 10 mg. colloidal Ag and with 1 cc. 0.1% phosphorated oil under various conditions. The animals were killed 24 hrs. later and the liver, kidneys and heart were fixed in formaldehyde and examd. for fatty substances. While the animals treated with phosphorated oil alone showed massive liposis, those treated with colloidal Ag and phosphorated oil did not show a trace of liposis. The colloidal Ag exerts a "blocking" action as well as a catalytic action on the fats or P. PETER MASUCCI

The calcium and potassium content of the blood serum of normal and epileptic subjects. VITO LONGO. *Boll. soc. ital. biol. sper.* 3, 112-4(1928).—Ca and K detns. were made on 20 normal and 20 epileptic subjects. The blood was withdrawn before breakfast; Ca and K were detd. by the Kramer-Tisdall methods. The Ca in the blood of normals varied from 9.5 to 12.70 mg. with an av. of 11.3 mg. per 100 cc. of blood; in the blood of epileptics it varied from 9.68 to 12.00 mg. with an av. of 9.68 mg. per 100 cc. In normals, K varied from 18.00 to 53.50 mg. with an av. of 22.32 mg. per

100 cc.; in epileptics it was 21.30 to 38.70 with an av. of 34.06 mg. per 100 cc. For normals the ratio $\text{Ca} \times 100/\text{K}$ had an av. value of 53.44; for epileptics it was 29.50.

PETER MASUCCI

The effect of tuberculin on erythrocytes. K. V. BERESHIN, N. D. ABRAMOVA AND A. U. SIMSKII. *Zhurnal eksptl. biol. Med.* **8**, 540-9 (1928).—Incubation of erythrocytes from healthy or sick rabbits and guinea pigs with tuberculin results in many cases in the adsorption of the sp. substances of the tuberculin. At the same time the erythrocytes lose N in the form of non-protein N.

S. MORGULIS

Content of chlorine and of nitrogenous substances in the duodenal liquid of uremics. C. AUGUSTE. *Bull. soc. chim. biol.* **10**, 386-96 (1928).—The duodenal liquid of uremics is much increased in vol. and decreased in concn. as compared with that of normal subjects. The Cl is increased and surpasses the Cl concn. of the urine. The content of N substances decomposable by hypobromite is increased parallel to the progress of N retention and maintains a level slightly below the azotemia.

L. W. RIGGS

Plasma acid-base equilibrium in malaria. SHIH-HAO LIU. *Chinese J. Physiol.* **2**, 151-5 (1928).—Acid-base equilibria in 13 cases of malaria were studied. The measurements included p_{H} , total base, CO_2 content, chlorides and proteins. All the values obtained were within normal limits. During the febrile paroxysm the p_{H} remained unchanged, but there was a slight increase in total base and a slight decrease in bicarbonate and chloride. All these changes tend to increase the residual base and the excess of residual base during fever is probably bound by org. acids of undetd. nature. All these variations are considered to be the result of fever, and are not due to the sp. effects of malarial infection.

L. W. RIGGS

Plasma lipids. I. Aliphatic acids of blood plasma in diabetes and nephrosis. SCHMORL M. LING AND SHIH-HAO LIU. *Chinese J. Physiol.* **2**, 157-61 (1928). The aliphatic acids of normal blood are highly unsatd. with an av. I value of 156.6, while in diabetes mellitus and nephrosis they are much less unsatd., their I value being 45 to 98 in the former and 59 to 87 in the latter.

L. W. RIGGS

Variations of blood phosphorus in glucose tolerance tests. HSIAO CH'EN CHANG. *Chinese J. Physiol.* **2**, 195-201 (1928).—The results of the present and of previous work indicate that P plays an important but temporary role in one of the intermediary stages of carbohydrate metabolism. The mobilization of P during, and its release after, the formation of the hypothetical compd. hexose-phosphate, is shown by prompt changes in the P content of both blood and urine, namely, a temporary diminution followed by a compensatory increase. Inability, partial or complete, on the part of the organism to metabolize sugar can be detected by the absence or attenuation of this phenomenon. While the abnormality of the behavior of P always accompanies that of the blood sugar, it is usually of smaller magnitude, and in the diagnosis of mild or potential diabetes it may be easier to interpret the sugar than the P curve.

L. W. RIGGS

Variations of the uric acid content of the blood following the state of the respiratory function. Asphyxial hyperuricemia. LÉON BINET AND RENÉ FABRE. *Compt. rend.* **186**, 973-5 (1928).—Mech. asphyxia by stoppage of the trachea in the dog was followed by an av. rise of 17 to 18% in the uric acid content of the blood. The hyperuricemia varies with the degree and duration of the asphyxia and is general, in that it affects both plasma and corpuscles. It is transient and the content of uric acid returns to its former value 15 min. after normal respiration is restored. It is not a function of the no. of red corpuscles, and is observed with the same characters in splenectomized dogs, or in dogs in which both liver and spleen are deprived of their vascular connections. Pulmonary hyperventilation for 30 to 45 min. in normal dogs did not modify the uric acid content of the blood.

L. W. RIGGS

Influence of alkalosis on the urinary elimination of nitrogen and ammonia. R. RAFFLIN. *Compt. rend. soc. biol.* **98**, 763-4 (1928); cf. *C. A.* **21**, 1144-5.—The logarithmic formulas developed in preceding papers are applied in this study. The absorption of NaHCO_3 generally lowers the output of total N. When the output of N is unchanged or increased there is always a notable increase in the hourly vol. This form of alkalosis where K_1 and K_2 are always lowered with a sufficient dose of NaHCO_3 is sharply distinguished from the alkalosis of hyperpnea in which K_1 and K_2 are raised. **Ammonia and real acidity of the urine.** *Ibid.* 765-6.—Further applications of logarithmic formulas are made. The lowering of K_1 and K_2 below normal limits in the course of the evolution of nephritis shows a deficiency in the ammonogenic function of the kidney.

L. W. RIGGS

Mechanism of uremia. A. OZORIO DE ALMEIDA. *Compt. rend. soc. biol.* **98**, 766-8 (1928); cf. *C. A.* **22**, 2204.—Expts in which nephrectomized dogs were intravenously injected with a soln. made up with P_2O_5 2.98 g., CaCO_3 0.538, MgCO_3 0.452, K_2CO_3

2.347, Na_2CO_3 1.993, 0.1 N H_2SO_4 499.7, N HCl 42.3, H_2O up to 1 l., confirmed the idea that uremia is produced by the salts of the urine L. W. RIGGS

Urea and creatinine contents of the blood in renal diseases. A statistical analysis of 5000 observations. F. S. PATCH AND I. M. RABINOWITCH. *J. Am. Med. Assoc.* 90, 1092-5(1928).—In some cases the general relationships between the urea and creatinine concns. of blood were absent. In these cases, high urea values were found assocd. with normal or nearly normal creatinine values. Notwithstanding high urea values, symptoms of uremia were usually absent when the creatinine values were about normal. Although high creatinine values and symptoms of uremia were accompanied by positive diazo color reactions, this was not necessarily so with high urea values. Since the different creatinine values could not be explained wholly on the basis of different rates of creatinine excretion, it is suggested that the greater part of what is regarded as creatinine is probably not creatinine. Blood urea values unaccompanied by observations on the "creatinine" and the diazo color reaction are unreliable for estg. progress or prognosis.

L. W. RIGGS

Inflammation. V. Acetone bodies in the blood of inflamed tissues. F. BRICKER. *Arch. expl. Path. Pharm.* 129, 285-7(1928). cf. *C. A.* 22, 2213.—In the venous blood from the inflamed rabbit ear the content of acetone bodies is very considerably greater than in the blood of normal ear

G. H. S.

Photosensitization of animals after the ingestion of buckwheat. CHARLES SHEARD, H. D. CAYLOR AND CARL SCHLOTTHAUER. *J. Exptl. Med.* 47, 1013-28(1928).—Following the ingestion of buckwheat (plant or seed) vari-colored guinea pigs, white swine and goats exhibited symptoms of photosensitization, the degree being in the order given. Rabbits, dogs, white mice and rats did not manifest symptoms of photosensitization. Irradiation by a quartz Hg vapor lamp apparently develops a resistance to photosensitization, probably because of increased pigmentation induced by ultra-violet light. From the nature of the physiol. and path. reactions produced under various filters and from a consideration of the % of transmission of solar energy in the visible spectrum, it would seem that the region of photosensitization lies between 580 millimicrons (yellow) and the red end of the spectrum, this is substantiated by the fact that irradiation by a quartz Hg vapor lamp produces no symptoms or reactions. Spectrophotometric detns. of alc. exts. of grass (non-toxic) and of buckwheat (toxic) show the presence of 2 additional bands in the absorption spectra of buckwheat with max. at about 540 and 600 millimicrons, resp., together with the common absorption zones at 430 to 490 and 630 to 690 millimicrons. Spectrophotometric detns. of blood serums of sensitized animals show, besides the usual absorption bands peculiar to oxyhemoglobin 2 zones with max. at 600 and 660 millimicrons, resp. The fluorescence of chlorophyll *per se* is not, in all probability, the cause of the sensitization nor is hematoporphyrin the photodynamic substance. Phylloporphyrin may be the photodynamic substance but the possibility of cholehematin is not ruled out.

C. J. WEST

Antigenic complex of Streptococcus hemolyticus. IV. Anaphylaxis with two non-type-specific fractions. REBECCA C. LANCEFIELD. *J. Exptl. Med.* 47, 843-55(1928); cf. *C. A.* 22, 1620.—The anaphylactic reactions of 2 non-type sp. fractions of hemolytic streptococcus exts. parallel the precipitin reactions. The nucleoprotein, P, is a true antigen, in that it stimulates antibody production in rabbits, as shown before, and produces anaphylactic shock in guinea pigs actively as well as passively. The probable carbohydrate, C, on the other hand, does not induce antibody formation in rabbits, so far as known at present, but does produce typical anaphylactic shock in guinea pigs passively sensitized with antibacterial serum provided the serum shows a high titer of C precipitins. This is an instance of a hapten, probably carbohydrate in nature, causing anaphylactic shock in passively sensitized guinea pigs. **V. Anaphylaxis with the type-specific substance.** *Ibid.* 857-75.—Type-sp. anaphylactic shock was produced with HCl exts. of *Streptococcus hemolyticus* in guinea pigs sensitized with antibacterial sera. With occasional sera and certain HCl exts., type-sp. shock was not produced unless the serum was first absorbed with heterologous bacteria or unless the guinea pigs were desensitized with heterologous exts. before testing with the homologous ext. The findings indicated that this was due to the presence of the non-type sp. substance which has been provisionally designated as Y. Tryptic digestion destroyed the ability of HCl exts. contg. the type-sp. M substance and the non-type-sp. Y substance to produce anaphylactic shock in passively sensitized guinea pigs. Active sensitization was not accomplished with the type-sp. M. It seems probable, therefore, that this substance is a hapten reacting with antibodies, but not stimulating their production after sepn. from the bacterial cell.

C. J. WEST

H—PHARMACOLOGY

A. N. RICHARDS

Liver injury in acute alcohol poisoning. R. P. WALLACE. *Proc. Soc. Exptl. Biol. Med.* **24**, 598-9(1927).—The bilirubin in the blood serum and urobilinogen in the urine of 17 cases of acute alc. poisoning were studied. The increase of both was proportionate to the severity of the poisoning. This affords definite evidence of liver injury. C. V. B.

Note on the pharmacology of ergothioneine. M. I. TAINTER. *Proc. Soc. Exptl. Biol. Med.* **24**, 621(1927).—Contrary to the statement of Barger and Ewins ergothioneine had no well marked pharmacological action when tested on the rabbit and the cat. C. V. B.

Effects of anesthetics on osmotic resistance of erythrocytes: I. Ether and chloroform. C. D. LEAKE, CHARLOTTE BACKUS, HOBART BURCH AND KATHARINE O'SHEA. *Proc. Soc. Exptl. Biol. Med.* **25**, 92-3(1927).—After about 10 min. of ether anesthesia, an apparent increased resistance was noted on the part of the erythrocytes of the dog blood to the hemolyzing action of hypotonic fluids. After 30 min. of ether anesthesia, the osmotic resistance of the red cells was much below normal. With CHCl_3 , there was a prompt and marked lowering of the osmotic resistance of the erythrocytes. II. Nitrous oxide or ethylene with oxygen. C. D. LEAKE, HARRY LAPP, JANE TENNEY AND R. M. WATERS. *Ibid* 93-4.— NO or C_2H_4 with O_2 caused a slight reduction in the osmotic resistance of the red cells to hypotonic fluids, which, even after an hour's anesthesia, was not nearly as marked as that noted under ether or CHCl_3 . When ethylene was pushed to asphyxiation after 20 min. without O_2 , the red cell resistance was reduced considerably in the lower dilns. of hypotonic Simmel's fluid (0.4%), but in the higher dilns. (0.7% and 0.6%) it was only slightly below the normal levels. III. Carbon dioxide with oxygen. *Ibid* 94-5.—A mixt. of 25% CO_2 with 75% O_2 was administered to dogs without rebreathing. The amplitude of respiration was greatly increased, the pulse was greatly retarded, and convulsions occurred quickly, being stopped by giving pure O_2 . The osmotic resistance of the erythrocytes to hypotonic solns. was greater than normal. The administration of CO_2 caused very rapid clotting of the blood. C. V. B.

Modification of adrenaline effect with functional status of stomach. S. ARQUIN. *Proc. Soc. Exptl. Biol. Med.* **25**, 97-8(1927).—In a starving dog, during the period of relative quiescence between periods of active hunger contractions, the administration of adrenaline intracutaneously resulted (after complete absorption) in a rapid increase in gastric tonus and forcible hunger contractions. In a starving dog with active hunger contractions, the giving of adrenaline resulted in marked gastric dilatation, lasting for 20 to 30 min. Stomachs in active digestive contractions were not influenced by adrenaline. It appears that adrenaline may produce opposite reactions in the stomach muscle depending on the pre-existing state. C. V. B.

Effect of intravenous injection of Dakin's solution on cholecystectomized dogs. J. P. BURGESS AND A. C. IVY. *Proc. Soc. Exptl. Biol. Med.* **25**, 101-2(1927).—The intravenous injection of Dakin's soln. is somewhat more toxic in cholecystectomized than in normal dogs. C. V. B.

Antagonistic action of anesthetics and alkali metal ions on permeability of cell. J. F. McLENDON. *Proc. Soc. Exptl. Biol. Med.* **25**, 116-7(1927).—Isotonic solns. of NaHCO_3 and of the nitrates of Ca and Na were made and mixed so as to reproduce the cations in about the same concns. as in sea water. In this soln. or in distd. H_2O practically no Cl diffused out of *Fundulus* eggs. It appears that Na and OH ions increase the permeability of the egg membrane and Ca and H ions inhibit their action. Alc. has a similar effect to Ca ions. C. V. B.

The influence of amytal upon blood sugar content. F. P. UNDERHILL AND D. H. SPRUNT. *Proc. Soc. Exptl. Biol. Med.* **25**, 137-8(1927).—In a series of 10 expts. on rabbits, 8 gave evidence of a distinct hyperglucemia during amytal narcosis. It is induced by doses from 50 to 100 mg. of amytal per kg., whether given by mouth, subcutaneously or intraperitoneally. C. V. B.

Concentration of arsenic in blood subsequent to serial administration of neoarsphenamine. D. P. UNDERHILL AND M. HORN. *Proc. Soc. Exptl. Biol. Med.* **25**, 138-9(1927).—With increasing injections of neoarsphenamine into dogs there is a slight but definite tendency toward a "lag" in the elimination of arsenic from the blood. C. V. B.

The effect of hypercalcemia on the creatine output in myasthenia gravis. H. BERGLUND, G. MEDES AND A. LOHMANN. *Proc. Soc. Exptl. Biol. Med.* **25**, 204-5(1927).—An expt. was performed to study the effect of hypercalcemia on the creatine output

in a patient with myasthenia gravis. The blood Ca showed no increase on intravenous administration of CaCl_2 alone. On subcutaneous administration of parathyroid hormone in combination with large doses of Ca lactate by mouth the blood Ca slowly rose from 10–11 mg. to 13.3 mg. per 100 cc. serum. At no time did the creatine or creatinine output in the urine show any significant changes. C. V. B.

Effect of glucose on the ketone body excretion in fasting depancreatized dogs. I. L. CHAIKOFF AND J. J. WEBER. *Proc. Soc. Exptl. Biol. Med.* 25, 212–3 (1927).—The antiketogenic action of carbohydrate does not occur in the animal organism in the complete absence of insulin; since glucose stimulates the secretion of insulin in the normal animal, the antiketogenic action of carbohydrate fed in diabetes mellitus and in phlorhizin poisoning may possibly be due to the ensuing secretion of insulin, which lowers the ketone bodies of the blood when injected into fasted, depancreatized dogs. C. V. B.

Effect of radium on pharmacological properties of mercurochrome. D. I. MACHT AND G. F. REDDISH. *Proc. Soc. Exptl. Biol. Med.* 25, 299–300 (1928).—Radium radiations do not effect the potency of mercurochrome, as tested for pharmacol. effect on animals and toxicity for *Bacillus typhosus* and living seedlings of *Lupinus albus*. Mercurochrome is very stable as far as these radiations are concerned. C. V. B.

Insulin and the diabetic pancreas. WILLIAM SUSMAN. *Edinburgh Med. J.* 35, 206–13 (1928).—Report of the histological examn. of the pancreas of 13 diabetics, undergoing insulin treatment, 11 of whom died in diabetic coma despite the insulin. S. suggests that while insulin probably causes a hyperplasia of islet tissue, the tissue is not functionally active. Some other substance is required by the diabetic to restore him to normal. H. J. DEUEL, JR.

Thyroxine as a depressant of cell division; its effect on the cleavage and early development of sea urchin and ascidian. H. B. TORREY. Cornell Univ. *Endocrinology* 12, 65–80 (1928).—Thyroxine retards cleavage rate and differentiation in the eggs of *Echinometra* and *Phallusia* to a like degree, the effect varying with the thyroxine content. It is not due directly to the I. Since thyroxine depresses cell division in such widely different organisms, it is believed that it may act as a cell depressant throughout the animal kingdom. H. J. DEUEL, JR.

The storage of sulfur in the adrenal glands. MARK LURIE. United Israel Zion Hosp., Brooklyn. *Endocrinology* 12, 84–8 (1928).—The av. S content of the organs of 5 normal white rats (1) and of 10 animals which were given daily inunctions of S ointment for a month by rubbing on the skin of the back for 15 min. (2) was as follows: liver (1) 0.736%, (2) 0.893%; spleen (1) 0.856%, (2) 1.14%; kidney (1) 0.832%, (2) 0.941% and muscle (1) 0.72%, (2) 0.891%. The av. S content of the adrenals of 28 normal animals amounted to 1.52% while the av. of the 10 receiving the S ointment was 3.526%. The S in the adrenal is presumably not stored as a constituent of protein. It is probably stored in the cortical portion. H. J. DEUEL, JR.

The effect of adrenaline on sugar metabolism. W. E. BURGE, G. C. WICKWIRE, A. M. ESTES AND L. D. SEAGER. Univ. Ill. *Endocrinology* 12, 157–60 (1928).—Under conditions of expt *Paramesicium caudatum* used 39% of sugar in its medium in 12 hrs. With adrenaline in dilns. of 1:1,000,000 the sugar utilization increased to 43%, at 1:24,000,000, to 57%, and at 1:40,000,000, to 58%. At higher dilns. the results were the same as the control. At lower dilns., the carbohydrate metabolism was checked, at 1:200,000 the value being 22% and at 1:100,000, 19%. H. J. DEUEL, JR.

Observations on the oral administration of the estrus-producing autacoid. JOHN H. HANNAN. London. *Endocrinology* 12, 193–8 (1928).—The estrus-producing hormone is active when introduced by mouth. The dose required is 60 times that required when injected as detd. by expts. on oöphorectomized virgin female rats. H. J. D., JR.

The effect of duodenal secretin upon the secretion of insulin by the pancreas. R. N. SANTOS. *Endocrinology* 12, 199–202 (1928).—The injection of insulin produces a much more pronounced effect on the blood sugar of normal animals than does the injection of secretin. In depancreatized dogs, the injection of secretin was entirely ineffective, proving that any activity it possesses in the case of normal animals is by virtue of its effect on the pancreas and not on the blood sugar directly. H. J. DEUEL, JR.

Fatal action of scopolamine per os and injected potassium cyanide. A. H. SCHIRM AND D. H. WEBSTER. *Arch. Pharm.* 266, 283–9 (1928).—A discussion of the findings of an apparently criminal case. W. O. E.

Localization of injected potassium cyanide, its action and that of scopolamine as antagonist. A. H. SCHIRM AND D. H. WEBSTER. *Arch. Pharm.* 266, 200–9 (1928).—An exptl. study of the toxicology of injected KCN and scopolamine as applied to rabbits and cats in an endeavor to throw additional light on the preceding case, where death occurred following administration of scopolamine and KCN. Injected KCN acts more

quickly than when given orally, but the lethal dose is in both cases the same. The cause of death in the above cited case was the KCN, not scopolamine. W. O. E.

Action of very minute doses of mercury on the differential blood picture. KURT LÜDDICKE. *Klin. Wochschr.* 7, 398-401(1928).—Hg, in very minute quantities, is absorbed from Cu amalgam fillings or from the atm in rooms contg. reservoirs of Hg (either as liquid metal or as Hg ointment). The urine of persons exposed in this manner contains demonstrable amts of Hg. The metal, even in these small concns., is poisonous. The subjective symptoms are lassitude, headache, lack of self confidence and of ambition. The objective symptoms are stomatitis, salivation, colitis and tremor. Persons whose urine contain demonstrable amts. of Hg always show an increased concn of lymphocytes in the differential count. MILTON HANKE

Comparison of the effects of glucose and dihydroxyacetone in metabolism. M. W. GOLDBLATT. *Biochem. J.* 22, 464-73(1928).—Following the administration of dihydroxyacetone (A) there is a much greater O₂ intake and higher R Q than when glucose is administered. A is not effective as an antiketogenic substance. The question of preferential oxidation and the mechanism of the production of carbohydrate intolerance in starvation are discussed. BENJAMIN HARROW

Iodine compounds. Their selective absorption by the hyperplastic thyroid gland of the dog. H B VAN DYKE. *Arch. Internal Med.* 41, 615-21(1928), cf. C. A. 19, 3128.—The intervals between intravenous injection and a definite increase of I in the thyroid were: KI 5 min, KIO₃ 12 min, I₂ 1 hr., non-titratable traces 1-2 hrs. after the injection of thyroxine. Complete bilateral ligation of both adrenals 6-7 hrs. before the injection had no effect on the absorption. MARY JACOBSEN

The effect of narcosis on the urinary C:N quotient. Dysoxidative carbonuria following narcosis. A A GOLDBLOOM. *Biochem. Z.* 192, 298-302(1928).—Ether anesthesia produces a rise in the C:N ratio of the urine of dogs which can be regarded as a case of dysoxidative carbonuria not caused by excretion of reducing substances. The N excretion is diminished, while the C excretion is frequently increased. S. M.

The influence of arsenious acid on respiration models, particularly the oxidation of tartaric acid in the presence of iron. KURT DRESEL. *Biochem. Z.* 192, 358-68(1928), cf. C. A. 21, 1680.—As₂O₃ inhibits the oxidation of tartaric acid which takes place under the influence of Fe⁺⁺⁺. S. MORGULIS

Comparative studies on the effect of arsenate and of organic arsenic acid compounds on the alcoholic sugar cleavage. A contribution to the analysis of the action of arsenic. PAUL MAVER. *Biochem. Z.* 193, 176-80(1928).—Organic arsenic compounds possess in common with arsenic acid the characteristic property of promoting the fermentation of hexose diphosphate esters. S. MORGULIS

Enzymic processes as the cause of the Gottlieb phenomenon of detoxication of digitalis substances in the heart. O A STEPPUHN AND J. NOLLE. *Biochem. Z.* 193, 409-15(1928).—Active digitalis substances left with heart muscle pulp undergo a loss of toxicity during the process of autolysis. This is attributed to an enzymic cleavage of the digitalis substances. It is suggested that the renewal of activity of the frog heart temporarily stopped through intoxication with digitalis (Gottlieb's detoxication) may also be explained on the assumption of an enzymic decompn in the myocardium. S. MORGULIS

An insulin-like substance from yeast. ULF VON EULER. *Biochem. Z.* 194, 197-203(1928).—A yeast ext. prepd with 25% alc. contg. 1% HCl produces the typical insulin effect in the system: fresh muscle pulp + methylene blue + glucose + buffer (phosphate), with a max influence in a concn of 10⁻⁸ g./cc. Injected subcutaneously in an amt. of 50 mg., it failed to produce a noticeable lowering of the blood sugar in rabbits, but this is attributed to the low concn. of the active principle. S. MORGULIS

Experimental studies on the effect of parasympathetic poisons on the blood sugar. II. Further studies on the lowering of blood sugar by parasympathetic poisons. TORAO SAKURAI. *J. Biochem. (Japan)* 8, 365-70(1928).—The combined effect of ergotoxin and pilocarpine is to lower the blood sugar, which can be prevented by atropine. S. MORGULIS

The affinity of veratrine for the autonomic nervous system. GUNHILD BERGSTRÖM. *Skand. Arch. Physiol.* 53, 208-35(1928).—Veratrine has a variable action on the frog heart, causing contraction in 2/4 but inhibition in the last third. Veratrine suppresses completely the stimulating effect on the frog's heart of parasympathetic drugs like acetylcholine, arecoline or pilocarpine, but this influence is reversible. The sympathetic stimulus, adrenaline, is likewise without action on the heart intoxicated with veratrine. In large doses veratrine causes a great increase in tone of the rabbit intestine followed by a loss of tone even below normal; the contractions become irregular and less frequent,

It also greatly diminishes the motor effects of parasympathetic drugs on the rabbit's intestine, or the inhibitory effects of adrenaline. Large doses of veratrine almost completely suppress the effect of BaCl_2 on the musculature.

S. MORGULIS

Studies on the pharmacological properties of cumarin on the isolated and surviving organs. ERIK BERGSTRÖM. *Skand. Arch. Physiol.* 53, 236-58(1928).—Cumarin exerts an inhibitory action on the isolated frog heart, diminishing the amplitude of its beat, and finally arresting it in diastole. Cumarin, in sufficiently large doses, diminishes or even suppresses the motor effect of adrenaline or acetylcholine on the rabbit uterus. In equiv. doses, cumarin can inhibit the motor effect of pituitrin or BaCl_2 , so that it must actually diminish the excitability of the smooth muscle cells. In relatively small doses cumarin increases the adrenaline effect on the rabbit intestine which indicates that it probably has a certain affinity for the inhibitory portion of the sympathetic nervous system.

S. MORGULIS

A study of the effect exerted by cinnamic acid and certain of the cinnamic esters on the formed elements of the blood and especially on the platelets. BO CLARSON. *Skand. Arch. Physiol.* 53, 259-77(1928).—Na cinnamate provokes a primary thrombopenia followed by a secondary thrombocytosis accompanied generally by a lymphocytosis. Conclusion. Cinnamic acid depresses the function of the bone marrow. The esters of cinnamic acid behave similarly.

S. MORGULIS

A pharmacodynamic study of agaric acid. ERIK BERGSTRÖM. *Skand. Arch. Physiol.* 53, 278-315(1928).—Agaric acid in very small doses has a motor effect on the rabbit uterus, but in larger doses it causes a fall in tone and a weakening of the automaticity. It inhibits and practically suppresses the action of parasympathetic stimulants (acetylcholine, arecoline, pilocarpine). The action of BaCl_2 upon the uterus is not interfered with by agaric acid except in very large doses, so that the inhibition of the parasympathetic stimulants may be due partly to a lowered excitability of the terminal parasympathetic nerve organs. Agaric acid greatly prolongs the effect of a single adrenaline dose in the uterus, because of the increased excitability of the terminal sympathetic nerve organs. On the rabbit intestine agaric acid has a motor effect, and often in small doses it reinforces the motor action of acetylcholine or arecoline. This effect cannot be obtained with pilocarpine. In most cases, a relatively large dose of agaric acid causes inhibition or even complete suppression of parasympathetic stimulants on the intestine. Agaric acid in small quantities must, therefore, increase the excitability of the parasympathetic terminal organs in the intestine and decreases it in large doses. Small doses of agaric acid likewise reinforce and prolong the adrenaline effects on the intestine. On the isolated frog heart agaric acid does not act regularly: in small doses there is a slight motor effect and large doses cause paralysis. Small doses increase the cardio-inhibitory action of acetylcholine, and larger doses diminish this effect. No evidence was obtained of a change in the adrenaline action on the heart. Conclusion. Agaric acid has a special affinity for the terminal nerve organs of the autonomic, increasing the excitability of the inhibitory sympathetic organs in the intestine and of the parasympathetic in the intestine and heart. It can therefore augment the effect of adrenaline and of alkaloids acting on the parasympathetic. Larger doses diminish the excitability of the parasympathetic and organs, while still larger doses paralyze the smooth muscle fibers.

S. MORGULIS

The effect of alcohol in solutions of varying concentration on mechanical precision and the alcohol content of the blood. P. I. TUOVINEN. *Skand. Arch. Physiol.* 51, 287-304(1927).—Alc. in quantities of 40-60 cc. definitely diminishes the capacity for doing work requiring precision (threading sewing needles) in a subject unaccustomed to alc. Ten % alc. acts more quickly and more powerfully than 60% though with the dil. solns. the effect was proportional to the concn. The absorption of 4-10% alc. solns. is much quicker than that of the stronger solns. as is shown by the alc. content of the blood.

S. MORGULIS

The intramuscular quinine depot. A. B. KHAVKIN. *Zhurnal ekspl. biol. Med.* 9, 45-9(1928).—Following intramuscular quinine injection the alkaloid is retained in the muscle at the site of injection, 10% still being found there after 24 days. S. M.

The peripheral action of chloroform, ether and alcohol. I. SVERTZEN. *Zhurnal ekspl. biol. Med.* 8, 142-52(1928).— CHCl_3 , ether and alc. act locally on the blood vessels. High concns. of CHCl_3 produce generally vasoconstriction, while low concns. produce dilation of the vessels of isolated organs. Large concns. of ether (1:25-1:50) dilate the vessels of the liver. Amyl and isoamyl alc. dilate the liver vessels, while ethyl alc. produces no uniform action.

S. MORGULIS

Pharmacology of autooxidation products of ethyl ether. J. CH. NOLLE. *Zhurnal ekspl. biol. Med.* 8, 271-86(1928).—Light, temp., O_2 and age are important factors

detg. the autoxidation of Et_2O . Narcosis ether which has been kept for a long time undergoes autoxidation with the production of peroxides but not of aldehydes. Ordinary ether contg. aldehydes also develops peroxides on standing. The aldehyde contg. ether has no toxic effect on the isolated heart or nerve-muscle prepn. whereas the peroxide contg. ether is toxic. S. MORGULIS

The action of adrenaline on the isolated frog heart. S. V. TSIGANOFF. *Zhurnal expl. biol. Med.* 8, 437-49 (1928).—The isolated heart of *Rana esculenta* was perfused with dil. sea water. The isolated heart is very sensitive to adrenaline provided the entire heart serves as object. This sensitivity manifests itself even in a diln. of $1:5 \times 10^9$. The frequency of the beat increases; the systolic and diastolic alteration in the heart are considerably diminished, resulting in a reduced pulse vol. The action of the adrenaline is much stronger at $18-23^\circ$ than at $7-15^\circ$. S. MORGULIS

Passage of bismuth from the blood into the cerebrospinal fluid and nerve centers under various physiological and pathological conditions. G. KASSIL AND E. S. LOKSHINA. *Zhurnal expl. biol. Med.* 8, 503-14 (1928).—Bi injected intravenously into rabbits was not detected either in the cerebrospinal fluid or in the brain. In acute and subacute poisoning with alc. or illuminating gas, blockading of the reticuloendothelial system with massive doses of India ink, in the hypothermy phase of diphtheria intoxication or in acute chilling Bi passes through. On the contrary, in chronic poisoning with alc. or gas, in anaphylactic shock, in blockading the reticuloendothelial system with small doses, and in the hyperthermic phase of diphtheria intoxication Bi does not pass into the cerebrospinal fluid. S. MORGULIS

Pharmacological action of fluid from isolated mammary glands. M. P. NIKOLAEV AND V. V. HERBST. *Zhurnal expl. biol. Med.* 8, 551-60 (1928).—Ringer-Locke soln. perfused through the isolated mammary gland causes increased tonus and greater frequency in the contraction of the uterine horn of the cat. Dilg. this perfusion fluid increases the action of the isolated heart and vasoconstriction in the ear; the coned fluid depresses the heart action but practically has no effect on the ear vessels. Intravenous injection causes a rise in blood pressure over the normal level which lasts several minutes; in female dogs it has a hyperglucemic effect (28-77%) lasting several hrs. No toxic effect was noted even with amts. up to 20 cc. when injected intravenously. S. M.

Effect of urotropine on liver autolysis. A. V. TRUFANOV. *Zhurnal expl. biol. Med.* 8, 582-90 (1928).—The inhibiting effect of urotropine on autolysis at the acid reaction is attributed to the formation of formaldehyde. In alc. medium certain concns. (0.025%) of urotropine accelerate while larger or smaller concns. inhibit the autolysis. After feeding urotropine the postmortem autolysis of the liver in alk. medium is less than in controls. S. MORGULIS

Contribution to the physiology of the respiratory bulbar centers. Effect of the application of lobeline to the floor of the fourth ventricle. A. CLEMENTI. *Boll. soc. ital. biol. sper.* 3, 32-4 (1928).—The local application of lobeline to the floor of the 4th ventricle of dogs does not excite the bulbar centers of the vagus. The alkaloid has a selective exciting action on the respiratory bulbar centers. PETER MASUCCI

Modifying the toxicity of acidified alkaloidal solutions by the addition of bile or bile salts. A. CLEMENTI AND E. PISTORIO. *Boll. soc. ital. biol. sper.* 3, 36-7 (1928).—The addn. of bile or bile salts to a soln. of strychnine or curare causes a ppt. which carries with it a part of the alkaloid. PETER MASUCCI

Pilocarpine glucemia. GIULIO BUCCIARDI. *Boll. soc. ital. biol. sper.* 3, 70-3 (1928).—The intraperitoneal injection of pilocarpine into guinea pigs in doses less than 0.013 g. and more than 0.12 g. per kg. wt. does not influence the glucemic titer; doses injected between these limits always give rise to a variable hyperglucemia, which reaches its max. value 60-90 min. after and is later followed by a hypoglucemia lasting for 24 hrs. Since pilocarpine exerts a selective action on the parasympathetic system it is undeniable that the parasympathetic system influences the equil. of blood sugar. Small doses stimulate too little, large doses paralyze; hence, there is no influence; medium doses are very effective. PETER MASUCCI

Further work on the action of pilocarpine on the glucemic titer. GIULIO BUCCIARDI. *Boll. soc. ital. biol. sper.* 3, 73-6 (1928).—If after the injection of a medium dose of pilocarpine capable of producing hyperglucemia, there is injected, 50 min. later, a large dose of pilocarpine, the hyperglucemia diminishes or disappears. If after obtaining hyperglucemia, 50 min. later, there is injected a small dose, the hyperglucemia is increased. After the injection of a small dose insufficient to change the glucemic titer, a succeeding small dose slightly increases the blood sugar. If the injection of pilocarpine in either a small dose or large dose incapable of changing the blood sugar is followed by the injection of insulin, a hypoglucemia is obtained equal to that obtained in animals

under normal conditions. In animals in which pilocarpine caused hyperglucemia a successive injection of pilocarpine does one of 3 things (a) if the hyperglucemia is small, the injection of insulin brings about a hypoglucemia less marked than the same dose of insulin under normal conditions; (b) if the hyperglucemia is large, the successive injection of insulin diminishes it or even produces hypoglucemia; (c) in cases where the pilocarpine hyperglucemia is very intense, the injection of insulin has no effect; e. g., 20 clinical units fail to reduce the hyperglucemia. Hypoglucemia due to insulin is not influenced by any dose of pilocarpine if injected during the hypoglucemia phase.

PETER MASUCCI

Ergotamine glucemia. GIULIO BUCCIARDI. *Boll. soc. ital. biol. sper.* 3, 77-80 (1928).—Ergotamine has a tendency to abolish the hyperglucemia provoked by preceding exciting substances whether on the sympathetic or parasympathetic system. In guinea pigs injected with ergotamine, subsequent injection of adrenaline produces hyperglucemia but subsequent injection of pilocarpine produces instead a hypoglucemia. Ergotamine does not modify insulin hypoglucemia but insulin loses its hypoglucemic action if it is preceded by an injection of a large dose of ergotamine. PETER MASUCCI

The action of insulin and adrenaline in guinea pigs. GIULIO BUCCIARDI. *Boll. soc. ital. biol. sper.* 3, 81-4 (1928).—Insulin causes hypoglucemia when injected into guinea pigs. The hypoglucemia is not modified by subsequent injections of ergotamine. The effects of ergotamine on insulin under various conditions and in various doses are summarized. Likewise the effect of adrenaline on insulin is discussed. An injection of adrenaline diminishes or causes to disappear completely the symptoms from a lethal dose of insulin; yet it diminishes the hypoglucemia only slightly. This leads to the supposition that the antagonistic action of insulin is not manifested entirely on the regulation of blood sugar, but also on other organs and tissues. PETER MASUCCI

Biochemical modifications in the blood produced by histamine. G. DE TONI. *Boll. soc. ital. biol. sper.* 3, 87-92 (1928).—14 babies of various ages were bled from the ear vein and then injected with histamine $\frac{1}{30}$ mg. per kg. Detns. were made of glucose, uric acid, chlorides, and albumin before and after injection. The results were variable but certain facts could be deduced. Histamine modified the aq. equil. of the blood with a tendency towards diln.; there was an increase of blood sugar in most cases; uric acid increased; the chlorides were variable. PETER MASUCCI

The inhibiting action of inulin on glucose hyperglucemia. G. SOLARINO. *Boll. soc. ital. biol. sper.* 3, 108-11 (1928).—Inulin produces in dogs a variable but definite hyperglucemia; it has an inhibiting action on glucose hyperglucemia not as marked as starch, but comparable to that of levulose. PETER MASUCCI

Curarization and phosphogen content of striated muscles. G. MARTINO. *Boll. soc. ital. biol. sper.* 3, 114-6 (1928).—Curare 1:40 in Ringer soln. was injected in various doses into the dorsal lymph sacs of *Bufo viridis*. Before the injection, the normal phosphoric acid and phosphogen contents of one of the gastrocnemii were detd. Four to five hrs. after the injection the same detns. were made on the other gastrocnemius while completely paralyzed. The phosphogen content after curarization increased from 2.5 mg. % to 8 mg. %. There was a corresponding decrease in phosphoric acid. PETER MASUCCI

Hyperglucemia by pilocarpine. ANTONIETTA ORRU. *Boll. soc. ital. biol. sper.* 3, 135-7 (1928).—Pilocarpine in doses larger than 5 mg. per kg. produces constantly a hyperglucemia; within certain limits it varies in intensity and duration directly with the dose. Hyperglucemia is rapid; it is observed 15 min. after injection. P. M.

The effect of morphine and some of the other opium alkaloids on the muscular activity of the alimentary canal. III. Action on the stomach in unanesthetized dogs. O. H. PLANT AND G. H. MILLER. *J. Pharmacol.* 32, 413-35 (1928).—Dogs with a permanent gastric fistula were used. A balloon was introduced, and the contractions of the stomach were recorded on a drum. Doses of morphine from 0.02 mg. to 16 mg. per kg. were given hypodermically. With doses above 0.1 mg. there resulted a decrease in tone of the stomach, and a diminution in amplitude and frequency of the peristaltic waves, these finally disappearing altogether. With smaller doses there was sometimes an increase in amplitude, but diminution in frequency. The duration of the effect parallels the size of the dose. With larger doses the effect sometimes lasted 18 hrs. or more. An experiment on one cat gave similar results. Fluoroscopic pictures after morphine also showed the absence of contractions. Similar results were obtained with opium (as Pantopon), codeine, papaverine, narcotine, and heroine, although the effects were less with all except heroine and Pantopon. IV. Action of morphine on the colon of unanesthetized dogs and man. *Ibid* 437-50.—The dogs used had permanent fistulas opening into the colon, made by fastening the appendix into the belly wall. A rubber balloon

was introduced and the movements were recorded on a moving drum. Morphine sulfate, 0.01 to 5 mg. per kg., was given hypodermically. With moderate doses (0.25 to 1 mg. per kg.) there was an increase in tone, lasting many hrs. With larger doses the duration of the increase was somewhat less. Peristaltic activity was increased. There was no influence on the small rhythmic contractions. With very small doses (less than 0.2 mg.) the effects were the same, but less marked. In three cases of colostomy studied, the effect of small doses of morphine was found to be the same on the human colon.

C. RIEGEL

Antagonism of adrenaline by ergotamine. R. MENDEZ. *J. Pharmacol.* **32**, 451-62(1928).—The action of ergotamine on isolated rabbit uterus was very slow, and M. suggests leaving the ergotamine in contact with the tissue for 10 min. and omitting the washing out of ergotamine before applying adrenaline. Tissues studied other than rabbit uterus (guinea pig vas deferens, pregnant uterus of guinea pig, sheep carotid) were found not as suitable for standardization of ergotamine. Ergotamine had no effect on the inhibitor action of adrenaline.

C. RIEGEL

The antagonism between adrenaline and ergotamine. A. J. CLARK. *J. Pharmacol.* **32**, 462-4(1928).—Clark suggests the formula (concn. Ac Ch. — min. concn. Ac Ch) ÷ concn. Atr = constant (where min. concn. Ac Ch represents the concn. of acetylcholine producing action in the absence of atropine) to express the antagonism of acetylcholine by atropine. The same formula expresses the relation between the concns. of adrenaline and ergotamine acting on rabbit uterus. For the vas deferens of guinea pig the following formula is suggested (concn. adren. — min. effective concn. adren.) ÷ (concn. ergot.)^{1/2} = const. = 0.14.

C. RIEGEL

Pathologic signification of variations of free and latent acidities in the gastric liquids. H. SURMONT AND J. SWYNGEDAUF. *Bull. soc. chim. biol.* **10**, 450-5(1928).—See C. A. **22**, 620.

L. W. RIGGS

Influence of adrenaline on the human spleen and blood picture. CHI SHIH YANG. *Chinese J. Physiol.* **2**, 163-71(1928).—There was a marked decrease in the size of the spleen in all cases with splenic enlargement after subcutaneous injection of 0.5 to 1.0 cc. of 1 to 1000 adrenaline. There was a definite increase of hemoglobin of from 4 to 20%, of erythrocytes from 430,000 to 1,100,000 and of leucocytes of 5000 to 27,000. In splenectomized patients there was no increase in hemoglobin or erythrocytes after adrenaline injection, but an increase of leucocytes of 2000 to 10,000, with a marked increase of the lymphocytes. The increase of the blood cellular elements in the normal individuals was not nearly as great as in those with the enlarged spleen. It is assumed that this increase of the blood cellular elements was produced by the mech. squeezing of the contracted spleen following the adrenaline injection.

L. W. RIGGS

Auto-digestion. III. Anti-trypsin and insulin. H. NECHELES. *Chinese J. Physiol.* **2**, 229-30(1928), cf. C. A. **21**, 596.—Insulin in physiol. concns. does not play a role as "antitryptic" agent in dog blood.

L. W. RIGGS

Influence of insulin on the blood sugar content in nephrectomized animals. H. GNOINSKI. *Compt. rend. soc. biol.* **98**, 785-6(1928).—Nephrectomized dogs react to insulin in the same manner as normal animals, except that the latter return to their normal state within 24 hrs., while in the nephrectomized dogs a hyperglucemia still persists. The nephrectomized dogs were more sensitive to the consequences of hypoglycemia than were the normal animals. The action of insulin was slower and less in dogs with the ureters ligated and sectioned. These also showed a hypoglycemia 24 hrs. after the injection of insulin.

L. W. RIGGS

Direct stimulating action of adrenaline upon the islets of Langerhans. EDGARD ZUNZ AND JEAN LABARRE. *Compt. rend. soc. biol.* **98**, 858-9(1928).—By using the technic of Delezenne, Hallion and Gayet (cf. *Ann. physiol. physicochem. biol.* **3**, 508-11) it was found that adrenaline was a physiol. excitant of the insulin secretion, acting even in a pancreas in a purely humoral connection with the perfusing animal.

L. W. RIGGS

A propos the paper of A. Tournade and H. Hermann entitled "The adrenaline secretion during the course of shock caused by the intravenous injection of peptone."

JEAN LABARRE. *Compt. rend. soc. biol.* **98**, 861-3(1928).

L. W. RIGGS

Does an ephedrine-chloroform syncope exist? JEAN LABARRE. *Compt. rend. soc. biol.* **98**, 863-6(1928).—With cats ephedrine administered at the same time as CHCl₃ did not lead to that kind of intoxication presented by chloroformed animals treated with adrenaline. In these tests the ephedrine-chloroform syncope was not attained. Ephedrine is much less toxic than adrenaline for the heart muscle.

L. W. RIGGS

Hypotonic action of ultra-violet rays on the parasympathetic system. LUCIEN GAROT. *Compt. rend. soc. biol.* **98**, 867-9(1928); cf. C. A. **21**, 2333.—Prolonged treatment of 8 children 6 to 14 years old by ultra-violet rays generally led to a lowering of the

parasympathetic tonus. **Influence of ultra-violet ray treatment on the cardiac test with atropine.** *Ibid* 869-70.—Further expts. with children showed that after a single treatment with ultra-violet rays the hypotonus of the vagus was transitory and disappeared within 48 hrs. After prolonged treatment (10 to 15 irradiations) the hypotonus of the vago-sympathetic became stabilized, and the vagus recovered, in a new equil., its usual reacting powers. **Do ultra-violet rays modify the blood pressure?** *Ibid* 871-2.—From tests with children it was concluded that in the doses used, ultra-violet treatment did not modify the blood pressure. L. W. RIGGS

Action of amino acids, biliary salts, papaverine, cocaine, caffeine and derivatives of cinchona bark on the chronaxie of smooth muscle fibers. MARCEL FLORKIN. *Compt. rend. soc. biol.* 98, 872-3(1928).—The chronaxie of the isolated cloaca of the frog is prolonged by glycocoll or *D*-alanine at 1 to 5 per 100, by Na glycocholate, 1 to 1000 and 1 to 100, by Na taurocholate 1 to 1000, papaverine 1 to 100,000, cocaine 1 to 1000, caffeine 2 to 1000 and quinine 5 to 1000. The chronaxie is reduced by cocaine 1 to 20,000, quinine 1 to 1000 and quinidine 1 to 10,000. The findings of Lapicque were generally confirmed. L. W. RIGGS

Influence of the active substances of the ureters on the bladder of mammals. W. VAN SLIJPE. *Compt. rend. soc. biol.* 98, 874-7(1928).—There exists in the ureters of the guinea pig a substance which acts on the bladder of that animal. This substance is not adsorbed by sand; it dialyzes; the dialyzate resists a temp. of 100°, but its activity is totally destroyed on keeping 72 hrs. L. W. RIGGS

Irritability of the isolated heart of the frog under the influence of magnesium chloride. W. DULIERE AND L. DEBORGRAFF. *Compt. rend. soc. biol.* 98, 883-5(1928); cf. *C. A.* 22, 1627.—Mg may replace in part the Ca ions in a perfusing liquid without marked change in the irritability. The replacement of K by Mg is not so well tolerated. L. W. RIGGS

Action of synthalin on the respiratory quotient in the totally depancreated dog. L. HÉDON AND G. VERTZMAN. *Compt. rend. soc. biol.* 98, 1093-4(1928).—Synthalin is incapable of raising the respiratory quotient of the diabetic dog as does insulin, and thus gives further support to the conclusion that the mechanism of action of synthalin is essentially different from that of the internal secretion of the pancreas. L. W. R.

Fluorosis. NICOLA SETTE. *Compt. rend. soc. biol.* 98, 1094-6(1928); cf. Christiani, *C. A.* 21, 1666, 3404.—Cattle living in the vicinity of a fertilizer factory showed alterations in bone tissue similar to those observed by Christiani in cattle living near an Al factory. From expts. with guinea pigs living under the same conditions as the cattle, it appears that the symptoms are not due solely to the F contained in the superphosphates but more to the vapors of HNO₃ and H₂SO₄ which cause a general acid intoxication. L. W. RIGGS

Elimination of phenolsulfonephthalein after ingestion of lactoserum. MAURICE RENAUD, J. MULLER AND A. MIGET. *Compt. rend. soc. biol.* 98, 1127-8(1928).—The elimination of color substances depends upon the same rhythm as that of urea and salts, and the stimulation of renal parenchyma by lacto-serum increases in general all of the constituents of the urine. L. W. RIGGS

Toxicity of the bile. D. ANTITCH. *Compt. rend. soc. biol.* 98, 1145-8(1928).—The results of this study confirm those of Bouchard as to the high toxicity of intravenously injected bile. L. W. RIGGS

Diuretic and cholagogic actions of sodium thiosulfate. J. LEDUSKA. *Compt. rend. soc. biol.* 98, 1171-3(1928).—Expts. with dogs proved that Na₂S₂O₃ has a strong diuretic action on the kidney epithelium. When administered by mouth it causes an increase in the biliary secretion. L. W. RIGGS

Mechanism of the diminution of blood sugar under the action of insulin. B. MATSUOKA. *Compt. rend. soc. biol.* 98, 1178-9(1928).—Expts. with rabbits indicated that the diminution of blood sugar by insulin was due to the production of lactacidogen in the liver (perhaps also in the muscles) and the transformation of lactacidogen into glycogen. L. W. RIGGS

Cholagogic properties of lacto-serum. MAURICE RENAUD, J. MULLER AND A. MIGET. *Compt. rend. soc. biol.* 98, 1211-2(1928).—Lacto-serum may be classed among the better cholagoges. Various suggestions are made as to the mechanism of its action. **Purgative and laxative action of lacto-serum. Its mechanism.** • The principles of the hepato-duodenal purgations. MAURICE RENAUD. *Ibid* 1213-4. L. W. RIGGS

Venesection hyperglucemia in rabbits deprived of suprarenals. HIROSHI TACHI. *Tohoku J. Exptl. Med.* 10, 307-18(1928); cf. *C. A.* 22, 2003.—The hyperglucemia caused by venesection occurs in long-surviving rabbits deprived of suprarenals. Although the hyperglucemia was less than in normal rabbits, it was greater than in doubly

splanchnectomized animals. **Influence of different blood-replacing liquids on the hyperglucemia of venesection in rabbits.** *Ibid* 319-43.—From 20 to 25 g. of blood per kg. of body wt. was withdrawn from rabbits and the same quantity of replacing liquid was injected intravenously. Ringer-Locke soln., Ringer-Locke-gum arabic soln. as well as blood plasma fail nearly or completely to suppress the occurrence of venesection hyperglucemia. Notwithstanding these injections, an increase in the blood sugar concn. occurs. Defibrinated blood and 50% erythrocyte Ringer-Locke liquid nearly or completely suppress the evolution or venesection hyperglucemia (Cf. following abstr.)

L. W. RIGGS

Influence of the administration of alkali upon hemorrhagic hyperglucemia. HIROSHI TACHI *Tohoku J. Exptl. Med.* 10, 344-9(1928), cf. preceding abstr.—The increase in the blood sugar concn. after bleeding has a relation to the loss of blood corpuscles. Such hyperglucemia is a form of asphyxia diabetes. Intravenously injected NaHCO_3 soln. immediately after bleeding reduces the intensity of the ensuing hyperglucemia

L. W. RIGGS

Pancreatic hormone and mineral metabolism. I. Influence of the pancreatic hormone on the excretions of different urinary constituents (particularly inorganic salts) by normal and by pancreas-diabetic dogs. SOSUICHI TAKEUCHI *Tohoku J. Exptl. Med.* 10, 388-407(1928).—In normal dogs under a controlled diet, subcutaneous injections of the pancreatic hormone caused an increase in the daily excretion of Cl, K and total N. The results for the other inorg. constituents in the 3 subjects studied are variable and may depend on the different doses of the hormone administered in each case. In 2 depancreatized dogs the daily quantity of urine, P, Cl, Ca, Mg, K, Na, total N, SO_4 and Na/K were decreased and $\text{P}_2\text{O}_5/\text{N}$ was increased by the injection of the pancreatic hormone. The conclusions of this study fill several pages.

L. W. R.

Fate of acetylcholine in the blood. I. O. GALEHR AND F. PLATTNER *Arch. ges. Physiol.* (Pflüger's) 218, 488-505(1928).—Because of the fact that both vagus substance and acetylcholine become deprived of their influence on the frog heart by exposure to blood they are assumed to be probably identical. In blood acetylcholine is broken down into its components, the cleavage taking place with great rapidity (at 20° in 24 sec., at 40° in 15 sec.). Whole blood, and blood cells, with or without hemoglobin, have approx. the same effect while serum or other extd. blood are less effective. Activity appears to reside in the albumin fraction; globulin and red cells structurally damaged are inert. Cleavage of acetylcholine in blood is regarded as a surface catalytic phenomenon. Since vagus substance is the same as, or is closely allied to, acetylcholine probably its introduction into the circulation is followed by the same course of events as attend injections of acetylcholine. **II. Destruction in the blood of different mammals.** *Ibid* 506-13.—From a qual. standpoint the bloods of different mammals break down acetylcholine as does human blood, but from a quant. point of view different bloods show considerable differences in the rate at which the change takes place. Arranged according to rates, the bloods are, human, pig, cow, dog, horse, rabbit, cat, that of man being the most active.

G. H. S.

The use of sanocrysin in tuberculosis. D. MURRAY LYON *Edinburgh Med. J.* 35, 125-40(1928).—Sanocrysin was injected intravenously into tuberculosis patients. A series of definite responses, both focal and general, were elicited. These reactions were usually followed by a rapid return to the previous state or to an improved condition. Sanocrysin seemed to have a selective affinity for tuberculosis lesions and the administration of the drug produced at least temporary improvement. Therefore, further extended trial and exptn. with this drug are desirable.

M. H. SOULE

A pharmacological note on Baptisia tinctoria. D. I. MACHT AND J. A. BLACK. *J. Am. Pharm. Assoc.* 16, 1056-59(1927).—Exts. of *Baptisia tinctoria* are used in mouth washes. The ext. is bitter and causes a tingling of the tongue similar to that produced by aconite preps. Infusions and decoctions of the plant injected intraperitoneally produced death in white rats. In rabbits the infusion by stomach tube produced some paralysis of the hind legs and some narcotic effect. Subcutaneous injections of the solns. in cats produced violent poisoning. The drug was tested for local anesthetic effects by the usual methods but the results were negative.

I—ZOOLOGY

R. A. GORTNER

The gustatory sense of bees. K. v. FRISCH. *Naturwissenschaften* 16, 307-15(1928).—The minimum sucrose concn. accepted by bees varies individually and depends on their degree of starvation. It lies around 17% for normal animals but can go as low

as 8 or 4%. The latter value is probably the threshold value for their sweet taste. For glucose the normal value was 18%; the action of various sugar mixts. is additive. The taste of bees for "sweet" substances is less general than that of man; saccharin and dulcin are not accepted, neither glucine, eupatorin, or glycyrrhizic acid. The sugars, glucose, fructose, sucrose, maltose, trehalose and melezitose, are accepted; other sugars act indifferently. A table is given of hexoses, sexivalent alcs., glucosides, pentoses, tetrahydric alcs., disaccharides and trisaccharides with their degree of sweetness for man and bee. No regularity on a structural basis in either case has been found as yet.

B. J. C. VAN DER HOEVEN

The effect of iodized spleen and liver of lamb and of organs of chicken treated with such substances upon the metamorphosis of axolotl. E. GIACOMINI. *Boll. soc. ital. biol. sper.* 3, 92-7(1928).—Iodized spleen and liver of lamb were fed to chickens which were later killed, their organs dried and ground, and fed to axolotl. There was complete metamorphosis, indicating a perfect parallelism to the effects obtained with thyroid. Apparently the influence of these substances on metamorphosis is not due to inorg. I, but to org. I compds. (iodoproteins) formed either outside or inside the organism, which by transformation after absorption form an active hormone. PETER MASUCCI

Bufodesoxycholic acid in the bile of *Bufo vulgaris Japonicus*. I. TAKEJI OKANURA. *J. Biochem. (Japan)* 8, 351-60(1927).—A desoxycholic acid of the composition $C_{24}H_{46}O_4$ was found in the bile of *Bufo vulgaris*. It has a strong stimulating effect on the lipase action and is hemolytic in a diln. of 1:3200. S. MORGULIS

Ionic antagonism in the regeneration of *Hydra fusca*. M. P. KOZAK. *Zhurnal expil. biol. Med.* 8, 515-24(1928).—A toxic soln. of NaCl can be detoxicated by the addn. of $CaCl_2$, and a toxic soln. of KCl can be detoxicated with $CaCl_2$ or NaCl. When the KCl concn. exceeds 0.024 N it can no longer be detoxicated. When the concn. is below this max. level the detoxication can be accomplished with half quantities of NaCl or $CaCl_2$ provided both are used simultaneously. S. MORGULIS

The role of tryptophan in the animal organism. S. J. DEMIANOVSKII. *Zhurnal expil. biol. Med.* 8, 526-31(1928).—Silk worms in pathological condition or under unfavorable living conditions produce silk with a higher tryptophan content. Also in *Biochem. Z.* 193, 245-50 (1928). S. M.

Insect scatology. S. W. FROST. *Ann. Entomol. Soc. Am.* 21, 36-46(1928).—Discharges from the alimentary tract of insects are of 3 classes: (1) material which enters the mouth but does not pass through the alimentary canal; (2) excretions by the alimentary canal or its appendages including excretions from salivary glands, malpighian tubules, and secretions of honey dew by some insects; (3) fecula or true excrement which is voided in the form of pellets or as a semi-liquid. This paper treats the true excrement of insects. The conservation, utilization and disposal of the excrement by a no. of species of insects are considered. Fecula is the proper term to use for the excrement of insects. C. H. RICHARDSON

The formation of d-lactic acid during the incubation of hen eggs. AKISUKE MATSUMOTO. *Acta Schol. Med. Univ. Imp. Kioto* 10, 265-9(1928).—Small amts. of glycerol were introduced in eggs through a hole, the hole was covered with paraffined paper and incubated for 3 days at 39.5°. In the yolk, the lactic acid seemed to be very slightly increased; in the white of the egg, it stayed the same as in the controls. G. SCHWOCH

12—FOODS

F. C. BLANCK AND H. A. LEPPER

The chemistry of bread. D. W. KENT-JONES. *J. Soc. Chem. Ind.* 47, 143-9T (1928).—An attempt is made to trace the manuf. of bread through all stages: chemistry of flour, varieties of wheat, wheat blending, milling, flour treatment and breadmaking.

J. A. KENNEDY

Chemistry in the dairy industry. G. A. RICHARDSON. *World's Butter Review* 2, No. 4, 13-4(1928). F. H.

Phosphorus compounds in milk. IV. Presence of adenine nucleotide in milk. H. D. KAY AND P. G. MARSHALL. *Biochem. J.* 22, 416-8(1928).—The sepn. was based on Jackson's method (*C. A.* 18, 2178). The adenine nucleotide is present in milk in the order of 3 mg. nucleotide to 100 cc. milk. It is associated with some other phosphoric ester with similar pptn. reactions and solubilities. BENJAMIN HARROW

Direct microscopic examination of milk. LEROY FORMAN AND I. H. SHAW. *N. J. Dept. of Health. Milk Plant* 17, No. 4, 36-40(1928). H. F. ZOLLER

The preservation of milk samples for fat estimation. P. MARSCHEW. *Milch-wirtschaft. Zentr.* 57, 85-8(1928).—A study of HCHO , K_2CrO_7 and HgCl_2 as preservatives. Their effect on the analysis by different methods and means of overcoming difficulties are described.

GEORGE R. GREENBANK

Methods and standards for the production of certified milk, adopted by the American Association of Medical Milk Commissions, Inc., revised May 17, 1927. *Certified Milk Conferences* 1927, 311-22.—The standard butterfat content is an av. of 4.0% and a min. of 3.5%. Other av. values are permitted provided the % of butterfat is stated on the seal of the container.

JOSEPH S. HEPBURN

Study of "flaky" milk. F. S. JONES AND R. B. LITTLE. *Certified Milk Conferences* 1927, 109-15.—The tiny elongated tenacious floccules, which appear irregularly in the milk of certain cows, are composed of mucus, leucocytes, and bacteria (hemolytic staphylococci, and both hemolytic and non-hemolytic streptococci). The milk has a relatively high blood protein content and leucocyte count. The cause is a mild prolonged mastitis.

JOSEPH S. HEPBURN

The handling and marketing of unpreserved cream. L. J. LORD. *Food Manuf.* 3, 343-4(1928).

J. A. KENNEDY

Preparation of lactic acid milk mixtures for infant feeding. MCK. MARRIOTT. *J. Am. Med. Assoc.* 89, 862, 863 (1927); *Expt. Sta. Record* 57, 893.—A simple and convenient method for prepg. lactic acid milk from evapd. milk and lactic acid is described.

L. W. RIGGS

Homogenization and freezing time of ice cream mix. W. H. E. REID. *Univ. Mo. Ice Cream Trade* 24, No. 1, 71-2(1928).—Expts. showed it always to be impossible to incorporate 100% over-run in unprocessed ice cream mix. With increase of homogenization pressure the percentage incorporation of air increased in a like period of freezing time. See also *Milk Plant* 17, No. 2, 111-24(1928) for more complete data.

H. F. ZOLLER

Sherbet crustation remedies. L. K. ROWE. *Univ. of Neb. Ice Cream Trade* 24, No. 2, 43-4(1928).—The following influences on crustations were studied: (1) exposure of the surface of the frozen product to the air, (2) effect of percent of sucrose, (3) effect of sweetening materials other than sucrose and (4) effect of different stabilizers, i. e., tragacanth, arabic and Indian gum, gelatin and agar. The surface should be kept covered. Corn and invert sugar reduces crustation but must be used in small amounts to prevent too great lowering of freezing point. Gelatin or India gum or both in best stabilization.

H. F. ZOLLER

The manufacture of margarine. P. S. ARUP. *Food Manuf.* 1, 73-5(1927).

F. H.

Utilization of the soy bean. II. YOSHITARO TAKAYAMA. *J. Soc. Chem. Ind. (Japan)* 31, 319-22(1928); Suppl. binding 77-8(1928) (In English).—The bean was ground to powder after the removal of oil and bran, was digested with H_2SO_4 of various concns. in the range of 1-0.025 *N* at 100° for various durations in the range of 1-19 hrs. The amount of dissolved protein and that of the reducing sugar increased as the total amount of H_2SO_4 added increased; the concn. of the acid did not effect the amts. eventually dissolved, but lessened the time required for solution.

SHUMPEI OKA

Tests of method for the commercial standardization of raisins. R. M. CHACE AND C. G. CHURCH. *U. S. Dept. Agr., Tech. Bull.* 1, 1 23(1927).—Mech. and chem. methods for grading raisins are offered as substitutes for the visual methods previously used. Meatiness or plumpness is graded by a method depending upon the relation between wt. and vol. Moisture is measured by the compressibility of a given vol. of the berries under a given pressure for a given length of time. Traces of mold are detected by means of H_2O_2 . Sand is detd. by brushing the fruit submerged in water and allowing the sand to settle in a calibrated measuring device. Sunburn is detected by viewing the berries through selected color screens. A description of other methods for moisture and data on the compn. of raisins of different grades are included.

R. M. CHACE

The successful cider mill of today. H. F. MACMILLAN. *Fruit Products J. and Am. Vinegar Ind.* 7, No. 9, 9-11(1928).—Suggestions to those who are about to start a new apple cider enterprise or revive an old one.

J. A. KENNEDY

Crushed peaches—a new canned peach product. W. V. CRUESS AND J. H. IRISH. *Food Products J. and Am. Vinegar Ind.* 7, No. 9, 20-21(1928).—The process of prepg. and cannng this product which utilizes the under-sized fruit, and its many uses are given.

J. A. KENNEDY

Scientific control in the sugar confectionery industry. R. H. MORGAN. *Food Manuf.* 1, 127-8(1927).

R. H.

The cause of musty odor in cooling plants. W. JURGES AND O. REICHARD. *Gesundh. Ing.* 51, 304-8(1928).—It was noticed that foods such as meat, butter, etc., showed moldy odors after storage in certain cooling rooms. Tests revealed that the cause was molding of insulating material (cork). In order to prevent this decompn., all of the bacteria, etc., in the cork must be killed and the nutritive value present in the cork must be destroyed. This is best accomplished by application of dry heat. WAYNE L. DENMAN

A new combined method to titrate the volatile, soluble and insoluble fatty acids of butter and fats (TCHÉTCHEROFF) 27. Properties of the bactericidal substance in milk (Jones) 11A. Mixing and emulsifying apparatus for treating foods (U. S. pat. 1,671,868) 1.

Wetting agents. S. R. TROTMAN. *Ind. Chemist* 4, 201-4(1928).—A comprehensive review of the nature of wetting agents and of the detn. of wetting power. T. S. C.

The mechanical basis of filtration. J. A. PICKARD. *Ind. Chemist* 4, 186-90(1928).—Attempts to develop the theory of filtration on a mathematical basis have little practical value, since slight differences in the nature of the particles or the manner in which they are deposited on the cloth have considerable effect on the rate of filtration. When the particles in the filter cake are inelastic, the structure of the cake is the same, no matter what filtration pressure is employed. When the particles are deformable, a dense cake is obtained at the face of the cloth and a soft cake at the prefiltered side. With particles of this nature, the rate of filtration is not increased proportionately with increase in pressure. T. S. CARSWELL

The manufacture of insulators and molded products. H. SAGET. *Rev. gén. mat. plastiques* 4, 279-83(1928).—A description of the manuf. of such products from natural and from artificial resins

Refrigerating system. A. LENNING (to Electrolux Servel Corp.) U. S. 1,672,265, June 5th

Rectifying and condensing apparatus for refrigerator systems. A. LENNING (to Electrolux Servel Corp.). U. S. 1,671,949, May 29.

Decolorizing sirups and other aqueous liquids. BRITISH DYESTUFFS CORP., LTD. C. HOLLINS and E. CHAPMAN. Brit 278,485, Aug. 24, 1926. Decolorization by adsorbent materials such as C or silica gel is effected in the presence of small quantities of wetting-out agents such as alkyl-naphthalenesulfonic acids, substances prepd. from mineral oil fractions by sulfonation and condensation with isopropyl alc., ligninsulfonic acids, naphthenic acids and sulfonated higher fatty acids

Treating waste acid liquors. C. A. KLEIN and R. S. BROWN. Brit 277,769, July 8, 1926. Waste liquors contg. H_2SO_4 and which may also contain Fe salts such as are obtained in the prepn. of Ti pigments as described in Brit. 243,081 (*C. A.* 20, 3826) may be preliminarily decolorized with C, SO_2 or by pptn., and are then treated with a Ba compd. such as BaO or BaCO_3 to obtain BaSO_4 (without completely neutralizing the liquor) so that a ppt. free from Fe is formed. The reaction may be facilitated by the addn. of a small quantity of an acid or sol. salt adapted to form a sol. Ba salt, e. g., HCl , HNO_3 or HOAc or their alkali salts.

Separating various materials from liquids and gases. A. H. PETERSON. Brit 278,722, Oct. 7, 1926. Tar, mercaptans from pulp, or metallic compds. may be condensed from vapors and the condensation may be assisted by injecting or spreading water, tar, lye or tailings from the pulp industry into or on the charge. Lignin can be recovered from pulp tailings as a coating on wood chips, sawdust, peat or the like. If peat is used the product may form a binder for briquetting ore, coal, etc.

Insulating and filtering material. W. ZIMMERMANN. Brit 277,577, April 28, 1927. Mg-contg. minerals such as hornblende, dolomite, magnesite or steatite, with or without addn. of fluorspar, are fused and converted into threads by blowing with compressed air or steam.

Composition for absorbing gases. L. A. LEVY. Brit. 277,540, Jan. 25, 1927. A compn. for use in gas analysis app. or in respirators consists of a mixt. of hydrated Ba(OH)_2 , Ca(OH)_2 or the like, KOH or NaOH , with or without activated C.

Electric hot-plates (refractory insulation). F. C. WÜTHRICH. Brit. 277,432, June 18, 1926. A refractory material suitable for embedding resistance wires is formed of a mixt. of ordinary clay, fireclay and quartz sand. Various structural features also are specified.

Sci. Ind. Research Mem. Geol. Survey England 1928, 270 pp.—Analyses and a bibliography are given. E. H.

Iodine content of some water supplies in goitrous regions. G. H. BECKWITH. *Proc. Soc. Exptl. Biol. Med.* 25, 117(1927).—Detns. of iodine in drinking water of several towns and cities in Illinois and in several other goitrous regions showed a very low content in I_2 . C. V. B.

Water supply and hydroelectric plant at Spartanburg, South Carolina. H. F. WIEDEMAN. *J. Am. Water Works Assoc.* 19, 511-21(1928).—South Pacolet River is the supply; it is dammed above the plant. Lime and alum are used. Details of the first ten months' operation are available. D. K. FRENCH

The filtration of Lake Ontario water. J. M. CAIRD. *J. Am. Water Works Assoc.* 19, 526-33(1928).—A discussion with tabulated data of the results of ten yrs.' treatment of the Rochester city supply. $Al_2(SO_4)_3$ and liquid Cl have been used. When phenol odors have appeared, $KMnO_4$ has been successfully used. D. K. FRENCH

New rapid sand filter plant, Washington, D. C. P. O. MACQUEEN. *J. Am. Water Works Assoc.* 19, 483-502(1928).—The Potomac River at the head of Great Falls is the source of supply. Alum can be added to the water both before and after passage to the mixing chambers as well as to settled water before filtering. A control chamber where alum and Cl can be added as well provides the limit of flexibility. Sirup of alum is used and is manufd. at the plant by the Hoover process from bauxite and H_2SO_4 . There is a hydroelec. plant combined. D. K. FRENCH

Chemical engineering applied in new St. Louis water plant. C. W. CUNO. *Chem. Met. Eng.* 35, 230-1(1928). J. A. KENNEDY

Water-softening plant and pumping station improvements at Fostoria, Ohio. J. F. LABOON. *J. Am. Water Works Assoc.* 19, 503-10(1928).—This will be a "lime-soda" type plant combining the functions of clarifier and settling basins in one unit. Cl will be applied in the clear water main and in the suction of the raw water pumps when pre-chlorination is necessary. Aeration equipment is provided and a minimum detention period of 5 min for carbonation is also planned. D. K. FRENCH

Iron-removal plant at Champaign, Illinois. F. C. AMSBARY, JR. *J. Am. Water Works Assoc.* 19, 522-5(1928).—This is an outline of successive problems met and solved. Aeration and Cl together were necessary. D. K. FRENCH

A small filter for water softening. E. QUITMANN. *Gesundh. Ing.* 51, 340-2(1928).—Zeolite filtration is probably the simplest process for small plants. A small zeolite softener using a material known as "Natrolith" as the active softening agent is described. The water softened by this process has zero hardness, whereas the "Soda lime" process yields a water which has a hardness of 2-3°. "Natrolith" is able to remove Fe, Mn, Pb and NH_4 compds. to a certain extent, also many colored substances such as methylene blue combined quant. with it, whereas other solns. such as methyl orange filter through unchanged. In order to obtain a satisfactory effluent it is necessary to use an unobjectionable feed water low in Fe and Mn, to use a good grade of salt in regenerating the "Natrolith" and to keep the softener well cleaned in order to prevent the growth of noxious organisms. WAYNE L. DENMAN

Modern aspects of chlorination of water. N. J. HOWARD. *J. Am. Water Works Assoc.* 19, 546-52(1928).—A very interesting survey of the history of the use of Cl, the development and use of chloramine compounds, super-chlorination and the problem of destroying or removing taste-forming substances. D. K. FRENCH

Water sterilization by chlorine. F. DIENERT. *Tech. sanit. munic.* 23, 50-8(1928).—The lethal dosage of Cl for the cholera bacillus in water was 0.2 mg. per l. The dysentery bacillus required approx. twice the dosage of Cl necessary to destroy *B. coli*. The Flexner dysentery bacillus required a dose of 0.18 mg. per l.; the Shiga bacillus 0.15 while *B. paratyphosus* required 0.2 mg. Similar results were obtained with both liquid Cl and $NaOCl$ in H_2O treatment. The Cl in ClO_2 was fully as efficient as the Cl in $NaOCl$ or in liquid Cl. Various theories of microbial destruction by Cl are discussed. The Cl treatment of H_2O must be conditioned on the amt. of org. matter present, the nature of the bacteria and the clearness of the water. C. R. FELLERS

Test for phenolic tastes and odors in water after chlorination. F. W. SPERR, JR., W. H. FULWEILER, F. E. DANIELS AND O. O. MALLETS. *U. S. Public Health Repts.* 43, 881-2; *J. Am. Water Works Assoc.* 19, 605-6(1928).—The above committee has proposed the following tentative method. Acidulate 500 cc. of the material with H_2SO_4 until acid to litmus, and distil off 250 cc. Catch the distillate in a 500-cc. volumetric flask, make to the mark with distd. H_2O and dil. as follows: 1 to 10, 1 to 100, 1 to 1000, etc., prepg. as many dilns. as may be necessary. Take 200 cc. of the distillate in the volumetric flask after making to the mark (this representing the original material

undild.) and a like amt. of each successive diln. Treat with a slight excess of chlorine water (a total of 0.3 p.p.m. of Cl is usually sufficient). Let stand 15 min. and then boil until the excess Cl is removed as evidenced by test with *o*-tolidine. Make the odor test by smelling the hot liquid. Make the taste test after the liquid has cooled. In the taste test, swallowing a small quantity of the liquid is the best method for revealing the presence of taste-producing substances. Results shall be expressed as the lowest diln. in which the taste and odor are negative.

J. A. KENNEDY

Report of Committee No. 1 on Standard Methods of Water Analysis. R. C. BARDWELL, *et al.* *J. Am. Water Works Assoc.* 19, 553-73(1928).—In particular are considered brilliant green lactose bile medium, the detection of phenols, the detn. of iodine and the *o*-tolidine test for free Cl; recommendations and methods are included. There is much other material in the form of progress reports.

D. K. FRENCH

Standard methods of water analysis. HAROLD FARMER, *et al.* *J. Am. Water Works Assoc.* 19, 587-91(1928).—The work for the past year has been confined to the detn. of dissolved O and CO₂. The present methods are not considered satisfactory and further work will be done.

D. K. FRENCH

Determination of oxygen in water. F. LIEBERT AND W. M. DEIRNS. *Chem. Weekblad* 25, 226-8(1928).—The accuracy of several methods (Winkler, Romijn, Smit) for detn. of O₂ in water was studied. The Winkler method gave very satisfactory results accurate in 0.008 cc. per l., if not too much org. matter is present (fresh water). The results are tabulated.

B. J. C. VAN DER HOEVEN

Notes on practical water analysis. W. D. COLLINS. U. S. Geol. Survey, *Water-Supply Paper* 596-H, 235-61(1928).—The methods described are those used by the U. S. Geol. Survey for the analysis of waters of moderate mineral content in order to learn their suitability for industrial use. The analyses so made have little or no reference to the sanitary condition of the water. Unless the compn. of the water is approx. known, a preliminary examn. should be made by titration for alky, Cl and NO₃ and for Ca by turbidity or soap-destroying power. The results of the preliminary examn. may show that a more complete analysis is unnecessary. Eleven analyses are tabulated, the constituents detd. being total solids, SiO₂, Fe, Ca, Mg, Na, K, (HCO₃), (SO₄), Cl and (NO₃). Samples should be analyzed soon after being taken, and reagents kept freshly prepd., since a common source of error is material dissolved from glass.

L. W. RIGGS

Treatment of feed water. W. G. CAREY. *Fuel Econ. Rev.* 6, 36-9(1927).—A review.

E. H.

Deconcentrators and continuous blow-down apparatus. R. C. BARDWELL, *et al.* *J. Am. Water Works Assoc.* 19, 579-86(1928), cf. *C. A.* 22, 128.—After a description of and pointing out both the advantages and disadvantages of the deconcentrator system, the stabilizer system and the continuous blow-down idea, further study is recommended.

D. K. FRENCH

The law relating to the pollution of rivers (England.) ALFRED HEBBINGTON. *Munic. Eng. Sanit. Record* 79, 436-7(1927).—Comment on the Rivers Pollution Prevention Act, 1876, West Ridings of Yorkshire Rivers Act, 1894, and Salmon and Fresh-water Fisheries Act, 1923.

C. H. BADGER

Pollution of streams in Illinois. A. M. BUSWELL. Illinois State Water Survey, *Bull.* No. 24, 33 pp.(1928).

E. H.

Pollution problems in the state of Washington and their solution. H. W. NIGHTINGALE. *Trans. Am. Fish. Soc.* 57, 294-300(1927).—Domestic sewage free from trade wastes is not harmful to fish life unless it reduces the O₂ content to less than 30% satn. Sulfite wastes from pulp mills are very destructive, since the wastes from a fifty-ton sulfite mill equal the sewage from a city of 81,000. No special toxic action with sulfite wastes has been found. The wastes from a mill using the lime soda process have proved very destructive to young fry. Black ash wastes are very destructive to seed clams. A discussion of the legal control of industrial wastes is included.

C. M. McCAY

Toxicity experiments with fish in reference to trade waste pollution. D. L. BEIDING. *Trans. Am. Fish. Soc.* 57, 100-19(1927).—The factors that must be considered in studying the effects of pollution of water upon fish are the species of test fish, the hardness of the individuals, the age and the size. The environment factors that must be controlled are the chem. characteristics of the water, the size of containers, the oxygen content and the temp. of the water. Brook trout, rainbow trout, chinook salmon, carp, goldfish and suckers were studied. Brook trout of about 200 g. wt. are the most satisfactory. HNO₃, HCl and H₂SO₄ produce the same symptoms of loss of equil. and irregular respiration at a *p*_H of 4-5. M. L. D. is 1:100,000. Org. acid

presents greater diversity of actions. Trout can survive after immersion in 1:200 of AcOH. Phenol is marked by its irritating action but produces no evidence of O₂ hunger. Tannic acid injures the gills and produces O₂ hunger. NH₄OH, NaOH and KOH differ only in degree of toxicity. KOH is less marked in activity. Lead arsenate produced no characteristic symptoms. Ca(OCl)₂ produces characteristic head-balancing motions. CuSO₄ shows wide variations in toxicity. Fish once poisoned do not recover in fresh water. FeSO₄ has a low toxicity. HgCl₂ kills fish, leaving them with pale gills and auricles filled with blood. KMnO₄ will color fish yellow but they promptly recover in fresh pure water. H₂S produces respiratory paralysis. Fish can recover in fresh water. The author includes tables comparing his data with those of previous workers.

C. M. MCCAY

Treatment of the sewage from Paris. W. J. MULLER. *Gesundh. Ing.* 51, 342-3 (1928).—In past years much of the sewage from Paris was disposed of by irrigation on to fields. In recent years such methods no longer sufficed and other biol. processes were employed. Partial treatment is obtained by settling basins which remove the readily removable solids and the suspended material is removed by irrigation on to fields. The fields take care of 40,000 cu. m. of sewage per ha. per year. Further treatment is obtained at some stations by filter basins. Treatment with three processes using activated sludge was tried. The "Simplex process" was the most economical. Satisfactory disposal of sludge was obtained by burning after drying on sludge beds followed by a drier. The burning of the combustible matter furnishes enough heat to operate the drier. Other methods of sludge disposal under consideration are biol. decompn. and drying by centrifugal force.

W. L. DENMAN

Effect of salt on sludge digestion. WILLEM RUDOLFS. *U. S. Public Health Repts.* 43, 874-81 (1928).—The effect of increasing amts. of NaCl upon the rate of decompn. of org. matter in sewage sludge by bacteria is, progressively, (a) indifferent, (b) stimulating, (c) retarding and (d) toxic. There is a comparatively large number of sewage-disposal plants where salt is received as mine water, brine, or soil leachings. When rather concd. salt solns. are received continuously or temporarily a number of questions arise: (1) How much salt can be handled by a tank without upsetting the biological equil.? (2) What is the effect upon gas production? (3) Is the compn. of the gas changed? (4) How much larger should the digestion capacity be? The effect of salt upon the rate of decompn. of sewage sludge was only slightly noticeable with addns. of 5 g. per l. of sludge, but with larger quantities the destruction of volatile matter and total gas production decreased markedly. The compn. of the gas changed greatly with the salt addns. With the largest quantities of salt practically no CH₄ was produced. Mixts. of NaCl and SO₄ appear to be somewhat stimulating. Methods and material used are given and the results are tabulated, and discussed with the aid of graphs.

J. A. KENNEDY

Effect of certain trade wastes on sludge digestion. WILLEM RUDOLFS. *U. S. Pub. Health Repts.* 43, 945-51 (1928).—This preliminary study shows laundry waste somewhat detrimental to digestion of sludge. A dye waste containing 1.2% sulfur black, 2.0% NaCl, 1.6% Na₂S and Na₂SO₄ and 0.6% Na₂CO₃ was markedly detrimental and H₂S was liberated. Sepn. of the clear upper layer of dye from the settled solids after 6 hrs. gave somewhat better results but with 1% of dye waste the H₂S odor disappeared after more than 5 weeks. 500 p. p. m. of H₂SO₄ were not markedly detrimental but 1000 p. p. m. retarded digestion. Both gave H₂S. Retardation by 500 or 1000 p. p. m. of NaOH was not great. Neither 500 p. p. m. of H₂SO₄ and NaOH together nor 0.3% FeSO₄ showed any important effect.

FOSTER DEE SNELL

Burley-in Wharfedale and Menston joint sewerage board (England). ANON. *Munic. Eng. Sanit. Record* 79, 473-4 (1927).—The works and the method of purifying the sewage are described.

C. H. BADGER

Hertford (England) sewage-disposal works. CHARLES DUCKWORTH. *Munic. Eng. Sanit. Record* 79, 496 (1927).—The works, designed for a max. of 2 million gal. per day, and the process of purification are described. Activated sludge is employed. Chem. analyses of the crude sewage after passing through the detritus tanks, and the effluent are given.

C. H. BADGER

The operation of activated-sludge plants. H. T. CALVERT. *Munic. Eng. Sanit. Record* 79, 276-7 (1927).—The causes of troubles in these plants are summarized. In the discussion which followed W. H. Hoyle told of successfully overcoming a mass of filamentous growth of *Sperothilus natans*. It was agitated in the tank for several hrs. with a thin paste made of 8 cwt. of screened rich soil and 1½ cwt. of lime to gain the necessary humus in the aeration plant. Shutting off the flow and aerating until the next day, and the addn. of precipitants to wt. the sludge did not help.

C. H. B

The problem of the projection of the sedimentation slot in two-storied treatment plants. MORGENROTH. *Gesundh. Ing.* 51, 290-1(1928).—The characteristics of such installations are briefly discussed.

WAYNE L. DENMAN

House refuse collection and disposal (Willesden, England). F. WILKINSON. *Munic. Eng. Sanit. Record* 79, 503(1927).—Discussion and costs.

C. H. BADGER

Automobile exhaust gas in streets and repair shops of large cities. J. J. BLOOMFIELD AND H. S. ISBELL. *U. S. Public Health Repts.* 43, 750-65(1928).—Air samples analyzed by the I_2O_5 method with liquid air cooling tube to eliminate gasoline vapor showed a dangerous concn. of CO in repair shops, but almost no hazard in congested city streets and in autobuses. The av. for 102 tests in 27 repair garages was 2.1 parts in 10,000, 59% of them being over 1 part and 18% over 4 parts. The av. for 141 tests in heavy street traffic was 0.8 part CO in 10,000; only 24% being over 1 part, and in only one location, a covered passageway, was there as much as 2 parts CO in 10,000 of air.

C. M. SALLS

Fumigation tests with ethylene dichloride-carbon tetrachloride mixture. L. F. HOYT. *Ind. Eng. Chem.* 20, 460-1(1928).—Because of its low cost, ease and comparative safety of application, and easy removal following fumigation, coupled with its satisfactory killing effect on insects when used in a dosage of 14 lb. per 1000 cu. ft for 24 hrs. at 70° F. or higher, this new non-burnable $(CH_2Cl)_2-CCl_4$ mixt. appears to be a valuable, safe fumigant.

C. M. SALLS

Colliery surface and mine waters (SIMPKIN) 21. A photoelectric turbidity meter (HAASE, THIELE) 1. The ash content of brown coal [water-softening compound] (FISCHER, FUCHS) 21. Volumetric displacement apparatus for controlling the supply of gas for chlorinating water (Brit. pat. 277,869) 1. Purifying tannery wastes (U. S. pat. 1,672,586) 29. Electric system for preventing corrosion of water mains (Brit. pat. 277,417) 4.

Apparatus for softening water by base-exchange materials. T. B. CLARK (to Ward-Love Pump Corporation). U. S. 1,671,699, May 29.

Softening water and similar exchange reactions. E. B. HIGGINS (to United Water Softeners, Ltd.). U. S. 1,671,864, May 29. The exchange material is maintained in suspension in the liquid under treatment by the upward flow of the liquid. An app. is described.

Valve system and construction for water-softening apparatus. L. G. DANIELS. U. S. 1,671,672, May 29.

Purifying sewage and other polluted liquids. J. T. TRAVERS (to Travers-Lewis Process Corp.). U. S. 1,672,587, June 5. The OH concn. of the liquid is increased (e. g., by adding lime) sufficiently to force substantially all colloids present in the liquid to become completely negatively charged, and an electrolyte-producing material such as $CaSO_4$ is then added. Coagulants also may be used.

Treating domestic sewage and industrial wastes. J. T. TRAVERS (to Travers-Lewis Process Corp.). U. S. 1,672,584, June 5. Waste dust collected from precipitators in the manuf. of cement is added to sewage or the like in order to ppt. colloids. $FeSO_4$ and lime also may be used. U. S. 1,672,585 specifies the addn. of solid waste material which has been pptd. from the waste solns. discharged during the manuf. of Cl_2 , "chloride of lime" and NaOH.

Apparatus for sterilizing small articles by heat and antiseptics. D. G. WILL. U. S. 1,672,592, June 5.

Closed chamber apparatus for disinfecting clothes or other articles. W. H. DODWELL and W. G. DUNNING. Brit. 277,750, June 24, 1926.

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER

Content of barium in arable soil. GABRIEL, BERTRAND AND L. SILBERSTEIN. *Bull. soc. chim.* 43, 458-61(1928).—See C. A. 22, 1643.

E. H.

Soil erosion. HERBERT ASIPLANT. *Bull. Rubber Growers' Assoc.* 10, 265-73 (1928).—The paper deals chiefly with the prevention of erosion by cultivation, but in an appendix are estd. losses in N, P and K fertilizer from typical soils through erosion and in latex. The loss in latex is insignificant.

C. C. DAVIS

The influence of soil reaction on flax and oats. M. DOMONTOVICH AND G. ABOLINA. *Nauchno Agronomicheskii Zhurnal* 4, 346-54(1927); *Deut. landw. Rundschau* 1,

815.—Yields on oats show a maxima at p_H 4.1 and 8.1. Neutral and alk. soils produced a larger percentage of N than acid soils; there was little difference in the H_2PO_4 content. In contrast the optimum for flax was p_H 6. The N content was not influenced by the soil reaction.

GEORGE R. GREENBANK

The p_H values of plants and corresponding soils. A. V. BLAGOVESHCHENSKII, N. I. SOSEDOV AND A. G. TOSHCHEVIKOVA. *Bull. Univ. Asie Centrale (Tachkent)* 1926, 9-16.—The p_H values of alk. soils in the salt desert of West Ferghana were studied. The p_H values of the soils at 10-20 cm. depth are very const. (p_H 7.8 \pm 0.003). The p_H values of press-juice of leaves of various plants are more diverse and range from 3.0 to 8.2.

H. R. KRAYBILL

The variation presented in the hydrogen-ion concentration of the soil in adjacent points. CL. FROMAGEOT. *Compt. rend.* 186, 787-90(1928).—The acidity as ordinarily measured on large samples represents only an av figure, and one has, then among other things, an explanation of the fact why certain soils, very clearly of av. acidity, can present still distinctly the phenomenon of nitrification although the nitrous and nitric bacillus do not appear to be able to function below a slight acidity. E. F. SNYDER

The effect of soil acidity on the growth and composition of leguminous plants. ARTTURI I. VIRTANEN. *Biochem. Z.* 193, 300-12(1928).—Diminished acidity of the soil leads to a considerable increase in the N content of the plants (at p_H 6.0 it is 30% higher than at p_H 5.0). The P content diminishes with increasing acidity, which is true also for the K though not to the same degree.

S. MORGULIS

The relation between soil reaction and plant growth. H. OSKIERSKI. *Botan. Arch* 20, 22-42(1927), *Deut. landw. Rundschau* 1, 703(1928).—A study of p_H and buffer level of soils on the plant growth of oats and mustard. O. also shows that there is no relation between Ca deficiency and p_H or buffer level.

GEORGE R. GREENBANK

The influence of chemical constitution on the hygroscopicity of the soil. F. GIESICKE. *Chem. Erde* 3, 98-136(1927); *Deut. landw. Rundschau* 1, 702(1928).—Other authors consider the hygroscopicity to be due to physical structure. G. finds that the Fe and Al oxides modify the effect of the physical properties.

G. R. G.

The use of Lundegarth's bell apparatus for measuring the carbon dioxide production of the soil. D. FEHER. *Biochem. Z.* 193, 350-5(1928).

S. MORGULIS

Air electrification and electroculture. Investigations in the ionization of plants. E. A. TSCHERNIAWSKY. *Bull. Univ. Asie Centrale (Tachkent)* 1926, 235-76.—Electroculture is a process of increased action of atmospheric ions built up under the influence of different natural or artificial conditions.

H. B. KRAYBILL

Experiments on the fertilizing of fruit trees. I. T. WALLACE. *J. Pomology Hort. Sci.* 4, 117-40(1925).—The effect of deficiency of each of the essential plant food elements was studied by growing Orange Pippin apple trees in various nutrient soils. The soln. for series A contained N 110, Ca 30, Mg 20, K 126, Na 175, P 18, S 40 and Cl 86 p. p. m. In series C, D, E, F and G the quantities were the same except that N, K, P, Ca and Mg. resp., were lacking. Series H plants were grown in rain water. The kind and quantity of foliage and roots were different in each series. Lack of N and P resulted in delayed opening of buds and greatly reduced the number of blossoms. Premature defoliation preceded by various colored tinting of the leaves occurred in series C, E, G and H. The barks were lighter in color and the fruits were more highly colored and harder in texture in series G and H than in the others. The fruits of series E were soft and of very poor quality. II. *Ibid* 5, 1-33.—Results of expts. with gooseberry, currant, raspberry and strawberry plants similar to those above are given. Deficiency of any of the essential plant food elements produced characteristic effects on the various plants and the view is expressed that some of these may be used for diagnostic purposes in the field. The N/K and K/Mg ratios in the diet of plants are shown to be important. For instance plants will show symptoms of Mg starvation in the presence of an excess of K when the quantity of Mg present would have been ample with a normal amt. of K. Twenty references are appended.

A. L. M.

The influence of pulverulent materials on the solubility of lime and on the absorption by the soil of nitrogen from ammoniacal fertilizers. J. BRAVARD AND RENÉ DUBRISAY. *Compt. rend. acad. agr. France* 14, 572-7(1928).—The presence of argillaceous or siliceous pulverulent products should favor in arable land (1) the absorption of N contained in ammoniacal fertilizers and (2) the decalcification of the soil by the solns. from the fertilizers.

E. F. SNYDER

The fertilizing action of sulfur. Recent experiments performed by the Institute of Agricultural Research. DEMOLON. *Compt. rend. acad. agr. France* 14, 616-21(1928).—S alone provokes an increase in yield in soils rich in org. material, even though these soils contain appreciable amts. of SO_4 .

Fertilizers and insecticides. ANON. *Chemist and Druggist* **107**, 448-50(1927).—Review of a Report, Rothamstead Experimental Station, September, 1927. S. W.

Use of lubricating oils as insecticidal material for spraying. SCHIFFELE. *Petro-leum Z.* **24**, 147-8(1928).—Most lubricating oils have insecticidal properties but the fraction 240-300° is most effective. It is not known whether most effective results are obtained by the use of the oil as vapor, liquid or in emulsions, but it is known that the action is not through the respiratory organs. The toxicity of oils does not depend on the viscosity. Lighter-colored oils are most efficient. M. B. HART

Turpentine oil as an attractant of the wheel bug (*Arilus cristatus* L.). F. W. METZGAR. *J. Econ. Entomol.* **21**, 431-2(1928).—Turpentine U. S. P. has a strong attraction for this insect. C. H. R.

Lime and sodium fluosilicate. S. MARCOVITCH. *J. Econ. Entomol.* **21**, 436-7(1928).— $\text{Ca}(\text{OH})_2$ has often been recommended as a carrier for Na_2SiF_6 in insecticide dusts. In the absence of moisture, $\text{Ca}(\text{OH})_2$ carbonates and acts as a neutral carrier. When plants are wet with dew at the time of dusting, the $\text{Ca}(\text{OH})_2$ dissolves and reacts with the Na_2SiF_6 to form sol. CaSiF_6 which may cause foliage injury. Under these conditions, an inert carrier (flour, talc, S. infusorial earth) is much safer. Several light preps. of Na_2SiF_6 , suitable for dusting, and mixts. of Na_2SiF_6 , S and infusorial earth are now manufactured by American companies. C. H. R.

Oil sprays and oil injury. W. E. BRITTON. *J. Econ. Entomol.* **21**, 418-21(1928).—Cont. miscible oil preps. and home-made oil emulsions are briefly described. The effects of oil sprays on various deciduous fruit and shade trees and on coniferous trees are discussed. C. H. R.

Extermination of earwigs. ANON. *Chemist and Druggist* **107**, 452(1927); cf. C. A. **21**, 4010.—Muggeridge (*J. Agr. (New Zealand)* 1927) uses As compds. (Paris green, Na_2HAsO_4 , As_2O_3); Fultton (Oregon Agr. Expt. Sta., *Bull.* 207) NaF in 2 formulas: (1) NaF 1 lb., molasses 4 lbs., H_2O 1.5 gallons, wheat bran 16 lbs.; (2) NaF 1 oz., molasses 5, glycerol 5, H_2O 5 oz., ground oat hulls 1 lb. S. WALDBOTT

Report of committee to formulate plans for investigations of the codling moth from biologic and control standpoints. B. A. PORTER. *J. Econ. Entomol.* **21**, 31-8(1928).—This is a report of investigations recently made and contemplated by state and federal entomologists on the control of the codling moth. The following subjects are discussed: As residues on fruits sprayed with PbHAsO_4 ; As residue removal by mech. means; avoidance of excessive As residues by shortened spray schedules and by the use of dusts, petroleum oils, nicotine sulfate, pyrethrum, derris, As compds. other than PbHAsO_4 , and inorg. and org. non-arsenical compds.; use of chemically treated bands to trap and kill the larvae; use of trap baits for the adult moth; parasitic control; orchard and packing sheds sanitation. Biol. studies are also discussed. C. H. R.

Codling moth control in Georgia apple orchards. C. H. ALDEN AND M. S. YEO-MANS. *J. Econ. Entomol.* **21**, 319-24(1928).—Control of the codling moth in Ga. can be obtained with 6 PbHAsO_4 sprays. The As residues on fruit sprayed according to this schedule are within the British tolerance (1.429 mg As_2O_3 per kg. fruit). Mg arsenate was less effective than PbHAsO_4 but gave better control than com. Ca arsenate, $\text{Ca}_3(\text{AsO}_4)_2$, Al arsenate, Zn arsenate, Mn arsenate and scorodite. PbHAsO_4 dusts were inferior to sprays against this insect. Cloth bands dipped in petroleum oil contg. β -naphthol were effective as traps for the larvae. Other biol. and mech. control data are given. C. H. RICHARDSON

Relative resistance to arsenical poisoning of two codling moth strains. W. S. HOUGH. *J. Econ. Entomol.* **21**, 325-9(1928).—Codling moth larvae (*Carpocapsa pomonella*) from Grand Junction, Colorado and from Shenandoah Valley, Va. were compared in respect of their ability to enter apples sprayed with PbHAsO_4 (4 lbs. in 100 gals.). The Colo. larvae showed a much greater capacity to enter the sprayed fruit than the Va. larvae. The strains were cross bred and the first generation of each cross was less resistant to PbHAsO_4 than the pure Colo. larvae but more resistant than Va. larvae. C. H. RICHARDSON

Some results of three years' experience seeking better control measures for the codling moth in the Yakima Valley, Wash. W. S. REGAN AND A. B. DAVENPORT. *J. Econ. Entomol.* **21**, 330-8(1928).—The addn. of petroleum oil emulsion to sprays contg. PbHAsO_4 aids materially in the control of the codling moth. The effectiveness of

oil sprays is discussed from the standpoints of degree of refinement, volatility, oil penetration, emulsification and residue removal from sprayed fruit. C. H. R.

The significance of nicotine in plant protection and preparation of the extract. D. SCHERPE. *Obst. Gemusebau*. 16, 253-4 (1927); *Deut. landw. Vermessungswesen in Wien. Vienna: Staatsdruckerei österr. Verlag. 163 pp. Bound in half linen, öst. Sch. 7.

Fermenting vessel. M. A. ADAM. U. S. 1,672,743, June 5. Vessels for fermentation to produce acetone and BuOH or for other purposes are formed of riveted steel plates lined with rubber vulcanized *in situ*.

Butyl alcohol-acetone fermentation. W. J. EDMONDS. Can. 276,823, January 3, 1928. In a process for the production of BuOH, acetone and fermenter gas, fermenter gas is displaced in a fermenting vessel by a carbohydrate mash, and the mash is then caused to be fermented by butyl alc.-acetic bacilli in an atm. of fermenter gas under pressure. The gas generated by the fermentation is lead off and the fermented mash is displaced by fermenter gas. Cf. C. A. 22, 1433.

Butyl-acetone fermentation. D. A. LEGG (to Commercial Solvents Corp.). Brit. 278,307, Oct. 1, 1926. See U. S. 1,668,814 (C. A. 22, 2235).

Acetone and butyl alcohol by fermentation. G. W. FREIBERG. U. S. 1,672,487, June 5. In fermenting a carbohydrate mash with bacteria capable of producing butyl

alc. and acetone, the water used in the process is softened by reagents such as zeolites or by NaOH, lime and Na_2CO_3 to reduce the content of Ca and Mg compds which have a tendency to stimulate acid formation.

Glycerol by fermentation of sugar. K. LÜDECKE and N. LÜDECKE. Brit. 278,086, June 30, 1926. In producing glycerol by fermenting sugar in alk. soln., the volatile fermentation products are distd. off when the fermentation is entirely or partially finished, so that when more sugar is added fermentation continues. Ni or Co sulfates may be used as catalysts, and the yeast may be filtered off before the distn. and may be mixed with fresh yeast or regenerated before readdition. Na_2SO_3 , Na phosphate, $(\text{NH}_4)_2\text{SO}_4$ and MgSO_4 may be added in small proportions and fermentation may be allowed to proceed for 2 days at 30-35° before filtering off the yeast and distg. the volatile products.

Distilling alcoholic liquids. U. S. INDUSTRIAL ALCOHOL CO. Brit. 278,211, Nov. 29, 1926. Weak alc. liquid such as beer is distd. to sep. strong alc., fusel oil and light-boiling products such as aldehydes. An app. is described.

Distilling vinasses, etc. NOUVELLES INDUSTRIES CHIMIQUES, SOC. ANON. Brit. 277,932, Sept. 21, 1926. Distillery vinasses, sugar refining molasses or similar nitrogenous residues are distd. for recovery of nitrogenous substances and acetone in the presence of excess of lime or other alk. earth and in a current of inert or reducing gas such as N, H or CH_4 , which may be satd. or not with water vapor. Gases produced in the distn., after sepn. of constituents such as acetone, NH_3 and amines, may be used in the distn.

Purifying glycerol. K. LÜDECKE and N. LÜDECKE (to Vereinigte chemische Werke A.-G.). Brit. 278,703, Oct. 11, 1926. Glycerol produced by fermentation is deodorized by treatment with oxidizing agents such as hypochlorites, permanganates or H_2O_2 .

Yeast. FLEISCHMANN CO. (to International Yeast Co., Ltd.). Brit. 277,476, Aug. 24, 1926. Wort of low gravity such as 2° Balling contg. water, seed yeast and nutrient sufficient to increase the seed yeast by one-half is fermented, in either an open or a closed fermenter, at about 31-33°, with aeration, to effect increase of the yeast content by one-half. One-third of the yeast-contg. liquid is then removed and water and nutrients are added to compensate for evapn. and utilization of nutrient. Over 20 successive yields may be taken in this manner. A fermenter 11 ft. high and 4 feet in diam. is suitable and the nutrient may be formed from sugar, grain and NH_4 compds such as the phosphate, sulfate and hydroxide.

17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

Estrogen, a new sex hormone: its clinical use with case reports. FRED FIRESTONE. *Endocrinology* 12, 151-6(1928).—Estrogen, prepd. from human placenta, contains the ovarian hormone. In 6 cases it relieved the nervous functional manifestations of ovarian deficiency.

H. J. DEUEL, JR.

Molecular compounds of the veronal series. P. PFEIFFER and R. SEYDEL. *Z. physiol. Chem.* 176, 1-16(1928).—The compds. obtained by uniting 1 mol. of veronal with 1 mol. of pyrimidone, antipyrine or sarcosine anhydride are due to the satn. of secondary valences between the CO of the pyrimidone component and both NH groups of the veronal. "Veramon," which is claimed to be a compd. of 1 veronal with 2 pyrimidone, is in reality a mixt. of the 1:1 compd. with 1 pyrimidone. When $(\text{NH}_4)_2\text{SO}_4$ is added to a soln. of veramon the 1:1 compd. crystallizes out. If one imide H of the veronal is substituted by alkyl the product is no longer capable of forming a mol. complex with pyrimidone. *N*-Methylveronal and *N*-phenylveronal do not yield compds. with antipyrine, pyrimidone or sarcosine anhydride, as shown by a total lack of irregularity in the m. p. and thawing p. curves. Homologs of veronal, and the parent barbituric acid itself, form mol. complexes with pyrimidone, provided both imide groups are unsubstituted. Cryst. compds. were prepd. contg. 1 luminal + 1 pyrimidone* and 2 luminal + 1 sarcosine anhydride, m. 132° and 127°, resp. The m. p. curves show the existence of the compds.: 1 barbituric acid + 1 antipyrine and 2 barbituric acid + 1 sarcosine anhydride, but the products have not been obtained cryst.

A. W. DOX

Orthosiphon stamineus Benth. W. PEYER and W. LIEDISCH. *Apoth. Ztg.* 43, 555-7(1928).—A morphological treatment of this drug, official only in the Dutch

Pharmacopeia, in connection with certain data on its active constituents. These latter consist mainly of essential oil, tannin, K salts and a glucoside "orthosiphonin." W. O. E.

Estimation of condurangin. LUDWIG ZECHNER, FRITZ WISCHO AND HUGO WAGNER. *Pharm. Monatsh.* 9, 79-82, 102-3(1928).—After reviewing methods previously suggested for the evaluation of the various official condurango preps., as also for the isolation of its active principle condurangin, the authors outline a procedure in great detail for the estn. of condurangin in such preps. Briefly, this procedure in the case of the ext. involves diln. of 25 cc. with H₂O after previous evapn. of the alc., satn. of the resulting liquid with NaCl, then extn. with 5 portions of CHCl₃. The united chloroformic ext. is decolorized, clarified and filtered. An aliquot thereof is then dild. with petr. ether and the pptd. condurangin isolated, dried and weighed. W. O. E.

Limits of error in German pharmacopeial methods from a physico-chemical standpoint. J. EISENBRAND. *Pharm. Ztg.* 73, 582-3, 597-8, 613-5, 626-8(1928).—In a former paper (cf. *C. A.* 22, 1213) the general viewpoints of the theme are discussed in connection with a critical consideration of the analytical findings. In the present series a study has been made of the accuracy to be desired and reasonably expected in such methods. Numerous examples are cited illustrative of the proper interpretation of values obtained. W. O. E.

Simple ampoule-filling device. C. STICH. *Pharm. Ztg.* 73, 584(1928).—Two types of burets are illustrated with rubber pinch-cock and bulb control. W. O. E.

Some reactions of pharmacology on pharmacy. H. H. DALE. *Am. J. Pharm.* 100, 299-317(1928).—An address. W. G. GAESSLER

The reliability of preparations of ergot and the necessity for standardization. W. B. GARNER. *Am. J. Pharm.* 100, 318-32(1928).—A compilation of the present-day information on ergot with the following summary and conclusions: (1) The U. S. P. method is the only suitable method at present for prep. liquid ext. of ergot. (2) The ergot should be of Spanish origin. (3) The medical profession engaged in obstetric work should give more careful attention to the results of the use of ergot. (4) Careful notes of the results obtained should be taken. (5) It is possible that a combination of ergotoxine and histamine together may eventually prove to be the most satisfactory method of administering ergot. (6) Continued efforts are necessary to make the estn. for the active principles of ergot chem. instead of biological. W. G. GAESSLER

Pharmacy in relation to science. EDWARD MAYHEW. *Am. J. Pharm.* 100, 333-43(1928).—An address in which M. presents an outline of the development of pharmacy which in effect is an account of the early development of the science of chemistry. W. G. GAESSLER

Naturally occurring anthraquinone drugs and coloring matters. L. J. HOOLEY. *Z. Farben-Ind.* 20, 12-3(1928).—A review. FREDERICK C. HAHN

The essential oil from *Gastrochilus panduratum* Ridl. A. J. ULTEE. *Proc. Acad. Sci. Amsterdam* 31, 62-4(1928).—See *C. A.* 22, 2236. E. H.

Manufacture of phytin in Kharkov. K. A. KRASUSKII. *Ukrainskii Khem. Zhurnal* 1, tech. part, 11-28(1925).—K. suggests, on the basis of the available literature on the subject, that phytin is not a single compd., but rather a group of compds. and may differ in compn. depending on the origin and the method of sepn. Comparison of the Russian phytin with the product made in Basel (Switzerland) shows that the former contains somewhat less phosphorus ($C:P = 1.3-1.4$ instead of $C:P = 1.0$), but is free from iron, contains some magnesium instead of calcium, has no taste and is not hygroscopic. K. reviews the historical development and the present economical situation of the extn. of phytin from hemp in Kharkov. G. B. KISTIAKOWSKY

Determination of nicotine and ammonia in tobacco. YUZURU OKUDA. *J. Biochem. (Japan)* 8, 361-4(1928).—The principle of the method is to distil the substance (about 3-6 g. tobacco in 50 cc. H₂O) over magnesia with steam and to collect both the ammonia and nicotine in standard acid. In an aliquot the sum of the 2 is detd. by titration with standard alkali while in another portion the NH₃ is detd. by a formal titration. Another method depends upon the fact that NH₃ but not nicotine liberates N₂ from HNO₃. The total N and the NH₂N are detd. (Van Slyke method) in the tobacco distillate. S. MORGULIS

Application of the metamorphosis reaction of the axolotl to the standardization of the thyroid hormone. B. ZAVADOVSKII AND L. P. LIPCHINA. *Zhurnal expl. biol. Med.* 8, 591-9(1928).—The reduction of the dorso-caudal fin of the axolotl serves best for the purpose of standardizing the thyroid hormone, although other signs of meta-

morphosis must also be considered. A series of pictures is given in the text for guidance in judging the phases of metamorphosis
S. MORGULIS

The relationship between ethereal oils and resins. G. V. FIGULEVSKIĬ. *J. Russ. Phys.-Chem. Soc.* **59**, 299-303 (1927).—Appreciable quantities of resin are found during the first days of a conifer's growth and only traces of the ethereal oils (C. A. **18**, 1366; **19**, 2222, 2223). The formation of the latter continues for several weeks after the period of intensive growth. Flavitskiĭ (1883) regarded galipot as a complex compd. of terpenes and resin acids which broke down in the presence of water or at high temps. P. postulates the formation of esters which decompose into the resp. hydrocarbons and acids: $C_{10}H_{17}OOC_{20}H_{39} \rightarrow C_{10}H_{16} + C_{20}H_{39}O_2$, or the galipot should contain 31% turpentine, which is true in the case of *Pinus maritima* (Dupont) and *P. silvestris* (Arbu-ov). Similarly for sesquiterpenes: $C_{15}H_{25}OOC_{20}H_{39} \rightarrow C_{15}H_{24} + C_{20}H_{39}O_2$, or 40.5% turpentine. The exudates of *P. cembra* contain 32% of ethereal oils which is a mixt. of pinene and cadimene (7.3). The esterification no. of resin shows it to contain 68-75% of the acids of mol. wt. $C_{20}H_{39}O_2$. Hence the terpenes form 42.2-38.4% of the mixt. of resin acids and hydrocarbons (theory 33.4%). The ethereal oil of *P. strobus* is composed of 9% esters; the resin (84.1% of the total secretion) contains 42.1% acids. The ratio of ethereal oils to acids is about 29:71 (theory 31:69). The secretions of *Abies sibirica* consist of 27.7% of ethereal oil (sapon no. 126-70, or 44-59% of bornyl esters). The resin contains 55-65% acids. Hence the terpene content of the hydrocarbon-acid mixt. is 25.7-26.5% (theory 31%).
B. SOYENKOFF

Types of bath salts. ANON. *Chemist and Druggist* **107**, 539-40 (1927).—Of the 3 salts chiefly used as bath salts, solns. of crystd. Na_2CO_3 are more alk. than those of borax, and these slightly more alk. than solns. of Na_2HPO_4 , as seen by their p_H values. Borax has special, favorable properties; p_H of borax solns. is but slightly affected by concn., varying from 9.19 to 9.30 at 18° for concns. from 0.19% to 9.55% and from 8.89 to 9.00 for the same concns. at 60°. When mixing at 38-40° a 0.5% borax soln. (p_H 9.10) with a 5.0% soap soln. (p_H 10.25 in a blank test) p_H of the mixt. is 8.8, proving that addn. of borax to soap soln. reduces its alk. This explains the well known fact that the presence of borax will prevent the irritation and unpleasant dryness of the skin caused by soap rich in alkali. Besides, crystd. borax has the highest m. p. (75.5°) of the 3 salts, indicating greater stability and better appearance. On account of the lesser soly. of borax in H_2O . (8.79%), suspend the salt in a muslin bag in the running water underneath the tap.
S. WALDBOTT

Cineole determination. JOHN ALLAN. *Chemist and Druggist* **107**, 615 (1927); cf. C. A. **18**, 1031, 1730—Abstr. of a committee report recommending for adoption in the next Brit. Pharm. the *o*-cresol method which consists of the detn. of the f. p. of a mixt. of 3 g. of the oil previously dried by shaking with a small quantity of dry, granular $CaCl_2$, and 2.1 g. of *o*-cresol. The cineole % is then read from a scale prepd. from the f. p. of *o*-cresol with mixts. of known cineole content. The table and method of procedure are given.
S. WALDBOTT

Solid perfumes. W. A. POUCHER. *Chemist and Druggist* **107**, 669 (1927).—To replace EtOH and Me_2CHOH as vehicles in perfumery, P. gives a general formula for non-greasy, solid perfumes: Mix 20 g. Japan wax, 20 g. white beeswax, 40 cc. ethyl phthalate and 20 cc. concd. perfume. In the prepn. of the latter, a list of suitable materials to select from in blending is given in each case for carnation, heliotrope, jasmin, lilac, rose, treffe and violet.
S. WALDBOTT

Gold compounds for medicinal use. F. R. GREENBAUM. *J. Am. Pharm. Assoc.* **17**, 232-8 (1928).—A review of the Au compds. used in medicine. Structural formulas are given. Attention is called to the fact that those with a S linking exceed those which do not contain S.
L. E. WARREN

Radioactive materials [for use in therapeutics] (Brit. pat. 278,347) 3.

LAPIERRE, G. Pianta aromatiche medicinali ed industriali: coltivazione, raccolta e preparazione. Florence: G. Ramella e Co. 31 pp.

Pharmaceutical compounds. F. HOFFMANN-LA ROCHE & Co., A.-G. Brit. 278,672, Oct. 9, 1926. Diphenolisatin treated with Me_2SO_4 yields dianisolisatin or N-methyldianisolisatin; the dianisolisatin, which yields an N-acetyl deriv. with HOAc, may also be converted into N-methyldianisolisatin. These and similar products possess laxative properties. Diphenetolisatin is prepd. by interaction of diphenolisa-

tin with EtI; by use of isopropyl bromide, the di-O-isopropylidiphenolisatin is obtained and from this N-acetyl-di-O-isopropylidiphenolisatin may be obtained by acetylation. Di-O-benzyl-diguaiacolisatin is made by treating diguaiacolisatin with benzyl bromide.

Medicines comprising scopolamine. W. MERCK, K. MERCK, L. MERCK, W. MERCK and F. MERCK (trading as the Firm of E. Merck). Brit. 278,693, Oct. 11, 1926. A prepn. comprising scopolamine and ephedrine is an anesthetic without undesirable effects on the heart, breathing or blood pressure. Scopolamine may also be used with camphor, caffeine or adrenaline.

Medical compound. G. C. MILLER. Can. 277,180, January 17, 1928. An agar liquid petrolatum emulsion is produced by adding a H₂O soln. of an acid to agar agar, boiling the mixt., adding a preservative and a flavoring, combining the soln. with a mineral oil, and agitating the mixt. so prepd. until cool.

Solid alcoholic solutions of iodine. K. JUNGMANN and O. KOLBERT. Brit. 277,953, Sept. 21, 1926. An antiseptic solid compn. is prepd. by adding I or a soln. of I to solidified alc. in a melted state and also adding a stabilizing substance such as Na alcoholate and NaI. Reaction of the I may also be restricted by immediate cooling and solidification of the compn. after the I is added to it.

Ointments for preventing insect bites. I. G. FARBERNINO, A.-G. Brit. 277, 710, Sept. 20, 1926. Lanoline, vaseline or other ointment bases are used with oils such as cedar oil, juniper oil, thuja oil and templin oil. Mucilages such as tragacanth or carrageen mucilage may also be used as vehicles.

Camphoric alkaloids. W. SCHOELLER and H. SCHOTTE (to Chem. Fabrik auf Aktien, vorm. E. Schering). U. S. 1,672,000, June 5. Equimol. proportions of the camphoric acid radical and of an alkaloid such as hyoscyamine, scopolamine or atropine are combined to form a salt which has a vigorous therapeutic paralyzing effect on the nervous vagus. Cf. C. A. 22, 1366.

Urease. HENKEL ET CIE GES. Brit. 277,644, Sept. 15, 1926. In order to obtain a solid urease prepn. an aq. ext. of plants such as soy beans or jack beans is filtered or centrifuged, atomized in a current of dry heated air or other suitable gas (which may be at a temp. above 100°) and substances such as Na₂HPO₄, KH₂PO₄ or a mixt. of these may be added, before atomizing the ext., to render the product more readily sol. in water.

Metal salts of the N-methylenesulfonic acids of diaminodihydroxyarsenobenzene or sulfoarsenol. F. LEHNHOFF-WYLD. U. S. 1,671,141, May 29. ZnCl₂ or other sol. salt of a non-alk. metal is first combined with arspenamine and the product is treated with formaldehyde Na bisulfite to obtain a complex therapeutic compd. of low toxicity. Cf. C. A. 21, 916.

Alkyl mercuric derivatives containing sulfur. M. S. KHARASCH. U. S. 1,672,615, June 5. CH₃HgCl by reaction with thiosalicylic acid in alc. and in the presence of NaOH yields methylmercurithiosalicylic acid which is a white solid m. about 171° and sol. in alc. and ether, forming a Na salt by reaction with NaHCO₃ or NaOH. Its K salt, alkyl-ammonium salts and Ca and other alk. earth salts also are referred to. Methylmercuric hydroxide also may be used as a starting material, as may also other compds. such as the ethylmercuric, propylmercuric, butylmercuric, amylmercuric or allylmercuric salts or hydroxides or their isomers, and, instead of thiosalicylic acid there may be used: thioglycollic acid, *p*-mercaptophenylacetic acid, *p*-mercaptobenzenesulfonic acid, *β*-mercaptopropionic acid, *α*-mercaptobutyric acid and cysteine. Among the products mentioned or described are: ethylmercuri-*p*-sulfobenzenesulfonic acid, a white solid, not melting up to 300°, and its salts; ethylmercurithiosalicylic acid, m. about 110°; ethylmercuri-*m*-sulfobenzoic acid, m. about 105°; isoamylmercuri-*β*-sulfopropionic acid, m. (decompn.) about 215°; isoamylmercuricysteine hydrochloride, m. about 95°; allylmercuricysteine hydrochloride, m. (decompn.) about 93°; methylmercuri-*α*-sulfobutyric acid, m. about 73°; allylmercuri-*p*-sulfobenzenesulfonic acid, not melting up to about 300°; methylmercurithioglycollic acid, m. about 87°; ethylmercurithioglycollic acid, m. about 79°; propylmercurithioglycollic acid, m. about 73°; butylmercurithioglycollic acid, m. about 68°; ethylmercuri-*β*-sulfopropionic acid; butylmercuri-*α*-sulfopropionic acid; ethylmercuri-*α*-sulfobutyric acid; butylmercuri-*α*-sulfobutyric acid; ethylmercuricysteine hydrochloride; butylmercuricysteine hydrochloride; ethylmercurisulfosuccinic acid; butylmercurithiosalicylic acid; ethylmercuri-*m*-sulfobenzoic acid; butylmercuri-*m*-sulfobenzoic acid; ethylmercuri-*p*-sulfobenzoic acid; butylmercuri-*p*-sulfobenzoic acid; isoamylmercuri-*p*-sulfobenzoic acid; ethylmercuri-*p*-sulfophenylacetic acid; methylmercuri-*p*-sulfobenzenesulfonic acid; allylmercurithiosalicylic acid; ethylmercuri-*p*-sulfoalicylic acid; and butylmercuri-*p*-sulfoalicylic acid. These compds.

possess *germicidal properties* and some of their salts are suitable for intravenous injection as *therapeutic agents*.

Synthetic drugs and dye intermediates. BRITISH DYESTUFFS CORP., LTD., G. M. DYSON, F. A. MASON and A. RENSHAW. Brit. 278,037, May 25, 1926. Carbazides and thiocarbazides of the naphthalene series are obtained by the action of phosgene or thiophosgene on hydrazines such as those which may be obtained by condensing nitro-arylolefinic-carboxylic acid chlorides, nitroaryl fatty acid chlorides, nitroacyl chlorides, nitroarylsulfo chlorides, nitronaphthoyl chlorides, nitronaphthalene sulfo chlorides or their substitution products with naphthylaminesulfonic acids or their substitution products, followed by reduction of the nitro group, diazotization and further reduction. Before diazotization, the amino compds. formed by the first reduction may be again condensed with nitroacidyl halides and reduced, and this process may be repeated several times if desired, before converting into the hydroazines by diazotization and reduction. Numerous examples are given. The products may be used as therapeutic agents for the destruction of blood parasites or as intermediates for the manuf. of dyes.

Denicotinizing tobacco. T. SCHLOESING. U. S. 1,671,250, May 29. A mixt. of steam and gaseous NH_3 is circulated through tobacco in a closed system, nicotine is removed from a condensate which is formed and the mixt. is repeatedly used. An app. is described.

Paper handkerchief treated with glycerol, ammonia and hydrogen peroxide. H. CHONLA. U. S. 1,672,803, June 5.

18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

Ammonia synthesis with electrically heated wire catalysts. W. FLÖRKE. *Z. physik. chem. Unterrichts*, 39, 283 (1926), cf. *Ibid* 80-1.-A simple expt. showing $\text{N}_2 + 3\text{H}_2 \rightarrow 2\text{NH}_3$ is described. M. BEBER

Ammonia synthesis by means of catalysts. H. VALENTIN. *Z. physik. Chem. Unterrichts* 40, 271-2 (1927).—Ammonia prepared according to method of Florke (cf. preceding abstract) is formed by reduction of traces of N_2O . N_2 freed from the N_2O forms no NH_3 after $1/2$ hr. M. BEBER

Causticization of sodium carbonate by ferric oxide. XI. Heat of solution of sodium carbonate. MOTORARO MATSUI, SUKEO NAKATA, KENICHI AKIYAMA and KATASHI HIRO. *J. Soc. Chem. Ind. (Japan)* 31, 140-7, Suppl. binding 53-6B (In English) (1928).—The heat of soln. of Na_2CO_3 in water was measured by means of a const.-temp. calorimeter with an elec. heating device, and was found to be: Na_2CO_3 [solid] + H_2O [1000 mol] = Na_2CO_3 [aq] + 5606.7 ± 22.1 cal. at 25° . S. O.

Chemistry and technology of zirconium oxide. HANS TRAPP. *Chem.-Ztg.* 52, 365-6 (1928).—Zr is sepd. best from SiO_2 , Fe_2O_3 , TiO_2 , etc., by fractional crystn. of its (a) double alkali oxalates (especially NH_4) or (b) double sulfates. General directions for such sepn. are given. For making Zr products technically the process of Lench ($\text{ZrOCl}_2 \rightarrow \text{ZrO}_2 \cdot 0.4\text{SO}_3$ aq) is not as desirable as that of the German patent 434,987, according to which $2\text{ZrO}_2 \cdot 3\text{SO}_3 \cdot 3\text{H}_2\text{O}$ is made. This sulfate is said to be more stable than others with either a higher Zr or SO_3 content. As a second phase of the process the above sulfate is hydrolyzed in dil. soln., yielding ZrO_2 . W. C. E.

The technology of water-glass manufacture. M. VON REIBOLDT. *Chem.-Ztg.* 52, 345-6 (1928).—A general discussion of the construction and operation of a 15-ton water-glass plant. W. C. EBAUGH

Lead and zinc pigments and salts in 1925. J. A. STADER and A. STOLL. *Bur. Mines, Mineral Resources of the U. S. 1925*, Pt. 1, 149-56 (preprint No. 10, published December 29, 1926). E. H.

Lead and zinc pigments and salts in 1926. A. STOLL. *Bur. Mines, Mineral Resources of the U. S. 1926*, Pt. 1, 217-26 (preprint No. 13, published December 22, 1927). E. H.

Gypsum in 1926. R. M. SANTMYERS and JEFFERSON MIDDLETON. *Bur. Mines, Mineral Resources of the U. S. 1926*, Pt. II, 141-50, (preprint No. 13, published November 10, 1927). E. H.

Separation of potassium sulfate from crude potassium ferricyanide by crystallization. V. P. IL'INSKII and N. P. LAPIN. *Trans. State Inst. Applied Chem. (Moscow)* 1927, No. 5, 8-17.— K_2SO_4 is the principal impurity of technical $\text{K}_3\text{Fe}(\text{CN})_6$ obtained by calcination of animal matter with K_2CO_3 and Fe. Technical $\text{K}_3\text{Fe}(\text{CN})_6$, sometimes

contains up to 10% of this impurity, which is due to oxidation of the S of org. matter, and also contains a little chloride and carbonate. The only practical method of purifying this $K_4Fe(CN)_6$ is by crystn. from H_2O . The dissolved system $K_4Fe(CN)_6$ - K_2SO_4 is found to be remarkable in this respect that the line of sepn. of crystn. fields is almost a straight line parallel to the axis of abscissas; this circumstance is particularly favorable to the sepn. of the 2 salts. Tables of solubilities of mixts. of $K_4Fe(CN)_6$ and K_2SO_4 at 25°, at 40°, at 55° and at the b. p. temps. are shown. If the admixt. of K_2SO_4 is small, the recommendation is to sep. it by cooling the satd. soln. of the 2 salts made at high temp. If the proportion of K_2SO_4 is large, it is necessary to allow it first to cool moderately, then sep. the part of K_2SO_4 which crystallizes and finally cool the satd. soln. for the sepn. of $K_4Fe(CN)_6$.

BERNARD NELSON

Separation of aluminum salts from iron by recrystallization. S. ZABICKI. *Przemysl Chem.* 12, 77-90(1928).—A critical review of patents from 1878 to 1922 on processes for freeing aluminum ammonium alum from Fe is given. A method of doing this by recrystn. without the use of any reagents is described. An 86% yield of alum is obtained with an Fe_2O_3 content of only 0.002% after two recrystns. The effect of the no. of recrystns. on the purity of the product is shown graphically. It is found economically expedient to work with solns. of 65-68% concn. The rate of cooling and of stirring must be adjusted to produce small crystals (0.1-0.2 mm.), as larger crystals contain more impurity. The electrolytic method may be used for further purification of alum down to 0.004% Fe_2O_3 (cf. Wasilewski and Mantel, *C. A.* 22, 1915).

A. C. Z.

Graphite. ANDRÉ DUBOSC. *Caoutchouc & gutta-percha* 25, 13930-1(1928); cf. *C. A.* 22, 1217.—The characteristics of graphite from various localities are described.

C. C. DAVIS

Graphite in 1926. JEFFERSON MIDDLETON. *Bur. Mines, Mineral Resources of the U. S.* 1926, Pt. II, 91-7 (preprint No. 8, published October 17, 1927).

E. H.

Sulfur and motive power in Sicily. GIULIO BUOGO. *Giorn. chim. ind. applicata* 10, 131-5(1928).—One of the causes of the economic position of the Sicilian S industry is the limited distribution and uneconomical production of energy. It is proposed to abandon present methods and establish a uniform system of power supply, a scheme of which is described in detail, with calcns. of its efficiency. In brief, the S is fused in autoclaves with simultaneous production of motive power. To this end steam is generated at 25-30 atm. pressure to drive turbines for elec. and mech. power, the exhaust steam heating the autoclaves contg. the S. ore.

C. C. DAVIS

Preparation of carbon from carbon monoxide. F. WAUGENHEIM. *Brennstoff-Chem.* 8, 385-8(1927).—An attempt was made to prepare pure C by passing CO over a pure Fe_2O_3 catalyzer at temps. under 650°. The reduced Fe was removed from the prepd. C by vaporization in a current of Cl. The recovered C was not entirely iron-free, but it was non-magnetic. It was a good conductor of electricity.

J. D. D.

Preparation of pure carbon at low temperatures. F. FISCHER AND P. DITTHEY. *Brennstoff-Chemie* 8, 388-91(1927); 9, 24-30(1928).—C is prepd. by passing CO with H_2 (see preceding abstract) over reduced alkalized Fe_2O_3 at temps. around 500°. The catalyst is prepd. by moistening 10 g. Fe_2O_3 with 1 cc. water glass + 15 cc. H_2O and painting this on an iron spiral made from a strip of Knepp soft sheet 70 cm. × 4 cm. This was heated in an Al retort similar to that used for low temp. assay of coal, the preheated supply gas passing in at the bottom and out at the top of the retort chamber. A contact mass of this size (active Fe 6.8 g. Fe_2O_3) will take gas at about 40 l. per hr. and give 47% of the theoretical yield of C. The yield falls off in time, possibly because of conversion of active Fe_3C into higher inactive carbides. S is a contact poison; both the gas and iron used must be free from S. A used contact mass could be repeatedly regenerated by dipping into 5 N KOH. The optimum temp. for CO reduction was 480° to 490°, and the optimum ratio CO: H_2 3:1. An app. is shown for moderately large-scale work in which the C formed can be renewed continuously. The form of C recovered was investigated by x-ray and chem. methods but no definite conclusion was reached. Its reactivity was found to be high. This, however, diminished on removal of Fe.

J. D. DAVIS

Annual review for 1927 of progress in the manufacture of plastic materials with casein and similar albumoids as a base. OTTO MANFRED. *Caoutchouc & gutta-percha* 25, 13978-9(1928).—Patented processes are reviewed, with a bibliography of new publications.

C. C. DAVIS

Chemical technology of artificial horn. OTTO MANFRED. *Caoutchouc & gutta-percha* 25, 13904-5, 13940-4(1928); cf. *C. A.* 22, 1018.—Various app. and equipment are described, with diagrams and patent references.

C. C. DAVIS

Protection against fire in the chemical industry. RAYMOND DELABY. *Chimie et industrie* 19, 754-64(1928).—A general discussion of fire hazards in the chem. industry and of the precautions to be taken to minimize them. A. PAPINEAU-COUTURE

Use of carbon tetrachloride as a fire extinguisher. LUCIEN MAUGÉ. *Industrie chimique* 15, 186-9(1928).—A brief review of its properties from the standpoint of its use as fire extinguisher. A. PAPINEAU-COUTURE

CRIVELLI, E. L'industria chimico-metallurgica del solfato di rame e le miscele cupriche fungicide ed anticrittogamiche. Milan: Ulrico Hoepli, Editore Libraio della Real Casa. 321 pp. L. 35. Reviewed in *Chem. Trade J.* 82, 507(1928).

Phosphoric acid and hydrogen from phosphorus and steam. E. URBAIN. *Brit.* 278,578, Dec. 7, 1926. P vapors are mixed with HCl (which serves as a catalyst) and steam and the mixt. is passed over carbonaceous material maintained at about 350°; or, the P may first be adsorbed and the material then treated with HCl and steam. HBr or HI also may be used as catalysts. H_3PO_4 is obtained by washing the carbonaceous material.

Sulfur dioxide and sulfuric acid. R. VON ZELEWSKI. *Brit.* 277,382, Sept. 13, 1926. In producing sulfurous gas suitable for use in H_2SO_4 manuf., by roasting sulfide ores or other suitable S-bearing materials in a Dwight-Lloyd or similar app., in which the materials are passed in an even thin layer through a heating zone, air under pressure is forced though the material from above. The resulting gases may enter the Glover tower without cooling.

Carbon dioxide. P. E. HAYNES. *Brit.* 277,938, Sept. 27, 1926. $CaCO_3$ is passed through a furnace-heated retort in countercurrent to a stream of steam. Waste heat from the furnace is used to generate steam under pressure which drives a compressor to liquefy the CO_2 produced and the exhaust steam is used in the process. An app. and various details are described.

Carbon dioxide. B. LUNDIN. *Brit.* 278,304, Sept. 28, 1926. Solid $NaHCO_3$ is fed into an aq. soln. of $NaHSO_4$ in an app. which is described and the gas-outlet of which is provided with a pump or compressor to regulate the pressure at which the CO_2 generated is discharged. The app. may be lined with Pb or formed of rustless Fe, and steam may be used to remove air from the gas-generating chamber. Na_2SO_4 may be recovered from the residual soln. by crystn.

Reduction of alkali salts of chromic acid. R. CASPARI. *Can.* 277,173, January 17, 1928. Alkali metal salts of CrO_3 are heated in aq. soln. with carbohydrates at temps. above 110°.

Recovery of alkali iodide by absorption of the iodine. NAAMLOOZE VENNOOTSCHAP MIJNBOUW EN HANDELSMAATSCHAPPIJ "SOEMMER ASSIN". *Dutch* 17,807, March 15, 1928. Iodine is recovered from I-contg. water by absorption on starch and treatment of the starch by the calcd. amt. of soln. of alkali sulfite and carbonate or hydroxide and subsequently washing it with water.

Alumina, etc. J. C. SEAILLES. *Brit.* 277,697, Sept. 18, 1926. A hydrated alk. earth aluminate is made by treating a mixt. of pulverized halogenated ore of Al with an alk. earth base in the presence of water and is converted into Na aluminate by addn. of Na_2CO_3 or Na_2SO_4 ; alumina may then be prepd. by pptn. with CO_2 .

Alumina free from iron. HEINRICH SPECKETER (to I. G. Farbenind. A.-G.). U. S. 1,672,788, June 5. A mixt. comprising $AlCl_3$ and $FeCl_3$ such as is obtained by treating potter's earth with HCl is heated with sufficient water to effect hydrolysis of the $AlCl_3$ to form alumina and in the presence of a reducing gas such as H_2S capable of preventing the oxidation of the $FeCl_3$, at a temp. (suitably about 300° or somewhat higher) which will effect the hydrolysis but will not decomp. or volatilize the $FeCl_3$ and the latter is then selectively dissolved out of the resulting mass.

Antimony pentasulfide. H. NUHS and L. H. BLOOD (to Antimony Products Corp.). U. S. 1,671,203, May 29. Steam is employed to atomize a soln. of thioantimoniate and an acid gas such as SO_2 .

Alkali metal cyanides. C. P. DAVIS and G. B. FROST (to American Cyanamid Co.). U. S. 1,672,449, June 5. A carbonate such as Na_2CO_3 is heated in contact with HCN gas to progressively higher temps. (suitably about 200-500°) below the m. p. of the resulting mixt. but sufficiently high to convert most of the carbonate into cyanide. An app. is described.

Cyanides, etc. R. GOLDSCHMIDT and S. COULIER. *Brit.* 277,714, Sept. 20, 1928. Peat mixed with alkali, alk. earth or other metal compds. is subjected to wet or dry carbonization to form mixts. which on treatment at high temps. with N or NH_3 or

amines yield cyanides, cyanamides or nitrides and a residue of C having absorbent and decolorizing properties. Catalysts such as Fe, Mn, Cr, Ni or Co or their oxides may be present and substances for activating the C also may be added such as ZnCl_2 , ZnO , Mg phosphate or Ti compds. The nitrogenization may be effected under 1-2 atm. pressure at 950-1000° in a vertical or inclined furnace in the upper part of which the carbonization is effected. Brit. 277,715 specifies a similar process in which carbonized wood, spent malt, oil cake or the like may be used.

Cyanamide solution from calcium cyanamide. A. N. ERICKSON (to Union Carbide Co.). U. S. 1,671,183, May 29. A cyanamide soln. practically free from dicyanodiamide is obtained by treating Ca cyanamide with water and CO_2 while the temp. of the soln. is maintained sufficiently low (suitably about 10-20°) to prevent the formation of substantial quantities of dicyanodiamide while promoting the pptn. of substantially all the N as a carbonated lime-nitrogen compd., sepg. at least a portion of the water from the ppt. and moderately heating the residue in the presence of CO_2 to decompose the lime-nitrogen compd. into cyanamide and CaCO_3 and sepg. the latter. An app. is described.

Hydrogen peroxide, etc. OESTERREICHISCHE CHEMISCHE WERKE GES. Brit. 277,628, Sept. 16, 1926. Solns. of peroxides, peracids and persalts are rendered stable and suitable for use after diln. for bleaching straw, wool, felt or other materials by adding a substance which increases the stability and also substances which increase the activity; among the substances which may be used are: Na pyrophosphate, Na chloride, chlorinated hydrocarbons, and protective colloids such as Turkey red oil, waterglass or soap. H_2SO_4 or H_3PO_4 may be added to restore acidity.

Iron oxide catalyst. GEORGES CLAUDE (to Lazote, Inc.). U. S. 1,671,345, May 29. In forming a catalyst suitable for use in NH_3 synthesis, fused Fe oxide is heated upon a support contg. MgO , and MgO from the support is absorbed into the fused mass.

Lead carbonate. S. C. SMITH and CHEMICAL & METALLURGICAL CORP., LTD. Brit. 278,003, July 2, 1926. CO_2 is passed into a suspension of Pb chloride in a soln. of NH_3 at such a rate that it passes into the form of Pb carbonate as nearly as possible coincident with its introduction so that the presence of free CO_2 in the soln. is avoided so far as possible. Pb carbonate substantially free from Pb chloride is thus obtained.

Nitrates. B. F. HALVERSON. Can. 277,046, January 10, 1928. Solid products contg. $\text{Ca}(\text{NO}_3)_2$ and NaNO_3 are produced by evapg. a soln. of such nitrates, adding NH_4NO_3 to the product and cooling the mixt.

Zinc oxide. J. F. CREGAN. Can. 276,800, January 3, 1928. A body of Zn vapor at relatively high temp. is divided into a number of small streams and air is mixed with the streams, while the vapor is flowing through a restricted space, in vol. sufficient to oxidize all of the Zn vapor. The mixt. is then passed into a burning chamber to oxidize the Zn. Cf. C. A. 21, 2173.

Zinc and sodium sulfates. METALLBANK UND METALLURGISCHE GES. A.-G. Brit. 278,747, Oct. 7, 1926. A liquor contg. sulfates of Zn and Na is concd. until the content of Na_2SO_4 may be not more than a half g. mol. per kg. of liquor so that on cooling to 10-20° ZnSO_4 crystallizes free from Na. Excess Na_2SO_4 may be removed by cooling to 40-60° so that Na and Zn sulfates sep. as a double salt and the soln. then further treated as specified. The process may be applied to the liquor obtained by lixiviating chloridizing-roasted burnt sulfide ores after removal of Cu as insol. Cu_2Cl_2 by digestion with Cu and if desired removal of Fe and Co by lime and Zn dust. H_2SO_4 may be added to the soln.

Apparatus for drying and neutralizing ammonium salts, etc. F. BINSWANGER (to International Cement-Gun Co., Ges.). Brit. 277,652, Sept. 14, 1926.

Evaporating pan and associated scrapers for evaporating salt solutions. VEREINIGTE SCHWEIZERISCHE RHEINSALINEN. Brit. 277,639, Sept. 15, 1926.

Centrifugal process of forming globular sodium bisulfate from molten material. C. P. LINVILLE and C. E. MENSING (to Calco Chemical Co.). U. S. 1,671,866, May 29. An app. is described.

Active carbon. E. H. MEEZE (to J. S. Daniels). Brit. 277,987, Sept. 22, 1926. Wood, peat, lignite, brown coal, etc., is destructively distd. at reduced pressure in the presence of steam or inert gases or both or of oxidizing and other active gases; the C is then cooled and may be ground and treated with catalytic materials and subjected to another heat treatment. Various details are given and an app. is described. Compounds of Zn, Cd and Sn may be used as the catalysts, e. g., ZnCl_2 and CdCl_2 and ZnO with NH_4Cl . In the final heating, temps. up to 1000° may be used.

Dissolving aluminum from argillaceous materials. I. G. FARBENIND. A.-G. Brit. 278,370, Sept. 29, 1926. A mass of material such as clay, kaolin or bauxite which is

to be treated with HCl or other acid is kept covered with the acid in a stationary container throughout the treatment, and the supply of acid and outflow of soln. is regulated to maintain a temp. of $105\text{--}120^\circ$ in the reaction zone; the temp. increases from the top to the bottom of the charge.

Catalyst for producing hydrogen from carbon monoxide and steam. H. E. HEISLER (to Atmospheric Nitrogen Corp.). U. S. 1,672,528, June 5. A catalyst for producing H from CO and steam at temps. of $500\text{--}600^\circ$ consists of an oxide material contg. Fe as a major ingredient and K and Mn as minor ingredients. The catalyst may be formed from Fe, HNO_3 , magnesite and KMnO_4 and may be exposed to a temp. of 800° prior to its use.

Apparatus and system for separating nitrogen and carbon dioxide by compression and use of a selective solvent. H. BLAU. Brit. 278,712, Oct. 5, 1926. Sepn. of mixts. of hydrocarbon gases also is described.

Silica gel. E. B. MILLER and G. C. CONNOLLY (to Silica Gel Corp.). U. S. 1,672,768, June 5. In prepg. a hard high adsorbent silica gel, solns. of an acid and a silicate are mixed with gel "fines," with vigorous agitation, in such concns. and proportions that the liquid mixt., after a time, without pptn., sets to a hydrogel, and the latter is thereafter nearly dehydrated.

Filling for storing and transporting acetylene. J. POMMER. U. S. 1,672,688, June 5. A filling suitable for use with C_2H_2 dissolved in acetone consists of fritted and granulated punnee gravel which is placed in a pressure-resisting receptacle.

Treating phosphate rock. G. T. HARNED (to Phosphate Mining Co.). U. S. 1,671,765, May 29. Crude phosphate rock is calcined and while still hot is directly mixed with a proportion of wet rock to dry the latter and increase its percentage content of "bone phosphate of lime."

Phonograph records. F. G. MITCHELL. U. S. 1,671,437, May 29. A sheet of celluloid or similar material is coated with thermoplastic material, the materials are united under pressure and a record impression is formed in the coating. Cf. C. A. 22, 2037.

Phonograph records. F. E. SINCERE. U. S. 1,671,788, May 29. Inflexible fibrous material such as stiff paperboard is impregnated with a filling material, and immersed in a nitrocellulose soln., withdrawn and freed from surplus soln. and dried; this treatment may be repeated to obtain a coating of the desired thickness for sound records. ZnO and black pigments, etc., may be added.

Sound record. O. A. CHERRY (to Cutler-Hammer Mfg. Co.). U. S. 1,671,228, May 29. A sulfur-naphthalene resin is mixed with a waxy material such as ozokerite and with a suitable filler, and the mixt. is molded under pressure.

Diaphragms for acoustic instruments. T. B. SMITH. Brit. 277,908, May 20, 1927. Thin C diaphragms such as those of microphones are protected by a layer of Au, Ag or other metal foil adhering to the outer surface of the diaphragm by use of gelatin or other adhesive.

Phonograph needle. N. H. HOLLAND. U. S. 1,671,426, May 29. A wire is coated with a mixt. of beeswax 25, resin 25 and graphite 50%.

Composition for coating book cloth. H. V. DUNHAM. U. S. 1,671,856, May 29. A mixt. of casein 60, borax 10 and bentonite 30 parts is used to form a substantially transparent coating.

Adhesive. W. O. HERRMANN and W. HAEHNEL. Can. 277,169, January 17, 1928. An adhesive contains polymerized vinyl ester and softening materials.

Plastic composition. ALPHONS POLLER (to De Trev Bros., Ltd.). U. S. 1,672,776, June 5. A plastic compn. suitable for making dental impressions comprises rubber finely distributed in a reversible hydro-colloid obtained from mucilaginous vegetable matter such as "hai-thao" or "dschin-dschen" and substances such as resins, fats, fibers, etc.

Cold molding plastic composition. C. F. CHOSA (to Cutler-Hammer Mfg. Co.). U. S. 1,671,229, May 29. A compn. suitable for making molded articles is formed of Fe oxide 22, asbestos 1100, stearine pitch 100, a solidifiable oil such as castor oil 10, C_6H_6 or other solvent at least 25 and about 66 parts of a substance such as S which will act as a hardener under the influence of heat; the product is indurated by strong heat treatment (suitably at a temp. of about $95\text{--}260^\circ$). U. S. 1,671,230 relates to similar compns. in which stearine pitch and asphalt are used together.

Thermoplastic compositions for shoe toe stiffeners, etc. UNITED SHOE MACHINERY CORPORATION. Brit. 277,719, March 22, 1926. Thermoplastic stiffening compns. are rendered resilient by addn. of substances such as rubber or gutta percha. Various examples and formulas are given.

Friction material. I. J. NOVAK (to Raybestos Co.). U. S. 1,672,538, June 5. A friction material suitable for brake linings or clutch facings comprises an asbestos base with a binder of a phenolic condensation product and a "gum" such as rosin or other varnish gum. The phenolic condensation product remains in fusible form in the product as manufactured. U. S. 1,672,539 specifies satg. a preformed asbestos material with a waterproof binder such as gilsonite dispersed in an aq. vehicle so that the dispersed binder particles are smaller in size than the pores of the fibrous mass and have a negative elec. charge.

Friction material for brakes, etc. BRITISH DYESTUFFS CORPORATION, LTD., C. J. T. CRONSHAW, J. BADDILEY and E. CHAPMAN. Brit. 278,495, July 21, 1926. In order to counteract the effect of moisture on brakes, pulleys, etc., the surface is treated with water-sol protective colloids or wetting-out agents of the sulfonic acid class, which may be added to asbestos compns. or the like during their manuf. or may be subsequently applied. Several examples are given.

Stencil sheets. POLYGRAPHISCHE GES. Brit. 278,647, Oct. 8, 1926. A negative of the original is produced photographically on printing paper coated with a film of gelatin and having a Ag colloid layer; the negative is developed and together with its support is squeezed while wet onto a porous stencil sheet such as Japanese paper, and dried, the negative is then tanned with dichromate soln., the gelatin film is softened by pouring warm water onto the original paper support so that the latter can be removed, and the untanned parts are washed out.

Stencil sheets. A DE WAELE. Brit. 278,445, July 8, 1926. A coating for stencil sheets for use on duplicating devices comprises a gelatinizing org. colloid such as gelatin dispersed in water and a tempering agent consisting of a hydroxy fatty acid ester of a mono- or dihydric alc. such as the ricinoleic esters of ethyleneglycol, trimethyleneglycol or EtOH. Substances such as bentonite, a Ti pigment and sulfonated sperm oil also may be added to the compns.

Urea-formaldehyde condensation products. I. G. FARBENIND. A.-G. Brit. 278,698, Oct. 8, 1926. In effecting condensation as described in Brit. 258,289 (C. A. 21, 3109), materials capable of furnishing acids during the heat treatment required for hardening are added to the condensation products before the hardening. Among the substances which may be used are: $MgCl_2$, formic esters and formamide.

Printing surfaces and matrices formed of paper pulp or like material and synthetic resins. F. S. HOLE. Brit. 278,460, July 16, 1926. In prep. the impregnating material, substances such as $PhOH$ and CH_3O with a small quantity of alk. condensing agent such as KOH are boiled together and a strip of Al or a small quantity of H_2BO_3 may be added to increase the seething and indicate more clearly the end of the reaction when no more CH_3O is evolved. Cold water is then added and the mixt. is again boiled, and an aq. soln. of NH_4 chromate or dichromate and a small quantity of Cu hydroxide are added. Methylated spirits and glycerol and Ca chromate or borate may be added. Numerous other details are given.

Composition for preventing obscuration of windows by frost, rain or snow. K. DEUBEL. U. S. 1,672,604, June 5. Paraffin oil 3 grams, "kandabalsam" 3 g., xylene, toluene 3.5 g., melted celluloid 1 g., $EtOAc$ 1 oz., acetone 1 oz. and coloring material.

Compositions for cleaning and polishing metals. F. E. GENGE. Brit. 278,078, June 29, 1926. Pyridine is used in whole or in part to replace the usual cleansing substances in metal polishes which may also contain various mixts. of paraffin oil, oleic acid, NH_3 , oil of mirbane, Fe_2O_3 and kieselguhr or similar substances.

"Anti-slip" composition for coating tool handles. O. W. JARRED. U. S. 1,672,813, June 5. Beeswax 60, paraffin 30 and carnauba wax 5 parts are used with a solvent thinner such as naphtha or turpentine.

Oiled wiping paper for removing ink from printing plates. T. M. ROYAL. U. S. 1,671,612, May 29.

Ink eradicator for removing drawing inks. F. N. STEIGLEDER. U. S. 1,672,790, June 5. An alkali metal hypochlorite is used in water together with CO_2 and Cl water.

Dental cement. N. E. EBERLY (to S. S. White Dental Mfg. Co.). U. S. 1,671,104, May 29. In order to form a translucent cement with H_3PO_4 at room temp., 70-98% of a finely ground basic glass contg. Si and Al oxides fused together is mixed with 30-2% of finely ground calcined basic oxides such as ZnO or a mixt. of oxides of Zn, Mg and Bi. Cf. C. A. 21, 806.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON. C. H. KERR

The founding of the glass industry in Norway. P. R. SOLLIED. *Tids. Kemi Bergv* 7, 97-100, 116-9, 129-32, 142-4(1927).—Historical. C. A. ROBAK

The Hartman formula for the dispersion of glass. H. W. LEE. *Trans. Opt. Soc. (Brit.)* 28, 161(1927); *J. Soc. Glass Tech.* 11, 334A. D. F. SHARP

Stained glass of the Renaissance period. WALTER BUTTERWORTH. *Pottery Gazette* 53, 789-92(1928).—An historical sketch. R. A. HEINDL

Analysis of opal and alabaster glasses. J. D. CAUWOOD, J. H. DAVIDSON AND VIOLET DIMBLEBY. *J. Soc. Glass Tech.* 12, 7-16(1928).—The presence in these glasses of F, PO₄, Sn and Zr in addn. to the usual constituents makes necessary a few changes in their analysis. The qual. analysis should precede. (A) *F-contg. glasses, PO₄ absent.* Fuse 1 g. powd. sample in 5-6 g. Na₂CO₃ at low temps. to avoid volatilization of F. Ext. the resulting cake with hot H₂O, filter, wash and save the residue (ppt. A.) Nearly neutralize the filtrate contg. the alk. F with HCl, add 4-5 g. solid (NH₄)₂CO₃ and digest for several hrs. at about 40°. Filter the voluminous ppt., wash with warm H₂O and save (ppt. B). To remove slight amts. of SiO₂, evap. the filtrate to dryness, take up with H₂O and neutralize carefully with 2N HNO₃, using phenolphthalein, with repeated heating and acid addn. until less than 1 cc. acid is used to discharge the color. Ppt. the traces of SiO₂ with 2 cc Berzelius soln. (freshly pptd. Zn(OH)₂ dissolved in NH₄OH), filter, saving the residue as pptg. C. Neutralize the filtrate contg. all the F and then add 2 cc. of 1N Na₂CO₃ soln. Boil with an excess of CaCl₂. Filter the ppt. of CaF₂ and CaCO₃, wash and dry. Reject the filtrate. Transfer the ppt. to a Pt crucible and ash the paper separately. Heat the crucible slowly to dull redness. Add dil. HOAc to dissolve the CaCO₃ and CaO, digest, evap. to dryness, faintly acidify with dil. HOAc and filter off the CaF₂. Dry, ignite gently after separately ashing the paper. Moisten with H₂SO₄, evap. and ignite to const. wt. as CaSO₄. The other constituents are detd. in the reserved ppts. A, B, and C and the filtrate from the CaF₂ residue. (B) *Phosphate glasses. Fluorine absent.* The usual fusion in Na₂CO₃ is followed by soln. in HNO₃ and evapn. to remove the SiO₂. The final washing of the SiO₂ consists of warm dil. NH₄OH to remove contaminations of PO₄. This filtrate is evapd. separately to recover the SiO₂ dissolved, taken up in dil. HNO₃ and filtered. The combined SiO₂ ppts. are ignited and treated with HF and HNO₃. The HNO₃ soln. contg. the constituents other than SiO₂ is analyzed as usual. PO₄ is detd. directly as phosphomolybdate or sepd. from the soln. as Ag₃PO₄ by the addn. of solid Ag₂CO₃. The PO₄ content may be detd. in a fresh sample opened up by HF and HNO₃. (C) *Glasses contg. both F and PO₄.* The outline for F-contg. glasses is followed until the PO₄ must be removed from the SiO₂ filtrate, as Ag₃PO₄. F is detd. in the filtrate from the AgCl ppt. representing the excess Ag reagent used. (D) *Milky glasses contg. Cl or SO₄.* The usual detn. in the Na₂CO₃ fusion soln. is used. (E) *Alabaster glasses.* Similar procedures are used since the opacifying constituents are the same, but present in smaller quantities. (F) *Very dense white opal glasses contg. SnO₂.* Fuse as before, taking up the residue in HNO₃. Evap. to dryness twice, filter off SiO₂ and SnO₂, treat with HF and HNO₃, and ignite. Fuse the Sn-contg. residue with Na₂CO₃, take up in HCl and det. Sn by the usual means. H. F. K.

Analysis of opal glasses. W. SINGLETON AND R. C. CHIRNSIDE. *J. Soc. Glass Tech.* 12, 18-24(1928).—With glasses having less than 5% F the ordinary SiO₂ detn. is sufficiently accurate for general work, Pb can best be removed from the SiO₂ filtrate by H₂S in a faintly acid soln. and is converted to PbSO₄ for weighing. Al₂O₃, Fe₂O₃, CaO and MgO are detd. as usual. No difficulty was observed in the Zn sepn. or detn. Zn and Pb interfere with the B₂O₃ detn. while F up to 5% does not. Zr was detd. as PO₄ and Ti alone interferes. As is sepd. from the filtrate of SiO₂ and Pb by H₂S and is detd. volumetrically. F is sepd. as CaF₂ and the alkalis are found by the J. L. Smith method. H. F. K.

Three fundamental principles of ceramics. H. H. STEPHENSON. *Trans. Ceram. Soc. (Eng.)* 26, 21-2(1928).—Accepting the term thixotropy for the phenomenon Freundlich observed while agitating and thus liquifying Al(OH)₃ and Fe(OH)₃ colloids, S. sets forth as fundamental these three principles: (a) The chemistry of glazes deals with finished reactions while reactions in bodies are arrested reactions. (b) The conduct of a pottery body under and after heat is a function of the SiO₂ inversion.

(c) Clay is a thixotrope; its properties are altered by mechanical treatment. Credit is given to Mellor, Le Chatelier, and the author, resp. H. F. K.

Ceramic processes with special reference to heating practice. S. R. HIND. *Fuel Econ. Rev.* 6, 53-65(1927).—A review. E. H.

Characterization of clay. A. F. JOSEPH. *Trans. Ceram. Soc. (Eng.)* 27, 1-5 (1928); cf. C. A. 22, 1021.—Attention is called to the progress made in the classification and characterization of clays and heavy soils by soil scientists. Several soils and 12 ceramic clays were sepd. by alk. deflocculation and elutriation into sizes between 0.2 and 0.02 mm., 0.02 and 0.002 mm., and the "true clay" fraction 0.002 mm. and zero. In place of a mechanical measure of plasticity the detn. of "imbibitional H_2O " capacity is used. This capacity is the moisture equiv. as detd. by centrifuging a wet clay sample for 40 min. at 1000 gravities less the interstitial space measured under similar conditions of draining with an inactive liquid like xylene. The partial chem. analyses of 9 clays of widely different plasticities are given to indicate that plasticity and related properties increase with the SiO_2/Al_2O_3 ratio of the "true clay" fraction. J. believes that all "true clay" can be dispersed to true colloidal size if flocculating conditions and tendencies are minimized. H. F. K.

Effects of temperature on the mechanical properties of silica products. A. J. DALE and A. SCOTT. *Trans. Ceram. Soc. (Eng.)* 27, 23-59(1928); cf. C. A. 22, 1661.—A modified Mellor and Moore load test was made on $3.5 \times 2 \times 2$ -in. test pieces of refractories contg. over 92% SiO_2 . A const. temp. rise of 50° per 5 min. was used. The degree of SiO_2 conversion and the homogeneity of conversion were found highly important. The higher the load the less the low-temp. and high-temp. local expansions; also the lower the temp. at which vertical expansion ceases. The relation between ordinary refractoriness, porosity, or compn. and the behavior of SiO_2 bricks under stress at different temps is very indefinite. Mixing, making, heat history and especially the nature of the bond are factors of greater importance. The high temp. expansion is caused by the conversion of residual quartz to cristobalite, while the disintegration under high stress is due to weakness caused by the crystalline rearrangement of the conversion or to the internal stress associated with the change. Clay bondings up to 5% were successful when used with certain SiO_2 rocks, decreasing the disintegrating tendencies at both high and low temps. Lime bonding impeded the conversion rate but such brick had greater rigidity at high temps. With well-graded SiO_2 rock a lime-clay bond gives a moderately fired SiO_2 brick enough rigidity at high temps. to resist the high temp. conversion stress plus a considerable mechanical stress if the clayey material is not an excessive amount. When the probable thermal and mechanical conditions of use are known two modified Mellor and Moore tests (50 and 4 lb. per sq. in.) will suggest the fitness of brick for that purpose; also they suggest the precautions necessary to get the maximum service from the refractory. H. F. K.

Electromagnetic separators for the pottery trade. W. I. BOX. *Pottery Gazette* 53, 781 3(1928).—Removal of magnetic iron from dry and wet material by means of rotary and chute separators is described. R. A. HEINDL

Electrical pottery firing. B. J. MOORE and A. J. CAMPBELL. *Trans. Ceram. Soc. (Eng.)* 27, 12-9(1928).—Some notes are given on the construction and operation of the Moore and Campbell elec. enamel tunnel kiln. H. F. K.

Silica and magnesite bricks in metallurgical furnaces. GERHARD WOLFF. *Metal Ind. (N. Y.)* 25, 489 92(1927).—For silica brick the best material consists of quartzite with 0.5-1% Fe_2O_3 and less than 1.5% Al_2O_3 . The presence of more Al_2O_3 increases the porosity and decreases the softening point 125 - 175° for 2-6% Al_2O_3 . Fe_2O_3 acts as catalyst for the quartz-tridymite transformation. Silica and magnesite bricks are more sensitive to thermal shock than the other refractories used generally. Magnesite brick should contain 5-7% impurities, chiefly Fe_2O_3 to form $MgO.Fe_2O_3$ and the sintered condition. Methods used in the Pb, Cu, etc., metallurgical practices to protect the magnesite brick from sudden temp. change are described. H. F. KRIEGE

Refractories for brass-foundry furnaces. H. M. ST. JOHN. *Am. Foundrymen's Assocn.* 1928, 439-52.—This paper supplements a previous report by the Joint Comm. on Foundry Refractories—1926. The qualities required from the refractory structures depend upon the type of furnace and fuel used. The following list of furnaces and the refractory experience with each are discussed: crucible pit furnace using coke or hard coal; crucible pit furnace using gas or oil; open flame furnace using gas or oil; indirect arc electric furnace and induction electric furnace. J. W. BORCK

Open-hearth steel-works refractories. A. T. GREEN. *Trans. Ceram. Soc. (Eng.)* 27, 63-90(1928).—See C. A. 22, 1662. H. F. K.

Cupola refractories. J. G. A. SEERL. *Bull. Brit. Cast Iron Research Assoc.* 20,

18-21(1928).—The properties and care of refractory brick for cupola linings, the use of ganister for patching, and the making of monolithic linings are briefly outlined.

DOWNES SCHAAF

Ceramic materials resistant to cooking processes. FELIX SINGER. *Z. angew. Chem.* **40**, 1295-6(1927).—Recent improvements in stoneware have resulted in a product of low absorption, with resistance to thermal shock about equal to that of porcelain, while still suitable to be worked into large shapes.

Condition of field specimens of concrete exposed to alkaline soils and waters examined in December, 1927. C. J. MACKENZIE. *Eng. J. Can.* **1928**, Preprint.—This committee report contains the results of observations made on the action of alkali on 240 test specimens of concrete of various cements and aggregates partially buried in alkali soils in 1921 and finally examd. in 1927. The tests were carried out at Deacon, Man., Grandora, Sask., Cassils and Antelope Creek, Alta. Many of the specimens were subjected to special treatments or contained in the mix substances commercially

recommended to withstand alkali action. The results are in accord with field exposure tests obtained in other field investigations and very few new data have been acquired by these tests. A chem. analysis of the soil waters in which the specimens were buried and tables contg. the compn. of the test pieces and the observations made on the alkali action accompany the paper.

J. W. SHIPLEY

Relative resistance of various cements to the action of sulfate waters. T. THORVALDSON. *Eng. J. Can.* 1928, Preprint.—Neat cement bars of portland cement and of super-cement subjected to immersion in solns. of Na_2SO_4 and of MgOSO_4 expanded considerably and eventually cracked and fractured. Some of the cracks appeared on the edges of the bars within a year while large transverse cracks were observed in 2 yrs. time and at the end of 4 yrs. many of the bars had crumbled to pieces. Control tests in pure H_2O and other salt solns. showed no damage. The SO_4 content of the solid remaining material of the damaged bars was always found to be higher, sometimes almost twice as high, as that in the original cement. The fracture of field specimens exposed to alkali action in soils is attributed by T. to the uneven expansion caused by the absorption of sulfates near the surface of the ground. Rapid and extreme changes of temp. would also contribute to the disintegration. Concrete specimens prepd. from portland cement and super-cement and subjected to sulfate action in the lab. on the av. showed no difference in resistance. No distinction could be drawn between the behavior of the test pieces made from the 2 cements. Slag cements and natural cements showed a wide range in their resistance to sulfate action. As a rule concretes made from slag cements are more permeable and although showing high resistance in the lab. tests may fail during one season's exposure to field conditions. High alumina cements were found to be more resistant to SO_4 action in moderately rich mixes than any portland cement. Tension and compression tests give no indication of the sulfate resistance of a cement.

J. W. SHIPLEY

Requirements for a durable concrete as observed from structures in service. R. B. YOUNG. *Eng. J. Can.* 1928, Preprint.—A review of the knowledge and opinions held regarding the disintegration of concrete structures in sea water, alkali soils, fresh water and by mechanical agencies, vol. changes and by frost and crystn. Means of securing a durable concrete from cements and aggregates in common use are reviewed by Y. and examples of durable concrete structures given.

J. W. SHIPLEY

Some considerations in reinforced concrete. J. H. SOUTHERN. *Munic. Eng. Sanit. Record* 79, 253(1927).—A method of testing reinforced concrete beams or road slabs is described.

C. H. BADGER

Reinforced concrete with special reference to municipal and county engineers. EDDIE TASKER. *Munic. Eng. Sanit. Record* 79, 434-5(1927).—The concrete surface of a wall while still green may be brushed with a wire brush with water or a soln. of 1 part HCl to 6 parts of water until the surface cement is removed. This exposes the aggregate and gives relief to a flat surface. It is then washed with clean water. A sandblast surface can be obtained similar to that of a natural sandstone but more irregular due to the aggregate. Tooling is a more costly process. The color of sand particularly affects the finished colored concrete. The aggregate, usually not exposed, has little effect. The pigments added should be fast. There should be no greasy material present to prevent the bond between the steel and the cement, and no material which would reduce the tensile strength. Ordinary round mild steel bars appear the best to use; specially shaped bars are not often economical.

C. H. BADGER

Why concrete in the industrial plant? J. C. WITT. *Industrial Power* 1928, May, 63 5.—The developments and demands of industry, the characteristics of concrete, and plant facilities for concrete work account for the increasing use of concrete around industrial plants. The desirable qualities of the material include relatively low cost, availability, hardness, resistance to abrasion, and chem. inertness to most substances.

J. C. WITT

Painting of plasters and cements (GILES, *et al.*) 26.

BAUER, EDWARD E.: **Highway Materials.** New York: McGraw-Hill Book Co. Reviewed in *Rock Products* 31, 49(1928).

Coloring cement or other building materials. G. N. WHITE. *Brit.* 277,380, March 8, 1928. Cement, plaster, lime, asbestos and the like are colored with vat dyes or coloring agents which may be used dry or in suspension, *e. g.*, in colloidal soln. The coloring materials may be ground or a soln. of the leuco compd. may be oxidized in the presence of a dispersing agent. Several examples are given.

Composition for treating floors of magnesite cement and similar materials. R. DE WOLF. Brit. 277,444, June 24, 1926. A mixt. of American spindle oil with a small proportion of an aniline color is rubbed into the floor to prevent cracking and to lay dust.

Curing concrete. R. B. GAGE. U. S. 1,672,380, June 5. After placement of concrete, its surface is temporarily covered with a non-absorbent bituminous felt until even curing is effected.

Expansion joints for concrete roads, etc. D. L. IRWIN AND RUBBEROID CO., LTD. Brit. 277,513, Oct. 9, 1926. Expansion joints are formed of granulated cork or other resilient material bound by asphalt or like material and molded into strips or slabs with a high percentage of voids.

Bituminous material for use on roads. COLAS KALTASPHALT GES. Brit. 277,356, Sept. 9, 1926. Bituminous emulsions with only a small proportion of emulsifier, such as are described in Brit. 202,021 (C. A. 18, 326) are rendered suitable for coating aggregate for macadamized roads by adding substances such as glycerol or other polyhydroxy alc., a light mineral oil or a salt which increases the viscosity of the emulsion and retards its tendency to disruption on being mixed with the aggregate.

Bituminous material for roads. VERKAUFSVEREINIGUNG FÜR TEERERZEUGNISSE GES. Brit. 278,679, Oct. 7, 1926. Tar or tar oil is subjected to mild oxidation before mixing with stone, e. g., by heating at 150° with 5% of HNO₃ or by use of chromic acid, KMnO₄, H₂O₂ or air. The oxidized tar or tar oil may be mixed with petroleum residues or natural bitumens.

Bituminous paving material. O. H. BERGER (to W. P. McDonald Construction Co.). U. S. 1,672,361, June 5. A compn. suitable for cold laying when mixed with aggregate is composed of hard asphalt having a penetration not substantially in excess of 1 at a temp. of about 46°, 100 g., 5 sec., and a "fresh oil" flux contg. a substantial proportion of light volatiles. Cf. C. A. 21, 3115.

Bituminous pavement. J. W. FRAZIER (to Uvalde Rock Asphalt Co.). U. S. 1,672,408, June 5. Crushed rock and mineral particles such as sand are heated and coated with a thin film of asphaltic oil, mixed with about 10% by vol. of pulverized rock asphalt and the mixt. is agitated and further mixed at a temp. of about 1450°.

Impregnating unpaved roads. R. LICHTENSTERN. U. S. 1,671,218, May 29. A layer of material insol. in water and impervious to oil is formed in the road, e. g., by reaction of a naphthenic soap with a Ca compd., and an oily dust-binding medium is then applied.

Magnesitic artificial stone. R. H. ALLISON (to Royal Muralite Corp.). U. S. 1,672,293, June 5. Portland cement, calcined American magnesite, pulverized alum and silica are mixed in dry form and a soln. of water, H₂SO₄, MgCl₂ and a pigment is added.

Building and insulating material. P. A. BECH. Can. 277,217, January 17, 1928. A building and insulating material is made by mixing sawdust, wood chips, etc., with cement and Ca oxychloride, in dry condition, and then adding H₂O.

Cellular building blocks formed of gypsum compositions, etc. H. S. ASHENHURST (to Insulux Corp.). U. S. 1,671,216, May 29. Structural features.

Felted waterproof sheet material. L. KIRSCHBAUM. U. S. 1,672,262, June 5. Sheets suitable for roofing comprise wood or grass fiber or other fibrous material with an asphalt binder coating the fibers in the form of a substantially continuous film contg. a dispersing agent such as colloidal clay. In forming the sheet, the fibers are felted in the presence of the binder. Cf. C. A. 21, 1526.

Heat-exchange cylinder adapted for drying felt roofing, etc. J. W. OLTMAN (to Barrett Co.). U. S. 1,672,036, June 5.

Roofing tiles. A. E. E. CROCKOW. Brit. 278,592, March 26, 1927. Asbestos cement tiles are provided with a surface to promote growth of vegetation by facing them with materials such as sand, brick, dust or kiln dust.

Roofing, etc., formed with impregnated paper sheets and a core of asphaltic composition. T. ROBINSON (to International Copperclad Co.). Brit. 278,691, Oct. 5, 1926. Mech. features.

Composition floors, roofs or walls. W. K. NELSON. U. S. 1,671,995, June 5. A cast layer of porous material such as a gypsum compn. carries a thin coating of pitch and paraffin or other suitable water-repelling agent and a surface layer of portland cement or the like all united in a monolithic construction.

Floor covering. I. J. NOVAK (to Raybestos Co.). U. S. 1,672,537, June 5. A base sheet may be formed from a mixt. of chrome leather shavings 30, cotton or jute 70, wood flour or cork 125, coloring pigments 50, wax tailings 500, clay 250, Na silicate 50 and alum 80 parts, emulsified with water and sheeted in the same manner as paper.

stock. This base sheet may be united with a surface sheet similarly formed and which may be composed of chrome leather shavings 60, cotton or jute 40, wood flour or cork 125, coloring pigments 50, a linseed oil and copal varnish 500, clay 200, Na silicate 50 and alum 70 parts, also emulsified with water before sheeting.

Plaster. L. E. CHASSEVENT. U. S. 1,672,638, June 5. See Brit. 266,335 (C. A. 22, 491).

Plaster. C. IMMERHEISER, F. KNEBEL and H. SCHAUDER. Can. 276,833, January 3, 1928. An inorg. filler of scaly structure is incorporated with a cellulose plastic to produce a high-grade plaster.

Thin wood veneers impregnated with paraffin or the like and stamped with ornamental patterns. J. BRÜNING & SOHN A.-G. Brit. 278,699, Oct. 5, 1926

Wood preservation. L. P. CURTIN. Can. 277,103, January 17, 1928. Wood is impregnated with an aq. soln. contg. H_2O -sol. components capable of reacting, on exposure to the atm., to deposit $\text{Zn}(\text{AsO}_3)_2$ within the body of the wood. Cf. C. A. 21, 3726.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

The buying and selling of industrial fuel on a calorific value basis. A. H. TIS-
SINGTON. *Fuel Econ. Rev.* 6, 11-6 (1927). E. H.

Preparation of coal for the market and its purchase on a basis of the calorific value.
F. S. SINNATT. *Fuel Econ. Rev.* 6, 9-11 (1927) E. H.

Coal treatment and its effect on atmospheric pollution. J. S. OWENS. *Fuel Econ. Rev.* 6, 75-81 (1927).—A review. E. H.

Revision of thermic values. V. P. IZHEVSKII. *Ukrainskii Khim. Zhurnal* 1, tech. part, 29-39 (1925).—A review of the modern technic in utilization and economy of fuels and combustibles. G. B. KISTAKOWSKY

A rapid method for the determination of moisture in solid and liquid fuels. J. TAUSS AND H. RUMM. *Gas u. Wasserfach* 71, 417-20 (1928).—A new distn. method for detg. moisture in fuels is described which uses $\text{C}_2\text{H}_2\text{Cl}_4$ in a special app., permitting the rapid and easy sepn. and measurement of the water distd. over with the $\text{C}_2\text{H}_2\text{Cl}_4$. About 50 g. sample is used and this is covered with about 150 cc. $\text{C}_2\text{H}_2\text{Cl}_4$. It is only necessary to distil over 20 to 40 cc. of the $\text{C}_2\text{H}_2\text{Cl}_4$. Comparative moistures for coals were detd. by this method and by drying at 110° for two hours. The results for the new method were distinctly higher, but corresponded very closely with the moisture content obtained by drying in a vacuum at 60° to const. wt. Detns. may be carried out in 15 to 20 min. $\text{C}_2\text{H}_2\text{Cl}_4$ is not inflammable so that danger of fires occurring from breakage of app. is avoided. R. W. RYAN

Notes on the Franz Fischer low-temperature coal assay method. HEMPEL. *Brennstoff-Chem.* 9, 3-6 (1928).—The method (C. A. 20, 658) is said to give high tar yields with moist coal. H. finds the increase not greater than 0.4% when his modification of the method is used. This consists in warming the combined water and tar distillate in a bath at 70° , whereby the tar is completely melted and can be sepd. from the water. J. D. DAVIS

A comparison between the German and Dutch methods for determination of volatile matter in coal. D. J. W. KREYLEN. *Brennstoff Chem.* 9, 2-3 (1928).—German chemists use the Bochumer method, Dutch chemists the American. In the former case dried coal is used, in the latter "air-dried." K. compares the methods using "air-dried" samples of 8 different coals and finds that the Bochumer method gives results from 0.4 to 0.7% low. J. D. DAVIS

Comparative study of coal. G. A. BRENDER A BRANDIS AND J. C. VLUGTER. *Het Gas* 48, 183-6 (1928).—The Bauer method (Litinsky variation, *Messstechnik* 185 (1926)) for detn. of gas, tar, NH_3 , C_6H_6 , yield of coal, etc., by distn. is unreliable for several reasons. The authors use for the purpose of evaluation of important coal qualities a quartz tube (30 cm. long) open on both ends, filled for 10 cm. with 5 g. dry coal and for another 10 cm. with fireclay granules. These parts of the tube are heated in a Fletcher oven to 900° (thermocouple). A second quartz tube filled with cotton wool is ground to the first joint (just inside the oven) and serves for tar removal. The gas is collected over acid water satd. with CO_2 and H_2S . Calorific values (Union calorimeter) and compn. of the gas, (C_2H_2 , C_2H_4 and C_2H_6 sep. by Tauber method) are detd. The coke is weighed in the first quartz tube. The distn. takes 40 min. The app. is filled with H_2 initially. A table of analytical data: ash, volatile matter, coke yield, heating

value of gas per cu.m. and per ton of coal is given for 7 coal species (Bismarck nut, Constantin der Grosse nut, Barrow double nut, South Yorkshire nut, Emma semi-bituminous, German bituminous, cannel coal).

B. J. C. VAN DER HOEVEN

The ash content of brown coal. F. FISCHER AND W. FUCHS. *Brennstoff-Chem.* 8, 291-3(1927).—Cassel brown was extd. with EtOH-C₆H₆ soln. 1:1 to remove bitumens; the residue was then treated with 2 N NaOH, which dissolved the humic acids. On pptn. of these with dil. HCl it was found that they contained approx. as much ash as the original coal (10%). Further investigation showed that the original ash was mainly Ca, combined with the tetrabasic humic acids which apparently had a mol. wt. of 1400. The Ca could be replaced by Fe, Al, K or Na. Water could be softened by the sodium humates.

J. D. DAVIS

Growth of mold fungi on coals. F. FISCHER AND W. FUCHS. *Brennstoff-Chem.* 8, 231-3, 293-5(1927).—Molds of the genus *Penicilium* were found to propagate on Cassel brown, Union and Ilse briquets both in the raw state and after extn. with EtOH-C₆H₆ soln. Growth was favored by a nutrient soln. consisting of 2 l. H₂O, 50 g. (NH₄)₂SO₄, 1.5 g. K₂HPO₄, 1.5 g. MgSO₄ and several g. NaCl. Further work showed growth (slower) on bituminous coal and even on semi-coke. The presence of undecomposed cellulose was therefore not essential to propagation. Several other varieties of fungi (*Aspergillus*, *Mucor* and *budding fungus*), also bacteria were grown on coals both under aerobic and anaerobic conditions. Gases and humic acids were formed in the growth process, this being one of oxidation of the coal substance.

J. D. DAVIS

Some characteristics of colliery surface and mine waters. N. SIMPKIN. *J. Soc. Chem. Ind.* 47, 114-6T(1928).—S. briefly surveys the waters available at collieries.

J. A. KENNEDY

The flow of heat through furnace hearths. J. D. KELLER. *Fuels and Furnaces* 6, 743-56(1928).

E. H.

Heat transfer in heating tubes. WERNER EICKMANN. *Arch. Warmewirt.* 9, 5-8 (1928).—Tests were made on a two-pass waste heat boiler in use, only the flue gases being measured. The water temp. was about 180°; the gas temp. 220-400° at the inlet, 190-320° at the outlet, the velocity of the gases (*w*) 1.5 to 23.2 m. per sec. The formula derived was: $k = 98 \times 10^{-10} d^{0.4} + 88w/d$, where *k* is the heat transfer in kg. cal per sq. m. per hr. per degree, and *d* the temp. difference between gas and water.

ERNEST W. THIELE

Fuel briquets in 1926. F. G. TRYON. *Bur. Mines, Mineral Resources of the U. S.* 1926, Pt. II, 1-8(preprint No. 1, published June 20, 1927).

E. H.

The turbo-burner. ALBERT HERBERHOLZ. *Arch. Warmewirt.* 9, 15-6(1928).—The Eickworth gas burner is described. The entering gas turns the vanes of a fan which sucks in the air. Tests show that the burner holds the CO₂ const. over a wide range of combustion rates.

ERNEST W. THIELE

The Bergius process for liquid fuels. H. W. STRONG. *Chem. Eng. Mining Rev.* 19, 449-50(1927).—A good brief description of the Bergius process, describing the raw materials, app., procedure, products, yields, etc.

ALDEN H. EMERY

Chemical decomposition of sphagnum by pressure hydrogenation. H. I. WATERMAN AND J. N. PERQUIN. *Brennstoff-Chem.* 9, 57-9(1928).—Earlier work (C. A. 20, 3560; 21, 1705, 4062) showed that pressure hydrogenation of cellulose at 450° converted the most of it into oil. Sphagnum moss was now treated and likewise converted mostly into oil. Parallel tests were made and material balances obtained. As in the berginization of bituminous coal, oils apparently entirely fluid at first contained visible colloidal ppts after several days' standing. The colloids were of asphaltic character. It is important in berginization to keep colloids dispersed by suitable oil media (e. g., Edelnau-extract). Otherwise, they will be pptd. on the container walls and form coke which is resistant to hydrogenation.

J. D. DAVIS

Conversion of methane into hydrogen and carbon monoxide. F. FISCHER AND H. TROPSCH. *Brennstoff-Chem.* 9, 39-46(1928).—Mixts. of methane with CO₂ and methane with coke-oven gas and coke-oven gas with water vapor were decomposed by various catalysts (Fe, Co, Ni, Cu, Mo and W) supported on clay, silica and MgCO₃ or mixed with Al₂O₃. Temps. 840 to 920° were used with various space velocities (throughput in cc. per hr. divided by catalyst vol. in cc.); the best space velocity for decompn. of oven gas-steam mixts. was 800. In no case was CH₄ completely decomposed. An example of good conversion of an oven gas-CO₂ mixt. at 860° is given by the following analyses of original gas and the products, resp.: CO₂ 18.0, 1.4%; heavy hydrocarbons 1.0, 0.0; O₂ 1.7, 0.2; CO 5.1, 33.2; H₂ 41.7, 56.6; CH₄ 19.0, 1.4; N₂ 12.9, 7.2. The catalyst was Ni supported on silica. Fe, Cu, Mo and W were poor catalysts. Co proved as good as Ni, contrary to the literature. Activity of Ni and

Co was increased by addn. of Al_2O_3 . Clay proved best as a carrier for active metals.

Producer gas. A. T. GRISENTHWAITE. *Fuel Econ. Rev.* 6, 26-9(1927).—A review for 1926. J. D. DAVIS
E. H.

Gas-producer operation. VICTOR WINDETT. *Proc. Eng. Soc. West. Penn.* 44, 11-46(1928).—W. reviews the operation of a Wellman-Seaver-Morgan Type L mech. gas producer, over a period of 2 yrs., compiling thorough records of gasification performance. The following data, among others, are of especial interest. Coal analysis: moisture 1.54, volatile 34.57, fixed C 55.63, S (in volatile) 1.06, ash 8.26. Ultimate analysis: C 76.31, H 4.97, O 7.89, N 1.51, S 1.06, 14,155 B. t. u. at 62° F. Av. gas analysis: CO 25.0, CH_4 2.27, C_2H_4 0.87, H_2 14.49, CO_2 4.69, O_2 less than 0.14, N_2 56.68, B. t. u. 153.9, air temp. 123.4° F., gas temp. 1395° F. Tables indicate only slight seasonal effect on operation, radiation representing only 4% of the total heat. The air blast temp. for max. calorific value of the gas (174 B. t. u. at 62° F.) was 125° F. and the gas temp. range from 1250° to 1450°, with a max. at 1390° representing 162.3 B. t. u. Rise in temp. above this point gives a slight rise in CO and decrease in CO_2 and a marked decrease in H_2 . Tables of heat balances show an operating efficiency of 88.3% for hot, raw gas and 69.64% for cold, washed gas. Discussion of the paper before the society is included. A. S. CARTER

A combined boiler and producer plant. CHARLES LONGENECKER. *Blast Furnace & Steel Plant* 16, 642-5(1928).—At the Sharon (Pa.) Steel Hoop Co., the 2 boilers and 4 producers are all housed under one centrally located roof, simplifying their care and operation. Labor and coal-handling costs have been cut. W. H. BOYNTON

The effect on the gas-making value of gas oil of its previous use for the removal of naphthalene from coal gas. H. H. THOMAS. *Gas J.* 182, 538-40(1928).—The spent oil may be used in the water-gas plant with results inferior to those from new oil. This is recommended as the most economical method for its disposal. The flash point must be detd. and new oil added to bring it above 72° F. F. S. GRANGER

Dry purification at the Berlin-Tegel gas works. CRONACHER. *Gas u. Wasserfach* 71, 390-1(1928).—Purifier practice is discussed. R. W. RYAN

Activity of purification oxide. S. DE JONG. *Het Gas* 48, 195-201(1928).—A review. B. J. C. VAN DER HOEVEN

Carbon-sulfur complex and carbon disulfide formation. W. J. HUFF AND J. C. HOLTZ. *Ind. Eng. Chem.* 20, 226(1927).—Polemical (cf. *C. A.* 22, 1228) H. L. O.

Variation of viscosity of tars with temperature. H. SPIERS. *Brennstoff-Chem.* 9, 77-9(1928).—Controversial with Mallison and Soltau (*C. A.* 22, 494) as to whether the formula $\log(C_1/C_2 = K(T_2 - T_1))$ proposed by S. (*C. A.* 21, 4052) gives the true relation between temp. and viscosity of tars. J. D. DAVIS

Review of coke-oven technology in 1926. G. F. FOXWELL. *Fuel Econ. Rev.* 6, 23-6(1927). E. H.

High-temperature carbonization in 1926. E. V. EVANS. *Fuel Econ. Rev.* 6, 18-23(1927).—A review. E. H.

Low-temperature carbonization. C. H. LANDER. *Fuel Econ. Rev.* 6, 16-8(1927).—A review. E. H.

Study of elements in coal carbonization. F. M. REITER. *Blast Furnace & Steel Plant* 16, 635-7(1928).—The distribution of the elements in the substances formed by distn. is outlined in tabular form and discussed. W. H. BOYNTON

Low-temperature carbonization. F. SCHWERS. *Chimie et industrie* 19, 583-8(1928).—A brief description of the installations and performances of Salerni low-temp. carbonization retorts at the Gand plant of the Centrales Electriques des Flandres (in a steam-elec. central power station using a high-volatile, caking coal), in the Zagreb district of Tzchecoslovakia (for the carbonization of a moist xyloid lignite), and at Resiutta (Frioul), Northern Italy (for the treatment of highly bituminous shale), bringing out particularly the attention which must be given to apparently insignificant details in order to obtain successful and efficient operation. A. PAPINEAU-COUTURE

The coking quality of bituminous coal and its determination. R. KATTWINKEL. *Teer u. Bitumen* 26, 245-7(1928).—A bibliographical review and discussion. In general, neither the total bitumen nor volatile is a criterion of the sintering quality on coking. This is associated, rather, with certain portions of the bitumen which are extd. by various solvents. With their extn. the coal loses its sintering ability, which it regains when they are returned to it. For detn. of relative coking quality, the Meurice method is recommended. One g. of powd. coal is coked with 17 g. of sand, and the crushing strength of the resulting cake is detd. by a suitable machine. K.'s app. for this purpose is described. F. S. GRANGER

The laboratory method for determination of yields of coke and by-products from coal. K. BRÜGGEMANN. *Brennstoff-Chem.* 9, 59-61(1928).—The lab. method involving 15-25 g. of sample proposed by Muschenbone (*C. A.* 21, 3122) is criticized. This method if carefully applied will give yields of coke gas and NH_3 agreeing closely with plant practice, but is very unreliable for detn. of tar and light oils. This is because coke oven heating conditions cannot be closely simulated in the small-scale test and, furthermore, accurate estn. of the very small amts. of tar and light oils recovered is impossible. J. D. DAVIS

The carburite process. FELIX BRAUNEIS. *Montan. Rundschau* 20, 253-6(1928).—The carburite process is a low-temp. distn. process for lignite and bituminous coals either yielding "carburite" when broken off after the exothermic decompn. of coal around 350° or "carburite coke" when continued to a more completely coked state of the coal. The coke has 200 to 400 Cal higher heating value than the carburite; the latter has 15 to 20% volatile, 6000 to 7500 Cal. heating value. The carburite tar is a low-temp. tar. The process consists of a preliminary drying out to 10 to 20% water and subsequent carbonization in a vertical shaft furnace externally heated by producer gas and continuously run. Figures are given on costs of a carburite plant using lignite with 50% water and on the probable yields. B. J. C. VAN DER HOEVEN

Color and free acid in coke-oven ammonium sulfate. H. SCHRAMM. *Brennstoff-Chem.* 9, 46-7(1928).—Color in the sulfate is caused mainly by metal carbonates, sulfides, and cyanides formed by corrosion of pipes leading to the saturator. These ppt. and mix with the salt when this is neutralized. Pyridine and amine compds. also contribute color. Free acid in the salt is best neutralized by gaseous NH_3 . J. D. DAVIS

Dry quenching of coke. WALTER SEYNNHAUSER. *Iron & Steel Eng.* 5, 184 9(1928).—A brief illus. description of the Sulzer system of dry quenching. Losses of sensible heat resulting from wet quenching are pointed out and the following advantages claimed for dry quenching: (1) steam generation from heat otherwise wasted, (2) better quality coke demanding a high price, (3) sometimes greater income due to higher proportion of coarse coke, (4) advantages in blast-furnace producer and water-gas plant operation, (5) reduction in transportation cost due to lower water content, and (6) reduction in maintenance costs, due to absence of wet corrosive quenching vapors. At present there are 12 plants in operation and 2 under construction. Discussion tended to discount some of the claims for dry quenching, as applied to American blast furnace practice, due to the usual addn. of some water in the furnace charge. W. H. B.

The firing of smelters from a central producer-gas plant (WEIDMANN) 9. Geology and oil and gas prospects of northeastern Colorado (MATHER, *et al.*) 8. Fuel requirements in iron and steel production (EVANS) 9. CH_4 and other hydrocarbons (as fuel in internal-combustion engines) (Brit. pat. 278,745) 10. Apparatus for separating benzene and water (U. S. pat. 1,671,115) 1. Apparatus and method for testing the tensile strength of gas mantles (U. S. pat. 1,672,077) 1.

Distilling solid fuels in permeable layers by use of gases and steam. M. KULZINSKI. Brit. 278,740, Oct. 7, 1926. The hot gases circulate in a direction transverse to that of the movement of the fuel and are reheated before reentering the fuel; the distn. products and heating gases are passed from one cross-section of the fuel to the next in a heating chamber or tunnel.

"Fuel saver" composition for sprinkling on fuel. A. CIVIER. Brit. 277,864, Feb. 28, 1927. Water 30, NaCl 30, tallow 1 and waste thick machine oil 1 part are boiled together repeatedly and water 70 parts are then added.

Fuel for internal-combustion engines. E. G. E. MEYER. U. S. 1,671,158, May 29. Hydrocarbon fuels are mixed with ether and with a highly volatile basic material such as NH_3 . Cf. *C. A.* 22, 1671.

Liquid fuel. I. G. FARBERIND. A.-G. Brit. 278,341, Nov. 5, 1925. Alcs. such as MeOH are mixed with products, consisting mainly of liquid hydrocarbons, obtained by the destructive hydrogenation of coals, tars, or mineral oils, etc. *Gasoline or C_6H_6 may be added, or the destructive hydrogenation product may be added to various fuels to lower their f. p. and reduce knocking. Cf. C. A. 21, 3448.

Liquid fuel from coal and oil. F. LAMPLOUGH and A. E. HODGSON. Brit. 277,419, June 15, 1926. Finely divided coal is intimately mixed with a heavy mineral oil such as an asphaltic fuel oil and the mixt. is heated to 400–500° under pressure (suitably 100–600 lbs. per sq. in.) to prevent vaporization; undissolved ash may be sepd. by settling and the liquid product may be used as fuel or may be distd. to sep. hydrocarbon fractions. Superheated steam may be admitted to the material during the settling stage. An app. is described.

Liquid hydrocarbon. F. WINKLER, R. WIETZEL and E. LINCKH. Can. 276,832, January 3, 1928. Liquid hydrocarbons, of low b. p., are produced by subjecting carbonaceous materials to pyrogenic decompn. with H_2O vapor. The resulting gases contg. olefins are exposed to heat in the absence of materials giving rise to the sepn. of C.

Distilling coal with superheated steam. SYNTHETIC AMMONIA & NITRATES, LTD. AND R. E. SLADE. Brit. 278,577, Feb. 21, 1927. The dirty steam from the retort is cooled only to a temp. well above its dew point by oil or other suitable scrubbing agent in a packed tower so as to sep. oil without condensing the steam. The residual steam is directly used as a source of heat for generating fresh steam or may be compressed and superheated for reuse.

Destructive hydrogenation of coal, tar, etc. A. L. H. SPILKER, C. ZERBE AND GES. FÜR TREERVERWERTUNG. Brit. 277,974, Sept. 23, 1926. Materials such as coal, tar, pitch or hydrocarbons are cracked and hydrogenated by treatment with H in the presence of a small quantity of I or material capable of yielding I or HI at the temp. of the process (e. g., FeI_2 may be used). Temps. of 200–500° or higher and pressures of 50–200 atm. may be used. Examples are given of the hydrogenation of crude $C_{10}H_8$ and coal-tar pitch.

Carbonizing and gasifying powdered coal. W. E. TRENT (to Trent Process Corp.). Brit. 277,660, Sept. 14, 1926. Carbonized coke particles are obtained by slowly heating pulverized coal to below its fusion point to promote a max. evolution of volatiles before a fusion temp. is reached, and then raising the temp. without causing agglomeration of the particles. Heating flues or heating rods may extend through the charge of material and air or steam may be supplied for gasification, or the powd. coke obtained may be gasified in a sep. producer. An app. is described.

Utilizing anthracite coal dust and like fuels in steam boiler and gas-producer furnaces. F. G. BREYER (one-half to J. A. Singmaster). U. S. 1,672,405, June 5. Fuel for use on continuous travelling grates is formed by loosely compressing the fuel dust into adhering particles which are fed directly to the furnace. An app. is described.

Fuel of coal dispersed in oil. W. E. TRENT (to Trent Process Corp.). Brit. 277,659, Sept. 14, 1926. Finely divided coal may be mixed with benzene, alc. or a petroleum oil and heated to about 400° under pressure while agitated.

Retort construction for low-temperature distillation of coal, etc. D. BRETHERICK and G. J. GLOSSOP. Brit. 277,819, Jan. 5, 1927.

Vertical retort apparatus for distilling comminuted wood, peat, coal or similar materials. F. E. HOBSON and J. F. SHELTON. U. S. 1,672,860, June 5.

Retort (with superposed annular carbonizing chambers) for carbonizing coal or similar materials. J. PLASSMANN. U. S. 1,671,448, May 29.

Conversion of carbonaceous substances. C. KARUCH and M. PIER. Can. 276,834, January 3, 1928. Carbonaceous liquids are converted into more valuable compds. by subjecting such liquids to a heat treatment in the presence of catalysts, and passing the resulting products in the vapor state and under a high pressure over catalysts.

Apparatus for cracking, catalyzing and hydrogenating carbonaceous materials. A. E. BIANCHI and G. GUARDABASSI. Brit. 277,404, June 8, 1926. An app. for treating oils, tar, naphtha, schists, ground coal and like materials at atm. pressure comprises a series of heated troughs provided with agitators for agitating material passing through the troughs; the latter are also provided with reticulated screens from which chains depend which may be vibrated by the revolving agitators. The chains and other parts of the app. contacting with the vapors may be coated with a catalyst such as reduced Ni, MgO, Fe oxide, Cu oxide or other suitable metal oxide mixed with silicate jelly or Ni oxide or nitrate or powd. glass may be incorporated with a suitable varnish or thin gummy substance. Various other structural details are described. The process is particularly adapted for carrying out the process of Brit. 278,041, according to which

the chains serve to retain in the reaction chamber dust and C formed by decompn. of vapors of the carbonaceous materials under treatment, and H may be used for hydrogenating with N_2 as a catalyst or removal of H may be effected by a catalyst such as Mg or Fe oxide.

Distributing valve for heating and distilling carbonaceous materials by gas currents. L. MOURGEON. Brit. 277,726, May 21, 1926. Structural features.

Apparatus for supplying oxygen to combustion chambers. A. O. HIGGINBOTHAM. U. S. 1,672,316, June 5.

Combustion apparatus for supplying a continuous stream of combustion gases. H. JEZLER. Brit. 277,957, Sept. 23, 1926.

Heating air supplied to furnaces by mixing it with hot combustion products of the furnace. W. H. BADAMS and J. FORGAN-POTTS. Brit. 278,549, Dec. 10, 1926. An app. is described.

Gas. A. E. BOURCOUD. Can. 276,732, January 3, 1928. In the production of a highly combustible gas, atomized carbonaceous fuel is gasified by suspending it in an oxidizing gaseous medium contg. a higher concn. of O_2 than air and also contg. H_2O in atomized form, the concn. of atomized carbonaceous fuel in the commingled suspension being substantially equal to the theoretical amt. of C which would be required to convert all of the O_2 present in either free or combined form into CO.

Gas. A. E. BOURCOUD. Can. 276,733, January 3, 1928. Atomized carbonaceous fuel is gasified to form a reducing gaseous mixt. by bringing such atomized fuel into intimate contact with a blast of air at normal temp. to form a suspension of such fuel in the air. The suspension thus formed is sent into a reaction chamber contg. air enriched with O_2 , such air being preheated to a temp. sufficient to supply the necessary heat to take care of radiation and other losses to enable the desired endothermic reaction to take place with a max. production of CO and a min. production of CO_2 .

Gas making. H. R. BERRY. U. S. 1,672,052, June 5. One of 2 beds of solid fuel is brought to incandescence by an air blast and the heat thus produced is utilized for distg. volatiles from the fuel of the second bed; the volatiles thus produced are conducted away from the combustion zone of the first bed, the air blast into the first bed is discontinued and, with air excluded, steam is delivered together with the distd. volatiles mentioned into the first fuel bed to produce a combustible gas. An app. is described.

Gas-making apparatus. WOODALL-DUCKHAM (1920), LTD., E. W. SMITH and T. C. FINLAYSON. Brit. 278,486, Aug. 25, 1926. Duplicated app. is provided for treating with liquor the gases generated in each retort of a plant comprising a plurality of continuously operated retorts, one or more of which may be used for the production of water gas as described in Brit. 253,702 (C. A. 21, 2552). Various structural details are described.

Carbureted water gas. C. W. ANDREWS. U. S. 1,672,109, June 5. In producing mixed carbureted water gas and coal gas, carbonized residue is air-blasted to heat it, the blast gases are carried off through a heat-absorbing structure surrounding a coking retort, steam is passed into the heated residue to generate hot water gas, the latter is further heated in the structure heated by the blast gases, and the hot water gas is passed through coal in a sep. coking retort to coke and distil coal in the retort; enriching material is added to the mixed water gas and coal gas and the mixt. of gases is passed through a cracking and fixing chamber at a temp. to effect efficient cracking of the enriching medium, which may be tar or oil. An app. is described.

Scrubbing gas. SOC. DU GAZ DE PARIS. Brit. 278,700, Oct. 11, 1926. Successively to remove HCN and H_2S by a mixt. of a ferrous salt soln. and milk of lime, the treatment is carried out in 2 stages and liquid for the second stage is intermittently regenerated by exposure to air. Fe_2O_3 and S are formed and may be sepd. as required.

Recovery of sulfuric acid from waste acids. Firm of C. STILL. Brit. 277,619, Sept. 20, 1926. Material such as acid tar obtained in purifying benzene with H_2SO_4 is heated with a concd. soln. of $(NH_4)_2SO_4$; residual benzenoid hydrocarbons are vaporized and resins sep. out as a floating fused mass which on cooling hardens into a cake which can be removed. The sulfate liquor contg. the H_2SO_4 is used in an NH_3 saturator to form $(NH_4)_2SO_4$. The sepd. resins may be admixed with coal tar to increase its pitchy content or may be distd. together with coal.

Coking coal to obtain an improved tar. S. W. PARR and T. E. LAYNG (to Urbans Coke Corp.). Brit. 277,955, Sept. 21, 1926. An improved tar contg. a high proportion of cresylic and tar acids is obtained from coal which is first heated close to the crit. temp. at which it becomes plastic (about 300°) and then heated so that it

passes quickly through the pasty stage and up to a temp. of 650–850°. An app. is described. Cf. C. A. 22, 156.

Calcing coke. V. C. DOERSCHUK and F. C. FRARY (to Aluminum Co. of America). U. S. 1,671,673, May 29. In a continuous process for calcing a large vol. of coke, a vertical column of coke of elongated cross-section is passed downwardly and an intermediate portion of the column is heated by passing an elec. current through it in the direction of its major axis. An app. is described. Cf. C. A. 22, 1286.

Coke-oven construction and operation. J. BECKER and J. VAN ACKEREN (to Koppers Co.). Brit. 278,012, Sept. 27, 1926. During the charging of high-chambered regenerative coke ovens, forced draft is applied to the gas or smoke offtake on both sides of each charge which is entering an oven and pressure above that of the atm. is maintained in the gas collecting system of the battery of ovens. Various other details of operation and construction are described.

Coke-oven or retort door construction. STETTINER CHAMOTTE A.-G. VORM. DIDIER. Brit. 278,269, April 9, 1927.

Firing system for heating coke ovens and like apparatus. H. KOPPERS (to Koppers Development Corp.). U. S. 1,671,194, May 29.

Retort oven construction. H. KOPPERS (to Koppers Development Corp.). U. S. 1,671,195, May 29.

Apparatus for removing coke from vertical retorts. F. J. WEST and E. WEST. U. S. 1,672,442, June 5.

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

F. M. ROGERS

A brief quality survey of California natural gasoline on the basis of Engler curves. R. W. GARMAN. *Petroleum World (Los Angeles)* 12, No. 12, 146–7, 152, 154, 156, 158, 160 (1927); cf. C. A. 22, 681.—Report of Specifications Committee of California Natural Gasoline Association. M. B. HART

Unusual type of crude oil found in Wyoming. H. L. KAUFFMAN. *Oil Weekly* 48, No. 13, 108, 110 (1928).—Simpson Ridge (Wyo.) crude oil has the characteristics of Gulf-Coastal crude, having 22° gravity (A. P. I.). A 15,000-cc. fire and steam distn. gave the following results: gasoline blending naphtha (47.2° A. P. I.) 3.6%; gas oil (29.9° A. P. I.) 27.2%; lubricating oil (22.9° A. P. I.) 48.6%; bottoms (15.2° A. P. I.) 20.0%. M. B. HART

Handling Winkler County crude oil. GEORGE REID. *Refiner Natural Gasoline Mfr.* 7, No. 3, 92, 94 (1928).—Winkler County (West Texas) crude oil is no more corrosive or difficult to handle than Smackover or Panhandle crude oils. Straight-run gasoline is acid treated with 8–10 lbs. 66° H₂SO₄ per bbl. Pressure distillate is treated with 10 lbs. 66° H₂SO₄, neutralized with caustic and charged to the rerun still battery. Anhydrous ammonia is introduced into the vapor line to render the gasoline slightly alk. and the gasoline so treated is given a 4° Bé. caustic wash to finish. The gasoline from the Liberty Oil Co. plant is 53° A. P. I. and is treated by a caustic wash and doctor treatment. At the Chalmette Petroleum Corp. plant 16° caustic is charged to the stills with the crude oil. M. B. HART

The composition of products obtained by the petroleum synthesis. F. FISCHER AND H. TROPSCH. *Brennstoff-Chem.* 9, 21–4 (1928).—The compn. of gases (gasols) varied with the catalyst and conditions of the expt. A gas obtained with a Fe-Cu catalyst showed the following compn. by condensation analysis: C₂H₄ 42.5, C₃H₆ 19.5, C₄H₁₀ 2.0, C₂H₂ 6.0, C₄H₂ 21.0, and C₄H₆ 9.0%. Benzene, b. 60° to 185°, recovered by adsorption in active charcoal and steaming out at 250° contained 30% paraffins, for the most part octane, nonane, and isononane, which were positively identified. The remaining 70% of the benzene were olefins. There were no diolefins present. Heavier products were examd. only for unsatn. by the Wijs I method. The degree of satn. could be varied by varying the catalyst or exptl. conditions; e. g., doubling the gas space-velocity increased the unsatn. of the oil 3 times. Water-sol. oxygenated products (aldehyde and acetone) amounted to 2% of total products recovered. There was no trace of compds. of ring structure found. All products could be converted into paraffins by hydrogenation in contact with Ni. The mechanism of the catalytic petroleum synthesis is discussed. J. D. DAVIS

Clays—and their application in refining. GEO. W. CUPITT, JR. *Refiner Natural Gasoline Mfr.* 7, No. 4, 69–71 (1928).—A discussion of the general practice in burning,

testing, and regenerating fuller's earth. The use of magnesite in distn. of oil produced a clear oil having a lower Conradson carbon content, a fine lace formed by steaming, and a S content about $1/2$ that of oil distd. without the use of clay. The action appears to be an actual prevention of discoloration perhaps by the action of CO_2 formed.

Flash system aids cracking operation. C. O. WILLSON. *Oil & Gas J.* **26**, No. 47, 140-1(1928).—The Dubbs process is applied at the Derby Oil Co.'s Wichita plant so that a flash still is positioned to receive residuum from the reaction chamber. Yields claimed are gasoline 10%, fuel oil 32%, coke 1%, loss 8-9%.

M. B. HART

Cracking investigation by the Dubbs process by distillation of Hannover petroleum. RICHARD HEINZE. *Petroleum Z.* **24**, 237-41(1928).—Gas oil (gr. 0.846) from a normal distn. of Hannover crude, and a 50% (by vol.) residue (gr. 0.968) from the same crude were cracked by the Dubbs process at various pressures.

M. B. HART

Simplification of oil-testing procedures. H. SCHLÜTER. *Chem.-Ztg.* **52**, 367 (1928).—The use of measuring bulbs for the Engler viscometer with two marks ("to contain" and "to-deliver") is recommended, and changes in the wording of the official (German) directions are suggested. Such vessels could be used both for calibrating and making actual tests with viscometers.

W. C. EBAUGH

Fluorescence of low-temperature distillation products of oil shales. W. WITTLICH. *Brennstoff-Chem.* **8**, 309-10(1927).—Oils distd. from Estonian and Manchurian shales were dild. with CaH_2 and studied for fluorescent colors under light from a quartz lamp. Characteristic differences were observed. One Estonian distillate gave colors, light bluish green mixed with violet changing to light blue (like benzidine); another gave grayish violet (first light, then dark) to blue, then light green. Manchurian oil was first grayish violet changing to bluish violet, to violet then blue and finally greenish blue. Phenols, neutral oils, carboxylic acids and light oils sep'd from the crudes also gave characteristic colors. With all the higher fractions (up to 500) the color was blue in various shades.

M. B. HART

Pressure of paraffin wax and other oil products at various temperatures and constant volume. L. SELSKII. *Azerbeydj Neft. Khos* **1928**, No. 4, 69-73.—In the thermodynamic equation $dt = [AT(\sigma - S)/S]dp$, t is temp., T absolute temp., p pressure, A thermic factor of work $1/426$, S latent heat of change from solid to liquid state, σ specific vol. of the liquid phase, S specific vol. of the solid phase of the melting material. For paraffin wax ($\sigma - S$) is positive, for water negative. Therefore, by increasing the pressure the m. p. is raised. Small increases in temp. increase the vols. greatly. This has been proved by the following expts. An autoclave to withstand a pressure up to 270 atm. was used. It was filled with paraffin wax and all air pockets were eliminated; the tube connecting the gage was filled with a semiliquid paraffin solar oil. For paraffin wax the following data were obtained. At 24°, pressure 0 atm.; 31°, 30 atm.; 38°, 140; 45°, 200; 46°, 250, 1.3% solid paraffin wax released; 55°, 270 atm., 1.58% semi-solid paraffin wax released; 59°, 250 atm., 1.44% semiliquid paraffin wax released; 63°, 250 atm., liquid paraffin released (1.6%); 65°, 260 atm., 1.7% released; 71°, 250 atm., 1.64% released; 86°, 250 atm., 1.75% released. After each release of paraffin wax the pressure dropped to 0. The temp. of the wax was measured with a thermometer inserted in a pocket in the autoclave filled with oil. The temp. in the autoclave was 2° below that of the water bath. Similar expts. were carried out with 2 parts by wt. of paraffin wax m. 54° and one part of gasoline d. 0.775 (the mixt. m. 45°); paraffin mazout f. p. 32°; semi-paraffin mazout f. p. 17°; kerosene d. 0.809. Check runs were made with H_2O up to 95.5°. Amara's table for H_2O agrees with this expt. only at lower temps.; this is probably due to defective app. used by S. for his expts.

A. A. BOERTLINGER

Transformer oils. MAURICE VAN RYSELBERGE. *Federation des industries chimiques de Belgique* 7, 149-78(1928).—A technical review with special reference to the artificial aging of oils. A. L. HENNE

Testing of the sludging tendencies of transformer oils. F. BEUVELOT. *Bull. soc. alsac. const. mécan.* 5, 60-76(1927); *Chimie et industrie* 19, 661(1928).—After a discussion of the constitution of transformer oils and the factor affecting the sludging test, B. recommends using an oil bath electrically heated to $150 \pm 0.2^\circ$, provided with a small agitator and covered with an atm. of CO_2 . It contains 3 receptacles (Union des Syndicats de l'Electricité type) each contg. 18 Pyrex tubes 15 mm. in diameter by 150 mm. deep and filled with oil to a depth of 105 mm. The sludge formed is detd. as usual. A. PAPINEAU-COUTURE

Continuous treatment of lubricating oils with ammonia for neutralizing. D. F. GERSTENBERGER. *Nat. Petroleum News* 20, No. 15, 111-2(1928).—In a continuous lubricating-oil-treating plant, heated oil and 16° acid are passed together through a mixing column and into the first of a series of agitators, oil from the first agitator overflowing into the next, while the acid settles into a cone at the bottom. The acid-treated oil is washed in the final agitator and ammonia is introduced and the oil blown bright. Where NaOH is used for neutralizing, a small amt. of oleic acid may be added to help break up any emulsion which may be formed. M. B. HART

Refining lubricating oils. P. TRUESDELL. *Nat. Petroleum News* 20, No. 16, 61-3(1928).—The Marland Refining Co.'s procedure in the manuf. of lubricating oils is described. M. B. HART

Notes on the dry distillation of lignin from beech, oak, and birch woods. G. SZELENYI AND A. GÖMÖRY. *Brennstoff-Chem.* 9, 73-7(1928).—Abundant data are found in the literature on distn. products yielded by lignins from soft woods such as pine, fir and aspen, but few are available on hard woods. The authors prepd. lignins from oak, birch and beech by first removing resins through extn. with $\text{EtOH}-\text{C}_6\text{H}_6$ and then hydrolyzing cellulose with HCl of 1.225 sp. gr. These were dry-distd. in Jena glass to 530° and the yields of products detd. The content of methoxyl was detd. for lignin and its distn. products, that recovered in the latter being about 10% of the total in the lignin which contained 15% methoxyl. Yields from the hard woods were all of the same order. Those from oak were 2.98, 1.29, 1.47, 0.21 and 53.0% resp. for tar, AcOH, MeOH, Me_2O and residue. Corresponding figures reported in the literature for fir lignin are: 13.33, 1.26, 0.83, 0.18 and 45.7. J. D. DAVIS

Critical study of the analysis of Bordeaux spirits of turpentine by the increase in temperature on mixing with sulfuric acid. (Miss) MARCELLE BARRAUD. *Bull. inst. pin* No. 47, 73-6(April 15, 1928); *Chimie et industrie* Special No. 565-7(April, 1928).—Excessive breakage of the flask due to the considerable rise in temp. can be avoided by using a small Dewar flask made of Pyrex glass. The rise obtained with freshly made spirits of turpentine and H_2SO_4 ($d_{18} 1.72$, contg. 79% H_2SO_4) is const. with products of the same origin, but increases very rapidly with aging of the turpentine (increased from 110.5° when freshly made to 142.5° after 30 days' exposure to the atm.). Addn. of 10% white spirit can therefore easily be passed unnoticed in the case of oxidized products. The first 20% fraction obtained on distg. spirits of turpentine gives a fairly const. rise, irrespective of whether or not the sample is oxidized, never falling below 113° , so that it can readily detect an addn. of as little as 2.5% white spirit, particularly when comparing the rise of the original sample and of the head fraction. The following increases were observed with pure products: spirits of turpentine consisting essentially of α - and β -pinene alone (*P. maritimus*, Aleppo pine, American turpentine, Austrian black pine) 115.5 - 116.5° ; spirits of turpentine consisting essentially of pinene and carene (*P. sylvestris*, *P. longifolia*) 108.5 - 110° ; redistd. terpinolene 86° ; spirits of turpentine consisting essentially of limonene (*P. pinea*) 91° ; redistd. Swedish pine oil 78° ; French pine oil 71.5° . A. PAPINEAU-COUTURE

The nature of the dextrorotatory constituent of the tail fraction of Bordeaux spirits of turpentine. G. DUPONT AND (Miss) M. BARRAUD. *Bull. inst. pin* No. 45, 76-7 (April 15, 1928); cf. D., C. A. 16, 4339-40.—The constituent is shown to be *d*-limonene, identification of which is complicated by the presence of a large proportion of dipentene. A. PAPINEAU-COUTURE

Geology and oil and gas prospects of northeastern Colorado (MATHER, et al.) 8. Desulfurizing action of SiO_2 gel and the failure of the lamp for determination of S in oils in the presence of mercaptans (WATERMAN, TUSSENBROEK) 7. Petroleum at Martinique (BARRABÉ) 8. Apparatus for distilling oils (Brit. pat. 277,952) 1. Filter for

gasoline (Brit. pat. 278,099) 1. Apparatus for cracking, catalyzing and hydrogenating carbonaceous materials (Brit. pat. 277,404) 21. Filter for oils (U. S. pat. 1,671,958) 1.

CROSS, ROY: **Handbook of Petroleum, Asphalt and Natural Gas.** Revised and enlarged. Kansas City, Mo.: Kansas City Testing Laboratory. 830 pp. Library ed. \$7.50; Pocket ed. \$10.

Cracking hydrocarbons. H. J. JANSEN. U. S. 1,672,459, June 5. The material to be cracked is passed in an extended horizontal path through molten Pb with an overlying layer of $ZnCl_2$; vapors and suspended C are sepd. from the materials. An app. is described.

Catalytic cracking of heavy hydrocarbons. F. ERLBACH (one-fourth to Sinclair Refining Co.). U. S. 1,671,573, May 29. Cracking is effected by heating to a cracking temp. in a still contg. a body of catalytic material such as activated C which extends across the still and divides the liquid body into 2 portions; liquid is withdrawn below the catalytic body and returned above it so that it circulates through the catalyst. An app. is described.

Cracking hydrocarbons by passing them through molten lead covered by molten zinc chloride. H. J. JANSEN. Brit. 278,235, Feb. 7, 1927. An app. is described in which the material treated passes horizontally through the molten metal. C formed is carried away with the other materials.

Cracking hydrocarbon oils. C. B. BUEGER (to Gulf Refining Co.). U. S. 1,672,801, June 5. In a cracking process in which pressure-still tar or residuum tends to clog the draw-off line, the latter is intermittently treated with a solvent such as gasoline or solvent naphtha which is forced through the line in reverse direction to that of usual flow. An app. is described.

Apparatus for cracking hydrocarbon oils. F. W. WELLMAN. U. S. 1,672,668, June 5. A vertical retort is provided with a discharge for taking off vapors near its top and with a draw-off for residuum and an oil supply at different points near its bottom, the connections to which may be reversed.

Apparatus and system for cracking oils. W. J. PERELIS. Brit. 277,983, Sept. 23, 1926. A stream of a petroleum oil is subjected, while under turbulent flow in a tubular heater, to increase, decrease and increase of temp. in succession while the pressure is correspondingly decreasing, increasing and decreasing. An app. is described.

Fractionating hydrocarbon oils. W. K. LEWIS and A. A. WELLS (to Standard Oil Development Co.). U. S. 1,672,849, June 5. In sepg. kerosene hydrocarbons from a gas oil distillate, vapors are bubbled through progressively cooler zones counter-currently into washing contact with condensate produced by the cooling of the vapors further along the course, while maintaining an operating pressure of about 30 mm. Hg.

Conversion of hydrocarbons. H. NIELSEN (one-half to B. LAING). U. S. 1,672,081, June 5. Hydrocarbons such as CH_4 (to produce formic acid) are passed in gaseous form over a Cu suboxide at a temp. of 250–800°.

Catalytic conversion of heavy into lighter hydrocarbons. L. EDELEANU (to Allgemeine Ges. für chemische Industrie). U. S. 1,671,517, May 29. Mineral oils (such as a Calif. gas oil) are mixed with liquefied SO_2 , undissolved constituents are sepd. and $AlCl_3$ is dissolved in the latter at temps. below the conversion point (suitably at a temp. of about 30–90°) to obtain a material which is suitable for use as a catalytic converting agent.

Catalytic conversion of hydrocarbon oils into products of lower boiling point. G. I. PRICHARD and H. HENDERSON (to Gulf Refining Co.). U. S. 1,672,339, June 5. Oils such as gas oil are distd. in the presence of anhyd. $AlCl_3$, used $AlCl_3$ is withdrawn when its activity is partially spent and the withdrawn material is heated and the volatile products of this heating are passed into the vapor space above the mixt. of oil and $AlCl_3$ in the conversion chamber. An app. is described.

Refining hydrocarbon oils. J. R. NELLER and G. M. VANCE (to Texas Co.). U. S. 1,672,621, June 5. Color-stabilization of an acid-treated and neutralized oil is effected by washing it with a relatively small quantity of alc. alkali soln. to remove potential color-forming substances.

Purifying and fractionating mineral oils. AKT.-GES. FÜR KOHLENSÄURE-INDUSTRIE and E. B. AUERBACH. Brit. 277,946, Sept. 25, 1926. Petroleum or its fractions are treated with liquid CO_2 ; e. g., crude paraffin oil or spindle oil or motor lubricating oil may be treated with 5 times its quantity of liquid CO_2 in a steel receptacle, the soln. sepd. and the CO_2 vaporized.

Bituminous composition. L. KIRSCHBAUM. Can. 276,936, January 10, 1928. An infusible compn. comprises a major portion of a normally fusible bitumen pitch type base and a minor portion of bentonite.

Agglomerating bituminous shales. PATENTAKTIEBOLAGET GRÖNDAL-RAMEN. Brit. 278,378, Oct. 2, 1926. Balls or nodules suitable for distn. or for use as fuel are formed by partial drying in a rotating drum of a mixt. of grains of material crushed to about 10 mm. with about 23% of water (about 18% of which may be left in the agglomerate).

Digestion of bituminous shale. H. D. RYAN. U. S. 1,672,231, June 5. Ground bituminous shale or similar material is digested with a hydrocarbon oil such as a heavy shale oil fraction at a temp. (suitably about 315–370°) sufficiently high to liquefy the shale bitumens; vaporization is limited to obtain a final product or digestion mixt. which is fluid, and residual solids are sepd. from the mixt.

Tunnel oven with travelling grates for distilling oil shale. PATENTAKTIEBOLAGET GRÖNDAL-RAMEN. Brit. 278,694, Oct. 7, 1926. Steam may be used to assist the distn.

Oil and alcohol emulsions. J. KIRSCHNER. Brit. 277,357, Sept. 9, 1926. Stable emulsions of mixts. of mineral oils or their distillates and alc. are treated with nascent H (which may be generated by adding oxalic or formic acid or HCl and bringing into contact with metals such as Ni and Pb or Zn while heated) in an app. which is described. Emulsions for use as motor fuels, detergents, treating leather or for other purposes may be thus prepd.

Apparatus for sulfonating oils. A. HORWITZ. U. S. 1,671,586, May 29. An oil tank is provided with a cooling coil and with an agitator operated by a shaft extending through the bottom of the tank; main and supplemental acid tanks are mounted above the oil tank with a valved connection between the acid tanks, and a plurality of discharge nozzles supply acid from the supplemental acid tank to the oil tank.

Nitrogenous-base oils from hydrocarbon materials. H. K. IHRIG (one-half each to Sumner E. Campbell and to Associated Oil Co.). U. S. 1,671,721, May 29. Hydrocarbon material such as a Calif. petroleum oil or distillate is treated with liquid SO₂ to sep. an oil ext. contg. impurities including the nitrogenous compds. originally present in the raw material; this ext. is then treated with a reagent such as 25% H₂SO₄ soln., which will combine with the nitrogenous compds. and the latter are sepd., *e. g.*, by adding excess of alkali and distg.

Preventing sludging of oils used for insulating electric transformers. D. C. COX (to British Thomson-Houston Co., Ltd.). Brit. 278,365, Sept. 28, 1926. A body of fullers' earth is immersed in the oil. Cf. C. A. 22, 1848.

Oil gas generator. E. BECKER and BECKER OIL GAS, LTD. Brit. 278,478, Aug. 12, 1926. Oil is injected through a nozzle into a rotating conical vessel.

Liquid fuel. M. MULLER-CUNRADI and W. WILKE. Can. 276,831, January 3, 1928. A liquid fuel contains between 2% and 1/10 of 1%, by wt., of a metal carbonyl compd., such as iron carbonyl.

Filter for gasoline, etc. SOC. ANON. DES NOUVELLES INVENTIONS MECANIQUEES ET ELECTRIQUES. Brit. 278,349, Sept. 30, 1926.

Filters for gasoline, etc. E. F. PIERCE (to Bassick Mfg. Co.). U. S. 1,671,606–7, May 29.

Mineral lubricating oils. M. L. CHAPPELL, G. J. ZISER and E. L. MOYER (to Standard Oil Co. of Calif.). U. S. 1,672,304, June 5. After acid treatment of the oil and removal of the sludge thus formed, the oil is repeatedly treated with a soln. of an alkali such as NaOH contg. over 90% by vol. of EtOH and sepd. from the mixt. by gravity.

Purifying used lubricating oils from internal-combustion engines. W. A. STREET and H. HEY. Brit. 278,434, July 6, 1926. The used oil is dild. with a volatile solvent such as gasoline, water and solids are pptd. by adding any of the sulfonated oils or fatty acids or their soaps described in Brit. 176,540 (C. A. 16, 2377), the sepd. oil is treated with concd. H₂SO₄ to ppt. deteriorated oil as acid sludge, and the oil is neutralized, sepd. from the volatile solvent added and decolorized. Numerous details are given.

Lubricants for fibrous materials, etc. A. E. BECKER and DEV STONAKER (to Standard Development Co.). Brit. 277,637, Sept. 14, 1926. A lubricant suitable for use on fibers such as those of artificial silk consists of a hydrocarbon lubricating oil contg. a small proportion of a water-sol. soap such as Na stearate or oleate.

Lubricants for fibers and threads. G. ZEMMERLI. Brit. 277,649, Sept. 16, 1926. A water-free neutral mixt. is formed of liquid petrolatum or paraffin oil or the like and a wetting material such as hydrogenated phenols, hydrogenated naphthalenes or hydrogenated terpenes.

Lubricants suitable for use in apparatus for condensing benzene and like hydrocarbons from gaseous mixtures. GES. FÜR LINDE'S EISMASCHINEN A.-G. Brit. 277,378, Sept. 13, 1926. Lubricants, suitable for app. in which benzene and like hydrocarbons are condensed by expanding cooled compressed gases, contain a substance of low vapor pressure, a substance of high lubricating power and low point of solidification and a substance which is a solvent for the ice, C_6H_6 , $C_{10}H_8$ and other substances condensed as solids; e. g., a mixt. of "ice-machine oil" 1 and toluene 1 part and another mixt. of equal quantities of toluene and ethylene glycol may be fed into the app. through sep. inlets. Xylene, petroleum, decahydronaphthalene, a ketone, isopropyl alc. and other alcs. may also be used in various mixts.

Metallizing bituminous and other surfaces. A. I. G. WARREN and PRECIOUS METAL INDUSTRIES, LTD. Brit. 278,437, July 7, 1926. The process described in Brit. 196,063 (C. A. 17, 3809) for producing metal surfaces on rubber contg. S by first producing a sulfide coating and then reducing the sulfide by electrolysis or otherwise is applied to tarry or bituminous compns. contg. S, e. g., to a compn. comprising asphalt, wood pulp and slate dust; and may also be applied to metallic bodies contg. S such as articles of Spence's metal.

Candle. J. MORCZEWSKI. U. S. 1,672,463, June 5. Paraffin 87 is used with oil of wintergreen 1, kerosene 1, aq. NH_3 8, glycerol 1 and banana oil 2%. Various perfumes may be added.

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Paper qualities in the government service. W. HOLWECH. *Tids. Kemi. Bergevesen* 7, 1-5(1927).—A committee has studied the measurements which might be taken for securing uniform and appropriate qualities in paper purchased for use in the Norw. government offices. The article contains an abstract of a report on the exams. carried out in order to establish efficient and reliable chem. and phys. testing methods. No substantially new methods are suggested.

Paper industry of Canada. SIGURD STECHMEST. *Papir-Journalen* No. 18, 225 (1927).—A review of the development of the newsprint industry in Canada, with tables showing mfg. costs.

History of sulfate pulp manufacture. L. J. DORENFELT. *Papir Journalen* No. 21, 268(1927).—A detailed account of European practice, with a translation of C. F. Dahl's "Vorschriften für die Cellulosefabrikation" as given to the author in 1884.

Proposed standard method for strength testing of unbeaten pulp. O. M. HALSE, KR. MORCH, A. BORRESEN and S. SAMUELSON. *Papir Journalen* No. 21, 266(1927).—A criticism of the T. A. P. P. I method, proposed by the Association of American Wood Pulp Importers as an international standard method. The Norwegian committee recommends that acceptance of the method as an international standard be deferred until Scandinavian mills have thoroughly proved its usefulness and reliability. More definite information is required as to (1) whether the method is for control or specifications or both, (2) whether wet or dry pulp is to be used and if the latter, what time of wetting is to be allowed before testing, (3) what types of pulp does the method apply to, (4) more specific details of procedure in sheet formation, and (5) duplicability of results on the same pulp in various mills and countries.

Furfural and carbon dioxide from wood before and after chlorination. G. J. RITTER and L. C. FLECK. *Ind. Eng. Chem.* 20, 371-3(1928).—During the chlorination used for isolating cellulose from wood, no furfural-producing compds. are formed; a considerable amt. of CO-yielding material is formed which differs from oxycellulose by the facts that it dissolves in sulfite and yields no furfural. Most of the CO-yielding material is formed during the first chlorination, when 56.6% of the unstable pentosans are rendered sol. in sulfite. CO equiv. to 0.86% is liberated from the original wood by boiling HCl. There is no formation of oxycellulose during the analysis by the chlorination method.

Apparatus for drying paper (U. S. pat. 1,671,493) 1. **Apparatus for casting solutions of celluloid into sheets** (U. S. pat. 1,672,403) 1.

Preliminary treatment of cellulose to be converted into various derivatives. W. KERSHAW, F. L. BARRETT and BLEACHERS ASSOCIATION, LTD. Brit. 277,722, April

23, 1926. Low-grade cotton waste, flocks, linters or the like is boiled with caustic alkali, bleached with hypochlorite liquor, further boiled with caustic alkali, rinsed and dried, and may be then subjected to an addnl. bleaching treatment.

Cellulose derivative. W. H. GLOVER and C. DIAMOND. Can. 277,024, January 10, 1928. Cellulose derivs. are produced by treating an ethylcellulose, which is insol. in H_2O and in dil. alkali and in the common org. solvents, with an acetylation agent contg. Ac_2O .

Coloring "soluble cellulose." E. C. DESTUBNER. Brit. 277,989, Sept. 23, 1926. Material for use in the manuf. of lacquers, enamels or celluloid or similar products is colored with a colloidal soln. of a pigment so that the latter is deposited on the cellulosic compn., e. g., by use of a pptg. agent after admixt. with the colloidal prepn. of the coloring agent. Numerous examples are given.

Sizing cellulosic materials. L. BRADSHAW. U. S. 1,672,705, June 5. A sizing suitable for use on paper is prepd. with peanut meal and casein.

Treating regenerated celluloses. I. G. FARBERIND. A.-G. Brit. 278,684, Oct. 5, 1926. The tendency to swell shown by regenerated celluloses is reduced by treating them with substances such as S-phenol- CH_2O resins sol. in water or alkali or S-phenol resins or with the substances which react together to form such resins. Examples and details are given.

Preparing cellulose for making viscose. J. UMBACH. Brit. 278,131, Aug. 5, 1926. Material such as colored cotton rags is treated with superheated steam and alkalis (suitably at 4-5 atm. pressure and a temp. of 240-250°) so that after washing but without subsequent bleaching a clean cellulose is obtained suitable for conversion into viscose. A 1% NaOH soln. may be used.

Esterification of cellulose. C. DIAMOND. Can. 276,825, January 3, 1928. Cellulose acetate is produced by treating cellulose, which has been treated with NaOH, with a phenolic body and then with an acetylating agent.

Modified cellulose for use in manufacture of cellulose acetate. M. CUSIN and P. A. CHEVALET (in part to Soc. Lyonnaise de soie artificielle). U. S. 1,671,513, May 29. See Can. 273,732 (C. A. 21, 4069).

Cellulose acetate solutions and plastics. I. G. FARBERIND. A.-G. Brit. 278,735, April 24, 1925. The compns. described in Brit. 251,303 (C. A. 21, 1320) are modified by substituting cellulose acetate instead of cellulose nitrate. Various examples are given.

Cellulose ethers. H. DREYFUS. Brit. 277,721, March 26, 1926. In an improvement on the process described in Brit. 166,767 (C. A. 16, 830) the quantity of water present during the substitution reaction is reduced by the addn. of water-binding agents to a quantity not exceeding 4 times the wt. of the cellulose or cellulosic compd. used (preferably not more than half the wt. of this material). Oxides of alkali or alk. earth metals may be used, as may also hydrides of Ca or Mg, alkali metals and alk. earth metals, sodamide and NaOEt powder. Various details and modifications are given.

Treating scrap celluloid. RHEINISCHE GUMMI- UND CELLULOID-FABRIK. Brit. 277,626, Sept. 18, 1926. Finely divided scrap celluloid is mixed with 2% or more of a non-volatile solvent of nitrocellulose such as triphenylphosphate, acetanilide, Et acetanilide, "palatinol" or "plastol" and molded under the action of heat and pressure into sheets, rods or other forms.

Apparatus for forming threads from cellulose acetate or similar solutions by extrusion. C. F. TORHAM (to Courtaulds, Ltd.). U. S. 1,671,878, May 29.

Applying tension to artificial silk filaments during their manufacture. J. L. RUSHTON. U. S. 1,671,785, May 29. Mech. features.

Artificial silk. S. I. VLES and M. P. A. BOUMAN (to Naamlouze Venootschap Nederlandsche Kunstzijdefabriek). U. S. 1,672,665, June 5. In the dry or evaporative method, filaments are extruded into a slowly ascending medium, the temp. of which increases gradually in an upward direction. An app. is described.

Artificial silk. R. CLAVEL. Brit. 277,602, Sept. 17, 1926. Artificial silk is weighted in a bath which contains together 2 or more substances which normally interact to form an insol. product; premature pptn. is prevented by maintaining a sufficient acidity or by use of protective colloids and a protective colloid may also be applied to the material before it is passed through the weighting bath. Different baths may also be used successively.

Artificial silk, artificial horsehair, artificial straw, films, etc., from viscose. KÖLN-RORRWEN. A.-G. Brit. 277,716, March 16, 1926. Substances are added to the spinning bath which depress the rate of diffusion of the acid into the viscose, the quantity of the substances added being detd. by preliminary tests. With a H_2SO_4 bath, the rate

of diffusion may suitably be reduced about 10-25% and substances which may be used comprise: naphtholsulfonic acid condensation products with CH_3O , "phenol wood resin" solubilized with H_2SO_4 , sulfite pulp lye, carbazolesulfonic acid, sulfonated cumarone resin, naphthalenesulfonic acid condensation products with CH_3O , "sulfonated machine oil," sulfonated lignite tar oil, sulfonic acids of aromatic hydrocarbons heated until the first formed insol. products become sol., hydroxymethylnaphthalenesulfonic acid and water-sol. sulfonic acids of the products obtained by fusing phenols with S, or salts or the specified acids. The addns. are especially suitable when use is made of immature viscose prepd. from immature alkali cellulose.

Artificial silk from viscose. I. G. FARBENIND. A.-G. Brit. 278,716, Oct. 5, 1926. Pptg. baths are satd. with Na_2SO_4 and also contain a high proportion of H_2SO_4 such that on crystn. tri-Na H sulfate first seps. Suitable concns. of H_2SO_4 are: at 20° , 16%; at 46° , 17-18%; and at 60° , 19%. Cf. C. A. 22, 2465.

Pump, pipe system and spinning nozzles for making artificial silk from viscose. E. LUNGE (to Courtaulds, Ltd.). U. S. 1,672,070, June 5.

Apparatus for spinning artificial silk. J. L. RUSHTON. U. S. 1,672,691, June 5.

Nozzle for spinning artificial threads. H. HOFFMANN, H. MARK and R. O. HERZOG. U. S. 1,672,644, June 5. Structural features.

Acid proportioning and control system for sulfite pulp plants. C. O. SISLER. U. S. 1,671,656, May 29.

Wood pulp. G. A. RICHTER. Can. 276,817, January 3, 1928. Wood chips are soaked in a soln. contg. about 20% Na_2SO_3 , and are then cooked under pressure at an elevated temp. in an acid sulfite soln. of much lower combined SO_2 content.

Apparatus and system of operation for making boards or sheets from fibrous pulp stock. G. H. ELLIS. U. S. 1,672,249, June 5.

Paper-making apparatus. AKT.-GES. DER MASCHINEN-FABRIKEN ESCHER, WYSS, ET CIE. Brit. 277,661, Sept. 20, 1926.

Removable colored coating on paper. H. C. MITCHELL. Brit. 277,733, June 15, 1926. Paper or similar material is first coated with china clay, blanc fixe or the like and then with an ink or other coloring material which can be removed with a pen to produce markings on the surface.

Controlling humidity while drying paper on heated cylinders. G. S. WITHAM, JR. U. S. reissue 16,990, June 5. Original pat. 1,646,515 was issued Oct. 25, 1927.

24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

Propagation of flame in mixtures of natural gas and air. H. F. COWARD AND H. P. GREENWALD. Bur. of Mines, *Tech. Paper No. 427*, 28 pp. (1928).—By quantitatively comparing the ease of ignition and rate of propagation of flame for natural gas with those of each of its combustible components it is shown that some properties of natural gas are such that each of such components contributes to the flame properties in almost exact proportion to the relative amt. of it present. Then the known values of the property for each individual hydrocarbon can be used to calc. values for the natural gas which agree well with exptl. values found. Natural gas is ignited for certain ranges more readily than CH_4 either by the hot walls of a quartz tube, a hot metal bar, or an elec. spark. In a quartz tube the ignition temps. of the natural gas mixts. were 15° to 50° lower than those of CH_4 but much higher than those of other paraffin hydrocarbons. The time lag was markedly less than for CH_4 . With the hot Ni bar the ignition temp. of natural gas throughout the range of inflammable mixts. was 30° lower than CH_4 . The natural gas mixt. most easily ignited by an elec. spark contained somewhat less of natural gas than the most easily ignitable CH_4 mixt. did of CH_4 and it required a somewhat weaker spark for ignition. The lower limit of ignitability of a natural gas mixt. in air may be calc. almost exactly, and the higher limit approx. from the limits of the component. The speed of uniform movement of flame hydrocarbons may be calc. from the known speeds of the individual hydrocarbons. Of all mixts. of natural gas and air that one which propagates flame fastest does so somewhat more rapidly than the fastest burning CH_4 + air mixt. and it contains somewhat less of the combustible gas than the fastest CH_4 mixt. does.

Effect of alkali metal compounds on combustion. C. A. THOMAS AND C. A. HOCHWALT. *Ind. Eng. Chem.* 20, 575-7 (1928).—Aq. solns. of alk. salts atomized on a gasoline fire have the power to extinguish it. This property is due neither to a cooling effect,

nor to a mechanical removal of the O. Of all the salts tested, only those contg. an alkali metal have an effect upon fire. The effectiveness increases with the mol. wt. of the cation, and in general, with the O content of the anion. A method has been developed by means of which it is possible to compare quant. the action of various materials upon a standard oil fire. The main features are as follows: the fire temp. is controlled and standardized; the aq. soln. is directed on to the fire from a fixed distance by means of a const.-pressure device; the diln. of the soln. is increased until fire is no longer extinguished. Practical application of this extinguishing property makes use of K salts.

A. L. HENNE

The influence of temperature on the formation of the explosive wave. P. LAFITTE. *Compt. rend.* 186, 951-3(1928).—Mixts. of $2H_2 + O_2$ and $CH_4 + 2O_2$, at 1 atm. and heated at varying temps. from 20° to 350° , were ignited in a tube by means of an electric spark and the wave studied photographically. Increasing the temp. of the gaseous mixt. before ignition retards the formation of the explosive wave.

E. G. VANDENBOSCHE

Analysis of the residual acid from nitroglycerin manufacture (YOUNG) 7.

Explosives. R. I. SROOPS (to Hercules Powder Co.). U. S. 1,671,792, May 29. An explosive salt, an oxidizing salt and a salt contg. water of crystn., e. g., a mixt. comprising $Ca(NO_3)_2 \cdot 4H_2O$ and NH_4NO_3 or KNO_3 or NH_4ClO_4 is fused, absorbed by material such as sawdust or similar material and the product is cooled. U. S. 1,671,793 specifies the use of a carbonaceous material such as balsa wood sawdust together with similar salts.

Toy torpedo with a casing of pitch composition or similar bituminous material. K. KOHN. U. S. 1,672,460, June 5.

L. A. OLNEY

1,8-Aminonaphthol-4-sulfonic acid. K. BRANDT. *Z. Farben-Ind.* 20, 5-6(1928).—Detailed conditions are given for the manuf. of this dye intermediate (Chicago Blue-monosulfonic acid) from naphthalene.

FREDERICK C. HAHN

Columbia Black FB. Wm. H. STEFFENS. *Z. Farben-Ind.* 20, 6-7(1928).—Detailed procedures are given for the prepn. of Columbia Black FB from *p*-nitroaniline, Cleve's acid and gamma acid as intermediates.

FREDERICK C. HAHN

Naphthol Blue Black. M. TURREL. *Z. Farben-Ind.* 20, 7-8(1928).—A description is given of the manuf. of Naphthol Blue Black (black agalma).

F. C. H.

Tartrazine. G. NORTON. *Z. Farben-Ind.* 20, 8-9(1928).—A description of the manuf. of tartrazine from Et oxalacetate and sulfanilic acid.

FREDERICK C. HAHN

1-Naphthylamine-8-sulfonic acid and its related dyes: sulfone cyanine, sulfone cyanine black and sulfone acid blue. I. MARTIN. *Z. Farben-Ind.* 20, 9-11, 76-8(1928).—A description is given of the manuf. of this intermediate and its related dyes.

FREDERICK C. HAHN

The dyeing of wool with vat dyes. FERNAND GIOT. *Tiba* 6, 431-5(1928).—Practical directions for obtaining even and uniform results are given.

A. P.-C.

Degreasing textile fibers by means of terpene complexes. M. VARINOIS. *Tiba* 6, 425, 427(1928).—Brief discussion of their merits, bringing out their advantages over the use of alkalis alone, with directions for the treatment of different kinds of fibers.

A. PAPINEAU-COUTURE

Rules to be observed to obtain even dyeing of cotton and rayon stockings and circular-knit goods. H. LAMERTZ. *Tiba* 6, 565, 567(1928).—Practical operating hints are given.

A. PAPINEAU-COUTURE

Dyeing of loaded fabrics. A. KUNZE. *Russa* 3, 375-9(1928). (In French and German).—Practical operating hints are given.

A. PAPINEAU-COUTURE

Theories of dyeing wool. ALBERT P. SACHS. *Bull. Natl. Assoc. Wool Manufrs.* 57, 243-51(1927); *Dyestuffs* 29, 1-6(1928).—The various theories are discussed. "The reaction between wool and dyestuff is probably similar in general nature to, but different greatly in detail from, the reactions between other textile fibers and dyestuffs. The process of dyeing wool is strictly a colloid-chem. phenomenon, involving adsorption of the dyestuff by the fiber, due to differences in elec. potential and the formation of a chem. compd. (a salt of wool and dyestuff) which causes the dyeing to be fast and

prevents the reversal of the adsorption. The colloid-chem. theory of dyeing wool reconciles the facts previously observed which formed the basis of rival and mutually contradictory theories of dyeing." CHAS. E. MULLIN

Relation of practice to theory. CHAS. E. MULLIN. *Am. Dyestuff Rept.* 17, 206-8 (1928).—An address upon conditions as existing in the textile plants and the relation of plant practice to theory.

The production of multi-colored effects (on wool). J. S. HEUTHWAITE. *Dyer, Calico Printer* 59, 184-5 (1928).—The usual methods, including the Vigoureux method of printing, are described. RUBY K. WORNER

Materials resistant to acids and alkalis used in the dye industry. FRED HORST. *Z. Farben-Ind.* 20, 13-4 (1928).—A discussion of the resistance of various metallic and non-metallic materials and protective coatings to the action of dil. and concd. inorg. and org. acids and alkalis. FREDERICK C. HAHN

Application of vat colors to animal fibers. T. F. McDERMOTT. *Proc. Am. Assoc. Textile Chem. Colorists* 1928, 164-7; *Am. Dyestuff Rept.* 17, 322-5.—An address and discussion. L. W. RIGGS

Dyeing horse hair for linings and stiffening fabrics. GEORGE RICE. *Am. Dyestuff Rept.* 17, 312-3 (1928).—Directions for prep. horse hair for dyeing are given. L. W. RIGGS

Use of formic acid in dyeing silk and rayon. FRED GROVE-PALMER. *Am. Dyestuff Rept.* 17, 314, 329 (1928).—The advantages of HCO_2H over AcOH are discussed. L. W. RIGGS

Ultra-violet rays and their applications in industrial laboratories. The Wood light. Q. HIRSCH. *Tiba* 6, 541-57 (1928).—An address dealing with the properties and production of ultra-violet light and their applications in the textile industry (acceleration of chemical reactions for artificial aging tests, analysis by fluorescence exemplified by a no. of possible applications). A. PAPINEAU-COUTURE

Textile research at M. I. T. ANON. *Textile World* 73, 3448 (1928).—The subjects studied during the past four years and those under investigation at present are listed. RUBY K. WORNER

Modern humidifying methods. W. B. HODGE. *Textile World* 73, 2993-4, 2998 (1928).—Application to textile mills. RUBY K. WORNER

Silk avivage. KARL WOLFGANG. *Kunstseide* 9, 517-8 (1927).—The special "feel" imparted to silk by the usual avivage often diminishes after a short time and even disappears completely. The addn. of oleic acid to the potash-olive oil soap usually employed imparts a much more durable "feel" to the silk without exerting any disadvantageous influence on the elasticity and durability of the silk fiber. The addn. of small quantities of materials such as hydroquinone, anthraquinone, or other compds. to the olive oil results in improved avivage. FREDERICK C. HAHN

Bleaching silk-cotton hosiery with hydrogen peroxide. H. G. SMOLENS. *Am. Dyestuff Rept.* 17, 309-12 (1928); cf. *C. A.* 21, 3748. Most of the silks used in silk-cotton hosiery are practically white when the gum is removed; hence the problem is to bleach the cotton without injuring the silk. This end is attained in bleaching with H_2O_2 by having a max. of total alk. possible within the safe limit of free alk. In the formulas given the alk. constituent of the bath is furnished by about 25 lbs of Na_2SiO_3 to 400 gallons of water, although these proportions are varied to suit particular conditions. L. W. RIGGS

A modified stoving test. F. L. GOODALL AND A. T. KING. *J. Soc. Dyers Colourists* 44, 145-7 (1928). L. W. RIGGS

Does formaldehyde protect wool against moths? C. O. CLARK. *J. Soc. Dyers Colourists* 44, 144-5 (1928).—Wool treated with HCHO as described by Trotman (cf. *C. A.* 22, 1858), and then subjected to the standard moth grub test as employed in testing Eulanized materials in the Zool. Lab. of the I. G. Farbenindustrie at Leverkusen, was not protected from grub moths in the slightest degree. L. W. RIGGS

Growth and use of the Mexican sisal plant. L. C. SCOTT. *Proc. Am. Assoc. Textile Chem. Colorists* 1928, 161-4; *Am. Dyestuff Rept.* 17, 319-22.—An address. L. W. RIGGS

Synthetic drugs and dye intermediates (Brit. 278,037) 17.

Year Book of the American Association of Textile Chemists, 1927. New York: Howes Publishing Co., Inc. 264 pp. Reviewed in *J. Soc. Dyers & Colourists* **44**, 83(1928).

Dyes. I. G. FARBENIND. A.-G. Brit. 278,651, Oct. 8, 1926. Dibenanthrone dyes are obtained from the nitrobenanthrone described in Example 2 of Brit. 12,518 of 1906 by exchanging the nitro group for an alkyloxy group and treating the products with alk. agents; a green dye is obtained, similar to that of Example 2 of Brit. 181,304 (C. A. 16, 3762).

Dyes. L. J. HOOLEY AND SCOTTISH DYES, LTD. Brit. 278,417, July 2, 1926. The 1-halogen-2-amino-3-chloroanthraquinones described in Brit. 264,916 (C. A. 22, 244) are condensed with primary aliphatic or aromatic amines, *e. g.*, with aniline, *p*-toluidine or methylamine, and the products are then treated with H_2SO_4 ; with concd. acid or oleum, sulfonic acids are produced which can be used for dyeing and printing silk, wool and cellulose acetate; with weaker sulfuric acid and the arylamino compds. products are obtained which may be acridines and which dye wool. Examples are given of dyes producing reddish shades.

Dyes. MORTON SUNDOWN FABRICS, LTD., J. MORTON, B. WYLAM, J. E. G. HARRIS and J. I. M. JONES Brit. 278,399, May 3, 1926. The process described in Brit. 251,491 (C. A. 21, 1360) in which vat dyes are treated, in the presence of a metal or a tertiary base, with chlorosulfonic acid or its salts, SO_3 or salts of pyrosulfuric acid, is carried out in the presence of a diluent such as acetone or $PhNO_2$. The products can be used for dyeing and printing as described in Brit. 251,491 (C. A. 21, 1360). Examples are given of the treatment of dimethoxydibenanthrone and of flavanthrone.

Dyes. SOC. ANON. POUR L'IND. CHIM. A BAILE. Brit. 278,728, Oct. 6, 1926. Anthraquinone vat dyes contg. cyanuric rings, such as those formed as described in Brit. 205,525 (C. A. 18, 1056), Brit. 231,688 (C. A. 19, 3597), Brit. 234,086 (C. A. 20, 829) and Brit. 237,872 (C. A. 20, 1721), are purified by treatment with aq. hypochlorites. When thus purified they produce much brighter colors than the untreated dyes. Several examples are given.

Dyes. W. SMITH, J. THOMAS AND SCOTTISH DYES, LTD. Brit. 278,039, May 26, 1926. 1-Halogenanthraquinone-2-urethans are treated with a metal such as Cu powder, with or without a diluent such as $PhNO_2$ or $C_{10}H_8$. At high temps. such as 160° , especially in the absence of a diluent, the products comprise mainly flavanthrones, but at lower temps. 1,1'-dianthraquinonyl-2,2'-diurethans are obtained. The latter can be purified by dissolving in org. solvents such as $PhNO_2$ or $PhCl$ and converted into flavanthrones by hydrolysis and ring closure. Several examples are given. Cf. C. A. 22, 1691.

Dyes and intermediates. BRITISH DYESTUFFS CORPORATION, LTD., J. BADDILEY, P. CHORLEY and R. BRIGHTMAN. Brit. 277,756, June 25, 1926. Unsym. ureas are made by treating with phosgene an equimol. mixt. of 2,8,6-aminonaphtholsulfonic acid or its salts with an aminoacetanilide or a sulfonated amine of the C_6H_5 or $C_{10}H_7$ series (other than an aminonaphtholsulfonic acid or a sulfonated diamine or a mono-formyl deriv. of the latter), in the presence of an alk. acetate, carbonate or hydroxide. Examples are given for the production of acetamidophenyl-8-hydroxy-8-sulfo-2-naphthylurea, 8'-hydroxy-1,2'-dinaphthylurea-4,6'-disulfonic acid and 8-hydroxy-2,2'-dinaphthylurea-6,6'-disulfonic acid. By coupling these ureas with various specified diazo compds. dyes suitable for dyeing viscose silk in bordeaux, even red, claret and blue shades are obtained.

Dye intermediates. I. G. FARBENIND. A.-G. Brit. 277,372, Sept. 11, 1926. 2,5,6-Trichloro-3-aminotoluene-4-sulfonic acid is made by treating 2,5,6-trichlorotoluene with a nitrating agent such as H_2SO_4 and HNO_3 and then reducing the nitro compd. formed.

Dye intermediates. BRITISH SYNTHETICS, LTD. AND E. B. HIGGINS. Brit. 278,463, July 20, 1926. Chlorides of *o*-hydroxycarboxylic acids are made by the action of thionyl chloride on salts such as the Na, Ca or Mg salts of 2,3-hydroxynaphthoic or similar acids (suitably in a ball mill). SO_2 is removed by use of a stream of dry air and any unchanged thionyl chloride may be decompd. with Na_2CO_3 or $CaCO_3$. The thionyl

chloride may be used in liquid form or suspended in air or other inert gas or as a vapor. The 2,3-hydroxynaphthoic acid may be used for producing intermediates for making dyes as described in Brit. 262,958 (C. A. 21, 3906).

Azo dyes. JOSEF HALLER (to Grasselli Dyestuff Corporation). U. S. 1,671,422, May 29. Aminonaphthol ethers such as 7-methoxy-1-aminonaphthalene or 1-methoxy-8-aminonaphthalene (which may be used in the form of their hydrochlorides) are diazotized and coupled with a 2,3-hydroxynaphthoic acid arylide such as 2,3-hydroxynaphthoic acid- β -naphthalide or β -hydroxynaphthoyl-2-amino-1,4-hydroquinone dimethyl ether. Dyes are obtained which give clear violet shades fast to Cl, light and boiling. The coupling may be effected in substance or on the fiber.

Perylene dyes. F. BENSA. Brit. 278,325, Oct. 2, 1926. A metal cyanide such as that of Cu is heated in the presence of a solvent such as pyridine or quinoline with Me or Et halogenperylene ketones with or without pressure. The Cu may be removed with NH_3 and the pure dye obtained by forming a vat and reoxidizing. The dyes give red shades on cotton which change to red-violet on exposure to the air. Diacetyldichloroperylene (which may be used as an intermediate) is prepd. by adding AcCl to a mixt. of anhyd. AlCl_3 and dichlorperylene in CS_2 . Dipropionylchloroperylene is similarly made from propionyl chloride.

Pyranthrone dyes. BRITISH DYESTUFFS CORP., LTD., A. SHEPHERDSON and A. HAILWOOD. Brit. 278,102, July 7, 1926. Pyranthrone is treated with oxidizing agents, e. g., with MnO_2 , in H_2SO_4 soln. or suspension. The product dyes cotton from the vat brown shades which are not fast but after alkylation (if desired after sepn. from unchanged pyranthrone or treatment with reducing agents) the product dyes cotton fast red to brown shades.

Colloidal dispersion of dyes. C. E. J. GOEDECKE. U. S. 1,672,454, June 5. Auramine, sulfur green or other dyes are colloiddally dispersed in a quantity of solvent insufficient to dissolve all of the dye present, in the presence of a protective agent for the dispersion. The products may be used for dyeing, printing or for making lakes.

Soluble derivatives of vat dyes, etc. B. WYLAM, J. E. G. HARRIS, H. A. I. DRESCHER, J. THOMAS and SCOTTISH DYES, LTD. Brit. 277,398, April 9, 1926. Quinones, including vat dyes such as those of the indigo, thioindigo and anthraquinone series, are converted into sol. derivs. by interaction with a metal, a tertiary base, a substance which in the presence of the tertiary base yields a sulfuric anhydride deriv. of the base (such as SO_3 , oleum, chlorosulfonic acid or alkyl chlorosulfonates) and an "assistant" which may be the anhydride or imide of phthalic or succinic acid, or an org. acyl chloride such as phosgene, ethyl chloroformate, AcCl , benzoyl chloride or *p*-toluenesulfonic chloride. The products may be used for dyeing or printing by processes such as those described in Brit. 247,787 (C. A. 21, 654). Several examples are given.

Benzanthrone derivatives. R. F. THOMSON, J. THOMAS and SCOTTISH DYES, LTD. Brit. 278,112, July 13, 1926. The process described in Brit. 251,313 (C. A. 21, 1361) is modified by effecting the oxidation at low temps. (suitably 0° or lower). Various details are given.

Benzanthrone derivatives. R. F. THOMSON, J. THOMAS and SCOTTISH DYES, LTD. Brit. 278,496, April 22, 1926. Benzanthrone derivs. having the 2- and Bz-1- positions free are treated in H_2SO_4 with an oxidizing agent such as MnO_2 to form corresponding substituted dibenzanthronyls together with substituted oxybenzanthrone; the treatment is similar to that of benzanthrone itself as described in Brit. 251,313 (C. A. 21, 1361). Examples are given of the treatment of 6-chlorobenzanthrone, β -chlorobenzanthrones, α -chlorobenzanthrones, 6-methylbenzanthrone and β -methylbenzanthrone. The substituted dibenzanthronyls can be purified by pptn. from H_2SO_4 and yield vat dyes of the dibenzanthrone type by alkali fusion; the substituted oxybenzanthrone can be alkylated and the alkyloxy compds. also converted into vat dyes by alkali fusion.

Lakes. I. G. FARBENIND. A.-G. Brit. 277,371, Sept. 11, 1926. Org. dyes contg. acid salt-forming groups are combined with org. bases such as dicyclohexylamine, guanidines, trisubstituted melamines and diethyl- β -naphthylamine which will yield with the dyes stable salts which are insol. or but sparingly sol. in water. Various substrata also may be used and the products may be used in varnishes or for printing etc. Numerous examples are given.

Dyeing wool and silk. L. B. HOLLIDAY & CO., LTD. AND C. SHAW. Brit. 277,833, Nov. 26, 1926. 1,4-Dihydroxy-2,5-dichloro (or dibromo)-benzoquinone is used with or without a mordant for dyeing wool or silk or both. After dyeing from an acid bath, the material may be afterchromed or immersed in a boiling soln. of a metal salt such as FeSO_4 or CuSO_4 .

Pattern effects on fabrics. BRITISH CELANESE, LTD., G. H. ELLIS and R. J.

MANN. Brit. 277,414, June 15, 1926. Fabrics formed at least in part of cellulose acetate threads are locally treated with protective agents such as org. acids and then subjected to the delustering action of hot or boiling aq. liquids or steam. Formic, acetic, propionic, butyric, chloroacetic, aminoacetic, glycollic, lactic, citric and succinic acids may be used for the preliminary treatment and thickening agents such as starch, flour or gums may be added.

Softening natural silk. S. S. SADTLER and E. C. LATHROP. U. S. 1,671,786, May 29. After treatment of a batch of silk in a softening bath such as an aq. soap and oil bath the silk is removed after it has become softened, sufficient fresh liquor is added to make up for that carried away from the soln. with the silk and a sufficient quantity of an alk. soln. such as NaOH or Na_2CO_3 is added to bring up the p_H to a point (suitably about 7.5-9) which will avoid injury of a fresh batch of silk when treated with the bath.

System for producing composite threads or yarns comprising natural and artificial fibers. C. W. PALMER (to Celanese Corp. of America). U. S. 1,672,083, June 5. Mech. features. An app. is described.

Wetting and degreasing agent. G. ZIMMERLI. U. S. 1,672,292, June 5. A wetting and degreasing agent suitable for use on textile materials consists of a neutralized mixt. of a highly sulfonated fat which may be prepd. from castor oil and which has a sulfonic acid content of at least 40%, together with hydrogenized raw cresol or other hydrogenated cresol insol. in water.

26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

The story of paint and varnish. I. E. C. HOLTON. Sherwin-Williams Co. J. Chem. Education 5, No. 5, 515-30(1928). E. H.

Inter-relations of paint, varnish and lacquer industries with chemical engineering. HARRY McCORMACK. Chem. Met. Eng. 35, 25-7(1928).—A review. R. J. MOORE

Analysis of paints and varnishes, according to the German association for testing technical products. ANON. Farben-Ztg. 33, 560-1(1927).—Detn. of the volatile diluent. Fifty g. of the well-mixed paint are submitted to steam distn. The oil layer is weighed. If water-sol. diluents are present a second sample is distd. directly. The distillate is taken up in water and from the contraction of its vol. the amt. of water-sol. diluent can be found. Detn. of the pigment content. Five g. material are extd. 4 times with 50 g. of ether. In the presence of ether-insol. products, such as linoxyn, the extd. pigment is treated with an ether soln. of HCl. For the detn. of the linoxyn the ether is removed and the residue heated with alc. KOH and filtered. The fatty acids of the filtrate are liberated with HCl, taken up in ether, dried over dry Na_2SO_4 and weighed when freed from the solvent. Detn. of the non-volatile vehicle. The ether solns. obtained by the above extns. are heated on a water bath in a stream of CO_2 until constancy in wt. is obtained, or the ether residue is heated on an oil bath to 180° in *vacuo*. In certain cases, e. g., in the presence of Paris blue, the vehicle is sepd. as follows. Five g. of the paint are heated to boiling with 50 cc. 0.5 N alc. KOH under reflux and with repeated shaking, for $\frac{1}{2}$ hr. Upon diln. with 50 cc. H_2O the mixt. is filtered and washed several times with 50% alc. The latter is removed, the filtrate is acidified with HCl and extd. with ether. The filter residue, too, is treated with HCl-ether. The combined ether fractions are washed 3 times with a 15% NaCl soln. and dried over desiccated Na_2SO_4 . The fatty acids are liberated as indicated. In order to obtain the correct values for the oil, the figures thus found are multiplied by 1.05. The pigment content can be calcd. by deducting the sum of vehicle and diluent from 100. J. SCHALCH

Accelerated tests of organic protective coatings. P. H. WALKER and E. F. HICKSON. Ind. Eng. Chem. 20, 591-6(1928).—An accelerated weathering app. is described. The factors used are an enclosed carbon arc light, water spray, refrigeration, and ozonized air. A cycle of these factors is described which gives results comparable to actual exposure. Various methods for quant. measuring of film failure are discussed. R. J. MOORE

Rust-preventive coatings. A. V. BLOW. Farben-Ztg. 33, 500-3(1927).—The structure of a paint film and the fineness of the pigment particles control the quality of the film. The degree of dispersion of the pigment is difficult to det. under the microscope; results are more easily obtained by sedimentation expts. as the settling curves as well as the sediment vols. are characteristic for a certain size of grain. The sediment

vols. are inversely proportional to the heat of adsorption and have a certain relation to the heats of vaporization. The following table gives the sediment vols. or ordinary (A), non-settling (B), and disperse minium, make "Rodleben" (C), expressed in cc. per kg. when suspended in various dispersion media, and the corresponding heat of adsorption (a) as compared with clay. Methanol: A 230, B 280, C 360, a 11.0. Alc.: A 240, B 290, C 430, a 10.8. Acetone: A 420, B 540, C 720, a 8.0. Benzene: A 500, B 640, C 760, a 5.8. CCl₄: A 530, B 690, C 700, a 1.8. The sediment vols. of C and the corresponding heat of adsorption (compared with Cu) are in kerosene contg. 1% linoleic acid 200, 22 resp.; in linseed oil 270, 14 resp.; in petroleum 540, 6 resp.; in paraffin oil 560, 4 resp. Minium of a paint film which consists originally of cryst. PbO and amorphous Pb plumbate changes its compn. inasmuch as the plumbate disappears and the PbO slightly increases. J. SCHALCH

Influence of negative catalysis on the structure of protective paints. JOHANNES SCHEIBER. *Farben-Ztg.* 33, 680-2(1927).—The preventive action of products such as phenols, amines, derivs. of hydroxylamine, hydrazine and urea toward oxidative decomposition of a linseed oil film in the presence of a drier may be fully utilized by applying paints which contain besides linseed oil and driers an antioxidant and oils, such as tung oil. In such a compn. the linseed oil is the continuous phase and is protected from oxidation by an excess of an antioxidant. The tung oil, capable of coagulation without the aid of O₂, but under the influence of a catalyst, such as is formed by a drier, represents the disperse phase. J. SCHALCH

Adhesions of films. H. A. GARDNER AND A. W. VAN HEUCKEROOTH. *Int. Eng. Chem.* 20, 600-1(1928).—The adhesion of films to metal, glass and wood surfaces is quant. measured by means of the silk strip method in conjunction with the Gardner-Parks mobilometer. A table is given showing adherence of different types of nitro-cellulose lacquers on various surfaces including galvanized Fe, Sn and Al. In general, adhesion of films to metal increases with the amt. of resin, up to a certain percentage. Tests should be carried out under const. temp. and humidity conditions to secure comparative results on different days. R. J. MOORE

Painting of plasters and cements: new and old. GODFREY GILES, et al. *J. Oil Colour Chem. Assoc.* 11, 124-49(1928).—This report of a joint discussion between the Institute of Brit. Decorators and the Oil & Colour Chem. Assoc. covers the use of various types of finishes over different varieties of plasters and cements. R. J. M.

Mill and laboratory experiments on tung oil production from 1927 American crop. H. A. GARDNER. *Am. Paint Varnish Manufs. Assoc. Circ.* No 329, 318-44(1928).—Results are tabulated on lab. extns. made on 20 samples of tung-oil seed from trees treated with different types of fertilizer, or from trees which bear either single or cluster type fruit. Oil and moisture contents are given. Various plant size hulling and oil crushing tests on the 1927 tung oil fruit are described. R. J. MOORE

Mineral spirits. HANS WOLFF. *Farbe u Lack* 1928, 177-8. —It was impossible to detect any differences in drying times or elongation of films of varnishes due to the use of varying amounts of the fraction b. 200-220°. G. G. SWARD

Emulsions as paint vehicles. FRIEDRICH WAGNER. *Farbe u Lack* 1928, 20, 30. —Stability is the most important property of emulsions. "Grundin" emulsions have stood for years without any sepn. Only casein-oil emulsions have succeeded as outside emulsion paints. G. G. SWARD

Linseed oil and its earlier use. CORNELIUS HEBING. *Farbe u Lack* 1928, 144-6 156-7, 166—Historical. G. G. SWARD

Vehicles for paint and varnish. JOHANNES SCHEIBER. *Farbe u Lack* 1928, 68-9, 80-1, 93-4. —S classifies vehicles as follows: aq. reversible-glue; aq. irreversible-water glass; non-aq. reversible-spirit varnishes; non-aq. irreversible-oleoresinous varnishes; and finally emulsions. He also classifies them as gel, associated colloid, resins, raw oils and processed oils. Wood oil dries by polymerization at its conjugated double bonds and the product is stable toward oxidizing compds. Linseed oil dries by oxidation and breaks down more rapidly than wood oil. Negative catalysts should be added in one of two different ways: to dried film, which is difficult or in a passive condition to the original oil, becoming active after the film is dry. Dried at 100° wood oil sets in 8-12 min. while perilla, linseed and poppyseed oils require 1-6 hrs. When dry the changes in wt. are, resp., 0, 3-7, 14 and 30%. Linseed-oil films are affected by water on account of the water-sol. products of oxidation. To overcome this, bases forming water-insol. products may be added. Rust-preventive paints usually contain pigments which combine with the decompn. products of the oil. Acid-resisting coatings are easier to prep. than alkali-resisting ones as most materials are saponif. by alkali. G. G. SWARD

Nature, effect and determination of the viscosity of printing varnishes. K. WÜRTH. *Farben-Ztg.* 33, 269-72(1927).—A review. J. SCHALCH

Benzine and turpentine as solvents for varnishes. HANS WOLFF. *Farben-Ztg.* 33, 420-1(1927).—W. compares the surface tension, the viscosity and the effect of diln. on the viscosity of varnishes made up with benzine, "resilvestrol" (a terpene similar compd.) and turpentine. The surface tension is the same for the 3 samples; it is therefore dependent on the constitution of the varnish base. When examg. the viscosity with Vollmann-Mallison's viscometer the highest viscosity was found with the turpentine, the lowest with the benzine varnish, the latter showing thus the lowest spreading power. Upon diln. the viscosity curve showed the expected features for the turpentine varnish, but not for the resilvestrol and less for the benzine varnish. From a certain point the viscosity of the latter increased slightly with an increase in diln., effected probably by coagulation of the disperse phase. W. shows with this example that the phys. properties of a varnish may vary with a change in diluents. J. SCHALCH

Bleaching of lac. M. VENUGOPALAN. *Indian Inst. Sci., Bangalore.* *J. Indian Inst. Sci.* 11A, 17-22.—Several methods for the bleaching of lac are described. The best method consists in dissolving powd. lac in 2.5% Na_2CO_3 soln. and bleaching with NaClO soln. The latter is easily prepd. by bubbling Cl through a soln. consisting of 2.5% Na_2CO_3 and 12.5% NaOH until a concn. of 6 to 8% available Cl is reached. The lac soln. after 20 hrs. treatment with hypochlorite is bleached and is then pptd. by slow addn. of 1:20 H_2SO_4 . One lb. of lac requires 40 to 50 cc. of the hypochlorite soln. for bleaching. L. B. MILLER

China wood oil in lacquer. W. E. FLOOD, D. E. BOOTH AND W. H. BEISLER. *Ind. Eng. Chem.* 20, 609-11(1928).—China wood oil, raw, heat treated and combined with ester gum was incorporated in nitrocellulose lacquers, film properties were studied and exposure tests made. Lacquers contg. the oil were more durable than corresponding samples without oil. R. J. MOORE

Brief review of lacquer solvents. W. W. WILSON. *Paint, Oil, Chem. Rev.* 85, No. 23, 14-5, 19(1928).—A wide range of lacquer solvents is reviewed. Prepn., advantages, disadvantages and evaluation are discussed. R. J. MOORE

Solvent specifications a necessity. W. C. WILSON. *Paint, Oil, Chem. Rev.* 85, No. 23, 10-1(1928).—The growing need for lacquer-solvent specifications is stressed and the following tests are advised and methods given: toxicity, evapn. rate at some temp. between 65° and 95°, temp. lowering during evapn., soly. of water in the solvent, diln. coeff., resin soly., stability, odor. R. J. MOORE

The role of solvents and diluents in lacquers. B. SCHEIFELE. *Farben-Ztg.* 33, 207-8(1927).—S. discusses the process of dissolving nitrocellulose in a solvent, the structure of the soln. and the mechanism of film formation. J. SCHALCH

Pigments in nitrocellulose lacquer enamels. H. A. NELSON AND W. C. NORRIS. *Research Bull. N. J. Zinc Co.* 1927, 24 pp.—A no. of lacquer pigments are considered with reference to particle size, oil absorption, hiding power and tinting strength, photochem. and chem. stability, ultra-violet penetration and other factors. Methods for detg. these factors and a reference bibliography are given. A supplement reviews the uses of the Zn pigments in lacquers. R. J. MOORE

Solubility of pigment colors in lacquers. HANS WAGNER AND J. KESSELRING. *Farben-Ztg.* 33, 619-21(1927).—A table is given which shows the soly. of dyes and lake colors in lacquer solvents and plasticizers. J. SCHALCH

Aging of nitrocellulose lacquer films and stability of the nitrocellulose. OTTO MERZ. *Farben-Ztg.* 33, 209(1927).—M. finds the accelerated testing methods in which the plasticizer is evapd. at higher temp. give results differing from the actual conditions as the high evapn. temp. lowers the stability of the nitrocotton. J. SCHALCH

Lacquer plasticizers. P. M. MOWEN. *Paint, Oil, Chem. Rev.* 85, No. 23, 12(1928).—Advantages and disadvantages of the usual plasticizers are described. R. J. MOORE

Detection of coumarone resins in varnishes. HANS WOLFF. *Farbe u Lack* 1928, 85.—The unsapon. matter is destructively distd. in a test tube and the distillate collected in a vial of glass wool in the mouth. The distillate is dissolved in Ac_2O and subjected to the Storch-Morawski reaction. A reddish yellow to orange color indicates coumarone resin. The color remains even after the characteristic color of rosin disappears. G. G. SWARD

Phenol-formaldehyde and allied compounds. A. JACKSON. *Dyer, Calico Printer* 59, 164-5, 192-3(1928).—A general discussion of resins, their properties and uses. RUBY K. WORTER

Acetone-condensation resins. H. A. GARDNER AND C. A. KNAUSS. *Ind. Eng. Chem.* 20, 599-600(1928).—Certain condensation resins of acetone with acetaldehyde, paraldehyde, aldol and furfural were prep'd. and tested in nitrocellulose lacquers. One variation used rosin in the mixt. All these gave a durability comparable to ester gum and damar but the color was darker. One modification contained nitrocellulose dissolved in the acetone and then condensed with aldol. This type gave good durability and pale color. R. J. MOORE

Resins from chlorinated cymene. P. H. GROGGINS. *Ind. Eng. Chem.* 20, 597-9 (1928).—Certain resins, prep'd. from *p*-cymene by chlorination, are described. The mechanism of the reaction, effect of catalysts and possible applications in coating compns. are discussed. R. J. MOORE

Malayan varnish resins. T. H. BARRY. *J. Roy. Soc. Arts* 76, 106-28(1927).—Present aspects of the industry in Malay are discussed and the gathering and treatment are described with photographic illustrations. Considerable data are given for the 2 principal damars, Mata Kuching (Cat's eye) and Penak. Other damars described are Saraya, Hitam or Sengal, Daging, Kepong, Kelulot, Siput, dead damar, Minyak and dragon's blood. R. J. MOORE

Less familiar aspects of plastics industry. CARLETON ELLIS. *Chem. Met. Eng.* 35, 18-9(1928).—Some recent work on synthetic resins is briefly reviewed. R. J. M.

Luminous colors. ANON. *Farben-Ztg.* 33, 24-5, 87-8(1927).—A review of the manuf. and use. J. S.

Standardizing dry testing of colors. ALBERT GRUNDER AND R. S. SHEPHERD. *Paint, Oil, Chem. Rev.* 85, No. 22, 10-1, 25(1928).—Methods commonly used for testing pigments are described and criticized; standard methods requiring standard app. and nomenclature are suggested. R. J. MOORE

Iron cyanide colors, especially milori-blue. ARNO MÜLLER-MAGDEBURG. *Chem.-Ztg.* 51, 923-4(1928).—A review of the chemical reactions and technical prepn. R. J. MOORE

Chemical and physical characteristics of red lake pigments. C. A. HENLEIN AND SEVIER BONNIE. *Paint, Oil & Chem. Rev.* 85, No. 20, 10-2, 22(1928).—Red lake pigments are reviewed. The dyes used, methods of manuf. and certain good and bad characteristics are described. R. J. MOORE

Studies on the hygienic manufacture of titanium dioxide and titanium white. K. B. LEHMANN AND LUDWIG HERGET. *Chem.-Ztg.* 51, 793-4(1927).—Prepn. of the 2 principal pigments is reviewed and methods of analysis are given. R. J. MOORE

Scattering of light by graded particles in suspension. T. M. LOWRY AND M. C. MARSH. *J. Oil & Colour Chem. Assoc.* 11, 3-15(1928).—A sample of barytes was sep'd. into 13 fractions by elutriation at water velocities of 0.5 to 12.5 mm. per sec. The diams. of the particles were measured and proved the validity of Stokes' law within the limits of the expt., on the assumption the particles behaved as spheres of slightly larger diam. than the mean width of the particles. The diam. of the elutriator has an effect on the const. in Stokes' formula. The various fractions were suspended in paraffin and the light-transmission was measured by means of a Hilger sector-photometer. The optical density is proportional to the surface-concn. of the powder, but increases slowly as the diam. is reduced to 50 μ , and much more rapidly when the diam. is reduced below 30 μ . The results indicate that a max. of covering power must exist for a given surface-concn. of the powder, but that this max. lies well beyond the limits of fineness that can be obtained by the methods of pigment grinding now in general use. A discussion follows. R. J. MOORE

Linnoxyn and linoleum. A. D. LUTTRINGER. *Caoutchouc & gutta-percha* 25, 13,900-3, 13,944-5(1928); cf. C. A. 22, 1050.—Various formulas and processes are reviewed, with a bibliography of 14 books. C. C. DAVIS

Pb and Zn pigments (STOLL) (STRADER, STOLL) 18. Purification of vegetable oils [for varnish] (ZINOV'EV) 27. Non-liquid disperse systems of fatty oils (AUER) 27. The relationship between ethereal oils and resins (PIGULEVSKI) 17. Treating waste acid liquors (Brit. pat. 277,769) 13. Mixing and emulsifying apparatus for treating paints (U. S. pat. 1,671,865) 1. Coloring "soluble cellulose" (Brit. pat. 277,989) 23. Lakes (Brit. pat. 277,371) 25.

Waterproof paint. C. N. EXLEY. U. S. 1,672,377, June 5. A paint suitable for spraying or use with a brush is formed of Na resinate soap 6, lithopone 60, raw rosin 9, turpentine 7 and water 18 parts, emulsified together.

Pigments, etc. E. C. DESTUBNER. Brit. 277,947, Sept. 23, 1926. Pigments

formed by pptn. in aq. media are dehydrated by adding a fluid miscible with water and compatible with the paint, printers' ink, lacquer, celluloid, artificial leather or other compn. in which the product is to be used as a coloring agent; the ppt^e is washed and preferably filter-pressed or centrifuged and then treated with the fluid; for coloring lacquer, 86-95% alc. may be used; for paint, enamel or printers' ink, acetone or pyridine; for cellulose formate, pyridine; for cellulose triacetate or triethyl cellulose, alc. or acetone. Several examples are given.

Coating compositions comprising cellulose esters or ethers, starch acetate or similar carbohydrate derivatives. J. D. MCBURNEY and E. H. NOLLAU (to E. I. duPont de Nemours & Co.). Brit. 278,696, Oct. 5, 1926. Livering or gelling is prevented by adding 0.1-5.0% of substances such as oxalic, phosphoric, tartaric, citric, malic, formic or acetic acids.

Apparatus for treating varnished surfaces with ultra-violet rays to dry the varnish. R. D. MAILEY (to Cooper Hewitt Elec. Co.). U. S. 1,672,331, June 5.

Condensation products of alcohols and ketones with urea. I. G. FARDENIND. A.-G. Brit. 278,390, Oct. 4, 1926. Oily or resinous products suitable for use as softening agents for cellulose esters or ethers, as resins, or as "water-swelling substances" are obtained by prolonged heating of urea or a deriv. such as acetylurea, thiourea or urethan with an excess of an alc. or ketone such as benzyl alc. or butylene glycol, EtOH, acetophenone, glycerol or the cyclic acetal produced by treating glycerol with AcH. Catalysts may be used (of which glycerol is mentioned as an example) and the process may be carried out under pressure.

Resinous reaction product of urea and formaldehyde. F. LAUTER (to Rohm & Haas Co.). U. S. 1,671,590, May 29. Products free from methylene urea are obtained by adding hot urea to a boiling soln. of CH₂O.

Resinous reaction product of urea and formaldehyde. F. LAUTER (to Rohm & Haas Co.). U. S. 1,672,848, June 5. Condensation is effected in the presence of an aromatic sulfonamide such as *p*-toluenesulfonamide which serves to stabilize and soften the product.

Synthetic resin composition. R. SCHROEDER, M. SCHROEDER, S. LEVIS and E. JAROSLAW (trading as Jaroslaw's Erste Glimmerwaren-Fabrik). Brit. 278,038, May 26, 1926. A moldable material is prepd. by impregnating paper or fabric with synthetic resin, scutching and mixing with addnl. powd. synthetic resin.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

Report of the Smalley Foundation Committee. H. C. MOORE, *et al.* *Oil Fat Ind.* 5, 146-51 (1928).—Tables are given showing the results of oil and NH₃ analysis of meal by the collaborators. The av. of the efficiencies for both oil and NH₃ on the 29 samples for the 10 highest collaborators for the year was 99.888 as against 99.862 for the previous year. The object of the Smalley Foundation is to improve the quality and standard of the analytical work of analysts in this industry. E. SCHERUBEL

Report of Moisture Committee. W. H. IRWIN, *et al.* *Oil Fat Ind.* 5, 124-9 (1928).—The Kingman distn. method was further modified, as the first modification did not give good results. Weigh 40 g. of sample into 500-cc. Erlenmeyer flask. Add 125 cc. C₂H₅Cl₄, connect with Kingman distn. tube and distil as follows: Heat with a Bunsen flame 1 to 1 1/4 in. high placed so that the flame strikes the gage under the flask. A thermometer calibrated at each degree should pass through the stopper of the flask with its bulb above the liquid. When the temp. rises to 135° take the temp. readings at 1-min. intervals. Draw off the solvent when the Kingman tube gets too full. When 3 successive temp. readings at 1-min. intervals show the same, shut off the flame and allow to cool. The const. b. p. is about 142° and should be reached in 30 min. After cooling wash down the condenser and tube into the graduated tube of the app. with a little benzene, removing any drops of H₂O adhering to the upper part of the condenser tube with a looped Cu wire. Read the column of water and calc. the %. The results are in better agreement than those of the previous year. They are somewhat higher than the oven method figures. The Committee does not feel that it would be practical to use a distn. method except in special cases, and recommends that a double-walled oven contg. glycerol in the jacket be used, and that the drying time be fixed at 3 hrs. The max. range of the cooperative work sent out in which the jacketed oven was used was 0.51%; the minimum 0.29% and the av. 0.40%. E. SCHERUBEL

Report of committee on crude mill operations. A. K. SCHWARTZ, *et al.* *Oil Fat Ind.* 5, 134-45(1928).—The object of the expt. was to det. if the slight preheating of seed without previous addition of H_2O had any effect upon the crude oil. The meats gave a better oil extn. The color of the refined and bleached oil was worse, showing an increase of 0.4 and 0.1 red, resp. Expt. 2 was made to det. the effect of the continuous addition of direct steam during the cooking process. It affected the standard of extn. but little. The quality of the crude was materially changed, the losses averaged a 0.6% improvement between max. and minimum application. The color of the crude was lighter. Expt. 3. By the production of 41.8% and 48.7% protein meals it was sought to det. if increased addition of hulls detrimentally affected the oil. The reverse is the case. Expt. 4. With addition of H_2O as steam before cooking and without any H_2O addition it was sought to det. the effect of increased cooking time. If enough H_2O was present increased cooking improved the extn. as represented by the standard of meals; to decrease the refining loss; to darken the color of refined and bleached oil and to lighten the color of crude oil. Where no H_2O is added the length of cooking time is limited and an increase of time decreases the extn., increases the loss on refining and reddens both refined and bleached oils, but lightens the crude. Expt. 5. It was sought to det. if the form of H_2O whether as steam or H_2O introduced before cooking affected the refining loss. The addition of steam shows increasing loss. Expt. 6. By allowing the moistened meats to stand 1 hr. in the bins the loss was increased 2.1% while the refined and bleached color remained the same. Expt. 7. The addition of H_2O to meats before cooking under 30 lb. jacket pressure showed that the best extn. is obtained when the meats contain 10% H_2O . With 70 lb. jacket pressure the best extn. was obtained with 9% H_2O content in the meats. Expt. 8. The use of high- and low-temp. cooking was tried. Lower loss in favor of low jacket pressure was shown. Expt. 9. The object of this expt. was to det. if there was any difference in the oil flowing from the press at different stages of pressing. The first oil gives a lower loss than the last flowing from the press. The committee hesitated to advance any theories on the correct cooking of cottonseed meals at this time.

E. SCHERUBEL

Report of Cake Color Committee. A. S. RICHARDSON, *et al.* *Oil Fat Ind.* 5, 132-3 (1928).—It is recommended that the meal to be graded should be placed in the center of a gray sheet or board 8 in. square; it should be flattened out to make a circle 3 or 4 in. across, and a 1 in. square of the color standard laid on the center of the meal. Both should then be observed in good daylight from a position directly above and at least 36 in. distant. Optionally use may be made of a horizontal rotating cylinder of clear glass contg. meal at the bottom and a strip of color standard above the meal. The width of the color standard, also of the band of meal exposed to view, should be not less than 1 in. The inside diam. of the cup should be about 2 in. All gradings should be made in good daylight with a speed of rotation sufficient to blur the individual particles of meal. For cake a portion should be ground so that 85% will pass a 20-mesh screen. The ground sample should be graded as for meal. Any samples of meal should be ground to the standard for cake and so stated in the report.

E. S.

Report of the Color Committee of A. O. C. S. J. D. EVANS, *et al.* *Oil Fat Ind.* 5, 130-2(1928).—The committee recommends that the Greiner or some modification of it, or the Bailey Tintometer be made standard, and that not more than 3 glasses be used. The $\frac{3}{4}$ -in. glass tube should be used rather than the 4-oz. bottle and the 75-watt lamp instead of the 150-watt one.

E. SCHERUBEL

Use of the rapid percolation procedure for the extraction of raffinose from cottonseed press-cake. M. BRIDEL AND (Mlle.) M. DESMARET. *Bull. soc. chim. biol.* 10, 510-21(1928); cf. *C. A.* 20, 1302; 22, 971.—Five hundred g. of press-cake contg. 36.464 g. of raffinose was extd. by percolation with 250-cc. portions of 60% alc. In 105 min. 54.23% of the raffinose was extd., in 5 hrs. 92.93% and in 10 hrs. 100%. In the first 2 fractions the raffinose was 50% of the dry residue, in the later fractions the raffinose decreased. Yield, 3.3% of the wt. of the press-cake.

L. W. RIGGS

Extraction of castor oil from the seed with gasoline. A. SLASHCHEV. *Maslo-boino-Zhrovoye Delo.* 1928, No. 3, 9-11.—According to A. G. Hoppe and contrary to other authors castor oil could be easily extd. with (hot) gasoline. In expts. carried out in the extn. plant of "Khimzhir" in Krasnodar the following results were obtained: Benzene, which is an excellent solvent, darkens the oil. A mixt. of gasoline and benzene, which is a fair solvent, spoils the color to some extent depending on the proportion of benzene. Gasoline, giving a bright oil, does not yield a complete extn. (loss 1.5-2%). Thirteen extns. were made with the same gasoline by distg. it off from the extd. oil. The first extn. was made with hot gas, the following with cooled. The app. was heated and the seed was slightly warm. The seed used contained 10% of

dirt and was of an inferior quality. No filters were used during the extn. The table shows the results obtained:

Color	Standard	Gasoline-Extd. Oil	Pressed Oil
	Colorless or faint yellow	Dark-yellow	Faint yellow
Sp. gr.	0.961-0.973	0.9655	0.963-0.964
Engler 50°	15	18.75	16.5-16.8
Engler 90°	3	3.5	3.2-3.5
Flash M. Penskii	240°	260°	252-235°
Acidity in % oleic acid	1.5	10	1.91-2.2
Tarry substances	none	none	none
Ash	0.01%	0.05%	0.001-0.009%
Sapon. number	176-183	180	182-187
Iodine number	82-85	80.3	91.4-93.1
Freezing point	below -16°	-17°	-16°
Soly. in 96% alc.	complete	complete	complete
Soly. in gasoline	insol.	insol.	20/60
Moisture		0	0.35

Extn. with cold gasoline was not satisfactory. Another batch with higher quality seeds was extd. and only 4.49% fatty acids obtained. This acid was neutralized with NaOH, leaving 0.2% acid. The soap stock could be separated. No details are given.

A. A. BOEHLING

Purification of vegetable oils. A. ZINOV'EV. *Masloboino-Zhirvoye Delo*. 1928, No. 3, 11-5.—Methods for treating vegetable oils to obtain oils suitable for varnishes are reviewed. To eliminate the slime always present in crude vegetable oils, the oil was heated in a kettle at 80-100° for 20-30 min. and a stream of dry air was blown through it; this destroys the slime and prevents its formation at higher temps. No further treatments are required such as H₂SO₄, fuller's earth, etc. To destroy the pigment the higher temps. used for blowing, etc., are sufficient. This new method cheapens the production to a very great extent. Linseed oil was treated this way. Similar expts. with CO₂ gave the same results. Oil in 4 flasks was heated, the first to 100°, 2nd to 150° and 3rd to 200°. The oil was heated for many hrs.; the corks had one hole each; and the oil was not agitated. In the 4th flask, which had a stirrer, the oil was kept at 150°. This method did not prevent the formation of slime. Blowing H₂ and N₂ through the oil gave the same results as blowing air. Wet air when preheated up to 100-120° is also a good dryer. The appearance of H₂O drops on the containers when air or gas was blown through led to the conclusion that the slime contains water which is evapd.

A. A. BOEHLING

Non-liquid disperse systems of fatty oils. LASZLO AUER. *Furben-Ztg.* 33, 682 (1927).—A. treated various oils with formic acid. Upon settling, 3 layers were formed, the bottom layer consisting of formic acid, the middle layer mainly of the dispersion medium and the top layer of the coagulated disperse phase. The following oils are classified according to a decreasing content of the disperse phase: Chinese wood oil, linseed, sunflower, poppy-seed, nut, olive and castor oil. Oil varnishes show a greater disperse phase than the corresponding oils. The relatively slow drying of stand oils and thick oils which contain a higher amt. of disperse phase than the tung oil can be explained by considering the difficulty with which the gas, necessary for the film formation (according to the gas coagulation theory), penetrates the very viscous and partly coagulated oil.

J. SCHALCH

Composition of hydrogenated rape oil. T. F. KITAEV. *Ukrainskii Khem. Zhurnal* 1, tech. part 40-9(1925).—The compn. of fatty acids in industrial hydrogenated rape oil is: behenic acid 10, stearic acid 32.8, erucic acid 43.2, rapinic acid (C₁₈H₃₄O₂) 10%. The characteristics of the oil analyzed were: I value 48-48.5, coeff. of sapon. 188, d₁₀₀ 0.850, m. 47°, av. mol. wt. 312-15, neutralization value 177.5.

G. B. KISTAKOWSKY

The effect of various compounds on the rate of development of rancidity in fats and oils. W. J. HUSA AND LYDIA M. HUSA. *J. Am. Pharm. Assoc.* 17, 243-7(1928).—The Krels test was used for detecting rancidity, the odor of the test samples serving as a confirmatory test. Hydroquinone reduces the rate of development of rancidity in oil of sweet almonds. The addn. of 0.5% of hydroquinone to lard reduces the rate of development of rancidity about 50%. The following compds. have no effect: salicylic acid, acetylsalicylic acid, β-naphthol, liquefied phenol, dl-alanine, pyrogallol acid and resorcinol.

L. E. WARREN

The seed of *Euphorbia verrucosa*, Jacq. PAUL GILLOT. *Mat. grasses* 20, 8166-8 (1928).—The av. compn. of the seed is: H_2O 8.84, fat 25.74, crude protein 21.12, N-free ext. 1.30, ash 5.80, crude fiber 37.20%. The oil obtained by cold pressing has α (200 mm. tube) $+10'$, d_{16}^{20} 0.9356, n_{22} 1.4829, n_{18} 1.4855, Crismer no. (alc. of d. 0.7967) 65°, f. p. -24° , acid no. 2.4, acidity (as oleic) 1.24%, sol. fatty acids (Planchon) 0.7 cc. 0.1 N KOH per 150 cc., sol. fatty acids (as butyric) 0.12%, Hehner no. 95.60%, sol. volatile fatty acids (Reichert-Wollny) 0.2 cc. 0.1 N KOH, insol. volatile fatty acids (Reichert-Wollny) 0.3 cc. 0.1 N KOH, sapon. no. 190.4, acid no. (Wijs) 209.0, Ac no. (André) 10.4, unsaponifiable 1.04%, Et_2O -insol. brominated glycerides (Hehner and Mitchell) 60.56%, degree of oxidation (Bishop) 21.20%; the elaidin, Bellier (CH_2O), arachidic acid tests were all negative; Halphen's Br reaction immediately gave a ppt.; Bellier's resorcinol tests gave a deep violet oil and yellow acid. The total fatty acids have n_{22} 1.4740, I no. (Wijs) 218.1, neutralization no. 197.5, solid fatty acids 2.5%, liquid fatty acids 97.5%. The liquid fatty acids have n_{22} 1.4745, I no. (Wijs) 222.3. The oil is very similar to that of *Mercurialis annua* (C. A. 20, 1258) and is one of the most highly drying oils. The oil content of the seed varies considerably from year to year. The compn. of the oil does not vary appreciably with the extn. process (pressure or extn. with petroleic ether), nor with the age of the seed. A. PAPINEAU-COUTURE

Variations in the constants of the oils of certain Leguminosae. G. HALDEN. *Mat. grasses* 20, 8168-71 (1928).—A discussion of variations in the published constants of the oils of various Leguminosae, which H. attributes to variations in the strains of the plants, botanical variations, variations in the methods of extn. of the oil and in the portion of the oil examd. A. PAPINEAU-COUTURE

A new combined method to titrate the volatile, soluble and insoluble fatty acids in butter and fats. E. TCHÉTCHEOFF. *Bull. soc. chim. Belg.* 37, 153-63 (1927).—Complete exptl details are given of a new method by which it is possible to det. the Reichert-Meissl, the Polenske, the xylene and the sapon. indexes in a sample of only 5 g. of butter. The principle of the method is as follows: only the lower fatty acids are distd. after decompn. of their sol. soaps, alc. being eliminated by distn., and the non-volatile fatty acids by filtration of their insol. Mg soaps. A. L. HENNE

Determination of degumming power of soaps (boiling-off soaps). R. TSUNOKAE. *J. Soc. Dyers Colourists* 44, 142-4 (1928).—The soaps were tested by 4 methods, viz., salting out, titration, toluene and elec. cond., of which the titration method by $H_2C_2O_4$ with phenolphthalein indicator was the most satisfactory. The degree of hydrolysis was calcd from the amt. of free alkali found. The degumming power varied with the degree of hydrolysis. L. W. RIGGS

A new electrically heated apparatus for fat and oil Soxhlet extractions (GOGOLEV) 1. Preparation of catalyst by electrolytic corrosion of Ni (Ikt) 4. Filter for oils (U. S. pat. 1,671,958) 1.

Fats and Oil Studies of the Food Research Institute. Stanford Univ., Calif.: Food Research Institute. Published as books and pamphlets of different lengths. Prices \$1, \$1.50 and \$2. Reviewed in *Oil & Fat Industries* 5, 88 (1928).

Countercurrent extraction system for recovery of wool grease from wool in a series of vats with intermediate squeeze rolls. J. L. TURTS. U. S. 1,672,289, June 5

Fatty acids and other substances from "tall-oil." OEL- UND FETT-CHEMIE GES. Brit. 278,097, Oct. 11, 1926. "Tall-oil" is sepd. into fatty acids and resin acids by distg. and fractionating, or by esterifying so as to leave the resin acids unaffected, and distg. "Sulfite alc." and H_2SO_4 may be used for effecting the esterification.

Extracting oils from seeds, etc. C. DOWNS and R. A. BELLWOOD. Brit. 278,145, Aug. 23, 1926. A thin layer of the crushed material is passed along within an enclosed chamber and repeatedly sprayed with solvent and subjected to suction to effect withdrawal of the solvent. An app. is described.

Refining cottonseed oil. D. McNICOLL (to British Oil and Cake Mills, Ltd.). U. S. 1,671,834, May 29. The oil is treated with sufficient of an aq. soln. of a borate such as borax or Mg borate to ppt. gossypol from the oil; the soln. also contains an added substance such as H_3BO_3 or glycerol which largely reduces the OH concn. normally possessed by the borate soln., so that coloring matter is pptd. without substantial neutralization of the fatty acid present.

Use of sulfonic acids as detergents. I. G. FARBERNIND. A.-G. Brit. 277,391, March 10, 1926. Sulfonic acids of cyclohexylnaphthalene and of isomeric methyl-
